             return compare_exchange_strong(expected, desired, order, fail_order);
where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced
by the value memory_order::acquire and a value of memory_order::release shall be replaced by
the value memory_order::relaxed.

```

19.11.8.2 Atomic specialization for weak_ptr

[util.smartptr.atomic.weak]

```

namespace std {
    template<class T> struct atomic<weak_ptr<T>> {
        using value_type = weak_ptr<T>;
        static constexpr bool is_always_lock_free = implementation-defined;

        bool is_lock_free() const noexcept;
        void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
    };
}

```

```

operator weak_ptr<T>() const noexcept;

weak_ptr<T> exchange(weak_ptr<T> desired,
                     memory_order order = memory_order::seq_cst) noexcept;

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                            memory_order success, memory_order failure) noexcept;

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                            memory_order order = memory_order::seq_cst) noexcept;

constexpr atomic() noexcept = default;
atomic(weak_ptr<T> desired) noexcept;
atomic(const atomic&) = delete;
void operator=(const atomic&) = delete;
void operator=(weak_ptr<T> desired) noexcept;

private:
    weak_ptr<T> p;           // exposition only
};

constexpr atomic() noexcept = default;

1   Effects: Initializes p{}.

atomic(weak_ptr<T> desired) noexcept;

2   Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.8.2). [Note: It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

3   Requires: The order argument shall not be memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

4   Effects: Atomically replaces the value pointed to by this with the value of desired as if by p.swap(desired). Memory is affected according to the value of order.

void operator=(weak_ptr<T> desired) noexcept;

5   Effects: Equivalent to store(desired).

weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;

6   Requires: order shall not be memory_order::release nor memory_order::acq_rel.

7   Effects: Memory is affected according to the value of order.

8   Returns: Atomically returns p.

operator weak_ptr<T>() const noexcept;

9   Effects: Equivalent to: return load();

weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

10  Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.8.2.1).

11  Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order success, memory_order failure) noexcept;

```

```
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                            memory_order success, memory_order failure) noexcept;
```

12 *Requires:* `failure` shall not be `memory_order::release` nor `memory_order::acq_rel`.

13 *Effects:* If `p` is equivalent to `expected`, assigns `desired` to `p` and has synchronization semantics corresponding to the value of `success`, otherwise assigns `p` to `expected` and has synchronization semantics corresponding to the value of `failure`.

14 *Returns:* `true` if `p` was equivalent to `expected`, `false` otherwise.

15 *Remarks:* Two `weak_ptr` objects are equivalent if they store the same pointer value and either share ownership, or both are empty. The weak form may fail spuriously. See 30.7.1.

16 If the operation returns `true`, `expected` is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.8.2) on the memory pointed to by `this`. Otherwise, the operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
```

17 *Effects:* Equivalent to:

```
    return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                            memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects:* Equivalent to:

```
    return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

19.12 Memory resources

[mem.res]

19.12.1 Header <memory_resource> synopsis

[mem.res.syn]

```
namespace std::pmr {
    // 19.12.2, class memory_resource
    class memory_resource;

    bool operator==(const memory_resource& a, const memory_resource& b) noexcept;
    bool operator!=(const memory_resource& a, const memory_resource& b) noexcept;

    // 19.12.3, class template polymorphic_allocator
    template<class Tp> class polymorphic_allocator;

    template<class T1, class T2>
        bool operator==(const polymorphic_allocator<T1>& a,
                         const polymorphic_allocator<T2>& b) noexcept;
    template<class T1, class T2>
        bool operator!=(const polymorphic_allocator<T1>& a,
                         const polymorphic_allocator<T2>& b) noexcept;

    // 19.12.4, global memory resources
    memory_resource* new_delete_resource() noexcept;
    memory_resource* null_memory_resource() noexcept;
    memory_resource* set_default_resource(memory_resource* r) noexcept;
    memory_resource* get_default_resource() noexcept;
```

```
// 19.12.5, pool resource classes
struct pool_options;
class synchronized_pool_resource;
class unsynchronized_pool_resource;
class monotonic_buffer_resource;
}
```

19.12.2 Class `memory_resource`

[mem.res.class]

- ¹ The `memory_resource` class is an abstract interface to an unbounded set of classes encapsulating memory resources.

```
namespace std::pmr {
    class memory_resource {
        static constexpr size_t max_align = alignof(max_align_t); // exposition only

        public:
            memory_resource() = default;
            memory_resource(const memory_resource&) = default;
            virtual ~memory_resource();

            memory_resource& operator=(const memory_resource&) = default;

            [[nodiscard]] void* allocate(size_t bytes, size_t alignment = max_align);
            void deallocate(void* p, size_t bytes, size_t alignment = max_align);

            bool is_equal(const memory_resource& other) const noexcept;

        private:
            virtual void* do_allocate(size_t bytes, size_t alignment) = 0;
            virtual void do_deallocate(void* p, size_t bytes, size_t alignment) = 0;

            virtual bool do_is_equal(const memory_resource& other) const noexcept = 0;
    };
}
```

19.12.2.1 Public member functions

[mem.res.public]

`~memory_resource();`

- ¹ *Effects:* Destroys this `memory_resource`.

`[[nodiscard]] void* allocate(size_t bytes, size_t alignment = max_align);`

- ² *Effects:* Equivalent to: `return do_allocate(bytes, alignment);`

`void deallocate(void* p, size_t bytes, size_t alignment = max_align);`

- ³ *Effects:* Equivalent to `do_deallocate(p, bytes, alignment)`.

`bool is_equal(const memory_resource& other) const noexcept;`

- ⁴ *Effects:* Equivalent to: `return do_is_equal(other);`

19.12.2.2 Private virtual member functions

[mem.res.private]

`virtual void* do_allocate(size_t bytes, size_t alignment) = 0;`

- ¹ *Requires:* `alignment` shall be a power of two.

- ² *Returns:* A derived class shall implement this function to return a pointer to allocated storage (6.6.4.4.1) with a size of at least `bytes`, aligned to the specified `alignment`.

- ³ *Throws:* A derived class implementation shall throw an appropriate exception if it is unable to allocate memory with the requested size and alignment.

`virtual void do_deallocate(void* p, size_t bytes, size_t alignment) = 0;`

- ⁴ *Requires:* `p` shall have been returned from a prior call to `allocate(bytes, alignment)` on a memory resource equal to `*this`, and the storage at `p` shall not yet have been deallocated.

5 *Effects:* A derived class shall implement this function to dispose of allocated storage.

6 *Throws:* Nothing.

```
virtual bool do_is_equal(const memory_resource& other) const noexcept = 0;
```

7 *Returns:* A derived class shall implement this function to return `true` if memory allocated from `this` can be deallocated from `other` and vice-versa, otherwise `false`. [Note: The most-derived type of `other` might not match the type of `this`. For a derived class `D`, an implementation of this function could immediately return `false` if `dynamic_cast<const D*>(&other) == nullptr`. —end note]

19.12.2.3 Equality

[mem.res.eq]

```
bool operator==(const memory_resource& a, const memory_resource& b) noexcept;
```

1 *Returns:* `&a == &b || a.is_equal(b)`.

```
bool operator!=(const memory_resource& a, const memory_resource& b) noexcept;
```

2 *Returns:* `!(a == b)`.

19.12.3 Class template polymorphic_allocator

[mem.polyallocator.class]

- 1 A specialization of class template `pmr::polymorphic_allocator` satisfies the *Cpp17Allocator* requirements (Table 34). Constructed with different memory resources, different instances of the same specialization of `pmr::polymorphic_allocator` can exhibit entirely different allocation behavior. This runtime polymorphism allows objects that use `polymorphic_allocator` to behave as if they used different allocator types at run time even though they use the same static allocator type.
- 2 All specializations of class template `pmr::polymorphic_allocator` satisfy the allocator completeness requirements (15.5.3.5.1).

```
namespace std::pmr {
    template<class Tp> class polymorphic_allocator {
        memory_resource* memory_rsrc; // exposition only

    public:
        using value_type = Tp;

        // 19.12.3.1, constructors
        polymorphic_allocator() noexcept;
        polymorphic_allocator(memory_resource* r);

        polymorphic_allocator(const polymorphic_allocator& other) = default;

        template<class U>
        polymorphic_allocator(const polymorphic_allocator<U>& other) noexcept;

        polymorphic_allocator& operator=(const polymorphic_allocator& rhs) = delete;

        // 19.12.3.2, member functions
        [[nodiscard]] Tp* allocate(size_t n);
        void deallocate(Tp* p, size_t n);

        template<class T, class... Args>
        void construct(T* p, Args&&... args);

        template<class T>
        void destroy(T* p);

        polymorphic_allocator select_on_container_copy_construction() const;

        memory_resource* resource() const;
    };
}
```

19.12.3.1 Constructors

[mem.poly_allocator.ctor]

```
polymorphic_allocator() noexcept;
1   Effects: Sets memory_rsrc to get_default_resource().
polymorphic_allocator(memory_resource* r);
2   Requires: r is non-null.
3   Effects: Sets memory_rsrc to r.
4   Throws: Nothing.
5   [Note: This constructor provides an implicit conversion from memory_resource*. —end note]
```

```
template<class U> polymorphic_allocator(const polymorphic_allocator<U>& other) noexcept;
6   Effects: Sets memory_rsrc to other.resource().
```

19.12.3.2 Member functions

[mem.poly_allocator.mem]

```
[[nodiscard]] Tp* allocate(size_t n);
1   Effects: If SIZE_MAX / sizeof(Tp) < n, throws length_error. Otherwise equivalent to:
           return static_cast<Tp*>(memory_rsrc->allocate(n * sizeof(Tp), alignof(Tp)));
void deallocate(Tp* p, size_t n);
2   Requires: p was allocated from a memory resource x, equal to *memory_rsrc, using x.allocate(n * sizeof(Tp), alignof(Tp)).
3   Effects: Equivalent to memory_rsrc->deallocate(p, n * sizeof(Tp), alignof(Tp)).
4   Throws: Nothing.
```

```
template<class T, class... Args>
void construct(T* p, Args&&... args);
5   Mandates: Uses-allocator construction of T with allocator *this (see 19.10.8.2) and constructor arguments std::forward<Args>(args)... is well-formed.
6   Effects: Construct a T object in the storage whose address is represented by p by uses-allocator construction with allocator *this and constructor arguments std::forward<Args>(args)....
7   Throws: Nothing unless the constructor for T throws.
```

```
template<class T>
void destroy(T* p);
8   Effects: As if by p->~T().
```

```
polymorphic_allocator select_on_container_copy_construction() const;
9   Returns: polymorphic_allocator().
10  [Note: The memory resource is not propagated. —end note]
```

```
memory_resource* resource() const;
11  Returns: memory_rsrc.
```

19.12.3.3 Equality

[mem.poly_allocator.eq]

```
template<class T1, class T2>
bool operator==(const polymorphic_allocator<T1>& a,
                  const polymorphic_allocator<T2>& b) noexcept;
1   Returns: *a.resource() == *b.resource().
template<class T1, class T2>
bool operator!=(const polymorphic_allocator<T1>& a,
                  const polymorphic_allocator<T2>& b) noexcept;
2   Returns: !(a == b).
```

19.12.4 Access to program-wide `memory_resource` objects

[mem.res.global]

```
memory_resource* new_delete_resource() noexcept;
```

- 1 *Returns:* A pointer to a static-duration object of a type derived from `memory_resource` that can serve as a resource for allocating memory using `::operator new` and `::operator delete`. The same value is returned every time this function is called. For a return value `p` and a memory resource `r`, `p->is_equal(r)` returns `&r == p`.

```
memory_resource* null_memory_resource() noexcept;
```

- 2 *Returns:* A pointer to a static-duration object of a type derived from `memory_resource` for which `allocate()` always throws `bad_alloc` and for which `deallocate()` has no effect. The same value is returned every time this function is called. For a return value `p` and a memory resource `r`, `p->is_equal(r)` returns `&r == p`.

- 3 The *default memory resource pointer* is a pointer to a memory resource that is used by certain facilities when an explicit memory resource is not supplied through the interface. Its initial value is the return value of `new_delete_resource()`.

```
memory_resource* set_default_resource(memory_resource* r) noexcept;
```

- 4 *Effects:* If `r` is non-null, sets the value of the default memory resource pointer to `r`, otherwise sets the default memory resource pointer to `new_delete_resource()`.

- 5 *Returns:* The previous value of the default memory resource pointer.

- 6 *Remarks:* Calling the `set_default_resource` and `get_default_resource` functions shall not incur a data race. A call to the `set_default_resource` function shall synchronize with subsequent calls to the `set_default_resource` and `get_default_resource` functions.

```
memory_resource* get_default_resource() noexcept;
```

- 7 *Returns:* The current value of the default memory resource pointer.

19.12.5 Pool resource classes

[mem.res.pool]

19.12.5.1 Classes `synchronized_pool_resource` and `unsynchronized_pool_resource` [mem.res.pool.overview]

- 1 The `synchronized_pool_resource` and `unsynchronized_pool_resource` classes (collectively called *pool resource classes*) are general-purpose memory resources having the following qualities:

- (1.1) — Each resource frees its allocated memory on destruction, even if `deallocate` has not been called for some of the allocated blocks.
- (1.2) — A pool resource consists of a collection of *pools*, serving requests for different block sizes. Each individual pool manages a collection of *chunks* that are in turn divided into blocks of uniform size, returned via calls to `do_allocate`. Each call to `do_allocate(size, alignment)` is dispatched to the pool serving the smallest blocks accommodating at least `size` bytes.
- (1.3) — When a particular pool is exhausted, allocating a block from that pool results in the allocation of an additional chunk of memory from the *upstream allocator* (supplied at construction), thus replenishing the pool. With each successive replenishment, the chunk size obtained increases geometrically. [Note: By allocating memory in chunks, the pooling strategy increases the chance that consecutive allocations will be close together in memory. — *end note*]
- (1.4) — Allocation requests that exceed the largest block size of any pool are fulfilled directly from the upstream allocator.
- (1.5) — A `pool_options` struct may be passed to the pool resource constructors to tune the largest block size and the maximum chunk size.

- 2 A `synchronized_pool_resource` may be accessed from multiple threads without external synchronization and may have thread-specific pools to reduce synchronization costs. An `unsynchronized_pool_resource` class may not be accessed from multiple threads simultaneously and thus avoids the cost of synchronization entirely in single-threaded applications.

```
namespace std::pmr {
    struct pool_options {
        size_t max_blocks_per_chunk = 0;
```

```

        size_t largest_required_pool_block = 0;
    };

    class synchronized_pool_resource : public memory_resource {
public:
    synchronized_pool_resource(const pool_options& opts, memory_resource* upstream);

    synchronized_pool_resource()
        : synchronized_pool_resource(pool_options(), get_default_resource()) {}
    explicit synchronized_pool_resource(memory_resource* upstream)
        : synchronized_pool_resource(pool_options(), upstream) {}
    explicit synchronized_pool_resource(const pool_options& opts)
        : synchronized_pool_resource(opts, get_default_resource()) {}

    synchronized_pool_resource(const synchronized_pool_resource&) = delete;
    virtual ~synchronized_pool_resource();

    synchronized_pool_resource& operator=(const synchronized_pool_resource&) = delete;

    void release();
    memory_resource* upstream_resource() const;
    pool_options options() const;

protected:
    void* do_allocate(size_t bytes, size_t alignment) override;
    void do_deallocate(void* p, size_t bytes, size_t alignment) override;

    bool do_is_equal(const memory_resource& other) const noexcept override;
};

class unsynchronized_pool_resource : public memory_resource {
public:
    unsynchronized_pool_resource(const pool_options& opts, memory_resource* upstream);

    unsynchronized_pool_resource()
        : unsynchronized_pool_resource(pool_options(), get_default_resource()) {}
    explicit unsynchronized_pool_resource(memory_resource* upstream)
        : unsynchronized_pool_resource(pool_options(), upstream) {}
    explicit unsynchronized_pool_resource(const pool_options& opts)
        : unsynchronized_pool_resource(opts, get_default_resource()) {}

    unsynchronized_pool_resource(const unsynchronized_pool_resource&) = delete;
    virtual ~unsynchronized_pool_resource();

    unsynchronized_pool_resource& operator=(const unsynchronized_pool_resource&) = delete;

    void release();
    memory_resource* upstream_resource() const;
    pool_options options() const;

protected:
    void* do_allocate(size_t bytes, size_t alignment) override;
    void do_deallocate(void* p, size_t bytes, size_t alignment) override;

    bool do_is_equal(const memory_resource& other) const noexcept override;
};
}

```

19.12.5.2 pool_options data members

[mem.res.pool.options]

¹ The members of pool_options comprise a set of constructor options for pool resources. The effect of each option on the pool resource behavior is described below:

```
size_t max_blocks_per_chunk;
```

- 2 The maximum number of blocks that will be allocated at once from the upstream memory resource (19.12.6) to replenish a pool. If the value of `max_blocks_per_chunk` is zero or is greater than an implementation-defined limit, that limit is used instead. The implementation may choose to use a smaller value than is specified in this field and may use different values for different pools.

```
size_t largest_required_pool_block;
```

- 3 The largest allocation size that is required to be fulfilled using the pooling mechanism. Attempts to allocate a single block larger than this threshold will be allocated directly from the upstream memory resource. If `largest_required_pool_block` is zero or is greater than an implementation-defined limit, that limit is used instead. The implementation may choose a pass-through threshold larger than specified in this field.

19.12.5.3 Constructors and destructors

[mem.res.pool.ctor]

```
synchronized_pool_resource(const pool_options& opts, memory_resource* upstream);
unsynchronized_pool_resource(const pool_options& opts, memory_resource* upstream);
```

- 1 *Requires:* `upstream` is the address of a valid memory resource.
- 2 *Effects:* Constructs a pool resource object that will obtain memory from `upstream` whenever the pool resource is unable to satisfy a memory request from its own internal data structures. The resulting object will hold a copy of `upstream`, but will not own the resource to which `upstream` points. [Note: The intention is that calls to `upstream->allocate()` will be substantially fewer than calls to `this->allocate()` in most cases. — end note] The behavior of the pooling mechanism is tuned according to the value of the `opts` argument.
- 3 *Throws:* Nothing unless `upstream->allocate()` throws. It is unspecified if, or under what conditions, this constructor calls `upstream->allocate()`.

```
virtual ~synchronized_pool_resource();
virtual ~unsynchronized_pool_resource();
```

- 4 *Effects:* Calls `release()`.

19.12.5.4 Members

[mem.res.pool.mem]

```
void release();
```

- 1 *Effects:* Calls `upstream_resource()->deallocate()` as necessary to release all allocated memory. [Note: The memory is released back to `upstream_resource()` even if `deallocate` has not been called for some of the allocated blocks. — end note]

```
memory_resource* upstream_resource() const;
```

- 2 *Returns:* The value of the `upstream` argument provided to the constructor of this object.

```
pool_options options() const;
```

- 3 *Returns:* The options that control the pooling behavior of this resource. The values in the returned struct may differ from those supplied to the pool resource constructor in that values of zero will be replaced with implementation-defined defaults, and sizes may be rounded to unspecified granularity.

```
void* do_allocate(size_t bytes, size_t alignment) override;
```

- 4 *Returns:* A pointer to allocated storage (6.6.4.4.1) with a size of at least `bytes`. The size and alignment of the allocated memory shall meet the requirements for a class derived from `memory_resource` (19.12.2).

- 5 *Effects:* If the pool selected for a block of size `bytes` is unable to satisfy the memory request from its own internal data structures, it will call `upstream_resource()->allocate()` to obtain more memory. If `bytes` is larger than that which the largest pool can handle, then memory will be allocated using `upstream_resource()->allocate()`.

- 6 *Throws:* Nothing unless `upstream_resource()->allocate()` throws.

```
void do_deallocate(void* p, size_t bytes, size_t alignment) override;
```

- 7 *Effects:* Returns the memory at `p` to the pool. It is unspecified if, or under what circumstances, this operation will result in a call to `upstream_resource()->deallocate()`.

8 *Throws:* Nothing.

```
9        bool do_is_equal(const memory_resource& other) const noexcept override;
10      Returns: this == &other.
```

19.12.6 Class `monotonic_buffer_resource`

[mem.res.monotonic.buffer]

1 A `monotonic_buffer_resource` is a special-purpose memory resource intended for very fast memory allocations in situations where memory is used to build up a few objects and then is released all at once when the memory resource object is destroyed. It has the following qualities:

- (1.1) — A call to `deallocate` has no effect, thus the amount of memory consumed increases monotonically until the resource is destroyed.
- (1.2) — The program can supply an initial buffer, which the allocator uses to satisfy memory requests.
- (1.3) — When the initial buffer (if any) is exhausted, it obtains additional buffers from an *upstream* memory resource supplied at construction. Each additional buffer is larger than the previous one, following a geometric progression.
- (1.4) — It is intended for access from one thread of control at a time. Specifically, calls to `allocate` and `deallocate` do not synchronize with one another.
- (1.5) — It frees the allocated memory on destruction, even if `deallocate` has not been called for some of the allocated blocks.

```
namespace std::pmr {
    class monotonic_buffer_resource : public memory_resource {
        memory_resource* upstream_rsrc;           // exposition only
        void* current_buffer;                    // exposition only
        size_t next_buffer_size;                // exposition only

    public:
        explicit monotonic_buffer_resource(memory_resource* upstream);
        monotonic_buffer_resource(size_t initial_size, memory_resource* upstream);
        monotonic_buffer_resource(void* buffer, size_t buffer_size, memory_resource* upstream);

        monotonic_buffer_resource()
            : monotonic_buffer_resource(get_default_resource()) {}
        explicit monotonic_buffer_resource(size_t initial_size)
            : monotonic_buffer_resource(initial_size, get_default_resource()) {}
        monotonic_buffer_resource(void* buffer, size_t buffer_size)
            : monotonic_buffer_resource(buffer, buffer_size, get_default_resource()) {}

        monotonic_buffer_resource(const monotonic_buffer_resource&) = delete;

        virtual ~monotonic_buffer_resource();

        monotonic_buffer_resource& operator=(const monotonic_buffer_resource&) = delete;

        void release();
        memory_resource* upstream_resource() const;

    protected:
        void* do_allocate(size_t bytes, size_t alignment) override;
        void do_deallocate(void* p, size_t bytes, size_t alignment) override;

        bool do_is_equal(const memory_resource& other) const noexcept override;
    };
}
```

19.12.6.1 Constructors and destructor

[mem.res.monotonic.buffer.ctor]

```
explicit monotonic_buffer_resource(memory_resource* upstream);
monotonic_buffer_resource(size_t initial_size, memory_resource* upstream);
```

1 *Requires:* `upstream` shall be the address of a valid memory resource. `initial_size`, if specified, shall be greater than zero.

2 *Effects:* Sets `upstream_rsrc` to `upstream` and `current_buffer` to `nullptr`. If `initial_size` is
specified, sets `next_buffer_size` to at least `initial_size`; otherwise sets `next_buffer_size` to an
implementation-defined size.

monotonic_buffer_resource(void* buffer, size_t buffer_size, memory_resource* upstream);

3 *Requires:* `upstream` shall be the address of a valid memory resource. `buffer_size` shall be no larger
than the number of bytes in `buffer`.

4 *Effects:* Sets `upstream_rsrc` to `upstream`, `current_buffer` to `buffer`, and `next_buffer_size` to
`buffer_size` (but not less than 1), then increases `next_buffer_size` by an implementation-defined
growth factor (which need not be integral).

`~monotonic_buffer_resource();`

5 *Effects:* Calls `release()`.

19.12.6.2 Members

[mem.res.monotonic.buffer.mem]

`void release();`

1 *Effects:* Calls `upstream_rsrc->deallocate()` as necessary to release all allocated memory.

2 *[Note:* The memory is released back to `upstream_rsrc` even if some blocks that were allocated from
`this` have not been deallocated from `this`. —end note]

`memory_resource* upstream_resource() const;`

3 *Returns:* The value of `upstream_rsrc`.

`void* do_allocate(size_t bytes, size_t alignment) override;`

4 *Returns:* A pointer to allocated storage (6.6.4.4.1) with a size of at least `bytes`. The size and alignment
of the allocated memory shall meet the requirements for a class derived from `memory_resource` (19.12.2).

5 *Effects:* If the unused space in `current_buffer` can fit a block with the specified `bytes` and `alignment`,
then allocate the return block from `current_buffer`; otherwise set `current_buffer` to `upstream_`
`rsrc->allocate(n, m)`, where `n` is not less than `max(bytes, next_buffer_size)` and `m` is not less
than `alignment`, and increase `next_buffer_size` by an implementation-defined growth factor (which
need not be integral), then allocate the return block from the newly-allocated `current_buffer`.

6 *Throws:* Nothing unless `upstream_rsrc->allocate()` throws.

`void do_deallocate(void* p, size_t bytes, size_t alignment) override;`

7 *Effects:* None.

8 *Throws:* Nothing.

9 *Remarks:* Memory used by this resource increases monotonically until its destruction.

`bool do_is_equal(const memory_resource& other) const noexcept override;`

10 *Returns:* `this == &other`.

19.13 Class template scoped_allocator_adaptor

[allocator.adaptor]

19.13.1 Header <scoped_allocator> synopsis

[allocator.adaptor.syn]

```
namespace std {
    // class template scoped allocator adaptor
    template<class OuterAlloc, class... InnerAllocs>
        class scoped_allocator_adaptor;

    // 19.13.5, scoped allocator operators
    template<class OuterA1, class OuterA2, class... InnerAllocs>
        bool operator==(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                          const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;
    template<class OuterA1, class OuterA2, class... InnerAllocs>
        bool operator!=(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                          const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;
}
```

- ¹ The class template `scoped_allocator_adaptor` is an allocator template that specifies the memory resource (the outer allocator) to be used by a container (as any other allocator does) and also specifies an inner allocator resource to be passed to the constructor of every element within the container. This adaptor is instantiated with one outer and zero or more inner allocator types. If instantiated with only one allocator type, the inner allocator becomes the `scoped_allocator_adaptor` itself, thus using the same allocator resource for the container and every element within the container and, if the elements themselves are containers, each of their elements recursively. If instantiated with more than one allocator, the first allocator is the outer allocator for use by the container, the second allocator is passed to the constructors of the container's elements, and, if the elements themselves are containers, the third allocator is passed to the elements' elements, and so on. If containers are nested to a depth greater than the number of allocators, the last allocator is used repeatedly, as in the single-allocator case, for any remaining recursions. [Note: The `scoped_allocator_adaptor` is derived from the outer allocator type so it can be substituted for the outer allocator type in most expressions. — *end note*]

```

namespace std {
    template<class OuterAlloc, class... InnerAllocs>
    class scoped_allocator_adaptor : public OuterAlloc {
private:
    using OuterTraits = allocator_traits<OuterAlloc>;           // exposition only
    scoped_allocator_adaptor<InnerAllocs...> inner;             // exposition only

      A in the set of OuterAlloc and InnerAllocs...; otherwise, false_type.

using is_always_equal = see below;
5   Type: true_type if allocator_traits<A>::is_always_equal::value is true for every A in the set
      of OuterAlloc and InnerAllocs...; otherwise, false_type.

```

19.13.3 Constructors

[allocator.adaptor.cnstr]

```

scoped_allocator_adaptor();

1   Effects: Value-initializes the OuterAlloc base class and the inner allocator object.

template<class OuterA2>
scoped_allocator_adaptor(OuterA2&& outerAlloc, const InnerAllocs... innerAllocs) noexcept;
2   Effects: Initializes the OuterAlloc base class with std::forward<OuterA2>(outerAlloc) and inner
      with innerAllocs... (hence recursively initializing each allocator within the adaptor with the
      corresponding allocator from the argument list).

3   Remarks: This constructor shall not participate in overload resolution unless is_constructible_-
      v<OuterAlloc, OuterA2> is true.

scoped_allocator_adaptor(const scoped_allocator_adaptor& other) noexcept;
4   Effects: Initializes each allocator within the adaptor with the corresponding allocator from other.

```

```

scoped_allocator_adaptor(scoped_allocator_adaptor&& other) noexcept;
5   Effects: Move constructs each allocator within the adaptor with the corresponding allocator from
      other.

template<class OuterA2>
scoped_allocator_adaptor(
    const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& other) noexcept;
6   Effects: Initializes each allocator within the adaptor with the corresponding allocator from other.
7   Remarks: This constructor shall not participate in overload resolution unless is_constructible_v<OuterAlloc, const OuterA2&> is true.

template<class OuterA2>
scoped_allocator_adaptor(scoped_allocator_adaptor<OuterA2, InnerAllocs...>&& other) noexcept;
8   Effects: Initializes each allocator within the adaptor with the corresponding allocator rvalue from
      other.
9   Remarks: This constructor shall not participate in overload resolution unless is_constructible_v<OuterAlloc, OuterA2> is true.

```

19.13.4 Members

[`allocator.adaptor.members`]

- 1 In the `construct` member functions, `OUTERMOST(x)` is `OUTERMOST(x.outer_allocator())` if the expression `x.outer_allocator()` is valid (12.9.2) and `x` otherwise; `OUTERMOST_ALLOC_TRAITS(x)` is `allocator_traits<remove_reference_t<decltype(OUTERMOST(x))>>`. [Note: `OUTERMOST(x)` and `OUTERMOST_ALLOC_TRAITS(x)` are recursive operations. It is incumbent upon the definition of `outer_allocator()` to ensure that the recursion terminates. It will terminate for all instantiations of `scoped_allocator_adaptor`. —end note]

```

inner_allocator_type& inner_allocator() noexcept;
const inner_allocator_type& inner_allocator() const noexcept;
2   Returns: *this if sizeof...(InnerAllocs) is zero; otherwise, inner.

outer_allocator_type& outer_allocator() noexcept;
3   Returns: static_cast<OuterAlloc&>(*this).

const outer_allocator_type& outer_allocator() const noexcept;
4   Returns: static_cast<const OuterAlloc&>(*this).

[[nodiscard]] pointer allocate(size_type n);
5   Returns: allocator_traits<OuterAlloc>::allocate(outer_allocator(), n).

[[nodiscard]] pointer allocate(size_type n, const_void_pointer hint);
6   Returns: allocator_traits<OuterAlloc>::allocate(outer_allocator(), n, hint).

void deallocate(pointer p, size_type n) noexcept;
7   Effects: As if by: allocator_traits<OuterAlloc>::deallocate(outer_allocator(), p, n);

size_type max_size() const;
8   Returns: allocator_traits<OuterAlloc>::max_size(outer_allocator()).

template<class T, class... Args>
void construct(T* p, Args&&... args);
9   Effects: Equivalent to:

    apply([p, this](auto&&... newargs) {
        OUTERMOST_ALLOC_TRAITS(*this)::construct(
            OUTERMOST(*this), p,
            std::forward<decltype(newargs)>(newargs)...);
    },
    uses_allocator_construction_args<T>(inner_allocator(),
        std::forward<Args>(args)...));

```

```

template<class T>
void destroy(T* p);

10   Effects: Calls OUTERMOST_ALLOC_TRAITS(*this)::destroy(OUTERMOST(*this), p).

scoped_allocator_adaptor select_on_container_copy_construction() const;

11   Returns: A new scoped_allocator_adaptor object where each allocator A in the adaptor is initialized
      from the result of calling allocator_traits<A>::select_on_container_copy_construction() on
      the corresponding allocator in *this.

```

19.13.5 Operators

[scoped.adaptor.operators]

```

template<class OuterA1, class OuterA2, class... InnerAllocs>
bool operator==(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                  const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;

1   Returns: If sizeof...(InnerAllocs) is zero,
           a.outer_allocator() == b.outer_allocator()
           otherwise
           a.outer_allocator() == b.outer_allocator() && a.inner_allocator() == b.inner_allocator()

template<class OuterA1, class OuterA2, class... InnerAllocs>
bool operator!=(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                  const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;

```

2 Returns: !(a == b).

19.14 Function objects

[function.objects]

1 A *function object type* is an object type (6.7) that can be the type of the *postfix-expression* in a function call (7.6.1.2, 11.3.1.1).²²⁴ A *function object* is an object of a function object type. In the places where one would expect to pass a pointer to a function to an algorithmic template (Clause 24), the interface is specified to accept a function object. This not only makes algorithmic templates work with pointers to functions, but also enables them to work with arbitrary function objects.

19.14.1 Header <functional> synopsis

[functional.syn]

```

namespace std {
    // 19.14.4, invoke
    template<class F, class... Args>
        invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
            noexcept(is_nothrow_invocable_v<F, Args...>);

    // 19.14.5, reference_wrapper
    template<class T> class reference_wrapper;

    template<class T> reference_wrapper<T> ref(T&) noexcept;
    template<class T> reference_wrapper<const T> cref(const T&) noexcept;
    template<class T> void ref(const T&&) = delete;
    template<class T> void cref(const T&&) = delete;

    template<class T> reference_wrapper<T> ref(reference_wrapper<T>) noexcept;
    template<class T> reference_wrapper<const T> cref(reference_wrapper<T>) noexcept;

- ¹ [Example: If a C++ program wants to have a by-element addition of two vectors **a** and **b** containing **double** and put the result into **a**, it can do:

```

transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
— end example]

```

- ² [Example: To negate every element of **a**:

```

transform(a.begin(), a.end(), a.begin(), negate<double>());
— end example]

```

19.14.2 Definitions

[func.def]

- ¹ The following definitions apply to this Clause:
- ² A *call signature* is the name of a return type followed by a parenthesized comma-separated list of zero or more argument types.
- ³ A *callable type* is a function object type (19.14) or a pointer to member.
- ⁴ A *callable object* is an object of a callable type.
- ⁵ A *call wrapper type* is a type that holds a callable object and supports a call operation that forwards to that object.
- ⁶ A *call wrapper* is an object of a call wrapper type.
- ⁷ A *target object* is the callable object held by a call wrapper.
- ⁸ A call wrapper type may additionally hold a sequence of objects and references that may be passed as arguments to the target object. These entities are collectively referred to as *bound argument entities*.
- ⁹ The target object and bound argument entities of the call wrapper are collectively referred to as *state entities*.

19.14.3 Requirements

[func.require]

- ¹ Define *INVOKE(f, t₁, t₂, ..., t_N)* as follows:
 - (1.1) — (t₁.*f)(t₂, ..., t_N) when **f** is a pointer to a member function of a class **T** and **is_base_of_v<T, remove_reference_t<decltype(t₁)>** is **true**;
 - (1.2) — (t₁.get().*f)(t₂, ..., t_N) when **f** is a pointer to a member function of a class **T** and **remove_cvref_t<decltype(t₁)>** is a specialization of **reference_wrapper**;
 - (1.3) — ((*t₁).*f)(t₂, ..., t_N) when **f** is a pointer to a member function of a class **T** and **t₁** does not satisfy the previous two items;

- (1.4) — $t_1.*f$ when $N == 1$ and f is a pointer to data member of a class T and $\text{is_base_of_v} < T, \text{remove_reference_t} < \text{decltype}(t_1) >$ is true;
 - (1.5) — $t_1.\text{get}().*f$ when $N == 1$ and f is a pointer to data member of a class T and $\text{remove_cvref_t} < \text{decltype}(t_1) >$ is a specialization of `reference_wrapper`;
 - (1.6) — $(*t_1).*f$ when $N == 1$ and f is a pointer to data member of a class T and t_1 does not satisfy the previous two items;
 - (1.7) — $f(t_1, t_2, \dots, t_N)$ in all other cases.
- 2 Define $\text{INVOKE} < R > (f, t_1, t_2, \dots, t_N)$ as $\text{static_cast} < \text{void} > (\text{INVOKE}(f, t_1, t_2, \dots, t_N))$ if R is *cv void*, otherwise $\text{INVOKE}(f, t_1, t_2, \dots, t_N)$ implicitly converted to R .
- 3 Every call wrapper (19.14.2) is *Cpp17MoveConstructible*. A *argument forwarding call wrapper* is a call wrapper that can be called with an arbitrary argument list and delivers the arguments to the wrapped callable object as references. This forwarding step delivers rvalue arguments as rvalue references and lvalue arguments as lvalue references. A *simple call wrapper* is an argument forwarding call wrapper that is *Cpp17CopyConstructible* and *Cpp17CopyAssignable* and whose copy constructor, move constructor, copy assignment operator, and move assignment operator do not throw exceptions. [Note: In a typical implementation, argument forwarding call wrappers have an overloaded function call operator of the form

```
template<class... UnBoundArgs>
R operator()(UnBoundArgs&&... unbound_args) cv-qual;
— end note]
```

- 4 A *perfect forwarding call wrapper* is an argument forwarding call wrapper that forwards its state entities to the underlying call expression. This forwarding step delivers a state entity of type T as *cv T&* when the call is performed on an lvalue of the call wrapper type and as *cv T&&* otherwise, where *cv* represents the *cv-qualifiers* of the call wrapper and where *cv* shall be neither *volatile* nor *const volatile*.
- 5 A *call pattern* defines the semantics of invoking a perfect forwarding call wrapper. A postfix call performed on a perfect forwarding call wrapper is expression-equivalent (15.3.11) to an expression e determined from its call pattern cp by replacing all occurrences of the arguments of the call wrapper and its state entities with references as described in the corresponding forwarding steps.
- 6 The copy/move constructor of a perfect forwarding call wrapper has the same apparent semantics as if memberwise copy/move of its state entities were performed (10.3.4.2). [Note: This implies that each of the copy/move constructors has the same exception-specification as the corresponding implicit definition and is declared as `constexpr` if the corresponding implicit definition would be considered to be `constexpr`. — end note]
- 7 Perfect forwarding call wrappers returned by a given standard library function template have the same type if the types of their corresponding state entities are the same.

19.14.4 Function template `invoke`

[func.invoke]

```
template<class F, class... Args>
invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
    noexcept(is_nothrow_invocable_v<F, Args...>);
```

- 1 Returns: $\text{INVOKE}(\text{std}:\text{forward}<F>(f), \text{std}:\text{forward}<\text{Args}>(args)\dots)$ (19.14.3).

19.14.5 Class template `reference_wrapper`

[refwrap]

```
namespace std {
    template<class T> class reference_wrapper {
        public:
            // types
            using type = T;

            // construct/copy/destroy
            template<class U>
                reference_wrapper(U&&) noexcept(see below);
                reference_wrapper(const reference_wrapper& x) noexcept;

            // assignment
            reference_wrapper& operator=(const reference_wrapper& x) noexcept;
```

```

    // access
    operator T& () const noexcept;
    T& get() const noexcept;

    // invocation
    template<class... ArgTypes>
    invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&...) const;
};

template<class T>
reference_wrapper(T&) -> reference_wrapper<T>;
}

```

¹ `reference_wrapper<T>` is a *Cpp17CopyConstructible* and *Cpp17CopyAssignable* wrapper around a reference to an object or function of type `T`.

² `reference_wrapper<T>` is a trivially copyable type (6.7).

³ The template parameter `T` of `reference_wrapper` may be an incomplete type.

19.14.5.1 Constructors and destructor

[refwrap.const]

```
template<class U>
reference_wrapper(U&& u) noexcept(see below);
```

¹ *Remarks:* Let `FUN` denote the exposition-only functions

```
void FUN(T&) noexcept;
void FUN(T&&) = delete;
```

This constructor shall not participate in overload resolution unless the expression `FUN(declval<U>())` is well-formed and `is_same_v<remove_cvref_t<U>, reference_wrapper>` is `false`. The expression inside `noexcept` is equivalent to `noexcept(FUN(declval<U>()))`.

² *Effects:* Creates a variable `r` as if by `T& r = std::forward<U>(u)`, then constructs a `reference_wrapper` object that stores a reference to `r`.

```
reference_wrapper(const reference_wrapper& x) noexcept;
```

³ *Effects:* Constructs a `reference_wrapper` object that stores a reference to `x.get()`.

19.14.5.2 Assignment

[refwrap.assign]

```
reference_wrapper& operator=(const reference_wrapper& x) noexcept;
```

¹ *Ensures:* `*this` stores a reference to `x.get()`.

19.14.5.3 Access

[refwrap.access]

```
operator T& () const noexcept;
```

¹ *Returns:* The stored reference.

```
T& get() const noexcept;
```

² *Returns:* The stored reference.

19.14.5.4 Invocation

[refwrap.invoke]

```

template<class... ArgTypes>
invoke_result_t<T&, ArgTypes...>
operator()(ArgTypes&&... args) const;

```

¹ *Mandates:* `T` is a complete type.

² *Returns:* `INVOKE(get(), std::forward<ArgTypes>(args)...)`. (19.14.3)

19.14.5.5 Helper functions

[refwrap.helpers]

¹ The template parameter `T` of the following `ref` and `cref` function templates may be an incomplete type.

```
template<class T> reference_wrapper<T> ref(T& t) noexcept;
```

² *Returns:* `reference_wrapper<T>(t)`.

```

template<class T> reference_wrapper<T> ref(reference_wrapper<T> t) noexcept;
3   Returns: ref(t.get()).

template<class T> reference_wrapper<const T> cref(const T& t) noexcept;
4   Returns: reference_wrapper <const T>(t).

template<class T> reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;
5   Returns: cref(t.get()).

```

19.14.5.6 Transformation type trait `unwrap_reference`

[refwrap.unwrapref]

```

template<class T>
struct unwrap_reference;

```

- 1 If T is a specialization `reference_wrapper<X>` for some type X, the member `typedef type` of `unwrap_reference<T>` is `X&`, otherwise it is T.

19.14.6 Arithmetic operations

[arithmetic.operations]

- 1 The library provides basic function object classes for all of the arithmetic operators in the language (7.6.5, 7.6.6).

19.14.6.1 Class template plus

[arithmetic.operations.plus]

```

template<class T = void> struct plus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1   Returns: x + y.

template<> struct plus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) + std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));
2   Returns: std::forward<T>(t) + std::forward<U>(u).

```

19.14.6.2 Class template minus

[arithmetic.operations.minus]

```

template<class T = void> struct minus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1   Returns: x - y.

template<> struct minus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) - std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));
2   Returns: std::forward<T>(t) - std::forward<U>(u).

```

19.14.6.3 Class template multiplies

[arithmetic.operations.multiplies]

```
template<class T = void> struct multiplies {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1   Returns: x * y.

template<> struct multiplies<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) * std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));

2   Returns: std::forward<T>(t) * std::forward<U>(u).
```

19.14.6.4 Class template divides

[arithmetic.operations.divides]

```
template<class T = void> struct divides {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1   Returns: x / y.

template<> struct divides<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) / std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));

2   Returns: std::forward<T>(t) / std::forward<U>(u).
```

19.14.6.5 Class template modulus

[arithmetic.operations.modulus]

```
template<class T = void> struct modulus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1   Returns: x % y.

template<> struct modulus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) % std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) % std::forward<U>(u));

2   Returns: std::forward<T>(t) % std::forward<U>(u).
```

19.14.6.6 Class template negate

[arithmetic.operations.negate]

```
template<class T = void> struct negate {
    constexpr T operator()(const T& x) const;
```

```

};

constexpr T operator()(const T& x) const;
1   Returns: -x.

template<> struct negate<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(-std::forward<T>(t));

    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));
2   Returns: -std::forward<T>(t).

```

19.14.7 Comparisons

[comparisons]

- 1 The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).
- 2 For templates `less`, `greater`, `less_equal`, and `greater_equal`, the specializations for any pointer type yield a strict total order that is consistent among those specializations and is also consistent with the partial order imposed by the built-in operators `<`, `>`, `<=`, `>=`. [Note: When `a < b` is well-defined for pointers `a` and `b` of type `P`, this implies `(a < b) == less<P>()(a, b)`, `(a > b) == greater<P>()(a, b)`, and so forth. —end note] For template specializations `less<void>`, `greater<void>`, `less_equal<void>`, and `greater_equal<void>`, if the call operator calls a built-in operator comparing pointers, the call operator yields a strict total order that is consistent among those specializations and is also consistent with the partial order imposed by those built-in operators.

19.14.7.1 Class template `equal_to`

[comparisons.equal_to]

```

template<class T = void> struct equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1   Returns: x == y.

template<> struct equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) == std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));
2   Returns: std::forward<T>(t) == std::forward<U>(u).

```

19.14.7.2 Class template `not_equal_to`

[comparisons.not_equal_to]

```

template<class T = void> struct not_equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1   Returns: x != y.

template<> struct not_equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) != std::forward<U>(u));

```

```

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) != std::forward<U>(u));
2     Returns: std::forward<T>(t) != std::forward<U>(u).

```

19.14.7.3 Class template greater

[comparisons.greater]

```

template<class T = void> struct greater {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1     Returns: x > y.

template<> struct greater<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) > std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) > std::forward<U>(u));
2     Returns: std::forward<T>(t) > std::forward<U>(u).

```

19.14.7.4 Class template less

[comparisons.less]

```

template<class T = void> struct less {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1     Returns: x < y.

template<> struct less<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) < std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) < std::forward<U>(u));
2     Returns: std::forward<T>(t) < std::forward<U>(u).

```

19.14.7.5 Class template greater_equal

[comparisons.greater_equal]

```

template<class T = void> struct greater_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1     Returns: x >= y.

template<> struct greater_equal<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) >= std::forward<U>(u));

    using is_transparent = unspecified;
};

```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) >= std::forward<U>(u));
2     Returns: std::forward<T>(t) >= std::forward<U>(u).
```

19.14.7.6 Class template less_equal

[comparisons.less_equal]

```
template<class T = void> struct less_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1     Returns: x <= y.

template<> struct less_equal<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) <= std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));
2     Returns: std::forward<T>(t) <= std::forward<U>(u).
```

19.14.8 Range comparisons

[range.cmp]

- 1 In this subclause, $BUILTIN_PTR_CMP(T, op, U)$ for types T and U and where op is an equality (7.6.10) or relational operator (7.6.9) is a boolean constant expression. $BUILTIN_PTR_CMP(T, op, U)$ is true if and only if op in the expression $\text{declval} < T >() \ op \ \text{declval} < U >()$ resolves to a built-in operator comparing pointers.
- 2 There is an implementation-defined strict total ordering over all pointer values of a given type. This total ordering is consistent with the partial order imposed by the builtin operators $<$, $>$, $<=$, and $>=$.

```
template<class T = void>
    requires EqualityComparable<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, ==, const T&)
struct ranges::equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

3     operator() has effects equivalent to: return ranges::equal_to<>{}(x, y);

template<class T = void>
    requires EqualityComparable<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, ==, const T&)
struct ranges::not_equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

4     operator() has effects equivalent to: return !ranges::equal_to<>{}(x, y);

template<class T = void>
    requires StrictTotallyOrdered<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, <, const T&)
struct ranges::greater {
    constexpr bool operator()(const T& x, const T& y) const;
};

5     operator() has effects equivalent to: return ranges::less<>{}(y, x);

template<class T = void>
    requires StrictTotallyOrdered<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, <, const T&)
struct ranges::less {
    constexpr bool operator()(const T& x, const T& y) const;
};

6     operator() has effects equivalent to: return ranges::less<>{}(x, y);
```

```

template<class T = void>
    requires StrictTotallyOrdered<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, <, const T&)
struct ranges::greater_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};

7     operator() has effects equivalent to: return !ranges::less<>{}(x, y);

template<class T = void>
    requires StrictTotallyOrdered<T> || Same<T, void> || BUILTIN_PTR_CMP(const T&, <, const T&)
struct ranges::less_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};

8     operator() has effects equivalent to: return !ranges::less<>{}(y, x);

template<> struct ranges::equal_to<void> {
    template<class T, class U>
        requires EqualityComparableWith<T, U> || BUILTIN_PTR_CMP(T, ==, U)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

9     Expects: If the expression std::forward<T>(t) == std::forward<U>(u) results in a call to a built-in
operator == comparing pointers of type P, the conversion sequences from both T and U to P shall be
equality-preserving (17.2).

10    Effects:
(10.1) — If the expression std::forward<T>(t) == std::forward<U>(u) results in a call to a built-in
operator == comparing pointers of type P: returns false if either (the converted value of) t
precedes u or u precedes t in the implementation-defined strict total order over pointers of type P
and otherwise true.
(10.2) — Otherwise, equivalent to: return std::forward<T>(t) == std::forward<U>(u);

template<> struct ranges::not_equal_to<void> {
    template<class T, class U>
        requires EqualityComparableWith<T, U> || BUILTIN_PTR_CMP(T, ==, U)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

11    operator() has effects equivalent to:
        return !ranges::equal_to<>{}(std::forward<T>(t), std::forward<U>(u));

template<> struct ranges::greater<void> {
    template<class T, class U>
        requires StrictTotallyOrderedWith<T, U> || BUILTIN_PTR_CMP(U, <, T)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

12    operator() has effects equivalent to:
        return ranges::less<>{}(std::forward<U>(u), std::forward<T>(t));

template<> struct ranges::less<void> {
    template<class T, class U>
        requires StrictTotallyOrderedWith<T, U> || BUILTIN_PTR_CMP(T, <, U)
    constexpr bool operator()(T&& t, U&& u) const;
};

```

```
    using is_transparent = unspecified;
};
```

13 *Expects:* If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` shall be equality-preserving (17.2). For any expressions `ET` and `EU` such that `decltype((ET))` is `T` and `decltype((EU))` is `U`, exactly one of `ranges::less<>{}(ET, EU)`, `ranges::less<>{}(EU, ET)`, or `ranges::equal_to<>{}(ET, EU)` shall be `true`.

14 *Effects:*

(14.1) — If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers of type `P`: returns `true` if (the converted value of) `t` precedes `u` in the implementation-defined strict total order over pointers of type `P` and otherwise `false`.

(14.2) — Otherwise, equivalent to: `return std::forward<T>(t) < std::forward<U>(u);`

```
template<> struct ranges::greater_equal<void> {
    template<class T, class U>
        requires StrictTotallyOrderedWith<T, U> || BUILTIN_PTR_CMP(T, <, U)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

15 *operator()* has effects equivalent to:

```
    return !ranges::less<>{}(std::forward<T>(t), std::forward<U>(u));
```

```
template<> struct ranges::less_equal<void> {
    template<class T, class U>
        requires StrictTotallyOrderedWith<T, U> || BUILTIN_PTR_CMP(U, <, T)
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

16 *operator()* has effects equivalent to:

```
    return !ranges::less<>{}(std::forward<U>(u), std::forward<T>(t));
```

19.14.9 Logical operations

[logical.operations]

¹ The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.1).

19.14.9.1 Class template logical_and

[logical.operations.and]

```
template<class T = void> struct logical_and {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns:* `x && y`.

```
template<> struct logical_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) && std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));
```

2 *Returns:* `std::forward<T>(t) && std::forward<U>(u)`.

19.14.9.2 Class template logical_or

[logical.operations.or]

```
template<class T = void> struct logical_or {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;

1   Returns: x || y.

template<> struct logical_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) || std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));

2   Returns: std::forward<T>(t) || std::forward<U>(u).
```

19.14.9.3 Class template logical_not

[logical.operations.not]

```
template<class T = void> struct logical_not {
    constexpr bool operator()(const T& x) const;
};

constexpr bool operator()(const T& x) const;

1   Returns: !x.

template<> struct logical_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(!std::forward<T>(t));

    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
    -> decltype(!std::forward<T>(t));

2   Returns: !std::forward<T>(t).
```

19.14.10 Bitwise operations

[bitwise.operations]

- 1 The library provides basic function object classes for all of the bitwise operators in the language ([7.6.11](#), [7.6.13](#), [7.6.12](#), [7.6.2.1](#)).

19.14.10.1 Class template bit_and

[bitwise.operations.and]

```
template<class T = void> struct bit_and {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1   Returns: x & y.

template<> struct bit_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) & std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));

2   Returns: std::forward<T>(t) & std::forward<U>(u).
```

19.14.10.2 Class template bit_or

[bitwise.operations.or]

```
template<class T = void> struct bit_or {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1     Returns: x | y.

template<> struct bit_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) | std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) | std::forward<U>(u));
2     Returns: std::forward<T>(t) | std::forward<U>(u).
```

19.14.10.3 Class template bit_xor

[bitwise.operations.xor]

```
template<class T = void> struct bit_xor {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1     Returns: x ^ y.

template<> struct bit_xor<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
2     Returns: std::forward<T>(t) ^ std::forward<U>(u).
```

19.14.10.4 Class template bit_not

[bitwise.operations.not]

```
template<class T = void> struct bit_not {
    constexpr T operator()(const T& x) const;
};

constexpr T operator()(const T& x) const;
1     Returns: ~x.

template<> struct bit_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(~std::forward<T>(t));

    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&&) const
    -> decltype(~std::forward<T>(t));
2     Returns: ~std::forward<T>(t).
```

19.14.11 Class identity

[func.identity]

```
struct identity {
    template<class T>
        constexpr T&& operator()(T&& t) const noexcept;
```

```

    using is_transparent = unspecified;
};

template<class T>
constexpr T&& operator()(T&& t) const noexcept;
1   Effects: Equivalent to: return std::forward<T>(t);

```

19.14.12 Function template `not_fn`

[func.not_fn]

```
template<class F> unspecified not_fn(F&& f);
```

1 In the text that follows:

- (1.1) — `g` is a value of the result of a `not_fn` invocation,
- (1.2) — `FD` is the type `decay_t<F>`,
- (1.3) — `fd` is the target object of `g` (19.14.2) of type `FD`, initialized with the *initializer* (`std::forward<F>(f)`) (9.3),
- (1.4) — `call_args` is an argument pack used in a function call expression (7.6.1.2) of `g`.

2 *Mandates*: `is_constructible_v<FD, F> && is_move_constructible_v<FD>` shall be true.

3 *Expects*: `FD` shall meet the requirements of *Cpp17MoveConstructible*.

4 *Returns*: A perfect forwarding call wrapper `g` with call pattern `!invoke(fd, call_args...)`.

5 *Throws*: Any exception thrown by the initialization of `fd`.

19.14.13 Function template `bind_front`

[func.bind_front]

```
template <class F, class... Args>
unspecified bind_front(F&& f, Args&&... args);
```

1 In the text that follows:

- (1.1) — `g` is a value of the result of a `bind_front` invocation,
- (1.2) — `FD` is the type `decay_t<F>`,
- (1.3) — `fd` is the target object of `g` (19.14.2) of type `FD` initialized with the *initializer* (`std::forward<F>(f)`) (9.3),
- (1.4) — `BoundArgs` is a pack that denotes `std::unwrap_ref_decay_t<Args>...`,
- (1.5) — `bound_args` is a pack of bound argument entities of `g` (19.14.2) of types `BoundArgs...`, initialized with *initializers* (`std::forward<Args>(args)`)..., respectively, and
- (1.6) — `call_args` is an argument pack used in a function call expression (7.6.1.2) of `g`.

2 *Mandates*:

```
conjunction_v<is_constructible<FD, F>, is_move_constructible<FD>,
            is_constructible<BoundArgs, Args>..., is_move_constructible<BoundArgs>...>
```

shall be true.

3 *Expects*: `FD` shall meet the requirements of *Cpp17MoveConstructible*. For each T_i in `BoundArgs`, if T_i is an object type, T_i shall meet the requirements of *Cpp17MoveConstructible*.

4 *Returns*: A perfect forwarding call wrapper `g` with call pattern `invoke(fd, bound_args..., call_args...)`.

5 *Throws*: Any exception thrown by the initialization of the state entities of `g` (19.14.2).

19.14.14 Function object binders

[func.bind]

1 This subclause describes a uniform mechanism for binding arguments of callable objects.

19.14.14.1 Class template `is_bind_expression`

[func.bind.isbind]

```
namespace std {
    template<class T> struct is_bind_expression; // see below
}
```

- ¹ The class template `is_bind_expression` can be used to detect function objects generated by `bind`. The function template `bind` uses `is_bind_expression` to detect subexpressions.
- ² Instantiations of the `is_bind_expression` template shall satisfy the *Cpp17UnaryTypeTrait* requirements ([19.15.1](#)). The implementation shall provide a definition that has a base characteristic of `true_type` if `T` is a type returned from `bind`, otherwise it shall have a base characteristic of `false_type`. A program may specialize this template for a program-defined type `T` to have a base characteristic of `true_type` to indicate that `T` should be treated as a subexpression in a `bind` call.

19.14.14.2 Class template `is_placeholder`

[`func.bind.isplace`]

```
namespace std {
    template<class T> struct is_placeholder;           // see below
}
```

- ¹ The class template `is_placeholder` can be used to detect the standard placeholders `_1`, `_2`, and so on. The function template `bind` uses `is_placeholder` to detect placeholders.
- ² Instantiations of the `is_placeholder` template shall satisfy the *Cpp17UnaryTypeTrait* requirements ([19.15.1](#)). The implementation shall provide a definition that has the base characteristic of `integral_constant<int, J>` if `T` is the type of `std::placeholders::_J`, otherwise it shall have a base characteristic of `integral_constant<int, 0>`. A program may specialize this template for a program-defined type `T` to have a base characteristic of `integral_constant<int, N>` with `N > 0` to indicate that `T` should be treated as a placeholder type.

19.14.14.3 Function template `bind`

[`func.bind.bind`]

- ¹ In the text that follows:

- (1.1) — `FD` is the type `decay_t<F>`,
- (1.2) — `fd` is an lvalue of type `FD` constructed from `std::forward<F>(f)`,
- (1.3) — T_i is the i^{th} type in the template parameter pack `BoundArgs`,
- (1.4) — TD_i is the type `decay_t<T_i>`,
- (1.5) — t_i is the i^{th} argument in the function parameter pack `bound_args`,
- (1.6) — td_i is an lvalue of type TD_i constructed from `std::forward<T_i>(t_i)`,
- (1.7) — U_j is the j^{th} deduced type of the `UnBoundArgs&&...` parameter of the argument forwarding call wrapper, and
- (1.8) — u_j is the j^{th} argument associated with U_j .

```
template<class F, class... BoundArgs>
unspecified bind(F&& f, BoundArgs&&... bound_args);
```

- ² *Requires:* `is_constructible_v<FD, F>` shall be `true`. For each T_i in `BoundArgs`, `is_constructible_v<TD_i, T_i>` shall be `true`. `(INVOKE(fd, w1, w2, ..., wN)` ([19.14.3](#)) shall be a valid expression for some values w_1, w_2, \dots, w_N , where N has the value `sizeof... (bound_args)`. The cv-qualifiers `cv` of the call wrapper `g`, as specified below, shall be neither `volatile` nor `const volatile`.

- ³ *Returns:* An argument forwarding call wrapper `g` ([19.14.3](#)). The effect of `g(u1, u2, ..., uM)` shall be

`(INVOKE(fd, std::forward<V1>(v1), std::forward<V2>(v2), ..., std::forward<VN>(vN))`

where the values and types of the bound arguments v_1, v_2, \dots, v_N are determined as specified below. The copy constructor and move constructor of the argument forwarding call wrapper shall throw an exception if and only if the corresponding constructor of `FD` or of any of the types TD_i throws an exception.

- ⁴ *Throws:* Nothing unless the construction of `fd` or of one of the values td_i throws an exception.

- ⁵ *Remarks:* The return type shall satisfy the *Cpp17MoveConstructible* requirements. If all of `FD` and TD_i satisfy the *Cpp17CopyConstructible* requirements, then the return type shall satisfy the *Cpp17CopyConstructible* requirements. [Note: This implies that all of `FD` and TD_i are *Cpp17MoveConstructible*. — end note]

```
template<class R, class F, class... BoundArgs>
unspecified bind(F&& f, BoundArgs&&... bound_args);
```

6 *Requires:* `is_constructible_v<FD, F>` shall be `true`. For each T_i in `BoundArgs`, `is_constructible_v<TDi, Ti>` shall be `true`. `INVOKE(fd, w1, w2, ..., wN)` shall be a valid expression for some values w_1, w_2, \dots, w_N , where N has the value `sizeof...(bound_args)`. The cv-qualifiers `cv` of the call wrapper `g`, as specified below, shall be neither `volatile` nor `const volatile`.

7 *Returns:* An argument forwarding call wrapper `g` (19.14.3). The effect of `g(u1, u2, ..., uM)` shall be

```
    INVOKE<R>(fd, std::forward<V1>(v1), std::forward<V2>(v2), ..., std::forward<VN>(vN))
```

where the values and types of the bound arguments v_1, v_2, \dots, v_N are determined as specified below. The copy constructor and move constructor of the argument forwarding call wrapper shall throw an exception if and only if the corresponding constructor of `FD` or of any of the types TD_i throws an exception.

8 *Throws:* Nothing unless the construction of `fd` or of one of the values td_i throws an exception.

9 *Remarks:* The return type shall satisfy the `Cpp17MoveConstructible` requirements. If all of `FD` and TD_i satisfy the `Cpp17CopyConstructible` requirements, then the return type shall satisfy the `Cpp17CopyConstructible` requirements. [Note: This implies that all of `FD` and TD_i are `Cpp17MoveConstructible`. — end note]

10 The values of the *bound arguments* v_1, v_2, \dots, v_N and their corresponding types V_1, V_2, \dots, V_N depend on the types TD_i derived from the call to `bind` and the cv-qualifiers `cv` of the call wrapper `g` as follows:

- (10.1) — if TD_i is `reference_wrapper<T>`, the argument is `tdi.get()` and its type V_i is `T&`;
- (10.2) — if the value of `is_bind_expression_v<TDi>` is `true`, the argument is `tdi(std::forward<Uj>(uj)...)` and its type V_i is `invoke_result_t<TDi cv &, Uj...>&&;`
- (10.3) — if the value j of `is_placeholder_v<TDi>` is not zero, the argument is `std::forward<Uj>(uj)` and its type V_i is `Uj&&;`
- (10.4) — otherwise, the value is `tdi` and its type V_i is `TDi cv &`.

19.14.14.4 Placeholders

[func.bind.place]

```
namespace std::placeholders {
    // M is the implementation-defined number of placeholders
    see below _1;
    see below _2;
    .
    .
    .
    see below _M;
}
```

¹ All placeholder types shall be `Cpp17DefaultConstructible` and `Cpp17CopyConstructible`, and their default constructors and copy/move constructors shall not throw exceptions. It is implementation-defined whether placeholder types are `Cpp17CopyAssignable`. `Cpp17CopyAssignable` placeholders' copy assignment operators shall not throw exceptions.

² Placeholders should be defined as:

```
inline constexpr unspecified _1{};
```

If they are not, they shall be declared as:

```
extern unspecified _1;
```

19.14.15 Function template mem_fn

[func.memfn]

```
template<class R, class T> unspecified mem_fn(R T::* pm) noexcept;
```

¹ *Returns:* A simple call wrapper (19.14.2) `fn` such that the expression `fn(t, a2, ..., aN)` is equivalent to `INVOKE(pm, t, a2, ..., aN)` (19.14.3).

19.14.16 Polymorphic function wrappers

[func.wrap]

¹ This subclause describes a polymorphic wrapper class that encapsulates arbitrary callable objects.

19.14.16.1 Class bad_function_call

[func.wrap.badcall]

- ¹ An exception of type `bad_function_call` is thrown by `function::operator()` (19.14.16.2.4) when the function wrapper object has no target.

```
namespace std {
    class bad_function_call : public exception {
    public:
        // 19.14.16.1.1, constructor
        bad_function_call() noexcept;
    };
}
```

19.14.16.1.1 Constructor

[func.wrap.badcall.const]

```
bad_function_call() noexcept;

1   Effects: Constructs a bad_function_call object.

2   Ensures: what() returns an implementation-defined NTBS.
```

19.14.16.2 Class template function

[func.wrap.func]

```
namespace std {
    template<class> class function; // not defined

    template<class R, class... ArgTypes>
    class function<R(ArgTypes...)> {
    public:
        using result_type = R;

        // 19.14.16.2.1, construct/copy/destroy
        function() noexcept;
        function(nullptr_t) noexcept;
        function(const function&);
        function(function&&) noexcept;
        template<class F> function(F);

        function& operator=(const function&);
        function& operator=(function&&);
        function& operator=(nullptr_t) noexcept;
        template<class F> function& operator=(F&&);
        template<class F> function& operator=(reference_wrapper<F>) noexcept;

        ~function();

        // 19.14.16.2.2, function modifiers
        void swap(function&) noexcept;

        // 19.14.16.2.3, function capacity
        explicit operator bool() const noexcept;

        // 19.14.16.2.4, function invocation
        R operator()(ArgTypes...) const;

        // 19.14.16.2.5, function target access
        const type_info& target_type() const noexcept;
        template<class T> T* target() noexcept;
        template<class T> const T* target() const noexcept;
    };

    template<class R, class... ArgTypes>
    function(R(*)(ArgTypes...)) -> function<R(ArgTypes...)>;

    template<class F> function(F) -> function<see below>;
}
```

```
// 19.14.16.2.6, Null pointer comparisons
template<class R, class... ArgTypes>
    bool operator==(const function<R(ArgTypes...)>&, nullptr_t) noexcept;

template<class R, class... ArgTypes>
    bool operator==(nullptr_t, const function<R(ArgTypes...)>&) noexcept;

template<class R, class... ArgTypes>
    bool operator!=(const function<R(ArgTypes...)>&, nullptr_t) noexcept;

template<class R, class... ArgTypes>
    bool operator!=(nullptr_t, const function<R(ArgTypes...)>&) noexcept;

// 19.14.16.2.7, specialized algorithms
template<class R, class... ArgTypes>
    void swap(function<R(ArgTypes...)>&, function<R(ArgTypes...)>&) noexcept;
}
```

- ¹ The **function** class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (19.14.2), given a call signature (19.14.2), allowing functions to be first-class objects.
- ² A callable type (19.14.2) **F** is *Lvalue-Callable* for argument types **ArgTypes** and return type **R** if the expression *INVOKE*<**R**>(*declval*<**F**>(), *declval*<**ArgTypes**>()...), considered as an unevaluated operand (7.2), is well-formed (19.14.3).
- ³ The **function** class template is a call wrapper (19.14.2) whose call signature (19.14.2) is **R(ArgTypes...)**.
- ⁴ [Note: The types deduced by the deduction guides for **function** may change in future versions of this International Standard. — *end note*]

19.14.16.2.1 Constructors and destructor

[func.wrap.func.con]

```
function() noexcept;
1      Ensures: !*this.

function(nullptr_t) noexcept;
2      Ensures: !*this.

function(const function& f);
3      Ensures: !*this if !f; otherwise, *this targets a copy of f.target().

4      Throws: Shall not throw exceptions if f's target is a specialization of reference_wrapper or a function pointer. Otherwise, may throw bad_alloc or any exception thrown by the copy constructor of the stored callable object. [Note: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f's target is an object holding only a pointer or reference to an object and a member function pointer. — end note]

function(function&& f) noexcept;
5      Ensures: If !f, *this has no target; otherwise, the target of *this is equivalent to the target of f before the construction, and f is in a valid state with an unspecified value.

6      [Note: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f's target is an object holding only a pointer or reference to an object and a member function pointer. — end note]

template<class F> function(F f);
7      Requires: F shall be Cpp17CopyConstructible.

8      Remarks: This constructor template shall not participate in overload resolution unless F is Lvalue-Callable (19.14.16.2) for argument types ArgTypes... and return type R.

9      Ensures: !*this if any of the following hold:
(9.1)   — f is a null function pointer value.
(9.2)   — f is a null member pointer value.
```

(9.3) — *F* is an instance of the `function` class template, and `!f`.
 10 Otherwise, `*this` targets a copy of *f* initialized with `std::move(f)`. [Note: Implementations should
 avoid the use of dynamically allocated memory for small callable objects, for example, where *f* is an
 object holding only a pointer or reference to an object and a member function pointer. — end note]
 11 *Throws*: Shall not throw exceptions when *f* is a function pointer or a `reference_wrapper<T>` for some
 T. Otherwise, may throw `bad_alloc` or any exception thrown by *F*'s copy or move constructor.

```
template<class F> function(F) -> function<see below>;
```

12 *Remarks*: This deduction guide participates in overload resolution only if `&F::operator()` is well-formed
 when treated as an unevaluated operand. In that case, if `decltype(&F::operator())` is of the form
 R(G::) (A...)* *cv &_{opt}* `noexceptopt` for a class type *G*, then the deduced type is `function<R(A...)>`.

13 *[Example*:

```
void f() {
    int i{5};
    function g = [&](double) { return i; }; // deduces function<int(double)>
}
```

— *end example*]

```
function& operator=(const function& f);
```

14 *Effects*: As if by `function(f).swap(*this)`;

15 *Returns*: `*this`.

```
function& operator=(function&& f);
```

16 *Effects*: Replaces the target of `*this` with the target of *f*.

17 *Returns*: `*this`.

```
function& operator=(nullptr_t) noexcept;
```

18 *Effects*: If `*this != nullptr`, destroys the target of `this`.

19 *Ensures*: `!(*this)`.

20 *Returns*: `*this`.

```
template<class F> function& operator=(F&& f);
```

21 *Effects*: As if by: `function(std::forward<F>(f)).swap(*this)`;

22 *Returns*: `*this`.

23 *Remarks*: This assignment operator shall not participate in overload resolution unless `decay_t<F>` is
 Lvalue-Callable ([19.14.16.2](#)) for argument types `ArgTypes...` and return type *R*.

```
template<class F> function& operator=(reference_wrapper<F> f) noexcept;
```

24 *Effects*: As if by: `function(f).swap(*this)`;

25 *Returns*: `*this`.

```
~function();
```

26 *Effects*: If `*this != nullptr`, destroys the target of `this`.

19.14.16.2.2 Modifiers

[func.wrap.func.mod]

```
void swap(function& other) noexcept;
```

1 *Effects*: Interchanges the targets of `*this` and *other*.

19.14.16.2.3 Capacity

[func.wrap.func.cap]

```
explicit operator bool() const noexcept;
```

1 *Returns*: `true` if `*this` has a target, otherwise `false`.

19.14.16.2.4 Invocation

[func.wrap.func.inv]

- `R operator()(ArgTypes... args) const;`
- 1 *Returns:* `INVOKE<R>(f, std::forward<ArgTypes>(args)...)` (19.14.3), where `f` is the target object (19.14.2) of `*this`.
 - 2 *Throws:* `bad_function_call` if `!*this`; otherwise, any exception thrown by the wrapped callable object.

19.14.16.2.5 Target access

[func.wrap.func.targ]

- `const type_info& target_type() const noexcept;`
- 1 *Returns:* If `*this` has a target of type `T`, `typeid(T)`; otherwise, `typeid(void)`.
- ```
template<class T> T* target() noexcept;
template<class T> const T* target() const noexcept;
```
- 2 *Returns:* If `target_type() == typeid(T)` a pointer to the stored function target; otherwise a null pointer.

**19.14.16.2.6 Null pointer comparison functions**

[func.wrap.func.nullptr]

- ```
template<class R, class... ArgTypes>
bool operator==(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;
template<class R, class... ArgTypes>
bool operator==(nullptr_t, const function<R(ArgTypes...)>& f) noexcept;

1   Returns: !f.
```
- ```
template<class R, class... ArgTypes>
bool operator!=(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;
template<class R, class... ArgTypes>
bool operator!=(nullptr_t, const function<R(ArgTypes...)>& f) noexcept;
```
- 2 *Returns:* `(bool)f`.

**19.14.16.2.7 Specialized algorithms**

[func.wrap.func.alg]

- ```
template<class R, class... ArgTypes>
void swap(function<R(ArgTypes...)>& f1, function<R(ArgTypes...)>& f2) noexcept;
```
- 1 *Effects:* As if by: `f1.swap(f2);`

19.14.17 Searchers

[func.search]

- 1 This subclause provides function object types (19.14) for operations that search for a sequence [`pat_first`, `pat_last`) in another sequence [`first`, `last`) that is provided to the object's function call operator. The first sequence (the pattern to be searched for) is provided to the object's constructor, and the second (the sequence to be searched) is provided to the function call operator.
- 2 Each specialization of a class template specified in this subclause 19.14.17 shall satisfy the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. Template parameters named
 - (2.1) — `ForwardIterator`,
 - (2.2) — `ForwardIterator1`,
 - (2.3) — `ForwardIterator2`,
 - (2.4) — `RandomAccessIterator`,
 - (2.5) — `RandomAccessIterator1`,
 - (2.6) — `RandomAccessIterator2`, and
 - (2.7) — `BinaryPredicate`

of templates specified in this subclause 19.14.17 shall satisfy the same requirements and semantics as specified in 24.1. Template parameters named `Hash` shall satisfy the *Cpp17Hash* requirements (Table 32).

- 3 The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.

19.14.17.1 Class template `default_searcher`

[func.search.default]

```

template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
class default_searcher {
public:
    constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                               BinaryPredicate pred = BinaryPredicate());

    template<class ForwardIterator2>
    constexpr pair<ForwardIterator2, ForwardIterator2>
    operator()(ForwardIterator2 first, ForwardIterator2 last) const;

private:
    ForwardIterator1 pat_first_;           // exposition only
    ForwardIterator1 pat_last_;           // exposition only
    BinaryPredicate pred_;                // exposition only
};

constexpr default_searcher(ForwardIterator pat_first, ForwardIterator pat_last,
                           BinaryPredicate pred = BinaryPredicate());

```

1 *Effects:* Constructs a `default_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, and `pred_` with `pred`.

2 *Throws:* Any exception thrown by the copy constructor of `BinaryPredicate` or `ForwardIterator1`.

```

template<class ForwardIterator2>
constexpr pair<ForwardIterator2, ForwardIterator2>
operator()(ForwardIterator2 first, ForwardIterator2 last) const;

```

3 *Effects:* Returns a pair of iterators `i` and `j` such that

(3.1) — `i == search(first, last, pat_first_, pat_last_, pred_)`, and

(3.2) — if `i == last`, then `j == last`, otherwise `j == next(i, distance(pat_first_, pat_last_))`.

19.14.17.2 Class template `boyer_moore_searcher`

[func.search.bm]

```

template<class RandomAccessIterator1,
         class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
         class BinaryPredicate = equal_to<>>
class boyer_moore_searcher {
public:
    boyer_moore_searcher(RandomAccessIterator1 pat_first,
                          RandomAccessIterator1 pat_last,
                          Hash hf = Hash(),
                          BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>
    pair<RandomAccessIterator2, RandomAccessIterator2>
    operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

private:
    RandomAccessIterator1 pat_first_;   // exposition only
    RandomAccessIterator1 pat_last_;   // exposition only
    Hash hash_;                      // exposition only
    BinaryPredicate pred_;            // exposition only
};

boyer_moore_searcher(RandomAccessIterator1 pat_first,
                     RandomAccessIterator1 pat_last,
                     Hash hf = Hash(),
                     BinaryPredicate pred = BinaryPredicate());

```

- 1 *Requires:* The value type of `RandomAccessIterator1` shall satisfy the `Cpp17DefaultConstructible` requirements, the `Cpp17CopyConstructible` requirements, and the `Cpp17CopyAssignable` requirements.
- 2 *Requires:* For any two values `A` and `B` of the type `iterator_traits<RandomAccessIterator1>::value_type`, if `pred(A, B) == true`, then `hf(A) == hf(B)` shall be true.

- 3 *Effects:* Constructs a `boyer_moore_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.
- 4 *Throws:* Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```
template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

5 *Requires:* `RandomAccessIterator1` and `RandomAccessIterator2` shall have the same value type.

6 *Effects:* Finds a subsequence of equal values in a sequence.

7 *Returns:* A pair of iterators `i` and `j` such that

(7.1) — `i` is the first iterator in the range `[first, last - (pat_last_ - pat_first_)]` such that for every non-negative integer `n` less than `pat_last_ - pat_first_` the following condition holds:
`pred(*(i + n), *(pat_first_ + n)) != false`, and

(7.2) — `j == next(i, distance(pat_first_, pat_last_))`.

Returns `make_pair(first, first)` if `[pat_first_, pat_last_]` is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

8 *Complexity:* At most `(last - first) * (pat_last_ - pat_first_)` applications of the predicate.

19.14.17.3 Class template `boyer_moore_horspool_searcher` [func.search.bmh]

```
template<class RandomAccessIterator1,
         class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
         class BinaryPredicate = equal_to<>>
class boyer_moore_horspool_searcher {
public:
    boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                                   RandomAccessIterator1 pat_last,
                                   Hash hf = Hash(),
                                   BinaryPredicate pred = BinaryPredicate());
```

```
template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

```
private:
    RandomAccessIterator1 pat_first_; // exposition only
    RandomAccessIterator1 pat_last_; // exposition only
    Hash hash_; // exposition only
    BinaryPredicate pred_; // exposition only
};
```

```
boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                               RandomAccessIterator1 pat_last,
                               Hash hf = Hash(),
                               BinaryPredicate pred = BinaryPredicate());
```

- 1 *Requires:* The value type of `RandomAccessIterator1` shall satisfy the `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and `Cpp17CopyAssignable` requirements.
- 2 *Requires:* For any two values `A` and `B` of the type `iterator_traits<RandomAccessIterator1>::value_type`, if `pred(A, B) == true`, then `hf(A) == hf(B)` shall be true.
- 3 *Effects:* Constructs a `boyer_moore_horspool_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.
- 4 *Throws:* Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1` or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```

template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

```

5 *Requires:* RandomAccessIterator1 and RandomAccessIterator2 shall have the same value type.

6 *Effects:* Finds a subsequence of equal values in a sequence.

7 *Returns:* A pair of iterators i and j such that

(7.1) — i is the first iterator i in the range [first, last - (pat_last_ - pat_first_)) such that for every non-negative integer n less than pat_last_ - pat_first_ the following condition holds:
 pred(*(i + n), *(pat_first_ + n)) != false, and

(7.2) — j == next(i, distance(pat_first_, pat_last_)).
Returns make_pair(first, first) if [pat_first_, pat_last_] is empty, otherwise returns make_pair(last, last) if no such iterator is found.

8 *Complexity:* At most (last - first) * (pat_last_ - pat_first_) applications of the predicate.

19.14.18 Class template hash

[unord.hash]

- 1 The unordered associative containers defined in 21.5 use specializations of the class template hash (19.14.1) as the default hash function.
- 2 Each specialization of **hash** is either enabled or disabled, as described below. [Note: Enabled specializations meet the *Cpp17Hash* requirements, and disabled specializations do not. —end note] Each header that declares the template **hash** provides enabled specializations of **hash** for **nullptr_t** and all cv-unqualified arithmetic, enumeration, and pointer types. For any type **Key** for which neither the library nor the user provides an explicit or partial specialization of the class template **hash**, **hash**<**Key**> is disabled.
- 3 If the library provides an explicit or partial specialization of **hash**<**Key**>, that specialization is enabled except as noted otherwise, and its member functions are **noexcept** except as noted otherwise.
- 4 If H is a disabled specialization of **hash**, these values are **false**: **is_default_constructible_v**<H>, **is_copy_constructible_v**<H>, **is_move_constructible_v**<H>, **is_copy_assignable_v**<H>, and **is_move_assignable_v**<H>. Disabled specializations of **hash** are not function object types (19.14). [Note: This means that the specialization of **hash** exists, but any attempts to use it as a *Cpp17Hash* will be ill-formed. —end note]
- 5 An enabled specialization **hash**<**Key**> will:
 - (5.1) — satisfy the *Cpp17Hash* requirements (Table 32), with **Key** as the function call argument type, the *Cpp17DefaultConstructible* requirements (Table 25), the *Cpp17CopyAssignable* requirements (Table 29),
 - (5.2) — be swappable (15.5.3.2) for lvalues,
 - (5.3) — satisfy the requirement that if **k1 == k2** is **true**, **h(k1) == h(k2)** is also **true**, where **h** is an object of type **hash**<**Key**> and **k1** and **k2** are objects of type **Key**;
 - (5.4) — satisfy the requirement that the expression **h(k)**, where **h** is an object of type **hash**<**Key**> and **k** is an object of type **Key**, shall not throw an exception unless **hash**<**Key**> is a program-defined specialization that depends on at least one program-defined type.

19.15 Metaprogramming and type traits

[meta]

- 1 This subclause describes components used by C++ programs, particularly in templates, to support the widest possible range of types, optimise template code usage, detect type related user errors, and perform type inference and transformation at compile time. It includes type classification traits, type property inspection traits, and type transformations. The type classification traits describe a complete taxonomy of all possible C++ types, and state where in that taxonomy a given type belongs. The type property inspection traits allow important characteristics of types or of combinations of types to be inspected. The type transformations allow certain properties of types to be manipulated.
- 2 All functions specified in this subclause are signal-safe (16.12.4).

19.15.1 Requirements

[meta.rqmts]

- 1 A *Cpp17UnaryTypeTrait* describes a property of a type. It shall be a class template that takes one template type argument and, optionally, additional arguments that help define the property being described. It shall be *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and publicly and unambiguously derived, directly or

indirectly, from its *base characteristic*, which is a specialization of the template `integral_constant` (19.15.3), with the arguments to the template `integral_constant` determined by the requirements for the particular property being described. The member names of the base characteristic shall not be hidden and shall be unambiguously available in the `Cpp17UnaryTypeTrait`.

- 2 A `Cpp17BinaryTypeTrait` describes a relationship between two types. It shall be a class template that takes two template type arguments and, optionally, additional arguments that help define the relationship being described. It shall be `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and publicly and unambiguously derived, directly or indirectly, from its *base characteristic*, which is a specialization of the template `integral_constant` (19.15.3), with the arguments to the template `integral_constant` determined by the requirements for the particular relationship being described. The member names of the base characteristic shall not be hidden and shall be unambiguously available in the `Cpp17BinaryTypeTrait`.
- 3 A `Cpp17TransformationTrait` modifies a property of a type. It shall be a class template that takes one template type argument and, optionally, additional arguments that help define the modification. It shall define a publicly accessible nested type named `type`, which shall be a synonym for the modified type.
- 4 Unless otherwise specified, the behavior of a program that adds specializations for any of the templates specified in this subclause 19.15 is undefined.
- 5 Unless otherwise specified, an incomplete type may be used to instantiate a template specified in this subclause. The behavior of a program is undefined if:
 - (5.1) — an instantiation of a template specified in this subclause directly or indirectly depends on an incompletely-defined object type `T`, and
 - (5.2) — that instantiation could yield a different result were `T` hypothetically completed.

19.15.2 Header `<type_traits>` synopsis

[meta.type.synop]

// 19.15.10, constant evaluation context
constexpr bool is_constant_evaluated() noexcept;
}

```

19.15.3 Helper classes

[meta.help]

```

namespace std {
    template<class T, T v> struct integral_constant {
        static constexpr T value = v;

        using value_type = T;
        using type = integral_constant<T, v>;

        constexpr operator value_type() const noexcept { return value; }
        constexpr value_type operator()() const noexcept { return value; }
    };
}

```

¹ The class template `integral_constant`, alias template `bool_constant`, and its associated *typedef-names* `true_type` and `false_type` are used as base classes to define the interface for various type traits.

19.15.4 Unary type traits

[meta.unary]

- ¹ This subclause contains templates that may be used to query the properties of a type at compile time.
- ² Each of these templates shall be a *Cpp17UnaryTypeTrait* (19.15.1) with a base characteristic of `true_type` if the corresponding condition is `true`, otherwise `false_type`.

19.15.4.1 Primary type categories

[meta.unary.cat]

- ¹ The primary type categories correspond to the descriptions given in subclause 6.7 of the C++ standard.
- ² For any given type `T`, the result of applying one of these templates to `T` and to `cv T` shall yield the same result.
- ³ [Note: For any given type `T`, exactly one of the primary type categories has a `value` member that evaluates to `true`. — end note]

Table 45 — Primary type category predicates

Template	Condition	Comments
<code>template<class T></code> <code>struct is_void;</code>	<code>T</code> is <code>void</code>	
<code>template<class T></code> <code>struct is_null_pointer;</code>	<code>T</code> is <code>nullptr_t</code> (6.7.1)	
<code>template<class T></code> <code>struct is_integral;</code>	<code>T</code> is an integral type (6.7.1)	
<code>template<class T></code> <code>struct is_floating_point;</code>	<code>T</code> is a floating-point type (6.7.1)	
<code>template<class T></code> <code>struct is_array;</code>	<code>T</code> is an array type (6.7.2) of known or unknown extent	Class template <code>array</code> (21.3.7) is not an array type.
<code>template<class T></code> <code>struct is_pointer;</code>	<code>T</code> is a pointer type (6.7.2)	Includes pointers to functions but not pointers to non-static members.
<code>template<class T></code> <code>struct is_lvalue_reference;</code>	<code>T</code> is an lvalue reference type (9.2.3.2)	
<code>template<class T></code> <code>struct is_rvalue_reference;</code>	<code>T</code> is an rvalue reference type (9.2.3.2)	
<code>template<class T></code> <code>struct is_member_object_pointer;</code>	<code>T</code> is a pointer to data member	
<code>template<class T></code> <code>struct</code> <code>is_member_function_pointer;</code>	<code>T</code> is a pointer to member function	
<code>template<class T></code> <code>struct is_enum;</code>	<code>T</code> is an enumeration type (6.7.2)	
<code>template<class T></code> <code>struct is_union;</code>	<code>T</code> is a union type (6.7.2)	
<code>template<class T></code> <code>struct is_class;</code>	<code>T</code> is a non-union class type (6.7.2)	
<code>template<class T></code> <code>struct is_function;</code>	<code>T</code> is a function type (6.7.2)	

19.15.4.2 Composite type traits

[meta.unary.comp]

- ¹ These templates provide convenient compositions of the primary type categories, corresponding to the descriptions given in subclause 6.7.
- ² For any given type `T`, the result of applying one of these templates to `T` and to `cv T` shall yield the same result.

Table 46 — Composite type category predicates

Template	Condition	Comments
<code>template<class T> struct is_reference;</code>	T is an lvalue reference or an rvalue reference	
<code>template<class T> struct is_arithmetic;</code>	T is an arithmetic type (6.7.1)	
<code>template<class T> struct is_fundamental;</code>	T is a fundamental type (6.7.1)	
<code>template<class T> struct is_object;</code>	T is an object type (6.7)	
<code>template<class T> struct is_scalar;</code>	T is a scalar type (6.7)	
<code>template<class T> struct is_compound;</code>	T is a compound type (6.7.2)	
<code>template<class T> struct is_member_pointer;</code>	T is a pointer-to-member type (6.7.2)	

19.15.4.3 Type properties

[meta.unary.prop]

- 1 These templates provide access to some of the more important properties of types.
- 2 It is unspecified whether the library defines any full or partial specializations of any of these templates.
- 3 For all of the class templates X declared in this subclause, instantiating that template with a template-argument that is a class template specialization may result in the implicit instantiation of the template argument if and only if the semantics of X require that the argument is a complete type.
- 4 For the purpose of defining the templates in this subclause, a function call expression `declval<T>()` for any type T is considered to be a trivial (6.7, 10.3.3) function call that is not an odr-use (6.2) of `declval` in the context of the corresponding definition notwithstanding the restrictions of 19.2.6.

Table 47 — Type property predicates

Template	Condition	Preconditions
<code>template<class T> struct is_const;</code>	T is const-qualified (6.7.3)	
<code>template<class T> struct is_volatile;</code>	T is volatile-qualified (6.7.3)	
<code>template<class T> struct is_trivial;</code>	T is a trivial type (6.7)	<code>remove_all_extents_-t<T></code> shall be a complete type or cv void.
<code>template<class T> struct is_trivially_copyable;</code>	T is a trivially copyable type (6.7)	<code>remove_all_extents_-t<T></code> shall be a complete type or cv void.
<code>template<class T> struct is_standard_layout;</code>	T is a standard-layout type (6.7)	<code>remove_all_extents_-t<T></code> shall be a complete type or cv void.
<code>template<class T> struct is_empty;</code>	T is a class type, but not a union type, with no non-static data members other than subobjects of zero size, no virtual member functions, no virtual base classes, and no base class B for which <code>is_empty_v</code> is false.	If T is a non-union class type, T shall be a complete type.
<code>template<class T> struct is_polymorphic;</code>	T is a polymorphic class (10.6.2)	If T is a non-union class type, T shall be a complete type.

Table 47 — Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T> struct is_abstract;</code>	T is an abstract class (10.6.3)	If T is a non-union class type, T shall be a complete type.
<code>template<class T> struct is_final;</code>	T is a class type marked with the <i>class-virt-specifier final</i> (Clause 10). [Note: A union is a class type that can be marked with <code>final</code> . —end note]	If T is a class type, T shall be a complete type.
<code>template<class T> struct is_aggregate;</code>	T is an aggregate type (9.3.1)	<code>remove_all_extents_t<T></code> shall be a complete type or <i>cv void</i> .
<code>template<class T> struct is_signed;</code>	If <code>is_arithmetic_v<T></code> is true, the same result as $T(-1) < T(0)$; otherwise, false	
<code>template<class T> struct is_unsigned;</code>	If <code>is_arithmetic_v<T></code> is true, the same result as $T(0) < T(-1)$; otherwise, false	
<code>template<class T, class... Args> struct is_constructible;</code>	For a function type T or for a <i>cv void</i> type T, <code>is_constructible_v<T, Args...></code> is false, otherwise <i>see below</i>	T and all types in the template parameter pack <code>Args</code> shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_default_constructible;</code>	<code>is_constructible_v<T></code> is true.	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_copy_constructible;</code>	For a referenceable type T (15.3.22), the same result as <code>is_constructible_v<T, const T&></code> , otherwise false.	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_move_constructible;</code>	For a referenceable type T, the same result as <code>is_constructible_v<T, T&&></code> , otherwise false.	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.

Table 47 — Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T, class U> struct is_assignable;</code>	The expression <code>declval<T>() =</code> <code>declval<U>()</code> is well-formed when treated as an unevaluated operand (7.2). Access checking is performed as if in a context unrelated to T and U. Only the validity of the immediate context of the assignment expression is considered. [Note: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — end note]	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_copy_assignable;</code>	For a referenceable type T, the same result as <code>is_assignable_v<T&,</code> <code>const T&>, otherwise</code> <code>false.</code>	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_move_assignable;</code>	For a referenceable type T, the same result as <code>is_assignable_v<T&,</code> <code>T&&>, otherwise false.</code>	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.

Table 47 — Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T, class U> struct is_swappable_with;</code>	The expressions <code>swap(declval<T>(),</code> <code>declval<U>())</code> and <code>swap(declval<U>(),</code> <code>declval<T>())</code> are each well-formed when treated as an unevaluated operand (7.2) in an overload-resolution context for swappable values (15.5.3.2). Access checking is performed as if in a context unrelated to T and U. Only the validity of the immediate context of the <code>swap</code> expressions is considered. [Note: The compilation of the expressions can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. —end note]	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_swappable;</code>	For a referenceable type T, the same result as <code>is_-</code> <code>swappable_with_v<T&,</code> <code>T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_destructible;</code>	Either T is a reference type, or T is a complete object type for which the expression <code>declval<U&>().~U()</code> is well-formed when treated as an unevaluated operand (7.2), where U is <code>remove_all_extents_-</code> <code>t<T></code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T, class... Args> struct is_trivially_constructible;</code>	<code>is_constructible_v<T,</code> <code>Args...></code> is <code>true</code> and the variable definition for <code>is_constructible</code> , as defined below, is known to call no operation that is not trivial (6.7, 10.3.3).	T and all types in the template parameter pack <code>Args</code> shall be complete types, <i>cv void</i> , or arrays of unknown bound.

Table 47 — Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T> struct is_trivially_default_constructible;</code>	<code>is_trivially_- constructible_v<T></code> is <code>true</code> .	T shall be a complete type, <code>cv void</code> , or an array of unknown bound.
<code>template<class T> struct is_trivially_copy_constructible;</code>	For a referenceable type T, the same result as <code>is_trivially_- constructible_v<T, const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <code>cv void</code> , or an array of unknown bound.
<code>template<class T> struct is_trivially_move_constructible;</code>	For a referenceable type T, the same result as <code>is_trivially_- constructible_v<T, T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <code>cv void</code> , or an array of unknown bound.
<code>template<class T, class U> struct is_triviallyAssignable;</code>	<code>is_assignable_v<T, U></code> is <code>true</code> and the assignment, as defined by <code>is_assignable</code> , is known to call no operation that is not trivial (6.7, 10.3.3).	T and U shall be complete types, <code>cv void</code> , or arrays of unknown bound.
<code>template<class T> struct is_trivially_copyAssignable;</code>	For a referenceable type T, the same result as <code>is_trivially_- assignable_v<T&, const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <code>cv void</code> , or an array of unknown bound.
<code>template<class T> struct is_trivially_moveAssignable;</code>	For a referenceable type T, the same result as <code>is_trivially_- assignable_v<T&, T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <code>cv void</code> , or an array of unknown bound.
<code>template<class T> struct is_trivially_destructible;</code>	<code>is_destructible_v<T></code> is <code>true</code> and <code>remove_all_- extents_t<T></code> is either a non-class type or a class type with a trivial destructor.	T shall be a complete type, <code>cv void</code> , or an array of unknown bound.
<code>template<class T, class... Args> struct is_nothrow_constructible;</code>	<code>is_constructible_v<T, Args...></code> is <code>true</code> and the variable definition for <code>is_constructible</code> , as defined below, is known not to throw any exceptions (7.6.2.7).	T and all types in the template parameter pack <code>Args</code> shall be complete types, <code>cv void</code> , or arrays of unknown bound.
<code>template<class T> struct is_nothrow_default_constructible;</code>	<code>is_nothrow_- constructible_v<T></code> is <code>true</code> .	T shall be a complete type, <code>cv void</code> , or an array of unknown bound.
<code>template<class T> struct is_nothrow_copy_constructible;</code>	For a referenceable type T, the same result as <code>is_nothrow_- constructible_v<T, const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <code>cv void</code> , or an array of unknown bound.

Table 47 — Type property predicates (continued)

Template	Condition	Preconditions
<code>template<class T> struct is_nothrow_move_constructible;</code>	For a referenceable type T, the same result as <code>is_nothrow_constructible_v<T, T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T, class U> struct is_nothrowAssignable;</code>	<code>is_assignable_v<T, U></code> is true and the assignment is known not to throw any exceptions (7.6.2.7).	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_nothrow_copyAssignable;</code>	For a referenceable type T, the same result as <code>is_nothrow_assignable_v<T&, const T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_nothrowMoveAssignable;</code>	For a referenceable type T, the same result as <code>is_nothrow_assignable_v<T&, T&&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T, class U> struct is_nothrow_swappableWith;</code>	<code>is_swappable_with_v<T, U></code> is true and each <code>swap</code> expression of the definition of <code>is_swappable_with<T, U></code> is known not to throw any exceptions (7.6.2.7).	T and U shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class T> struct is_nothrow_swappable;</code>	For a referenceable type T, the same result as <code>is_nothrow_swappable_with_v<T&, T&></code> , otherwise <code>false</code> .	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct is_nothrow_destructible;</code>	<code>is_destructible_v<T></code> is true and the indicated destructor is known not to throw any exceptions (7.6.2.7).	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.
<code>template<class T> struct has_virtual_destructor;</code>	T has a virtual destructor (10.3.6)	If T is a non-union class type, T shall be a complete type.
<code>template<class T> struct has_unique_objectRepresentations;</code>	For an array type T, the same result as <code>has_unique_object_representations_v<remove_all_extents_t<T>></code> , otherwise see below.	T shall be a complete type, <i>cv void</i> , or an array of unknown bound.

⁵ [Example:

```
is_const_v<const volatile int>           // true
is_const_v<const int*>                  // false
is_const_v<const int&>                  // false
is_const_v<int[3]>                      // false
is_const_v<const int[3]>                 // true
```

— end example]

⁶ [Example:

```

remove_const_t<const volatile int> // volatile int
remove_const_t<const int* const> // const int*
remove_const_t<const int&> // const int&
remove_const_t<const int[3]> // int[3]
— end example]

```

⁷ [Example:

```

// Given:
struct P final { };
union U1 { };
union U2 final { };

// the following assertions hold:
static_assert(!is_final_v<int>);
static_assert(is_final_v<P>);
static_assert(!is_final_v<U1>);
static_assert(is_final_v<U2>);

— end example]

```

⁸ The predicate condition for a template specialization `is_constructible<T, Args...>` shall be satisfied if and only if the following variable definition would be well-formed for some invented variable `t`:

```
T t(declval<Args>()...);
```

[Note: These tokens are never interpreted as a function declaration. — end note] Access checking is performed as if in a context unrelated to `T` and any of the `Args`. Only the validity of the immediate context of the variable initialization is considered. [Note: The evaluation of the initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — end note]

⁹ The predicate condition for a template specialization `has_unique_object_representations<T>` shall be satisfied if and only if:

- (9.1) — `T` is trivially copyable, and
- (9.2) — any two objects of type `T` with the same value have the same object representation, where two objects of array or non-union class type are considered to have the same value if their respective sequences of direct subobjects have the same values, and two objects of union type are considered to have the same value if they have the same active member and the corresponding members have the same value.

The set of scalar types for which this condition holds is implementation-defined. [Note: If a type has padding bits, the condition does not hold; otherwise, the condition holds true for integral types. — end note]

19.15.5 Type property queries

[`meta.unary.prop.query`]

¹ This subclause contains templates that may be used to query properties of types at compile time.

Table 48 — Type property queries

Template	Value
<code>template<class T></code> <code>struct alignment_of;</code>	<code>alignof(T).</code> Requires: <code>alignof(T)</code> shall be a valid expression (7.6.2.6)
<code>template<class T></code> <code>struct rank;</code>	If <code>T</code> names an array type, an integer value representing the number of dimensions of <code>T</code> ; otherwise, 0.
<code>template<class T,</code> <code>unsigned I = 0></code> <code>struct extent;</code>	If <code>T</code> is not an array type, or if it has rank less than or equal to <code>I</code> , or if <code>I</code> is 0 and <code>T</code> has type “array of unknown bound of <code>U</code> ”, then 0; otherwise, the bound (9.2.3.4) of the <code>I</code> th dimension of <code>T</code> , where indexing of <code>I</code> is zero-based

² Each of these templates shall be a *Cpp17UnaryTypeTrait* ([19.15.1](#)) with a base characteristic of `integral_constant<size_t, Value>`.

³ [Example:

```
// the following assertions hold:
assert(rank_v<int> == 0);
assert(rank_v<int[2]> == 1);
assert(rank_v<int[] [4]> == 2);
— end example]
```

⁴ [Example:

```
// the following assertions hold:
assert(extent_v<int> == 0);
assert(extent_v<int[2]> == 2);
assert(extent_v<int[2] [4]> == 2);
assert(extent_v<int[] [4]> == 0);
assert((extent_v<int, 1>) == 0);
assert((extent_v<int[2], 1>) == 0);
assert((extent_v<int[2] [4], 1>) == 4);
assert((extent_v<int[] [4], 1>) == 4);
— end example]
```

19.15.6 Relationships between types

[meta.rel]

- ¹ This subclause contains templates that may be used to query relationships between types at compile time.
- ² Each of these templates shall be a *Cpp17BinaryTypeTrait* (19.15.1) with a base characteristic of `true_type` if the corresponding condition is true, otherwise `false_type`.

Table 49 — Type relationship predicates

Template	Condition	Comments
<code>template<class T, class U></code> <code>struct is_same;</code>	T and U name the same type with the same cv-qualifications	
<code>template<class Base, class Derived></code> <code>struct is_base_of;</code>	Base is a base class of Derived (10.6) without regard to cv-qualifiers or Base and Derived are not unions and name the same class type without regard to cv-qualifiers	If Base and Derived are non-union class types and are not possibly cv-qualified versions of the same type, Derived shall be a complete type. [Note: Base classes that are private, protected, or ambiguous are, nonetheless, base classes. — end note]
<code>template<class From, class To></code> <code>struct is_convertible;</code>	<i>see below</i>	From and To shall be complete types, arrays of unknown bound, or <i>cv void</i> types.
<code>template<class From, class To></code> <code>struct is_nothrow_convertible;</code>	<code>is_convertible_v<From,</code> To> is <code>true</code> and the conversion, as defined by <code>is_convertible</code> , is known not to throw any exceptions (7.6.2.7)	From and To shall be complete types, arrays of unknown bound, or <i>cv void</i> types.
<code>template<class Fn, class... ArgTypes></code> <code>struct is_invocable;</code>	The expression <code>INVOKER(declval<Fn>(),</code> <code>declval<ArgTypes>()...)</code> is well-formed when treated as an unevaluated operand	Fn and all types in the template parameter pack ArgTypes shall be complete types, <i>cv void</i> , or arrays of unknown bound.
<code>template<class R, class Fn,</code> <code>class... ArgTypes></code> <code>struct is_invocable_r;</code>	The expression <code>INVOKER<R>(declval<Fn>(),</code> <code>declval<ArgTypes>()...)</code> is well-formed when treated as an unevaluated operand	Fn, R, and all types in the template parameter pack ArgTypes shall be complete types, <i>cv void</i> , or arrays of unknown bound.

Table 49 — Type relationship predicates (continued)

Template	Condition	Comments
template<class Fn, class... ArgTypes> struct is_nothrow_invocable;	is_invocable_v<Fn, ArgTypes...> is true and the expression <i>INVOKE</i> (declval<Fn>(), declval<ArgTypes>()...) is known not to throw any exceptions	Fn and all types in the template parameter pack ArgTypes shall be complete types, cv void, or arrays of unknown bound.
template<class R, class Fn, class... ArgTypes> struct is_nothrow_invocable_r;	is_invocable_r_v<R, Fn, ArgTypes...> is true and the expression <i>INVOKE</i> <R>(declval<Fn>(), declval<ArgTypes>()...) is known not to throw any exceptions	Fn, R, and all types in the template parameter pack ArgTypes shall be complete types, cv void, or arrays of unknown bound.

³ For the purpose of defining the templates in this subclause, a function call expression `declval<T>()` for any type T is considered to be a trivial (6.7, 10.3.3) function call that is not an odr-use (6.2) of `declval` in the context of the corresponding definition notwithstanding the restrictions of 19.2.6.

⁴ [Example:

```
struct B {};
struct B1 : B {};
struct B2 : B {};
struct D : private B1, private B2 {};

is_base_of_v<B, D>           // true
is_base_of_v<const B, D>       // true
is_base_of_v<B, const D>       // true
is_base_of_v<B, const B>       // true
is_base_of_v<D, B>             // false
is_base_of_v<B&, D&>          // false
is_base_of_v<B[3], D[3]>        // false
is_base_of_v<int, int>          // false

— end example]
```

⁵ The predicate condition for a template specialization `is_convertible<From, To>` shall be satisfied if and only if the return expression in the following code would be well-formed, including any implicit conversions to the return type of the function:

```
To test() {
    return declval<From>();
}
```

[Note: This requirement gives well-defined results for reference types, void types, array types, and function types. —end note] Access checking is performed in a context unrelated to To and From. Only the validity of the immediate context of the *expression* of the `return` statement (8.6.3) (including initialization of the returned object or reference) is considered. [Note: The initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. —end note]

19.15.7 Transformations between types

[meta.trans]

- ¹ This subclause contains templates that may be used to transform one type to another following some predefined rule.
- ² Each of the templates in this subclause shall be a *Cpp17TransformationTrait* (19.15.1).

19.15.7.1 Const-volatile modifications

[meta.trans.cv]

Table 50 — Const-volatile modifications

Template	Comments
<code>template<class T> struct remove_const;</code>	The member typedef <code>type</code> names the same type as <code>T</code> except that any top-level const-qualifier has been removed. [Example: <code>remove_const_t<const volatile int></code> evaluates to <code>volatile int</code> , whereas <code>remove_const_t<const int*></code> evaluates to <code>const int*</code> . — end example]
<code>template<class T> struct remove_volatile;</code>	The member typedef <code>type</code> names the same type as <code>T</code> except that any top-level volatile-qualifier has been removed. [Example: <code>remove_volatile_t<const volatile int></code> evaluates to <code>const int</code> , whereas <code>remove_volatile_t<volatile int*></code> evaluates to <code>volatile int*</code> . — end example]
<code>template<class T> struct remove_cv;</code>	The member typedef <code>type</code> shall be the same as <code>T</code> except that any top-level cv-qualifier has been removed. [Example: <code>remove_cv_t<const volatile int></code> evaluates to <code>int</code> , whereas <code>remove_cv_t<const volatile int*></code> evaluates to <code>const volatile int*</code> . — end example]
<code>template<class T> struct add_const;</code>	If <code>T</code> is a reference, function, or top-level const-qualified type, then <code>type</code> names the same type as <code>T</code> , otherwise <code>T const</code> .
<code>template<class T> struct add_volatile;</code>	If <code>T</code> is a reference, function, or top-level volatile-qualified type, then <code>type</code> names the same type as <code>T</code> , otherwise <code>T volatile</code> .
<code>template<class T> struct add_cv;</code>	The member typedef <code>type</code> names the same type as <code>add_const_t<add_volatile_t<T>></code> .

19.15.7.2 Reference modifications

[meta.trans.ref]

Table 51 — Reference modifications

Template	Comments
<code>template<class T> struct remove_reference;</code>	If <code>T</code> has type “reference to <code>T1</code> ” then the member typedef <code>type</code> names <code>T1</code> ; otherwise, <code>type</code> names <code>T</code> .
<code>template<class T> struct add_lvalue_reference;</code>	If <code>T</code> names a referenceable type (15.3.22) then the member typedef <code>type</code> names <code>T&</code> ; otherwise, <code>type</code> names <code>T</code> . [Note: This rule reflects the semantics of reference collapsing (9.2.3.2). — end note]
<code>template<class T> struct add_rvalue_reference;</code>	If <code>T</code> names a referenceable type then the member typedef <code>type</code> names <code>T&&</code> ; otherwise, <code>type</code> names <code>T</code> . [Note: This rule reflects the semantics of reference collapsing (9.2.3.2). For example, when a type <code>T</code> names a type <code>T1&</code> , the type <code>add_rvalue_reference_t<T></code> is not an rvalue reference. — end note]

19.15.7.3 Sign modifications

[meta.trans.sign]

Table 52 — Sign modifications

Template	Comments
<code>template<class T> struct make_signed;</code>	If <code>T</code> names a (possibly cv-qualified) signed integer type (6.7.1) then the member typedef <code>type</code> names the type <code>T</code> ; otherwise, if <code>T</code> names a (possibly cv-qualified) unsigned integer type then <code>type</code> names the corresponding signed integer type, with the same cv-qualifiers as <code>T</code> ; otherwise, <code>type</code> names the signed integer type with smallest rank (6.7.4) for which <code>sizeof(T) == sizeof(type)</code> , with the same cv-qualifiers as <code>T</code> . <i>Requires:</i> <code>T</code> shall be a (possibly cv-qualified) integral type or enumeration but not a <code>bool</code> type.

Table 52 — Sign modifications (continued)

Template	Comments
<code>template<class T> struct make_unsigned;</code>	If T names a (possibly cv-qualified) unsigned integer type (6.7.1) then the member typedef <code>type</code> names the type T; otherwise, if T names a (possibly cv-qualified) signed integer type then <code>type</code> names the corresponding unsigned integer type, with the same cv-qualifiers as T; otherwise, <code>type</code> names the unsigned integer type with smallest rank (6.7.4) for which <code>sizeof(T) == sizeof(type)</code> , with the same cv-qualifiers as T. <i>Requires:</i> T shall be a (possibly cv-qualified) integral type or enumeration but not a <code>bool</code> type.

19.15.7.4 Array modifications

[meta.trans.arr]

Table 53 — Array modifications

Template	Comments
<code>template<class T> struct remove_extent;</code>	If T names a type “array of U”, the member typedef <code>type</code> shall be U, otherwise T. [Note: For multidimensional arrays, only the first array dimension is removed. For a type “array of <code>const</code> U”, the resulting type is <code>const</code> U. —end note]
<code>template<class T> struct remove_all_extents;</code>	If T is “multi-dimensional array of U”, the resulting member typedef <code>type</code> is U, otherwise T.

¹ [Example:

```
// the following assertions hold:  
assert((is_same_v<remove_extent_t<int>, int>));  
assert((is_same_v<remove_extent_t<int[2]>, int>));  
assert((is_same_v<remove_extent_t<int[2][3]>, int[3]>));  
assert((is_same_v<remove_extent_t<int[]>, int[3]>));  
— end example]
```

² [Example:

```
// the following assertions hold:  
assert((is_same_v<remove_all_extents_t<int>, int>));  
assert((is_same_v<remove_all_extents_t<int[2]>, int>));  
assert((is_same_v<remove_all_extents_t<int[2][3]>, int>));  
assert((is_same_v<remove_all_extents_t<int[]>, int>));  
— end example]
```

19.15.7.5 Pointer modifications

[meta.trans.ptr]

Table 54 — Pointer modifications

Template	Comments
<code>template<class T> struct remove_pointer;</code>	If T has type “(possibly cv-qualified) pointer to T1” then the member typedef <code>type</code> names T1; otherwise, it names T.
<code>template<class T> struct add_pointer;</code>	If T names a referenceable type (15.3.22) or a <code>cv void</code> type then the member typedef <code>type</code> names the same type as <code>remove_reference_t<T>*</code> ; otherwise, <code>type</code> names T.

19.15.7.6 Other transformations

[meta.trans.other]

Table 55 — Other transformations

Template	Comments
<code>template<class T> struct type_identity;</code>	The member <code>typedef type</code> names the type <code>T</code> .
<code>template<size_t Len, size_t Align = default-alignment> struct aligned_storage;</code>	The value of <code>default-alignment</code> shall be the most stringent alignment requirement for any C++ object type whose size is no greater than <code>Len</code> (6.7). The member <code>typedef type</code> shall be a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most <code>Len</code> and whose alignment is a divisor of <code>Align</code> . <i>Requires:</i> <code>Len</code> shall not be zero. <code>Align</code> shall be equal to <code>alignof(T)</code> for some type <code>T</code> or to <code>default-alignment</code> .
<code>template<size_t Len, class... Types> struct aligned_union;</code>	The member <code>typedef type</code> shall be a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in <code>Types</code> ; its size shall be at least <code>Len</code> . The static member <code>alignment_value</code> shall be an integral constant of type <code>size_t</code> whose value is the strictest alignment of all types listed in <code>Types</code> . <i>Requires:</i> At least one type is provided. Each type in the template parameter pack <code>Types</code> shall be a complete object type.
<code>template<class T> struct remove_cvref;</code>	The member <code>typedef type</code> names the same type as <code>remove_cv_t<remove_reference_t<T>></code> .
<code>template<class T> struct decay;</code>	Let <code>U</code> be <code>remove_reference_t<T></code> . If <code>is_array_v<U></code> is <code>true</code> , the member <code>typedef type</code> shall equal <code>remove_extent_t<U>*</code> . If <code>is_function_v<U></code> is <code>true</code> , the member <code>typedef type</code> shall equal <code>add_pointer_t<U></code> . Otherwise the member <code>typedef type</code> equals <code>remove_cv_t<U></code> . [Note: This behavior is similar to the lvalue-to-rvalue (7.3.1), array-to-pointer (7.3.2), and function-to-pointer (7.3.3) conversions applied when an lvalue is used as an rvalue, but also strips <i>cv</i> -qualifiers from class types in order to more closely model by-value argument passing. —end note]
<code>template<bool B, class T = void> struct enable_if;</code>	If <code>B</code> is <code>true</code> , the member <code>typedef type</code> shall equal <code>T</code> ; otherwise, there shall be no member <code>type</code> .
<code>template<bool B, class T, class F> struct conditional;</code>	If <code>B</code> is <code>true</code> , the member <code>typedef type</code> shall equal <code>T</code> . If <code>B</code> is <code>false</code> , the member <code>typedef type</code> shall equal <code>F</code> .
<code>template<class... T> struct common_type;</code>	Unless this trait is specialized (as specified in Note B, below), the member <code>type</code> shall be defined or omitted as specified in Note A, below. If it is omitted, there shall be no member <code>type</code> . Each type in the template parameter pack <code>T</code> shall be complete, <i>cv void</i> , or an array of unknown bound.
<code>template<class, class, template<class> class, template<class> class> struct basic_common_reference;</code>	Unless this trait is specialized (as specified in Note D, below), there shall be no member <code>type</code> .
<code>template<class... T> struct common_reference;</code>	The member <code>typedef-name type</code> is defined or omitted as specified in Note C, below. Each type in the parameter pack <code>T</code> shall be complete or <i>cv void</i> .
<code>template<class T> struct underlying_type;</code>	The member <code>typedef type</code> names the underlying type of <code>T</code> . <i>Requires:</i> <code>T</code> shall be a complete enumeration type (9.6)

Table 55 — Other transformations (continued)

Template	Comments
<pre>template<class Fn, class... ArgTypes> struct invoke_result;</pre>	<p>If the expression <code>INVOKEDeclval<Fn>()</code>, <code>Declval<ArgTypes>()</code>... is well-formed when treated as an unevaluated operand (7.2), the member <code>typedef type</code> names the type <code>decltype(INVOKEDeclval<Fn>(), Declval<ArgTypes>())</code>; otherwise, there shall be no member type. Access checking is performed as if in a context unrelated to <code>Fn</code> and <code>ArgTypes</code>. Only the validity of the immediate context of the expression is considered.</p> <p>[<i>Note:</i> The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — <i>end note</i>]</p> <p><i>Requires:</i> <code>Fn</code> and all types in the template parameter pack <code>ArgTypes</code> shall be complete types, <code>cv void</code>, or arrays of unknown bound.</p>

¹ [*Note:* A typical implementation would define `aligned_storage` as:

```
template<size_t Len, size_t Alignment>
struct aligned_storage {
    typedef struct {
        alignas(Alignment) unsigned char __data[Len];
    } type;
};
```

— *end note*]

² Let:

- (2.1) — `CREF(A)` be `add_lvalue_reference_t<const remove_reference_t<A>>`,
- (2.2) — `XREF(A)` denote a unary alias template `T` such that `T<U>` denotes the same type as `U` with the addition of `A`’s cv and reference qualifiers, for a non-reference cv-unqualified type `U`,
- (2.3) — `COPYCV(FROM, TO)` be an alias for type `TO` with the addition of `FROM`’s top-level cv-qualifiers. [Example: `COPYCV(const int, volatile short)` is an alias for `const volatile short`. — *end example*]
- (2.4) — `COND_RES(X, Y)` be `decltype(false ? Declval<X(&)()>() : Declval<Y(&)()>())`.

Given types `A` and `B`, let `X` be `remove_reference_t<A>`, let `Y` be `remove_reference_t`, and let `COMMON_REF(A, B)` be:

- (2.5) — If `A` and `B` are both lvalue reference types, `COMMON_REF(A, B)` is `COND_RES(COPYCV(X, Y) &, COPYCV(Y, X) &)` if that type exists and is a reference type.
- (2.6) — Otherwise, let `C` be `remove_reference_t<COMMON_REF(X&, Y&)>&&`. If `A` and `B` are both rvalue reference types, `C` is well-formed, and `is_convertible_v<A, C> && is_convertible_v<B, C>` is true, then `COMMON_REF(A, B)` is `C`.
- (2.7) — Otherwise, let `D` be `COMMON_REF(const X&, Y&)`. If `A` is an rvalue reference and `B` is an lvalue reference and `D` is well-formed and `is_convertible_v<A, D>` is true, then `COMMON_REF(A, B)` is `D`.
- (2.8) — Otherwise, if `A` is an lvalue reference and `B` is an rvalue reference, then `COMMON_REF(A, B)` is `COMMON_REF(B, A)`.
- (2.9) — Otherwise, `COMMON_REF(A, B)` is ill-formed.

If any of the types computed above is ill-formed, then `COMMON_REF(A, B)` is ill-formed.

³ Note A: For the `common_type` trait applied to a template parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

- (3.1) — If `sizeof...(T)` is zero, there shall be no member `type`.
- (3.2) — If `sizeof...(T)` is one, let `T0` denote the sole type constituting the pack `T`. The member `typedef-name type` shall denote the same type, if any, as `common_type_t<T0, T0>`; otherwise there shall be no member `type`.

- (3.3) — If `sizeof...(T)` is two, let the first and second types constituting `T` be denoted by `T1` and `T2`, respectively, and let `D1` and `D2` denote the same types as `decay_t<T1>` and `decay_t<T2>`, respectively.
- (3.3.1) — If `is_same_v<T1, D1>` is `false` or `is_same_v<T2, D2>` is `false`, let `C` denote the same type, if any, as `common_type_t<D1, D2>`.
- (3.3.2) — [Note: None of the following will apply if there is a specialization `common_type<D1, D2>`. — end note]
- (3.3.3) — Otherwise, if

```
decay_t<decltype(false ? declval<D1>() : declval<D2>())>
```

 denotes a valid type, let `C` denote that type.
- (3.3.4) — Otherwise, if `COND_RES(CREF(D1), CREF(D2))` denotes a type, let `C` denote the type `decay_t<COND_RES(CREF(D1), CREF(D2))>`.

In either case, the member `typedef-name` type shall denote the same type, if any, as `C`. Otherwise, there shall be no member type.

- (3.4) — If `sizeof...(T)` is greater than two, let `T1`, `T2`, and `R`, respectively, denote the first, second, and (pack of) remaining types constituting `T`. Let `C` denote the same type, if any, as `common_type_t<T1, T2>`. If there is such a type `C`, the member `typedef-name` type shall denote the same type, if any, as `common_type_t<C, R...>`. Otherwise, there shall be no member type.

⁴ Note B: Notwithstanding the provisions of 19.15.2, and pursuant to 15.5.4.2.1, a program may specialize `common_type<T1, T2>` for types `T1` and `T2` such that `is_same_v<T1, decay_t<T1>>` and `is_same_v<T2, decay_t<T2>>` are each `true`. [Note: Such specializations are needed when only explicit conversions are desired between the template arguments. — end note] Such a specialization need not have a member named `type`, but if it does, that member shall be a `typedef-name` for an accessible and unambiguous cv-unqualified non-reference type `C` to which each of the types `T1` and `T2` is explicitly convertible. Moreover, `common_type_t<T1, T2>` shall denote the same type, if any, as does `common_type_t<T2, T1>`. No diagnostic is required for a violation of this Note's rules.

⁵ Note C: For the `common_reference` trait applied to a parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

- (5.1) — If `sizeof...(T)` is zero, there shall be no member `type`.
- (5.2) — Otherwise, if `sizeof...(T)` is one, let `T0` denote the sole type in the pack `T`. The member `typedef type` shall denote the same type as `T0`.
- (5.3) — Otherwise, if `sizeof...(T)` is two, let `T1` and `T2` denote the two types in the pack `T`. Then
 - (5.3.1) — If `T1` and `T2` are reference types and `COMMON_REF(T1, T2)` is well-formed, then the member `typedef type` denotes that type.
 - (5.3.2) — Otherwise, if `basic_common_reference<remove_cvref_t<T1>, remove_cvref_t<T2>, XREF(T1), XREF(T2)>::type` is well-formed, then the member `typedef type` denotes that type.
 - (5.3.3) — Otherwise, if `COND_REF(T1, T2)` is well-formed, then the member `typedef type` denotes that type.
 - (5.3.4) — Otherwise, if `common_type_t<T1, T2>` is well-formed, then the member `typedef type` denotes that type.
 - (5.3.5) — Otherwise, there shall be no member `type`.
- (5.4) — Otherwise, if `sizeof...(T)` is greater than two, let `T1`, `T2`, and `Rest`, respectively, denote the first, second, and (pack of) remaining types comprising `T`. Let `C` be the type `common_reference_t<T1, T2>`. Then:
 - (5.4.1) — If there is such a type `C`, the member `typedef type` shall denote the same type, if any, as `common_reference_t<C, Rest...>`.
 - (5.4.2) — Otherwise, there shall be no member `type`.

⁶ Note D: Notwithstanding the provisions of 19.15.2, and pursuant to 15.5.4.2.1, a program may partially specialize `basic_common_reference<T, U, TQual, UQual>` for types `T` and `U` such that `is_same_v<T, decay_t<T>>` and `is_same_v<U, decay_t<U>>` are each `true`. [Note: Such specializations can be used to influence the result of `common_reference`, and are needed when only explicit conversions are desired between the template arguments. — end note] Such a specialization need not have a member named `type`, but if it does, that member shall be a `typedef-name` for an accessible and unambiguous type `C` to which each of the types

`TQual<T>` and `UQual<U>` is convertible. Moreover, `basic_common_reference<T, U, TQual, UQual>::type` shall denote the same type, if any, as does `basic_common_reference<U, T, UQual, TQual>::type`. No diagnostic is required for a violation of these rules.

- 7 [Example: Given these definitions:

```
using PF1 = bool (&)();
using PF2 = short (*)(long);

struct S {
    operator PF2() const;
    double operator()(char, int&);
    void fn(long) const;
    char data;
};

using PMF = void (S::*)(long) const;
using PMD = char S::*;

the following assertions will hold:
```

```
static_assert(is_same_v<invoke_result_t<S, int>, short>);
static_assert(is_same_v<invoke_result_t<S&, unsigned char, int&>, double>);
static_assert(is_same_v<invoke_result_t<PF1>, bool>);
static_assert(is_same_v<invoke_result_t<PMF, unique_ptr<S>, int>, void>);
static_assert(is_same_v<invoke_result_t<PMD, S>, char&&>);
static_assert(is_same_v<invoke_result_t<PMD, const S*>, const char&>);

— end example]
```

19.15.8 Logical operator traits

[meta.logical]

- 1 This subclause describes type traits for applying logical operators to other type traits.

`template<class... B> struct conjunction : see below { };`

- 2 The class template `conjunction` forms the logical conjunction of its template type arguments.
- 3 For a specialization `conjunction<B1, ..., BN>`, if there is a template type argument `Bi` for which `bool(Bi::value)` is `false`, then instantiating `conjunction<B1, ..., BN>::value` does not require the instantiation of `Bj::value` for $j > i$. [Note: This is analogous to the short-circuiting behavior of the built-in operator `&&`. — end note]
- 4 Every template type argument for which `Bi::value` is instantiated shall be usable as a base class and shall have a member `value` which is convertible to `bool`, is not hidden, and is unambiguously available in the type.
- 5 The specialization `conjunction<B1, ..., BN>` has a public and unambiguous base that is either
- (5.1) — the first type `Bi` in the list `true_type, B1, ..., BN` for which `bool(Bi::value)` is `false`, or
 - (5.2) — if there is no such `Bi`, the last type in the list.

[Note: This means a specialization of `conjunction` does not necessarily inherit from either `true_type` or `false_type`. — end note]

- 6 The member names of the base class, other than `conjunction` and `operator=`, shall not be hidden and shall be unambiguously available in `conjunction`.

`template<class... B> struct disjunction : see below { };`

- 7 The class template `disjunction` forms the logical disjunction of its template type arguments.
- 8 For a specialization `disjunction<B1, ..., BN>`, if there is a template type argument `Bi` for which `bool(Bi::value)` is `true`, then instantiating `disjunction<B1, ..., BN>::value` does not require the instantiation of `Bj::value` for $j > i$. [Note: This is analogous to the short-circuiting behavior of the built-in operator `||`. — end note]
- 9 Every template type argument for which `Bi::value` is instantiated shall be usable as a base class and shall have a member `value` which is convertible to `bool`, is not hidden, and is unambiguously available in the type.
- 10 The specialization `disjunction<B1, ..., BN>` has a public and unambiguous base that is either

- (10.1) — the first type B_i in the list `false_type`, B_1 , ..., B_N for which `bool(B $_i$::value)` is `true`, or
 (10.2) — if there is no such B_i , the last type in the list.

[Note: This means a specialization of `disjunction` does not necessarily inherit from either `true_type` or `false_type`. — end note]

- 11 The member names of the base class, other than `disjunction` and `operator=`, shall not be hidden and shall be unambiguously available in `disjunction`.

```
template<class B> struct negation : see below { };
```

- 12 The class template `negation` forms the logical negation of its template type argument. The type `negation` is a *Cpp17UnaryTypeTrait* with a base characteristic of `bool_constant<!bool(B::value)>`.

19.15.9 Endian

[meta.endian]

- ¹ Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```
enum class endian {
    little = see below,
    big    = see below,
    native = see below
};
```

- ² If all scalar types have size 1 byte, then all of `endian::little`, `endian::big`, and `endian::native` have the same value. Otherwise, `endian::little` is not equal to `endian::big`. If all scalar types are big-endian, `endian::native` is equal to `endian::big`. If all scalar types are little-endian, `endian::native` is equal to `endian::little`. Otherwise, `endian::native` is not equal to either `endian::big` or `endian::little`.

19.15.10 Constant evaluation context

[meta.const.eval]

```
constexpr bool is_constant_evaluation() noexcept;
```

- ¹ Returns: `true` if and only if evaluation of the call occurs within the evaluation of an expression or conversion that is manifestly constant-evaluated (7.7).

- ² [Example:

```
constexpr void f(unsigned char *p, int n) {
    if (std::is_constant_evaluated()) {           // should not be a constexpr if statement
        for (int k = 0; k < n; ++k) p[k] = 0;
    } else {
        memset(p, 0, n);                      // not a core constant expression
    }
}
```

— end example]

19.16 Compile-time rational arithmetic

[ratio]

19.16.1 In general

[ratio.general]

- ¹ This subclause describes the ratio library. It provides a class template `ratio` which exactly represents any finite rational number with a numerator and denominator representable by compile-time constants of type `intmax_t`.
- ² Throughout this subclause, the names of template parameters are used to express type requirements. If a template parameter is named R_1 or R_2 , and the template argument is not a specialization of the `ratio` template, the program is ill-formed.

19.16.2 Header <ratio> synopsis

[ratio.syn]

```

namespace std {
    // 19.16.3, class template ratio
    template<intmax_t N, intmax_t D = 1> class ratio;

    // 19.16.4, ratio arithmetic
    template<class R1, class R2> using ratio_add = see below;
    template<class R1, class R2> using ratio_subtract = see below;
    template<class R1, class R2> using ratio_multiply = see below;
    template<class R1, class R2> using ratio_divide = see below;

    // 19.16.5, ratio comparison
    template<class R1, class R2> struct ratio_equal;
    template<class R1, class R2> struct ratio_not_equal;
    template<class R1, class R2> struct ratio_less;
    template<class R1, class R2> struct ratio_less_equal;
    template<class R1, class R2> struct ratio_greater;
    template<class R1, class R2> struct ratio_greater_equal;

    template<class R1, class R2>
        inline constexpr bool ratio_equal_v = ratio_equal<R1, R2>::value;
    template<class R1, class R2>
        inline constexpr bool ratio_not_equal_v = ratio_not_equal<R1, R2>::value;
    template<class R1, class R2>
        inline constexpr bool ratio_less_v = ratio_less<R1, R2>::value;
    template<class R1, class R2>
        inline constexpr bool ratio_less_equal_v = ratio_less_equal<R1, R2>::value;
    template<class R1, class R2>
        inline constexpr bool ratio_greater_v = ratio_greater<R1, R2>::value;
    template<class R1, class R2>
        inline constexpr bool ratio_greater_equal_v = ratio_greater_equal<R1, R2>::value;

    // 19.16.6, convenience SI typedefs
    using yocto = ratio<1, 1'000'000'000'000'000'000'000>; // see below
    using zepto = ratio<1,      1'000'000'000'000'000'000'000>; // see below
    using atto = ratio<1,          1'000'000'000'000'000'000'000>;
    using femto = ratio<1,           1'000'000'000'000'000'000>;
    using pico = ratio<1,             1'000'000'000'000'000>;
    using nano = ratio<1,               1'000'000'000'000>;
    using micro = ratio<1,                 1'000'000>;
    using milli = ratio<1,                   1'000>;
    using centi = ratio<1,                     100>;
    using deci = ratio<1,                      10>;
    using deca = ratio<1,                    10, 1>;
    using hecto = ratio<1,                  100, 1>;
    using kilo = ratio<1,                   1'000, 1>;
    using mega = ratio<1,                1'000'000, 1>;
    using giga = ratio<1,            1'000'000'000, 1>;
    using tera = ratio<1,        1'000'000'000'000, 1>;
    using peta = ratio<1,    1'000'000'000'000'000, 1>;
    using exa = ratio<1, 1'000'000'000'000'000'000, 1>;
    using zetta = ratio<1, 1'000'000'000'000'000'000'000, 1>; // see below
    using yotta = ratio<1'000'000'000'000'000'000'000'000, 1>; // see below
}

```

19.16.3 Class template ratio

[ratio.ratio]

```

namespace std {
    template<intmax_t N, intmax_t D = 1> class ratio {
    public:
        static constexpr intmax_t num;
        static constexpr intmax_t den;
        using type = ratio<num, den>;

```

```
};  
}
```

- 1 If the template argument D is zero or the absolute values of either of the template arguments N and D is not representable by type `intmax_t`, the program is ill-formed. [Note: These rules ensure that infinite ratios are avoided and that for any negative input, there exists a representable value of its absolute value which is positive. This excludes the most negative value. —end note]
- 2 The static data members `num` and `den` shall have the following values, where `gcd` represents the greatest common divisor of the absolute values of N and D:
 - (2.1) — `num` shall have the value `sign(N) * sign(D) * abs(N) / gcd`.
 - (2.2) — `den` shall have the value `abs(D) / gcd`.

19.16.4 Arithmetic on ratios

[ratio.arithmetic]

- 1 Each of the alias templates `ratio_add`, `ratio_subtract`, `ratio_multiply`, and `ratio_divide` denotes the result of an arithmetic computation on two ratios R1 and R2. With X and Y computed (in the absence of arithmetic overflow) as specified by Table 56, each alias denotes a `ratio<U, V>` such that U is the same as `ratio<X, Y>::num` and V is the same as `ratio<X, Y>::den`.
- 2 If it is not possible to represent U or V with `intmax_t`, the program is ill-formed. Otherwise, an implementation should yield correct values of U and V. If it is not possible to represent X or Y with `intmax_t`, the program is ill-formed unless the implementation yields correct values of U and V.

Table 56 — Expressions used to perform ratio arithmetic

Type	Value of X	Value of Y
<code>ratio_add<R1, R2></code>	$R1::num * R2::den + R1::den * R2::den$ $R2::num * R1::den$	
<code>ratio_subtract<R1, R2></code>	$R1::num * R2::den - R1::den * R2::den$ $R2::num * R1::den$	
<code>ratio_multiply<R1, R2></code>	$R1::num * R2::num$	$R1::den * R2::den$
<code>ratio_divide<R1, R2></code>	$R1::num * R2::den$	$R1::den * R2::num$

- 3 [Example:

```
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::num == 1, "1/3+1/6 == 1/2");
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::den == 2, "1/3+1/6 == 1/2");
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::num == 1, "1/3*3/2 == 1/2");
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::den == 2, "1/3*3/2 == 1/2");

// The following cases may cause the program to be ill-formed under some implementations
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::num == 2,
             "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::den == INT_MAX,
             "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::num == 1,
             "1/MAX * MAX/2 == 1/2");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::den == 2,
             "1/MAX * MAX/2 == 1/2");
— end example]
```

19.16.5 Comparison of ratios

[ratio.comparison]

```
template<class R1, class R2>
struct ratio_equal : bool_constant<R1::num == R2::num && R1::den == R2::den> { };

template<class R1, class R2>
struct ratio_not_equal : bool_constant<!ratio_equal_v<R1, R2>> { };
```

```

template<class R1, class R2>
struct ratio_less : bool_constant<see below> { };

1 If  $R1::\text{num} \times R2::\text{den}$  is less than  $R2::\text{num} \times R1::\text{den}$ , ratio_less<R1, R2> shall be derived from bool_constant<true>; otherwise it shall be derived from bool_constant<false>. Implementations may use other algorithms to compute this relationship to avoid overflow. If overflow occurs, the program is ill-formed.

template<class R1, class R2>
struct ratio_less_equal : bool_constant<!ratio_less_v<R2, R1>> { };

template<class R1, class R2>
struct ratio_greater : bool_constant<ratio_less_v<R2, R1>> { };

template<class R1, class R2>
struct ratio_greater_equal : bool_constant<!ratio_less_v<R1, R2>> { };

```

19.16.6 SI types for ratio

[ratio.si]

- ¹ For each of the *typedef-names* `yocto`, `zepto`, `zetta`, and `yotta`, if both of the constants used in its specification are representable by `intmax_t`, the *typedef* shall be defined; if either of the constants is not representable by `intmax_t`, the *typedef* shall not be defined.

19.17 Class type_index

[type.index]

19.17.1 Header <typeindex> synopsis

[type.index.synopsis]

```

namespace std {
    class type_index;
    template<class T> struct hash;
    template<> struct hash<type_index>;
}

```

19.17.2 type_index overview

[type.index.overview]

```

namespace std {
    class type_index {
        public:
            type_index(const type_info& rhs) noexcept;
            bool operator==(const type_index& rhs) const noexcept;
            bool operator!=(const type_index& rhs) const noexcept;
            bool operator< (const type_index& rhs) const noexcept;
            bool operator> (const type_index& rhs) const noexcept;
            bool operator<= (const type_index& rhs) const noexcept;
            bool operator>= (const type_index& rhs) const noexcept;
            size_t hash_code() const noexcept;
            const char* name() const noexcept;

        private:
            const type_info* target; // exposition only
            // Note that the use of a pointer here, rather than a reference,
            // means that the default copy/move constructor and assignment
            // operators will be provided and work as expected.
    };
}

```

- ¹ The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (21.4) and in unordered associative containers (21.5).

19.17.3 type_index members

[type.index.members]

```
type_index(const type_info& rhs) noexcept;
```

- ¹ *Effects:* Constructs a `type_index` object, the equivalent of `target = &rhs`.

```
bool operator==(const type_index& rhs) const noexcept;
```

- ² *Returns:* `*target == *rhs.target`.

```

bool operator!=(const type_index& rhs) const noexcept;
3   Returns: *target != *rhs.target.

bool operator<(const type_index& rhs) const noexcept;
4   Returns: target->before(*rhs.target).

bool operator>(const type_index& rhs) const noexcept;
5   Returns: rhs.target->before(*target).

bool operator<=(const type_index& rhs) const noexcept;
6   Returns: !rhs.target->before(*target).

bool operator>=(const type_index& rhs) const noexcept;
7   Returns: !target->before(*rhs.target).

size_t hash_code() const noexcept;
8   Returns: target->hash_code().

const char* name() const noexcept;
9   Returns: target->name().

```

19.17.4 Hash support

[type.index.hash]

```

template<> struct hash<type_index>;
1   For an object index of type type_index, hash<type_index>()(index) shall evaluate to the same
    result as index.hash_code().

```

19.18 Execution policies

[execpol]

19.18.1 In general

[execpol.general]

1 This subclause describes classes that are *execution policy* types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions. [Example:

```

using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());

```

— end example] [Note: Because different parallel architectures may require idiosyncratic parameters for efficient execution, implementations may provide additional execution policies to those described in this standard as extensions. — end note]

19.18.2 Header <execution> synopsis

[execution.syn]

```

namespace std {
  // 19.18.3, execution policy type trait
  template<class T> struct is_execution_policy;
  template<class T> inline constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}

```

```

namespace std::execution {
    // 19.18.4, sequenced execution policy
    class sequenced_policy;

    // 19.18.5, parallel execution policy
    class parallel_policy;

    // 19.18.6, parallel and unsequenced execution policy
    class parallel_unsequenced_policy;

    // 19.18.7, execution policy objects
    inline constexpr sequenced_policy           seq{ unspecified };
    inline constexpr parallel_policy            par{ unspecified };
    inline constexpr parallel_unsequenced_policy par_unseq{ unspecified };
}

```

19.18.3 Execution policy type trait

[execpol.type]

```
template<class T> struct is_execution_policy { see below };
```

- 1 `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.
- 2 `is_execution_policy<T>` shall be a *Cpp17UnaryTypeTrait* with a base characteristic of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.

[*Note*: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — *end note*]
- 3 The behavior of a program that adds specializations for `is_execution_policy` is undefined.

19.18.4 Sequenced execution policy

[execpol.seq]

```
class execution::sequenced_policy { unspecified };
```

- 1 The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.
- 2 During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` shall be called.

19.18.5 Parallel execution policy

[execpol.par]

```
class execution::parallel_policy { unspecified };
```

- 1 The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.
- 2 During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` shall be called.

19.18.6 Parallel and unsequenced execution policy

[execpol.parunseq]

```
class execution::parallel_unsequenced_policy { unspecified };
```

- 1 The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.
- 2 During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` shall be called.

19.18.7 Execution policy objects

[execpol.objects]

```
inline constexpr execution::sequenced_policy
inline constexpr execution::parallel_policy
```

```
execution::seq{ unspecified };
execution::par{ unspecified };
```

```
inline constexpr execution::parallel_unsequenced_policy execution::par_unseq{ unspecified };
```

¹ The header <execution> declares global objects associated with each type of execution policy.

19.19 Primitive numeric conversions

[charconv]

19.19.1 Header <charconv> synopsis

[charconv.syn]

```
namespace std {
    // floating-point format for primitive numerical conversion
    enum class chars_format {
        scientific = unspecified,
        fixed = unspecified,
        hex = unspecified,
        general = fixed | scientific
    };

    // 19.19.2, primitive numerical output conversion
    struct to_chars_result {
        char* ptr;
        errc ec;
    };

    to_chars_result to_chars(char* first, char* last, see below value, int base = 10);

    to_chars_result to_chars(char* first, char* last, float value);
    to_chars_result to_chars(char* first, char* last, double value);
    to_chars_result to_chars(char* first, char* last, long double value);

    to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
    to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
    to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);

    to_chars_result to_chars(char* first, char* last, float value,
                           chars_format fmt, int precision);
    to_chars_result to_chars(char* first, char* last, double value,
                           chars_format fmt, int precision);
    to_chars_result to_chars(char* first, char* last, long double value,
                           chars_format fmt, int precision);

    // 19.19.3, primitive numerical input conversion
    struct from_chars_result {
        const char* ptr;
        errc ec;
    };

    from_chars_result from_chars(const char* first, const char* last,
                                 see below& value, int base = 10);

    from_chars_result from_chars(const char* first, const char* last, float& value,
                               chars_format fmt = chars_format::general);
    from_chars_result from_chars(const char* first, const char* last, double& value,
                               chars_format fmt = chars_format::general);
    from_chars_result from_chars(const char* first, const char* last, long double& value,
                               chars_format fmt = chars_format::general);
}
```

¹ The type `chars_format` is a bitmask type (15.4.2.1.4) with elements `scientific`, `fixed`, and `hex`.

19.19.2 Primitive numeric output conversion

[charconv.to.chars]

¹ All functions named `to_chars` convert `value` into a character string by successively filling the range `[first, last)`, where `[first, last)` is required to be a valid range. If the member `ec` of the return value is such that the value is equal to the value of a value-initialized `errc`, the conversion was successful and the member `ptr` is the one-past-the-end pointer of the characters written. Otherwise, the member `ec`

has the value `errc::value_too_large`, the member `ptr` has the value `last`, and the contents of the range `[first, last)` are unspecified.

- 2 The functions that take a floating-point `value` but not a `precision` parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding `from_chars` function recovers `value` exactly. [Note: This guarantee applies only if `to_chars` and `from_chars` are executed on the same implementation. —end note] If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (16.3.3.1).
- 3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows: The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading "0x" in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

`to_chars_result to_chars(char* first, char* last, see below value, int base = 10);`

4 *Requires:* `base` has a value between 2 and 36 (inclusive).

5 *Effects:* The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a..z`. If `value` is less than zero, the representation starts with '`-`'.

6 *Throws:* Nothing.

7 *Remarks:* The implementation shall provide overloads for all signed and unsigned integer types and `char` as the type of the parameter `value`.

```
to_chars_result to_chars(char* first, char* last, float value);
to_chars_result to_chars(char* first, char* last, double value);
to_chars_result to_chars(char* first, char* last, long double value);
```

8 *Effects:* `value` is converted to a string in the style of `printf` in the "C" locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.

9 *Throws:* Nothing.

```
to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);
```

10 *Requires:* `fmt` has the value of one of the enumerators of `chars_format`.

11 *Effects:* `value` is converted to a string in the style of `printf` in the "C" locale.

12 *Throws:* Nothing.

```
to_chars_result to_chars(char* first, char* last, float value,
                        chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, double value,
                        chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, long double value,
                        chars_format fmt, int precision);
```

13 *Requires:* `fmt` has the value of one of the enumerators of `chars_format`.

14 *Effects:* `value` is converted to a string in the style of `printf` in the "C" locale with the given precision.

15 *Throws:* Nothing.

SEE ALSO: ISO C 7.21.6.1

19.19.3 Primitive numeric input conversion

[`charconv.from.chars`]

- 1 All functions named `from_chars` analyze the string `[first, last)` for a pattern, where `[first, last)` is required to be a valid range. If no characters match the pattern, `value` is unmodified, the member `ptr` of the return value is `first` and the member `ec` is equal to `errc::invalid_argument`. [Note: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. —end note] Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of `value`. The member `ptr` of the return value points to the first character not

matching the pattern, or has the value `last` if all characters match. If the parsed value is not in the range representable by the type of `value`, `value` is unmodified and the member `ec` of the return value is equal to `errc::result_out_of_range`. Otherwise, `value` is set to the parsed value, after rounding according to `round_to_nearest` (16.3.3.1), and the member `ec` is value-initialized.

```
from_chars_result from_chars(const char* first, const char* last,
                           see below& value, int base = 10);
```

2 *Requires:* `base` has a value between 2 and 36 (inclusive).

3 *Effects:* The pattern is the expected form of the subject sequence in the "C" locale for the given nonzero base, as described for `strtol`, except that no "0x" or "0X" prefix shall appear if the value of `base` is 16, and except that '-' is the only sign that may appear, and only if `value` has a signed type.

4 *Throws:* Nothing.

5 *Remarks:* The implementation shall provide overloads for all signed and unsigned integer types and `char` as the referenced type of the parameter `value`.

```
from_chars_result from_chars(const char* first, const char* last, float& value,
                           chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, double& value,
                           chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, long double& value,
                           chars_format fmt = chars_format::general);
```

6 *Requires:* `fmt` has the value of one of the enumerators of `chars_format`.

7 *Effects:* The pattern is the expected form of the subject sequence in the "C" locale, as described for `strtod`, except that

- (7.1) — the sign '+' may only appear in the exponent part;
- (7.2) — if `fmt` has `chars_format::scientific` set but not `chars_format::fixed`, the otherwise optional exponent part shall appear;
- (7.3) — if `fmt` has `chars_format::fixed` set but not `chars_format::scientific`, the optional exponent part shall not appear; and
- (7.4) — if `fmt` is `chars_format::hex`, the prefix "0x" or "0X" is assumed. [Example: The string 0x123 is parsed to have the value 0 with remaining characters x123. — end example]

In any case, the resulting `value` is one of at most two floating-point values closest to the value of the string matching the pattern.

8 *Throws:* Nothing.

20 Strings library

[strings]

20.1 General

[**strings.general**]

- ¹ This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.7) type. Such types are called *char-like types*, and objects of char-like types are called *char-like objects* or simply *characters*.
- ² The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 57.

Table 57 — Strings library summary

	Subclause	Header(s)
20.2	Character traits	<string>
20.3	String classes	<string>
20.4	String view classes	<string_view>
20.5	Null-terminated sequence utilities	<cctype> <cwctype> <cstring> <cwchar> <cstdlib> <cuchar>

20.2 Character traits

[**char.traits**]

- ¹ This subclause defines requirements on classes representing *character traits*, and defines a class template `char_traits<charT>`, along with five specializations, `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that satisfy those requirements.
- ² Most classes specified in 20.3, 20.4, and Clause 28 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member *typedef-names* and functions in the template parameter `traits` used by each such template. This subclause defines the semantics of these members.
- ³ To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (15.3.3) `C`, that and its related character traits class `X` are passed as a pair of parameters to the string, string view, or iostream template as parameters `charT` and `traits`. If `X::char_type` is not the same type as `C`, the program is ill-formed.

20.2.1 Character traits requirements

[**char.traits.require**]

- ¹ In Table 58, `X` denotes a traits class defining types and functions for the character container type `C`; `c` and `d` denote values of type `C`; `p` and `q` denote values of type `const C*`; `s` denotes a value of type `C*`; `n`, `i` and `j` denote values of type `size_t`; `e` and `f` denote values of type `X::int_type`; `pos` denotes a value of type `X::pos_type`; and `r` denotes an lvalue of type `C`. Operations on `X` shall not throw exceptions.

Table 58 — Character traits requirements

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>X::char_type</code>	<code>C</code>		compile-time
<code>X::int_type</code>		(described in 20.2.2)	compile-time
<code>X::off_type</code>		(described in 28.2.2 and 28.3)	compile-time
<code>X::pos_type</code>		(described in 28.2.2 and 28.3)	compile-time
<code>X::state_type</code>		(described in 20.2.2)	compile-time
<code>X::eq(c,d)</code>	<code>bool</code>	Returns: whether <code>c</code> is to be treated as equal to <code>d</code> .	constant

Table 58 — Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
X::lt(c,d)	bool	Returns: whether c is to be treated as less than d.	constant
X::compare(p,q,n)	int	Returns: 0 if for each i in [0,n), X::eq(p[i],q[i]) is true; else, a negative value if, for some j in [0,n), X::lt(p[j],q[j]) is true and for each i in [0,j) X::eq(p[i],q[i]) is true; else a positive value.	linear
X::length(p)	size_t	Returns: the smallest i such that X::eq(p[i],charT()) is true.	linear
X::find(p,n,c)	const X::char_type*	Returns: the smallest q in [p,p+n) such that X::eq(*q,c) is true, zero otherwise.	linear
X::move(s,p,n)	X::char_type*	for each i in [0,n), performs X::assign(s[i],p[i]). Copies correctly even where the ranges [p,p+n) and [s,s+n) overlap. Returns: s.	linear
X::copy(s,p,n)	X::char_type*	Expects: p not in [s,s+n). Returns: s. for each i in [0,n), performs X::assign(s[i],p[i]).	linear
X::assign(r,d)	(not used)	assigns r=d.	constant
X::assign(s,n,c)	X::char_type*	for each i in [0,n), performs X::assign(s[i],c). Returns: s.	linear
X::not_eof(e)	int_type	Returns: e if X::eq_int_type(e,X::eof()) is false, otherwise a value f such that X::eq_int_type(f,X::eof()) is false.	constant
X::to_char_type(e)	X::char_type	Returns: if for some c, X::eq_int_type(e,X::to_int_type(c)) is true, c; else some unspecified value.	constant
X::to_int_type(c)	X::int_type	Returns: some value e, constrained by the definitions of to_char_type and eq_int_type.	constant
X::eq_int_type(e,f)	bool	Returns: for all c and d, X::eq(c,d) is equal to X::eq_int_type(X::to_int_type(c),X::to_int_type(d)); otherwise, yields true if e and f are both copies of X::eof(); otherwise, yields false if one of e and f is a copy of X::eof() and the other is not; otherwise the value is unspecified.	constant

Table 58 — Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
X::eof()	X::int_type	Returns: a value e such that X::eq_int_type(e, X::to_int_type(c)) is false for all values c.	constant

² The class template

```
template<class charT> struct char_traits;
is provided in the header <string> as a basis for explicit specializations.
```

20.2.2 Traits typedefs

[char.traits.typedefs]

```
using int_type = see below;
```

¹ *Expects:* int_type shall be able to represent all of the valid characters converted from the corresponding char_type values, as well as an end-of-file value, eof().²²⁵

```
using state_type = see below;
```

² *Requires:* state_type shall meet the Cpp17Destructible (Table 30), Cpp17CopyAssignable (Table 29), Cpp17CopyConstructible (Table 27), and Cpp17DefaultConstructible (Table 25) requirements.

20.2.3 char_traits specializations

[char.traits.specializations]

```
namespace std {
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;
    template<> struct char_traits<char16_t>;
    template<> struct char_traits<char32_t>;
    template<> struct char_traits<wchar_t>;
}
```

¹ The header <string> defines five specializations of the class template char_traits: char_traits<char>, char_traits<char8_t>, char_traits<char16_t>, char_traits<char32_t>, and char_traits<wchar_t>.

20.2.3.1 struct char_traits<char>

[char.traits.specializations.char]

```
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                              const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    };
}
```

²²⁵ If eof() can be held in char_type then some iostreams operations can give surprising results.

```

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
};

}

```

- ¹ The type `mbstate_t` is defined in `<cwchar>` and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.
- ² The two-argument member `assign` is defined identically to the built-in operator `=`. The two-argument members `eq` and `lt` are defined identically to the built-in operators `==` and `<` for type `unsigned char`.
- ³ The member `eof()` returns EOF.

20.2.3.2 struct `char_traits<char8_t>` [char.traits.specializations.char8_t]

```

namespace std {
    template<> struct char_traits<char8_t> {
        using char_type = char8_t;
        using int_type = unsigned int;
        using off_type = streamoff;
        using pos_type = u8streampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                              const char_type& a);
        static char_type* move(char_type* s1, const char_type* s2, size_t n);
        static char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

```

- ¹ The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<` respectively.
- ² The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

20.2.3.3 struct `char_traits<char16_t>` [char.traits.specializations.char16_t]

```

namespace std {
    template<> struct char_traits<char16_t> {
        using char_type = char16_t;
        using int_type = uint_least16_t;
        using off_type = streamoff;
        using pos_type = u16streampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
    };
}

```

```

    static constexpr const char_type* find(const char_type* s, size_t n,
                                         const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
}
}

```

- ¹ The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.
- ² The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

20.2.3.4 struct `char_traits<char32_t>` [char.traits.specializations.char32_t]

```

namespace std {
    template<> struct char_traits<char32_t> {
        using char_type = char32_t;
        using int_type = uint_least32_t;
        using off_type = streamoff;
        using pos_type = u32streampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                             const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);

        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

```

- ¹ The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.
- ² The member `eof()` returns an implementation-defined constant that cannot appear as a Unicode code point.

20.2.3.5 struct `char_traits<wchar_t>` [char.traits.specializations.wchar.t]

```

namespace std {
    template<> struct char_traits<wchar_t> {
        using char_type = wchar_t;
        using int_type = wint_t;
        using off_type = streamoff;
        using pos_type = wstreampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
    };
}

```

```

    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                          const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
};

}

```

¹ The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

² The member `eof()` returns `WEOF`.

20.3 String classes

[`string.classes`]

¹ The header `<string>` defines the `basic_string` class template for manipulating varying-length sequences of char-like objects and five *typedef-names*, `string`, `u8string`, `u16string`, `u32string`, and `wstring`, that name the specializations `basic_string<char>`, `basic_string<char8_t>`, `basic_string<char16_t>`, `basic_string<char32_t>`, and `basic_string<wchar_t>`, respectively.

20.3.1 Header `<string>` synopsis

[`string.syn`]

```

#include <initializer_list>

namespace std {
    // 20.2, character traits
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;
    template<> struct char_traits<char16_t>;
    template<> struct char_traits<char32_t>;
    template<> struct char_traits<wchar_t>;

    // 20.3.2, basic_string
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
        class basic_string;

    template<class charT, class traits, class Allocator>
        basic_string<charT, traits, Allocator>
            operator+(const basic_string<charT, traits, Allocator>& lhs,
                        const basic_string<charT, traits, Allocator>& rhs);
    template<class charT, class traits, class Allocator>
        basic_string<charT, traits, Allocator>
            operator+(basic_string<charT, traits, Allocator>&& lhs,
                        const basic_string<charT, traits, Allocator>& rhs);
    template<class charT, class traits, class Allocator>
        basic_string<charT, traits, Allocator>
            operator+(const basic_string<charT, traits, Allocator>& lhs,
                        basic_string<charT, traits, Allocator>&& rhs);
    template<class charT, class traits, class Allocator>
        basic_string<charT, traits, Allocator>
            operator+(basic_string<charT, traits, Allocator>&& lhs,
                        basic_string<charT, traits, Allocator>&& rhs);

```

```

template<class charT, class traits, class Allocator>
    bool operator> (const basic_string<charT, traits, Allocator>& lhs,
                     const charT* rhs);
template<class charT, class traits, class Allocator>
    bool operator> (const charT* lhs,
                     const basic_string<charT, traits, Allocator>& rhs);

template<class charT, class traits, class Allocator>
    bool operator<=(const basic_string<charT, traits, Allocator>& lhs,
                      const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
    bool operator<=(const basic_string<charT, traits, Allocator>& lhs,
                      const charT* rhs);
template<class charT, class traits, class Allocator>
    bool operator<=(const charT* lhs,
                      const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
    bool operator>=(const basic_string<charT, traits, Allocator>& lhs,
                      const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
    bool operator>=(const basic_string<charT, traits, Allocator>& lhs,
                      const charT* rhs);
template<class charT, class traits, class Allocator>
    bool operator>=(const charT* lhs,
                      const basic_string<charT, traits, Allocator>& rhs);

// 20.3.3.3, swap
template<class charT, class traits, class Allocator>
    void swap(basic_string<charT, traits, Allocator>& lhs,
              basic_string<charT, traits, Allocator>& rhs)
        noexcept(noexcept(lhs.swap(rhs)));
}

// 20.3.3.4, inserters and extractors
template<class charT, class traits, class Allocator>
    basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,
                     basic_string<charT, traits, Allocator>& str);
template<class charT, class traits, class Allocator>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,
                     const basic_string<charT, traits, Allocator>& str);
template<class charT, class traits, class Allocator>
    basic_istream<charT, traits>&

20.3.2 Class template `basic_string`

[`basic.string`]

- ¹ The class template `basic_string` describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of this Clause, the type of the char-like objects held in a `basic_string` object is designated by `charT`.
- ² A specialization of `basic_string` is a contiguous container (21.2.1).
- ³ In all cases, [`data()`, `data() + size()`] is a valid range, `data() + size()` points at an object with value `charT()` (a “null terminator”), and `size() <= capacity()` is true.

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_string {
    public:
        // types
        using traits_type          = traits;
        using value_type            = charT;
        using allocator_type        = Allocator;
        using size_type              = typename allocator_traits<Allocator>::size_type;

}

```

⁴ A `size_type` parameter type in a `basic_string` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

20.3.2.1 General requirements

[`string.require`]

- 1 If any operation would cause `size()` to exceed `max_size()`, that operation throws an exception object of type `length_error`.
- 2 If any member function or operator of `basic_string` throws an exception, that function or operator has no other effect on the `basic_string` object.
- 3 In every specialization `basic_string<charT, traits, Allocator>`, the type `allocator_traits<Allocator>::value_type` shall name the same type as `charT`. Every object of type `basic_string<charT, traits, Allocator>` uses an object of type `Allocator` to allocate and free storage for the contained `charT` objects as needed. The `Allocator` object used is obtained as described in 21.2.1. In every specialization `basic_string<charT, traits, Allocator>`, the type `traits` shall satisfy the character traits requirements (20.2). [Note: The program is ill-formed if `traits::char_type` is not the same type as `charT`. —end note]

⁴ References, pointers, and iterators referring to the elements of a `basic_string` sequence may be invalidated by the following uses of that `basic_string` object:

- (4.1) — Passing as an argument to any standard library function taking a reference to non-const `basic_string` as an argument.²²⁶
- (4.2) — Calling non-const member functions, except `operator[]`, `at`, `data`, `front`, `back`, `begin`, `rbegin`, `end`, and `rend`.

20.3.2.2 Constructors and assignment operators

[string.cons]

```
explicit basic_string(const Allocator& a) noexcept;
```

1 *Ensures*: `size()` is equal to 0.

```
basic_string(const basic_string& str);
basic_string(basic_string&& str) noexcept;
```

2 *Effects*: Constructs an object whose value is that of `str` prior to this call.

3 *Remarks*: In the second form, `str` is left in a valid but unspecified state.

```
basic_string(const basic_string& str, size_type pos,
            const Allocator& a = Allocator());
basic_string(const basic_string& str, size_type pos, size_type n,
            const Allocator& a = Allocator());
```

4 *Effects*: Let `n` be `npos` for the first overload. Equivalent to:

```
basic_string(basic_string_view<charT, traits>(str).substr(pos, n), a)
```

```
template<class T>
basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());
```

5 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

6 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t`; and then behaves the same as:

```
basic_string(sv.substr(pos, n), a);
```

```
template<class T>
explicit basic_string(const T& t, const Allocator& a = Allocator());
```

7 *Constraints*:

(7.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(7.2) — `is_convertible_v<const T&, const charT*>` is false.

8 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t`; and then behaves the same as `basic_string(sv.data(), sv.size(), a)`.

```
basic_string(const charT* s, size_type n, const Allocator& a = Allocator());
```

9 *Expect*s: `[s, s + n]` is a valid range.

10 *Effects*: Constructs an object whose initial value is the range `[s, s + n]`.

11 *Ensures*: `size()` is equal to `n`, and `traits::compare(data(), s, n)` is equal to 0.

```
basic_string(const charT* s, const Allocator& a = Allocator());
```

12 *Constraints*: `Allocator` is a type that qualifies as an allocator (21.2.1). [Note: This affects class template argument deduction. — end note]

13 *Effects*: Equivalent to: `basic_string(s, traits::length(s), a)`.

```
basic_string(size_type n, charT c, const Allocator& a = Allocator());
```

14 *Constraints*: `Allocator` is a type that qualifies as an allocator (21.2.1). [Note: This affects class template argument deduction. — end note]

15 *Effects*: Constructs an object whose value consists of `n` copies of `c`.

²²⁶) For example, as an argument to non-member functions `swap()` (20.3.3.3), `operator>>()` (20.3.3.4), and `getline()` (20.3.3.4), or as an argument to `basic_string::swap()`.

```

template<class InputIterator>
basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());
16   Constraints: InputIterator is a type that qualifies as an input iterator (21.2.1).
17   Effects: Constructs a string from the values in the range [begin, end), as indicated in Table 66.

basic_string(initializer_list<charT> il, const Allocator& a = Allocator());
18   Effects: Equivalent to basic_string(il.begin(), il.end(), a).

basic_string(const basic_string& str, const Allocator& alloc);
basic_string(basic_string&& str, const Allocator& alloc);
19   Effects: Constructs an object whose value is that of str prior to this call. The stored allocator is
constructed from alloc. In the second form, str is left in a valid but unspecified state.
20   Throws: The second form throws nothing if alloc == str.get_allocator().

template<class InputIterator,
         class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
basic_string(InputIterator, InputIterator, Allocator = Allocator())
-> basic_string<typename iterator_traits<InputIterator>::value_type,
                char_traits<typename iterator_traits<InputIterator>::value_type>,
                Allocator>;
21   Constraints: InputIterator is a type that qualifies as an input iterator, and Allocator is a type that
qualifies as an allocator (21.2.1).

template<class charT,
         class traits,
         class Allocator = allocator<charT>>
explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;

template<class charT,
         class traits,
         class Allocator = allocator<charT>>
basic_string(basic_string_view<charT, traits>,
            typename see below::size_type, typename see below::size_type,
            const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;
22   Constraints: Allocator is a type that qualifies as an allocator (21.2.1).

basic_string& operator=(const basic_string& str);
23   Effects: If *this and str are the same object, has no effect. Otherwise, replaces the value of *this
with a copy of str.
24   Returns: *this.

basic_string& operator=(basic_string&& str)
noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
allocator_traits<Allocator>::is_always_equal::value);
25   Effects: Move assigns as a sequence container (21.2), except that iterators, pointers and references may
be invalidated.
26   Returns: *this.

template<class T>
basic_string& operator=(const T& t);
27   Constraints:
(27.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(27.2)   — is_convertible_v<const T&, const charT*> is false.
28   Effects: Equivalent to:
        basic_string_view<charT, traits> sv = t;

```

```

        return assign(sv);

basic_string& operator=(const charT* s);
29   Effects: Equivalent to: return *this = basic_string_view<charT, traits>(s);

basic_string& operator=(charT c);
30   Effects: Equivalent to:
        return *this = basic_string_view<charT, traits>(addressof(c), 1);

basic_string& operator=(initializer_list<charT> il);
31   Effects: Equivalent to:
        return *this = basic_string_view<charT, traits>(il.begin(), il.size());

```

20.3.2.3 Iterator support

[string.iterators]

```

iterator      begin() noexcept;
const_iterator begin() const noexcept;
const_iterator cbegin() const noexcept;

```

1 *Returns:* An iterator referring to the first character in the string.

```

iterator      end() noexcept;
const_iterator end() const noexcept;
const_iterator cend() const noexcept;

```

2 *Returns:* An iterator which is the past-the-end value.

```

reverse_iterator      rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
const_reverse_iterator crbegin() const noexcept;

```

3 *Returns:* An iterator which is semantically equivalent to `reverse_iterator(end())`.

```

reverse_iterator      rend() noexcept;
const_reverse_iterator rend() const noexcept;
const_reverse_iterator crend() const noexcept;

```

4 *Returns:* An iterator which is semantically equivalent to `reverse_iterator(begin())`.

20.3.2.4 Capacity

[string.capacity]

```

size_type size() const noexcept;
size_type length() const noexcept;

```

1 *Returns:* A count of the number of char-like objects currently in the string.

2 *Complexity:* Constant time.

```

size_type max_size() const noexcept;

```

3 *Returns:* The largest possible number of char-like objects that can be stored in a `basic_string`.

4 *Complexity:* Constant time.

```

void resize(size_type n, charT c);

```

5 *Effects:* Alters the value of `*this` as follows:

(5.1) — If $n \leq \text{size}()$, erases the last $\text{size}() - n$ elements.

(5.2) — If $n > \text{size}()$, appends $n - \text{size}()$ copies of `c`.

```

void resize(size_type n);

```

6 *Effects:* Equivalent to `resize(n, charT())`.

```

size_type capacity() const noexcept;

```

7 *Returns:* The size of the allocated storage in the string.

8 *Complexity:* Constant time.

```

void reserve(size_type res_arg);
9   Effects: A directive that informs a basic_string of a planned change in size, so that the storage
   allocation can be managed accordingly. After reserve(), capacity() is greater or equal to the
   argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise.
   Reallocation happens at this point if and only if the current capacity is less than the argument of
   reserve().
10  Throws: length_error if res_arg > max_size() or any exceptions thrown by allocator_traits
   <Allocator>::allocate.
void shrink_to_fit();
11  Effects: shrink_to_fit is a non-binding request to reduce capacity() to size(). [Note: The request
   is non-binding to allow latitude for implementation-specific optimizations. —end note] It does not
   increase capacity(), but may reduce capacity() by causing reallocation.
12  Complexity: Linear in the size of the sequence.
13  Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in
   the sequence as well as the past-the-end iterator. If no reallocation happens, they remain valid.
void clear() noexcept;
14  Effects: Equivalent to: erase(begin(), end());
[[nodiscard]] bool empty() const noexcept;
15  Effects: Equivalent to: return size() == 0;

```

20.3.2.5 Element access

[string.access]

```

const_reference operator[](size_type pos) const;
reference         operator[](size_type pos);

```

1 *Expects:* **pos <= size()**.
 2 *Returns:* ***(begin() + pos)** if **pos < size()**. Otherwise, returns a reference to an object of type **charT** with value **charT()**, where modifying the object to any value other than **charT()** leads to undefined behavior.
 3 *Throws:* Nothing.
 4 *Complexity:* Constant time.

```

const_reference at(size_type pos) const;
reference         at(size_type pos);

```

5 *Throws:* **out_of_range** if **pos >= size()**.
 6 *Returns:* **operator[](pos)**.

```

const charT& front() const;
charT& front();

```

7 *Expects:* **!empty()**.
 8 *Effects:* Equivalent to: **return operator[](0)**;

```

const charT& back() const;
charT& back();

```

9 *Expects:* **!empty()**.
 10 *Effects:* Equivalent to: **return operator[](size() - 1)**;

20.3.2.6 Modifiers

[string.modifiers]

20.3.2.6.1 **basic_string**::**operator+=**

[string.op.append]

```

basic_string& operator+=(const basic_string& str);

```

1 *Effects:* Equivalent to: **return append(str)**;

```

template<class T>
basic_string& operator+=(const T& t);

2   Constraints:
(2.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(2.2) — is_convertible_v<const T&, const charT*> is false.

3   Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return append(sv);

    basic_string& operator+=(const charT* s);

4   Effects: Equivalent to: return append(s);

    basic_string& operator+=(charT c);

5   Effects: Equivalent to: return append(size_type{1}, c);

    basic_string& operator+=(initializer_list<charT> il);

6   Effects: Equivalent to: return append(il);

```

20.3.2.6.2 basic_string::append

[string.append]

```

basic_string& append(const basic_string& str);

1   Effects: Equivalent to: return append(str.data(), str.size());

    basic_string& append(const basic_string& str, size_type pos, size_type n = npos);

2   Effects: Equivalent to:
    return append(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
basic_string& append(const T& t);

3   Constraints:
(3.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(3.2) — is_convertible_v<const T&, const charT*> is false.

4   Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return append(sv.data(), sv.size());

template<class T>
basic_string& append(const T& t, size_type pos, size_type n = npos);

5   Constraints:
(5.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(5.2) — is_convertible_v<const T&, const charT*> is false.

6   Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return append(sv.substr(pos, n));

    basic_string& append(const charT* s, size_type n);

7   Effects: [s, s + n] is a valid range.

8   Effects: Appends a copy of the range [s, s + n] to the string.

9   Returns: *this.

    basic_string& append(const charT* s);

10  Effects: Equivalent to: return append(s, traits::length(s));

```

```

basic_string& append(size_type n, charT c);
11   Effects: Appends n copies of c to the string.
12   Returns: *this.

template<class InputIterator>
basic_string& append(InputIterator first, InputIterator last);
13   Constraints: InputIterator is a type that qualifies as an input iterator (21.2.1).
14   Effects: Equivalent to: return append(basic_string(first, last, get_allocator()));

basic_string& append(initializer_list<charT> il);
15   Effects: Equivalent to: return append(il.begin(), il.size());

void push_back(charT c);
16   Effects: Equivalent to append(size_type{1}, c).

20.3.2.6.3 basic_string::assign [string.assign]

basic_string& assign(const basic_string& str);
1   Effects: Equivalent to: return *this = str;

basic_string& assign(basic_string&& str)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
            allocator_traits<Allocator>::is_always_equal::value);
2   Effects: Equivalent to: return *this = std::move(str);

basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);
3   Effects: Equivalent to:
    return assign(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
basic_string& assign(const T& t);
4   Constraints:
(4.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(4.2)   — is_convertible_v<const T&, const charT*> is false.

5   Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return assign(sv.data(), sv.size());

template<class T>
basic_string& assign(const T& t, size_type pos, size_type n = npos);
6   Constraints:
(6.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(6.2)   — is_convertible_v<const T&, const charT*> is false.

7   Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return assign(sv.substr(pos, n));

basic_string& assign(const charT* s, size_type n);
8   Effects: [s, s + n] is a valid range.
9   Effects: Replaces the string controlled by *this with a copy of the range [s, s + n].
10  Returns: *this.

basic_string& assign(const charT* s);
11  Effects: Equivalent to: return assign(s, traits::length(s));

```

```

basic_string& assign(initializer_list<charT> il);
12   Effects: Equivalent to: return assign(il.begin(), il.size());

basic_string& assign(size_type n, charT c);
13   Effects: Equivalent to:
      clear();
      resize(n, c);
      return *this;

template<class InputIterator>
  basic_string& assign(InputIterator first, InputIterator last);
14   Constraints: InputIterator is a type that qualifies as an input iterator (21.2.1).
15   Effects: Equivalent to: return assign(basic_string(first, last, get_allocator()));

20.3.2.6.4 basic_string::insert [string.insert]

basic_string& insert(size_type pos, const basic_string& str);
1   Effects: Equivalent to: return insert(pos, str.data(), str.size());

basic_string& insert(size_type pos1, const basic_string& str, size_type pos2, size_type n = npos);
2   Effects: Equivalent to:
      return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);

template<class T>
  basic_string& insert(size_type pos, const T& t);
3   Constraints:
(3.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(3.2)   — is_convertible_v<const T&, const charT*> is false.

4   Effects: Equivalent to:
      basic_string_view<charT, traits> sv = t;
      return insert(pos, sv.data(), sv.size());

template<class T>
  basic_string& insert(size_type pos1, const T& t, size_type pos2, size_type n = npos);
5   Constraints:
(5.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(5.2)   — is_convertible_v<const T&, const charT*> is false.

6   Effects: Equivalent to:
      basic_string_view<charT, traits> sv = t;
      return insert(pos1, sv.substr(pos2, n));

basic_string& insert(size_type pos, const charT* s, size_type n);
7   Effects: [s, s + n] is a valid range.
8   Throws:
(8.1)   — out_of_range if pos > size(),
(8.2)   — length_error if n > max_size() - size(), or
(8.3)   — any exceptions thrown by allocator_traits<Allocator>::allocate.

9   Effects: Inserts a copy of the range [s, s + n) immediately before the character at position pos if
      pos < size(), or otherwise at the end of the string.
10  Returns: *this.

basic_string& insert(size_type pos, const charT* s);
11  Effects: Equivalent to: return insert(pos, s, traits::length(s));

```

```

basic_string& insert(size_type pos, size_type n, charT c);
12   Throws:
(12.1)   — out_of_range if pos > size(),
(12.2)   — length_error if n > max_size() - size(), or
(12.3)   — any exceptions thrown by allocator_traits<Allocator>::allocate.
13   Effects: Inserts n copies of c before the character at position pos if pos < size(), or otherwise at the
      end of the string.

iterator insert(const_iterator p, charT c);
14   Expects: p is a valid iterator on *this.
15   Effects: Inserts a copy of c at the position p.
16   Returns: An iterator which refers to the inserted character.

iterator insert(const_iterator p, size_type n, charT c);
17   Expects: p is a valid iterator on *this.
18   Effects: Inserts n copies of c at the position p.
19   Returns: An iterator which refers to the first inserted character, or p if n == 0.

template<class InputIterator>
iterator insert(const_iterator p, InputIterator first, InputIterator last);
20   Constraints: InputIterator is a type that qualifies as an input iterator (21.2.1).
21   Expects: p is a valid iterator on *this.
22   Effects: Equivalent to insert(p - begin(), basic_string(first, last, get_allocator())).
23   Returns: An iterator which refers to the first inserted character, or p if first == last.

iterator insert(const_iterator p, initializer_list<charT> il);
24   Effects: Equivalent to: return insert(p, il.begin(), il.end());

```

20.3.2.6.5 `basic_string::erase` [string.erase]

```

basic_string& erase(size_type pos = 0, size_type n = npos);
1   Throws: out_of_range if pos > size().
2   Effects: Determines the effective length xlen of the string to be removed as the smaller of n and size() - pos. Removes the characters in the range [begin() + pos, begin() + pos + xlen].
3   Returns: *this.

iterator erase(const_iterator p);
4   Expects: p is a valid dereferenceable iterator on *this.
5   Throws: Nothing.
6   Effects: Removes the character referred to by p.
7   Returns: An iterator which points to the element immediately following p prior to the element being
      erased. If no such element exists, end() is returned.

iterator erase(const_iterator first, const_iterator last);
8   Expects: first and last are valid iterators on *this. [first, last) is a valid range.
9   Throws: Nothing.
10  Effects: Removes the characters in the range [first, last).
11  Returns: An iterator which points to the element pointed to by last prior to the other elements being
      erased. If no such element exists, end() is returned.

void pop_back();
12   Expects: !empty().

```

13 *Throws:* Nothing.

14 *Effects:* Equivalent to `erase(end() - 1)`.

20.3.2.6.6 `basic_string::replace` [string.replace]

```
basic_string& replace(size_type pos1, size_type n1, const basic_string& str);
1   Effects: Equivalent to: return replace(pos1, n1, str.data(), str.size());
basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
                     size_type pos2, size_type n2 = npos);
2   Effects: Equivalent to:
    return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));

template<class T>
basic_string& replace(size_type pos1, size_type n1, const T& t);
3   Constraints:
(3.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(3.2)   — is_convertible_v<const T&, const charT*> is false.
4   Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return replace(pos1, n1, sv.data(), sv.size());

template<class T>
basic_string& replace(size_type pos1, size_type n1, const T& t,
                     size_type pos2, size_type n2 = npos);
5   Constraints:
(5.1)   — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(5.2)   — is_convertible_v<const T&, const charT*> is false.
6   Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return replace(pos1, n1, sv.substr(pos2, n2));

basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);
7   Expects:  $[s, s + n2]$  is a valid range.
8   Throws:
(8.1)   — out_of_range if  $pos1 > size()$ ,
(8.2)   — length_error if the length of the resulting string would exceed max_size() (see below), or
(8.3)   — any exceptions thrown by allocator_traits<Allocator>::allocate.
9   Effects: Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1. If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters in the range  $[begin() + pos1, begin() + pos1 + xlen]$  with a copy of the range  $[s, s + n2]$ .
10  Returns: *this.

```
basic_string& replace(size_type pos, size_type n, const charT* s);
11 Effects: Equivalent to: return replace(pos, n, s, traits::length(s));
basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);
12 Throws:
(12.1) — out_of_range if $pos1 > size()$,
(12.2) — length_error if the length of the resulting string would exceed max_size() (see below), or
(12.3) — any exceptions thrown by allocator_traits<Allocator>::allocate.
```

```

13 *Effects:* Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range `[begin() + pos1, begin() + pos1 + xlen)` with `n2` copies of `c`.

14 *Returns:* `*this`.

```
basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);
```

15 *Effects:* Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(str));`

```
template<class T>
basic_string& replace(const_iterator i1, const_iterator i2, const T& t);
```

16 *Constraints:*

(16.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(16.2) — `is_convertible_v<const T&, const charT*>` is false.

17 *Requires:* `[begin(), i1]` and `[i1, i2)` are valid ranges.

18 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());
```

```
basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);
```

19 *Effects:* Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s, n));`

```
basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);
```

20 *Effects:* Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s));`

```
basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);
```

21 *Requires:* `[begin(), i1]` and `[i1, i2)` are valid ranges.

22 *Effects:* Equivalent to: `return replace(i1 - begin(), i2 - i1, n, c);`

```
template<class InputIterator>
basic_string& replace(const_iterator i1, const_iterator i2, InputIterator j1, InputIterator j2);
```

23 *Constraints:* `InputIterator` is a type that qualifies as an input iterator (21.2.1).

24 *Effects:* Equivalent to: `return replace(i1, i2, basic_string(j1, j2, get_allocator()));`

```
basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);
```

25 *Effects:* Equivalent to: `return replace(i1, i2, il.begin(), il.size());`

20.3.2.6.7 basic_string::copy

[string.copy]

`size_type copy(charT* s, size_type n, size_type pos = 0) const;`

1 *Effects:* Equivalent to: `return basic_string_view<charT, traits>(*this).copy(s, n, pos);`
 [Note: This does not terminate `s` with a null object. — end note]

20.3.2.6.8 basic_string::swap

[string.swap]

```
void swap(basic_string& s)
noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value);
```

1 *Requires:* `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `get_allocator() == s.get_allocator()`.

2 *Ensures:* `*this` contains the same sequence of characters that was in `s`, `s` contains the same sequence of characters that was in `*this`.

3 *Throws:* Nothing.

4 *Complexity:* Constant time.

20.3.2.7 String operations

[string.ops]

20.3.2.7.1 Accessors

[string.accessors]

```
const charT* c_str() const noexcept;
const charT* data() const noexcept;

1   Returns: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].
2   Complexity: Constant time.
3   Remarks: The program shall not modify any of the values stored in the character array; otherwise, the behavior is undefined.

charT* data() noexcept;
4   Returns: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].
5   Complexity: Constant time.
6   Remarks: The program shall not modify the value stored at p + size() to any value other than charT(); otherwise, the behavior is undefined.

operator basic_string_view<charT, traits>() const noexcept;
7   Effects: Equivalent to: return basic_string_view<charT, traits>(data(), size());

allocator_type get_allocator() const noexcept;
8   Returns: A copy of the Allocator object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.
```

20.3.2.7.2 Searching

[string.find]

1 Let F be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

(1.1) — Each member function of the form

```
size_type F(const basic_string& str, size_type pos) const noexcept;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(str), pos);`

(1.2) — Each member function of the form

```
size_type F(const charT* s, size_type pos) const;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(s), pos);`

(1.3) — Each member function of the form

```
size_type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(s, n), pos);`

(1.4) — Each member function of the form

```
size_type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to:

```
return F(basic_string_view<charT, traits>(addressof(c), 1), pos);
```

```
template<class T>
size_type find(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
size_type rfind(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
size_type find_first_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
size_type find_last_of(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept(see below);
```

2 Constraints:

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(2.2) — `is_convertible_v<const T&, const charT*>` is false.

3 *Effects:* Let `G` be the name of the function. Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.G(sv, pos);
```

4 *Remarks:* The expression inside `noexcept` is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

20.3.2.7.3 `basic_string::substr`

[`string.substr`]

```
basic_string substr(size_type pos = 0, size_type n = npos) const;
```

1 *Throws:* `out_of_range` if `pos > size()`.

2 *Effects:* Determines the effective length `rlen` of the string to copy as the smaller of `n` and `size() - pos`.

3 *Returns:* `basic_string(data() + pos, rlen)`.

20.3.2.7.4 `basic_string::compare`

[`string.compare`]

```
template<class T>
int compare(const T& t) const noexcept(see below);
```

1 *Constraints:*

(1.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(1.2) — `is_convertible_v<const T&, const charT*>` is false.

2 *Effects:* Equivalent to: `return basic_string_view<charT, traits>(*this).compare(t);`

3 *Remarks:* The expression inside `noexcept` is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

```
template<class T>
int compare(size_type pos1, size_type n1, const T& t) const;
```

4 *Constraints:*

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(4.2) — `is_convertible_v<const T&, const charT*>` is false.

5 *Effects:* Equivalent to:

```
return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);
```

```
template<class T>
int compare(size_type pos1, size_type n1, const T& t, size_type pos2, size_type n2 = npos) const;
```

6 *Constraints:*

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(6.2) — `is_convertible_v<const T&, const charT*>` is false.

7 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.substr(pos1, n1).compare(sv.substr(pos2, n2));
```

```
int compare(const basic_string& str) const noexcept;
```

8 *Effects:* Equivalent to: `return compare(basic_string_view<charT, traits>(str));`

```
int compare(size_type pos1, size_type n1, const basic_string& str) const;
```

9 *Effects:* Equivalent to: `return compare(pos1, n1, basic_string_view<charT, traits>(str));`

```
int compare(size_type pos1, size_type n1, const basic_string& str,
           size_type pos2, size_type n2 = npos) const;
```

10 *Effects:* Equivalent to:

```
return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);
```

```

int compare(const charT* s) const;
11   Effects: Equivalent to: return compare(basic_string_view<charT, traits>(s));

int compare(size_type pos, size_type n1, const charT* s) const;
12   Effects: Equivalent to: return compare(pos, n1, basic_string_view<charT, traits>(s));

int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;
13   Effects: Equivalent to: return compare(pos, n1, basic_string_view<charT, traits>(s, n2));

```

20.3.2.7.5 basic_string::starts_with

[string.starts.with]

```

bool starts_with(basic_string_view<charT, traits> x) const noexcept;
bool starts_with(charT x) const noexcept;
bool starts_with(const charT* x) const;

```

1 Effects: Equivalent to:

```
    return basic_string_view<charT, traits>(data(), size()).starts_with(x);
```

20.3.2.7.6 basic_string::ends_with

[string.ends.with]

```

bool ends_with(basic_string_view<charT, traits> x) const noexcept;
bool ends_with(charT x) const noexcept;
bool ends_with(const charT* x) const;

```

1 Effects: Equivalent to:

```
    return basic_string_view<charT, traits>(data(), size()).ends_with(x);
```

20.3.3 Non-member functions

[string.nonmembers]

20.3.3.1 operator+

[string.op.plus]

```

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
           const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

```

1 Effects: Equivalent to:

```
    basic_string<charT, traits, Allocator> r = lhs;
    r.append(rhs);
    return r;
```

```

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
           const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, const charT* rhs);

```

2 Effects: Equivalent to:

```
    lhs.append(rhs);
    return std::move(lhs);
```

```

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
           basic_string<charT, traits, Allocator>&& rhs);

```

3 Effects: Equivalent to:

```
    lhs.append(rhs);
    return std::move(lhs);
```

except that both `lhs` and `rhs` are left in valid but unspecified states. [Note: If `lhs` and `rhs` have equal allocators, the implementation may move from either. — end note]

```
template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
           basic_string<charT, traits, Allocator>&& rhs);
template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(const charT* lhs, basic_string<charT, traits, Allocator>&& rhs);

4   Effects: Equivalent to:
      rhs.insert(0, lhs);
      return std::move(rhs);

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);

5   Effects: Equivalent to:
      basic_string<charT, traits, Allocator> r = rhs;
      r.insert(0, lhs);
      return r;

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);

6   Effects: Equivalent to:
      basic_string<charT, traits, Allocator> r = rhs;
      r.insert(r.begin(), lhs);
      return r;

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(charT lhs, basic_string<charT, traits, Allocator>&& rhs);

7   Effects: Equivalent to:
      rhs.insert(rhs.begin(), lhs);
      return std::move(rhs);

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);

8   Effects: Equivalent to:
      basic_string<charT, traits, Allocator> r = lhs;
      r.push_back(rhs);
      return r;

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);

9   Effects: Equivalent to:
      lhs.push_back(rhs);
      return std::move(lhs);
```

20.3.3.2 Non-member comparison functions

[string cmp]

```
template<class charT, class traits, class Allocator>
bool operator==(const basic_string<charT, traits, Allocator>& lhs,
                  const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
bool operator==(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
```

```

template<class charT, class traits, class Allocator>
    bool operator==(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

template<class charT, class traits, class Allocator>
    bool operator!=(const basic_string<charT, traits, Allocator>& lhs,
                      const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
    bool operator!=(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
    bool operator!=(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

template<class charT, class traits, class Allocator>
    bool operator< (const basic_string<charT, traits, Allocator>& lhs,
                     const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
    bool operator< (const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
    bool operator< (const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

template<class charT, class traits, class Allocator>
    bool operator> (const basic_string<charT, traits, Allocator>& lhs,
                     const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
    bool operator> (const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
    bool operator> (const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

template<class charT, class traits, class Allocator>
    bool operator<=(const basic_string<charT, traits, Allocator>& lhs,
                     const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
    bool operator<=(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
    bool operator<=(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

template<class charT, class traits, class Allocator>
    bool operator>=(const basic_string<charT, traits, Allocator>& lhs,
                     const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
    bool operator>=(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
    bool operator>=(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

```

¹ *Effects:* Let *op* be the operator. Equivalent to:

```
return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);
```

20.3.3.3 swap

[string.special]

```

template<class charT, class traits, class Allocator>
void swap(basic_string<charT, traits, Allocator>& lhs,
          basic_string<charT, traits, Allocator>& rhs)
noexcept(noexcept(lhs.swap(rhs)));

```

¹ *Effects:* Equivalent to *lhs.swap(rhs)*.

20.3.3.4 Inserters and extractors

[string.io]

```

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, basic_string<charT, traits, Allocator>& str);

```

¹ *Effects:* Behaves as a formatted input function (28.7.4.2.1). After constructing a *sentry* object, if the *sentry* converts to *true*, calls *str.erase()* and then extracts characters from *is* and appends them to *str* as if by calling *str.append(1, c)*. If *is.width()* is greater than zero, the maximum number *n* of characters appended is *is.width()*; otherwise *n* is *str.max_size()*. Characters are extracted and appended until any of the following occurs:

- (1.1) — n characters are stored;
 (1.2) — end-of-file occurs on the input sequence;
 (1.3) — `isspace(c, is.getloc())` is true for the next available input character c .

2 After the last character (if any) is extracted, `is.width(0)` is called and the `sentry` object is destroyed.
 3 If the function extracts no characters, it calls `is.setstate(ios::failbit)`, which may throw `ios_base::failure` (28.5.5.4).

4 Returns: `is`.

```
template<class charT, class traits, class Allocator>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
           const basic_string<charT, traits, Allocator>& str);
```

5 Effects: Equivalent to: `return os << basic_string_view<charT, traits>(str);`

```
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
        basic_string<charT, traits, Allocator>& str,
        charT delim);
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
        basic_string<charT, traits, Allocator>& str,
        charT delim);
```

6 Effects: Behaves as an unformatted input function (28.7.4.3), except that it does not affect the value returned by subsequent calls to `basic_istream<>::gcount()`. After constructing a `sentry` object, if the `sentry` converts to `true`, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)` until any of the following occurs:

- (6.1) — end-of-file occurs on the input sequence (in which case, the `getline` function calls `is.setstate(ios_base::eofbit)`).
 (6.2) — `traits::eq(c, delim)` for the next available input character c (in which case, c is extracted but not appended) (28.5.5.4)
 (6.3) — `str.max_size()` characters are stored (in which case, the function calls `is.setstate(ios_base::failbit)`) (28.5.5.4)

7 The conditions are tested in the order shown. In any case, after the last character is extracted, the `sentry` object is destroyed.

8 If the function extracts no characters, it calls `is.setstate(ios_base::failbit)` which may throw `ios_base::failure` (28.5.5.4).

9 Returns: `is`.

```
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
        basic_string<charT, traits, Allocator>& str);
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
        basic_string<charT, traits, Allocator>& str);
```

10 Returns: `getline(is, str, is.widen('\n'))`.

20.3.3.5 Erasure

[string.erasure]

```
template <class charT, class traits, class Allocator, class U>
void erase(basic_string<charT, traits, Allocator>& c, const U& value);
```

1 Effects: Equivalent to: `c.erase(remove(c.begin(), c.end(), value), c.end())`

```
template <class charT, class traits, class Allocator, class Predicate>
void erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);
```

2 *Effects:* Equivalent to: `c.erase(remove_if(c.begin(), c.end(), pred), c.end());`

20.3.4 Numeric conversions

[[string.conversions](#)]

```
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

1 *Effects:* The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

2 *Returns:* The converted result.

3 *Throws:* `invalid_argument` if `strtol`, `strtoul`, `strtoll`, or `strtoull` reports that no conversion could be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtoll` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
long double stold(const string& str, size_t* idx = nullptr);
```

4 *Effects:* These functions call `strtod(str.c_str(), ptr)`, `strtold(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

5 *Returns:* The converted result.

6 *Throws:* `invalid_argument` if `strtod`, `strtold`, or `strtold` reports that no conversion could be performed. Throws `out_of_range` if `strtod`, `strtold`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

7 *Returns:* Each function returns a `string` object holding the character representation of the value of its argument that would be generated by calling `sprintf(buf, fmt, val)` with a format specifier of `"%d"`, `"%u"`, `"%ld"`, `"%lu"`, `"%lld"`, `"%llu"`, `"%f"`, `"%f"`, or `"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size.

```
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

8 *Effects:* The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store

at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

Throws: `invalid_argument` if `wcstol`, `wcstoul`, `wcstoll`, or `wcstoull` reports that no conversion could be performed. Throws `out_of_range` if the converted value is outside the range of representable values for the return type.

```
float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);
```

Effects: These functions call `wcstof(str.c_str(), ptr)`, `wcstod(str.c_str(), ptr)`, and `wcstold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

Throws: `invalid_argument` if `wcstof`, `wcstod`, or `wcstold` reports that no conversion could be performed. Throws `out_of_range` if `wcstof`, `wcstod`, or `wcstold` sets `errno` to `ERANGE`.

```
wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);
```

Returns: Each function returns a `wstring` object holding the character representation of the value of its argument that would be generated by calling `swprintf(buf, buffsz, fmt, val)` with a format specifier of `L"%d"`, `L"%u"`, `L"%ld"`, `L"%lu"`, `L"%lld"`, `L"%llu"`, `L"%f"`, `L"%f"`, or `L"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size `buffsz`.

20.3.5 Hash support

[[basic.string.hash](#)]

```
template<> struct hash<string>;
template<> struct hash<u8string>;
template<> struct hash<u16string>;
template<> struct hash<u32string>;
template<> struct hash<wstring>;
template<> struct hash<pmr::string>;
template<> struct hash<pmr::u8string>;
template<> struct hash<pmr::u16string>;
template<> struct hash<pmr::u32string>;
template<> struct hash<pmr::wstring>;
```

If `S` is one of these string types, `SV` is the corresponding string view type, and `s` is an object of type `S`, then `hash<S>()(s) == hash<SV>()(SV(s))`.

20.3.6 Suffix for `basic_string` literals

[[basic.string.literals](#)]

```
string operator""s(const char* str, size_t len);
1   Returns: string{str, len}.

u8string operator""s(const char8_t* str, size_t len);
2   Returns: u8string{str, len}.

u16string operator""s(const char16_t* str, size_t len);
3   Returns: u16string{str, len}.
```

```

u32string operator""s(const char32_t* str, size_t len);
4   Returns: u32string{str, len}.

wstring operator""s(const wchar_t* str, size_t len);
5   Returns: wstring{str, len}.

6 [Note: The same suffix s is used for chrono::duration literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. —end note]

```

20.4 String view classes

[**string.view**]

- 1 The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (20.1) objects with the first element of the sequence at position zero. In the rest of this subclause, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.
- 2 [Note: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types should define their own implicit conversions to `std::basic_string_view` in order to interoperate with these functions. —end note]

20.4.1 Header <string_view> synopsis

[**string.view.synop**]

```

namespace std {
    // 20.4.2, class template basic_string_view
    template<class charT, class traits = char_traits<charT>>
    class basic_string_view;

    // 20.4.3, non-member comparison functions
    template<class charT, class traits>
    constexpr bool operator==(basic_string_view<charT, traits> x,
                               basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
    constexpr bool operator!=(basic_string_view<charT, traits> x,
                               basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
    constexpr bool operator< (basic_string_view<charT, traits> x,
                               basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
    constexpr bool operator> (basic_string_view<charT, traits> x,
                               basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
    constexpr bool operator<= (basic_string_view<charT, traits> x,
                               basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
    constexpr bool operator>= (basic_string_view<charT, traits> x,
                               basic_string_view<charT, traits> y) noexcept;
    // see 20.4.3, sufficient additional overloads of comparison functions

    // 20.4.4, inserters and extractors
    template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<((basic_ostream<charT, traits>& os,
                basic_string_view<charT, traits> str);

    using u16string_view  = basic_string_view<char16_t>;
    using u32string_view  = basic_string_view<char32_t>;
    using wstring_view    = basic_string_view<wchar_t>;

```

```

// 20.4.5, hash support
template<class T> struct hash;
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;

inline namespace literals {
    inline namespace string_view_literals {
        // 20.4.6, suffix for basic_string_view literals
        constexpr string_view operator""sv(const char* str, size_t len) noexcept;
        constexpr u8string_view operator""sv(const char8_t* str, size_t len) noexcept;
        constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
        constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
        constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
    }
}
}

```

¹ The function templates defined in 19.2.2 and 22.7 are available when <string_view> is included.

20.4.2 Class template basic_string_view

[string.view.template]

```

template<class charT, class traits = char_traits<charT>>
class basic_string_view {
public:
    // types
    using traits_type          = traits;
    using value_type            = charT;
    using pointer               = value_type*;
    using const_pointer         = const value_type*;
    using reference             = value_type&;
    using const_reference       = const value_type&;
    using const_iterator         = implementation-defined; // see 20.4.2.2
    using iterator              = const_iterator;227
    using const_reverse_iterator = reverse_iterator<const_iterator>;
    using reverse_iterator       = const_reverse_iterator;
    using size_type              = size_t;
    using difference_type        = ptrdiff_t;
    static constexpr size_type npos = size_type(-1);

    // 20.4.2.1, construction and assignment
    constexpr basic_string_view() noexcept;
    constexpr basic_string_view(const basic_string_view&) noexcept = default;
    constexpr basic_string_view& operator=(const basic_string_view&) noexcept = default;
    constexpr basic_string_view(const charT* str);
    constexpr basic_string_view(const charT* str, size_type len);

    // 20.4.2.2, iterator support
    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr const_iterator cbegin() const noexcept;
    constexpr const_iterator cend() const noexcept;
    constexpr const_reverse_iterator rbegin() const noexcept;
    constexpr const_reverse_iterator rend() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept;
    constexpr const_reverse_iterator crend() const noexcept;

    friend constexpr const_iterator begin(basic_string_view sv) noexcept { return sv.begin(); }
    friend constexpr const_iterator end(basic_string_view sv) noexcept { return sv.end(); }

```

²²⁷ Because basic_string_view refers to a constant sequence, iterator and const_iterator are the same type.

```

// 20.4.2.3, capacity
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
constexpr size_type max_size() const noexcept;
[[nodiscard]] constexpr bool empty() const noexcept;

constexpr size_type find_first_not_of(charT c, size_type pos = 0) const noexcept;
constexpr size_type find_first_not_of(const charT* s, size_type pos,
                                    size_type n) const;
constexpr size_type find_first_not_of(const charT* s, size_type pos = 0) const;
constexpr size_type find_last_not_of(basic_string_view s,
                                    size_type pos = npos) const noexcept;
constexpr size_type find_last_not_of(charT c, size_type pos = npos) const noexcept;

```

```

constexpr size_type find_last_not_of(const charT* s, size_type pos,
                                     size_type n) const;
constexpr size_type find_last_not_of(const charT* s, size_type pos =npos) const;

private:
    const_pointer data_; // exposition only
    size_type size_; // exposition only
};

```

- 1 In every specialization `basic_string_view<charT, traits>`, the type `traits` shall satisfy the character traits requirements (20.2). [Note: The program is ill-formed if `traits::char_type` is not the same type as `charT`. —end note]
- 2 The type `iterator` satisfies the `constexpr` iterator requirements (22.3.1).
- 3 The complexity of `basic_string_view` member functions is $\mathcal{O}(1)$ unless otherwise specified.

20.4.2.1 Construction and assignment

[string.view.cons]

```

constexpr basic_string_view() noexcept;
1   Effects: Constructs an empty basic_string_view.
2   Ensures: size_ == 0 and data_ == nullptr.

constexpr basic_string_view(const charT* str);
3   Expects: [str, str + traits::length(str)) is a valid range.
4   Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with traits::length(str).
5   Complexity:  $\mathcal{O}(\text{traits}::\text{length}(\text{str}))$ .

constexpr basic_string_view(const charT* str, size_type len);
6   Expects: [str, str + len) is a valid range.
7   Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with len.

```

20.4.2.2 Iterator support

[string.view.iterators]

```

using const_iterator = implementation-defined;
1   A type that meets the requirements of a constant Cpp17RandomAccessIterator (22.3.5.6) and models ContiguousIterator (22.3.4.14), whose value_type is the template parameter charT.
2   For a basic_string_view str, any operation that invalidates a pointer in the range [str.data(), str.data() + str.size()) invalidates pointers, iterators, and references returned from str's member functions.
3   All requirements on container iterators (21.2) apply to basic_string_view::const_iterator as well.

```

```

constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
4   Returns: An iterator such that
(4.1)   — if !empty(), addressof(*begin()) == data_,
(4.2)   — otherwise, an unspecified value such that [begin(), end()) is a valid range.

```

```

constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
5   Returns: begin() + size().

constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
6   Returns: const_reverse_iterator(end()).

constexpr const_reverse_iterator rend() const noexcept;

```

```
constexpr const_reverse_iterator crend() const noexcept;
7   Returns: const_reverse_iterator(begin()).
```

20.4.2.3 Capacity

[string.view.capacity]

```
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

1 Returns: size_.

```
constexpr size_type max_size() const noexcept;
```

2 Returns: The largest possible number of char-like objects that can be referred to by a basic_string_view.

```
[[nodiscard]] constexpr bool empty() const noexcept;
```

3 Returns: size_ == 0.

20.4.2.4 Element access

[string.view.access]

```
constexpr const_reference operator[](size_type pos) const;
```

1 Expects: pos < size().

2 Returns: data_[pos].

3 Throws: Nothing.

4 [Note: Unlike basic_string::operator[], basic_string_view::operator[](size()) has undefined behavior instead of returning charT(). — end note]

```
constexpr const_reference at(size_type pos) const;
```

5 Throws: out_of_range if pos >= size().

6 Returns: data_[pos].

```
constexpr const_reference front() const;
```

7 Expects: !empty().

8 Returns: data_[0].

9 Throws: Nothing.

```
constexpr const_reference back() const;
```

10 Expects: !empty().

11 Returns: data_[size() - 1].

12 Throws: Nothing.

```
constexpr const_pointer data() const noexcept;
```

13 Returns: data_.

14 [Note: Unlike basic_string::data() and string literals, data() may return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass data() to a function that takes just a const charT* and expects a null-terminated string. — end note]

20.4.2.5 Modifiers

[string.view.modifiers]

```
constexpr void remove_prefix(size_type n);
```

1 Expects: n <= size().

2 Effects: Equivalent to: data_ += n; size_ -= n;

```
constexpr void remove_suffix(size_type n);
```

3 Expects: n <= size().

4 Effects: Equivalent to: size_ -= n;

```
constexpr void swap(basic_string_view& s) noexcept;
```

5 *Effects:* Exchanges the values of `*this` and `s`.

20.4.2.6 String operations

[string.view.ops]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 Let `rlen` be the smaller of `n` and `size() - pos`.

2 *Throws:* `out_of_range` if `pos > size()`.

3 *Expects:* `[s, s + rlen)` is a valid range.

4 *Effects:* Equivalent to `traits::copy(s, data() + pos, rlen)`.

5 *Returns:* `rlen`.

6 *Complexity:* $\mathcal{O}(r\text{len})$.

```
constexpr basic_string_view substr(size_type pos = 0, size_type n =npos) const;
```

7 Let `rlen` be the smaller of `n` and `size() - pos`.

8 *Throws:* `out_of_range` if `pos > size()`.

9 *Effects:* Determines `rlen`, the effective length of the string to reference.

10 *Returns:* `basic_string_view(data() + pos, rlen)`.

```
constexpr int compare(basic_string_view str) const noexcept;
```

11 Let `rlen` be the smaller of `size()` and `str.size()`.

12 *Effects:* Determines `rlen`, the effective length of the strings to compare. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`.

13 *Complexity:* $\mathcal{O}(r\text{len})$.

14 *Returns:* The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 59.

Table 59 — `compare()` results

Condition	Return Value
<code>size() < str.size()</code>	<code>< 0</code>
<code>size() == str.size()</code>	<code>0</code>
<code>size() > str.size()</code>	<code>> 0</code>

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
```

15 *Effects:* Equivalent to: `return substr(pos1, n1).compare(str);`

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
                     size_type pos2, size_type n2) const;
```

16 *Effects:* Equivalent to: `return substr(pos1, n1).compare(str.substr(pos2, n2));`

```
constexpr int compare(const charT* s) const;
```

17 *Effects:* Equivalent to: `return compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
```

18 *Effects:* Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
```

19 *Effects:* Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s, n2));`

```
constexpr bool starts_with(basic_string_view x) const noexcept;
```

20 *Effects:* Equivalent to: `return compare(0, npos, x) == 0;`

```

constexpr bool starts_with(charT x) const noexcept;
21   Effects: Equivalent to: return starts_with(basic_string_view(addressof(x), 1));

constexpr bool starts_with(const charT* x) const;
22   Effects: Equivalent to: return starts_with(basic_string_view(x));

constexpr bool ends_with(basic_string_view x) const noexcept;
23   Effects: Equivalent to:
      return size() >= x.size() && compare(size() - x.size(), npos, x) == 0;

constexpr bool ends_with(charT x) const noexcept;
24   Effects: Equivalent to: return ends_with(basic_string_view(addressof(x), 1));

constexpr bool ends_with(const charT* x) const;
25   Effects: Equivalent to: return ends_with(basic_string_view(x));

```

20.4.2.7 Searching

[**string.view.find**]

¹ Member functions in this subclause have complexity $\mathcal{O}(\text{size}() * \text{str.size}())$ at worst, although implementations should do better.

² Let F be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

(2.1) — Each member function of the form

```

constexpr return-type F(const charT* s, size_type pos) const;
has effects equivalent to: return F(basic_string_view(s), pos);

```

(2.2) — Each member function of the form

```

constexpr return-type F(const charT* s, size_type pos, size_type n) const;
has effects equivalent to: return F(basic_string_view(s, n), pos);

```

(2.3) — Each member function of the form

```

constexpr return-type F(charT c, size_type pos) const noexcept;
has effects equivalent to: return F(basic_string_view(addressof(c), 1), pos);

```

```
constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;
```

3 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(3.1) — $\text{pos} \leq \text{xpos}$

(3.2) — $\text{xpos} + \text{str.size()} \leq \text{size}()$

(3.3) — `traits::eq(at(xpos + I), str.at(I))` for all elements `I` of the string referenced by `str`.

4 Effects: Determines `xpos`.

5 Returns: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;
```

6 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(6.1) — $\text{xpos} \leq \text{pos}$

(6.2) — $\text{xpos} + \text{str.size()} \leq \text{size}()$

(6.3) — `traits::eq(at(xpos + I), str.at(I))` for all elements `I` of the string referenced by `str`.

7 Effects: Determines `xpos`.

8 Returns: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;
```

9 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(9.1) — $\text{pos} \leq \text{xpos}$

(9.2) — $\text{xpos} < \text{size}()$

(9.3) — `traits::eq(at(xpos), str.at(I))` for some element I of the string referenced by `str`.
 10 *Effects:* Determines `xpos`.
 11 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
```

12 Let `xpos` be the highest position, if possible, such that the following conditions hold:
 (12.1) — `xpos <= pos`
 (12.2) — `xpos < size()`
 (12.3) — `traits::eq(at(xpos), str.at(I))` for some element I of the string referenced by `str`.
 13 *Effects:* Determines `xpos`.
 14 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
```

15 Let `xpos` be the lowest position, if possible, such that the following conditions hold:
 (15.1) — `pos <= xpos`
 (15.2) — `xpos < size()`
 (15.3) — `traits::eq(at(xpos), str.at(I))` for no element I of the string referenced by `str`.
 16 *Effects:* Determines `xpos`.
 17 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;
```

18 Let `xpos` be the highest position, if possible, such that the following conditions hold:
 (18.1) — `xpos <= pos`
 (18.2) — `xpos < size()`
 (18.3) — `traits::eq(at(xpos), str.at(I))` for no element I of the string referenced by `str`.
 19 *Effects:* Determines `xpos`.
 20 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

20.4.3 Non-member comparison functions

[[string.view.comparison](#)]

- ¹ Let S be `basic_string_view<charT, traits>`, and sv be an instance of S. Implementations shall provide sufficient additional overloads marked `constexpr` and `noexcept` so that an object t with an implicit conversion to S can be compared according to Table 60.

Table 60 — Additional `basic_string_view` comparison overloads

Expression	Equivalent to
<code>t == sv</code>	<code>S(t) == sv</code>
<code>sv == t</code>	<code>sv == S(t)</code>
<code>t != sv</code>	<code>S(t) != sv</code>
<code>sv != t</code>	<code>sv != S(t)</code>
<code>t < sv</code>	<code>S(t) < sv</code>
<code>sv < t</code>	<code>sv < S(t)</code>
<code>t > sv</code>	<code>S(t) > sv</code>
<code>sv > t</code>	<code>sv > S(t)</code>
<code>t <= sv</code>	<code>S(t) <= sv</code>
<code>sv <= t</code>	<code>sv <= S(t)</code>
<code>t >= sv</code>	<code>S(t) >= sv</code>
<code>sv >= t</code>	<code>sv >= S(t)</code>

[*Example:* A sample conforming implementation for `operator==` would be:

```

template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                           type_identity_t<basic_string_view<charT, traits>> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}
template<class charT, class traits>
constexpr bool operator==(type_identity_t<basic_string_view<charT, traits>> lhs,
                           basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}

— end example]

template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept;

2   Returns: lhs.compare(rhs) == 0.

template<class charT, class traits>
constexpr bool operator!=(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept;

3   Returns: lhs.compare(rhs) != 0.

template<class charT, class traits>
constexpr bool operator<(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept;

4   Returns: lhs.compare(rhs) < 0.

template<class charT, class traits>
constexpr bool operator>(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept;

5   Returns: lhs.compare(rhs) > 0.

template<class charT, class traits>
constexpr bool operator<=(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept;

6   Returns: lhs.compare(rhs) <= 0.

template<class charT, class traits>
constexpr bool operator>=(basic_string_view<charT, traits> lhs,
                           basic_string_view<charT, traits> rhs) noexcept;

7   Returns: lhs.compare(rhs) >= 0.

```

20.4.4 Inserters and extractors

[string.view.io]

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);

1   Effects: Behaves as a formatted output function (28.7.5.2.1) of os. Forms a character sequence seq,
           initially consisting of the elements defined by the range [str.begin(), str.end()]. Determines
           padding for seq as described in 28.7.5.2.1. Then inserts seq as if by calling os.rdbuf()->sputn(seq,
           n), where n is the larger of os.width() and str.size(); then calls os.width(0).

2   Returns: os

```

20.4.5 Hash support

[string.view.hash]

```
template<> struct hash<string_view>;
```

```
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
```

¹ The specialization is enabled (19.14.18). [Note: The hash value of a string view object is equal to the hash value of the corresponding string object (20.3.5). — end note]

20.4.6 Suffix for `basic_string_view` literals

[`string.view.literals`]

```
constexpr string_view operator""sv(const char* str, size_t len) noexcept;
1 Returns: string_view{str, len}.
constexpr u8string_view operator""sv(const char8_t* str, size_t len) noexcept;
2 Returns: u8string_view{str, len}.
constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
3 Returns: u16string_view{str, len}.
constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
4 Returns: u32string_view{str, len}.
constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
5 Returns: wstring_view{str, len}.
```

20.5 Null-terminated sequence utilities

[`c.strings`]

20.5.1 Header `<cctype>` synopsis

[`cctype.syn`]

```
namespace std {
    int isalnum(int c);
    int isalpha(int c);
    int isblank(int c);
    int iscntrl(int c);
    int isdigit(int c);

20.5.6 Multibyte / wide string and character conversion functions

[c.mb.wcs]

- ¹ [Note: The headers <cstdlib> (16.2.2), <cuchar> (20.5.5), and <cwchar> (20.5.4) declare the functions described in this subclause. — end note]

```
int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);
```

- ² *Effects:* These functions have the semantics specified in the C standard library.

SEE ALSO: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

```
int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);
```

- ³ *Effects:* These functions have the semantics specified in the C standard library.

- ⁴ *Remarks:* Calls to these functions may introduce a data race (15.5.5.9) with other calls to the same function.

SEE ALSO: ISO C 7.22.7

```
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbsrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
```

`size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);`

5 *Effects:* These functions have the semantics specified in the C standard library.

6 *Remarks:* Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (15.5.5.9) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.

SEE ALSO: ISO C 7.29.6.3

`size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);`

7 *Effects:* If `s` is a null pointer, equivalent to `mbrtoc8(nullptr, "", 1, ps)`. Otherwise, the function inspects at most `n` bytes beginning with the byte pointed to by `s` to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if `pc8` is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by `pc8`. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is U+0000, the resulting state described is the initial conversion state.

8 *Returns:* The first of the following that applies (given the current conversion state):

- (8.1) — 0, if the next `n` or fewer bytes complete the multibyte character that corresponds to the U+0000 Unicode character (which is the value stored).
- (8.2) — between 1 and `n` inclusive, if the next `n` or fewer bytes complete a valid multibyte character (which is the value stored); the value returned is the number of bytes that complete the multibyte character.
- (8.3) — `(size_t)(-3)`, if the next character resulting from a previous call has been stored (no bytes from the input have been consumed by this call).
- (8.4) — `(size_t)(-2)`, if the next `n` bytes contribute to an incomplete (but potentially valid) multibyte character, and all `n` bytes have been processed (no value is stored).
- (8.5) — `(size_t)(-1)`, if an encoding error occurs, in which case the next `n` or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro `EILSEQ` is stored in `errno`, and the conversion state is unspecified.

`size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);`

9 *Effects:* If `s` is a null pointer, equivalent to `c8rtomb(buf, u8'\0', ps)` where `buf` is an internal buffer. Otherwise, if `c8` completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by `s`. At most `MB_CUR_MAX` bytes are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

10 *Returns:* The number of bytes stored in the array object (including any shift sequences). If `c8` does not contribute to a sequence of `char8_t` corresponding to a valid multibyte character, the value of the macro `EILSEQ` is stored in `errno`, `(size_t)(-1)` is returned, and the conversion state is unspecified.

11 *Remarks:* Calls to `c8rtomb` with a null pointer argument for `s` may introduce a data race (15.5.5.9) with other calls to `c8rtomb` with a null pointer argument for `s`.

21 Containers library [containers]

21.1 General

[`containers.general`]

- ¹ This Clause describes components that C++ programs may use to organize collections of information.
- ² The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 61.

Table 61 — Containers library summary

Subclause	Header(s)
21.2 Requirements	
21.3 Sequence containers	<code><array></code> <code><deque></code> <code><forward_list></code> <code><list></code> <code><vector></code>
21.4 Associative containers	<code><map></code> <code><set></code>
21.5 Unordered associative containers	<code><unordered_map></code> <code><unordered_set></code>
21.6 Container adaptors	<code><queue></code> <code><stack></code>
21.7 Views	<code></code>

21.2 Container requirements

[`container.requirements`]

21.2.1 General container requirements

[`container.requirements.general`]

- ¹ Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.
- ² All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects. [*Example*: The copy constructor of type `vector<vector<int>>` has linear complexity, even though the complexity of copying each contained `vector<int>` is itself linear. — *end example*]
- ³ For the components affected by this subclause that declare an `allocator_type`, objects stored in these components shall be constructed using the function `allocator_traits<allocator_type>::rebind_traits<U>::construct` and destroyed using the function `allocator_traits<allocator_type>::rebind_traits<U>::destroy` ([19.10.9.2](#)), where U is either `allocator_type::value_type` or an internal type used by the container. These functions are called only for the container's element type, not for internal types used by the container. [*Note*: This means, for example, that a node-based container might need to construct nodes containing aligned buffers and call `construct` to place the element into the buffer. — *end note*]
- ⁴ In Tables [62](#), [63](#), and [64](#) X denotes a container class containing objects of type T, a and b denote values of type X, u denotes an identifier, r denotes a non-const value of type X, and rv denotes a non-const rvalue of type X.

Table 62 — Container requirements

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition	Complexity
<code>X::value_ - type</code>	T		<i>Requires:</i> T is <code>Cpp17Erasable</code> from X (see 21.2.1 , below)	compile time
<code>X::reference</code>	<code>T&</code>			compile time

Table 62 — Container requirements (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition	Complexity
X::const_ reference	const T&			compile time
X::iterator	iterator type whose value type is T		any iterator category that meets the forward iterator requirements. convertible to X::const_iterator.	compile time
X::const_ iterator	constant iterator type whose value type is T		any iterator category that meets the forward iterator requirements.	compile time
X::difference_type	signed integer type		is identical to the difference type of X::iterator and X::const_iterator	compile time
X::size_type	unsigned integer type		size_type can represent any non-negative value of difference_type	compile time
X u;			Ensures: u.empty()	constant
X()			Ensures: X().empty()	constant
X(a)			Requires: T is Cpp17CopyInsertable into X (see below). Ensures: a == X(a).	linear
X u(a); X u = a;			Requires: T is Cpp17CopyInsertable into X (see below). Ensures: u == a	linear
X u(rv); X u = rv;			Ensures: u shall be equal to the value that rv had before this construction	(Note B)
a = rv	X&	All existing elements of a are either move assigned to or destroyed	a shall be equal to the value that rv had before this assignment	linear
a.~X()	void		the destructor is applied to every element of a; any memory obtained is deallocated.	linear
a.begin()	iterator; const_ iterator for constant a			constant
a.end()	iterator; const_ iterator for constant a			constant

Table 62 — Container requirements (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition	Complexity
<code>a.cbegin()</code>	<code>const_iterator</code>	<code>const_cast<X const&>(a).begin();</code>		constant
<code>a.cend()</code>	<code>const_iterator</code>	<code>const_cast<X const&>(a).end();</code>		constant
<code>a == b</code>	convertible to <code>bool</code>	<code>==</code> is an equivalence relation. <code>equal(a.begin(), a.end(), b.begin(), b.end())</code>	<i>Requires:</i> <code>T</code> is <i>Cpp17-EqualityComparable</i>	Constant if <code>a.size() != b.size()</code> , linear otherwise
<code>a != b</code>	convertible to <code>bool</code>	Equivalent to <code>!(a == b)</code>		linear
<code>a.swap(b)</code>	<code>void</code>		exchanges the contents of <code>a</code> and <code>b</code>	(Note A)
<code>swap(a, b)</code>	<code>void</code>	Equivalent to <code>a.swap(b)</code>		(Note A)
<code>r = a</code>	<code>X&</code>		<i>Ensures:</i> <code>r == a.</code>	linear
<code>a.size()</code>	<code>size_type</code>	<code>distance(a.begin(), a.end())</code>		constant
<code>a.max_size()</code>	<code>size_type</code>	<code>distance(begin(), end())</code> for the largest possible container		constant
<code>a.empty()</code>	convertible to <code>bool</code>	<code>a.begin() == a.end()</code>		constant

Those entries marked “(Note A)” or “(Note B)” have linear complexity for `array` and have constant complexity for all other standard containers. [Note: The algorithm `equal()` is defined in [Clause 24](#). —end note]

- ⁵ The member function `size()` returns the number of elements in the container. The number of elements is defined by the rules of constructors, inserts, and erases.
- ⁶ `begin()` returns an iterator referring to the first element in the container. `end()` returns an iterator which is the past-the-end value for the container. If the container is empty, then `begin() == end()`.
- ⁷ In the expressions

```
i == j
i != j
i < j
i <= j
i >= j
i > j
i - j
```

where `i` and `j` denote objects of a container’s `iterator` type, either or both may be replaced by an object of the container’s `const_iterator` type referring to the same element with no change in semantics.

- ⁸ Unless otherwise specified, all containers defined in this clause obtain memory using an allocator (see [15.5.3.5](#)). [Note: In particular, containers and iterators do not store references to allocated elements other than through the allocator’s pointer type, i.e., as objects of type `P` or `pointer_traits<P>::template rebind<unspecified>`, where `P` is `allocator_traits<allocator_type>::pointer`. —end note] Copy constructors for these container types obtain an allocator by calling `allocator_traits<allocator_type>::select_on_container_copy_construction` on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a `const allocator_type&` argument. [Note: If an invocation of a

constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization. — *end note*] A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or `swap()`. Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if `allocator_traits<allocator_type>::propagate_on_container_copy_assignment::value`, `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value`, or `allocator_traits<allocator_type>::propagate_on_container_swap::value` is true within the implementation of the corresponding container operation. In all container types defined in this Clause, the member `get_allocator()` returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

- ⁹ The expression `a.swap(b)`, for containers `a` and `b` of a standard container type other than `array`, shall exchange the values of `a` and `b` without invoking any move, copy, or swap operations on the individual container elements. Lvalues of any `Compare`, `Pred`, or `Hash` types belonging to `a` and `b` shall be swappable and shall be exchanged by calling `swap` as described in 15.5.3.2. If `allocator_traits<allocator_type>::propagate_on_container_swap::value` is true, then lvalues of type `allocator_type` shall be swappable and the allocators of `a` and `b` shall also be exchanged by calling `swap` as described in 15.5.3.2. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless `a.get_allocator() == b.get_allocator()`. Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value `a.end()` before the swap will have value `b.end()` after the swap.
- ¹⁰ If the iterator type of a container belongs to the bidirectional or random access iterator categories (22.3), the container is called *reversible* and satisfies the additional requirements in Table 63.

Table 63 — Reversible container requirements

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>X::reverse_iterator</code>	iterator type whose value type is <code>T</code>	<code>reverse_iterator<iterator></code>	compile time
<code>X::const_reverse_iterator</code>	constant iterator type whose value type is <code>T</code>	<code>reverse_iterator<const_iterator></code>	compile time
<code>a.rbegin()</code>	<code>reverse_iterator</code> ; <code>const_reverse_iterator</code> for constant <code>a</code>	<code>reverse_iterator(end())</code>	constant
<code>a.rend()</code>	<code>reverse_iterator</code> ; <code>const_reverse_iterator</code> for constant <code>a</code>	<code>reverse_iterator(begin())</code>	constant
<code>a.crbegin()</code>	<code>const_reverse_iterator</code>	<code>const_cast<X const&>(a.rbegin())</code>	constant
<code>a.crend()</code>	<code>const_reverse_iterator</code>	<code>const_cast<X const&>(a.rend())</code>	constant

- ¹¹ Unless otherwise specified (see 21.2.6.1, 21.2.7.1, 21.3.8.4, and 21.3.11.5) all container types defined in this Clause meet the following additional requirements:
 - (11.1) — if an exception is thrown by an `insert()` or `emplace()` function while inserting a single element, that function has no effects.
 - (11.2) — if an exception is thrown by a `push_back()`, `push_front()`, `emplace_back()`, or `emplace_front()` function, that function has no effects.
 - (11.3) — no `erase()`, `clear()`, `pop_back()` or `pop_front()` function throws an exception.
 - (11.4) — no copy constructor or assignment operator of a returned iterator throws an exception.
 - (11.5) — no `swap()` function throws an exception.

- (11.6) — no `swap()` function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped. [Note: The `end()` iterator does not refer to any element, so it may be invalidated. — end note]
- 12 Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.
- 13 A *contiguous container* is a container whose member types `iterator` and `const_iterator` meet the `Cpp17RandomAccessIterator` requirements (22.3.5.6) and model `ContiguousIterator` (22.3.4.14).
- 14 Table 64 lists operations that are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics described in Table 64 unless otherwise stated. If the iterators passed to `lexicographical_compare` satisfy the `constexpr` iterator requirements (22.3.1) then the operations described in Table 64 are implemented by `constexpr` functions.

Table 64 — Optional container operations

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition	Complexity
<code>a < b</code>	convertible to <code>bool</code>	<code>lexicographical_- compare(a.begin(), a.end(), b.begin(), b.end())</code>	<i>Requires:</i> <code><</code> is defined for values of <code>T</code> . <code><</code> is a total ordering relationship.	linear
<code>a > b</code>	convertible to <code>bool</code>	<code>b < a</code>		linear
<code>a <= b</code>	convertible to <code>bool</code>	<code>!(a > b)</code>		linear
<code>a >= b</code>	convertible to <code>bool</code>	<code>!(a < b)</code>		linear

[Note: The algorithm `lexicographical_compare()` is defined in Clause 24. — end note]

- 15 All of the containers defined in this Clause and in 20.3.2 except `array` meet the additional requirements of an allocator-aware container, as described in Table 65.

Given an allocator type `A` and given a container type `X` having a `value_type` identical to `T` and an `allocator_type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue `m` of type `A`, a pointer `p` of type `T*`, an expression `v` of type (possibly `const`) `T`, and an rvalue `rv` of type `T`, the following terms are defined. If `X` is not allocator-aware, the terms below are defined as if `A` were `allocator<T>` — no allocator object needs to be created and user specializations of `allocator<T>` are not instantiated:

- (15.1) — `T` is *Cpp17DefaultInsertable into X* means that the following expression is well-formed:
`allocator_traits<A>::construct(m, p)`
- (15.2) — An element of `X` is *default-inserted* if it is initialized by evaluation of the expression
`allocator_traits<A>::construct(m, p)`
 where `p` is the address of the uninitialized storage for the element allocated within `X`.
- (15.3) — `T` is *Cpp17MoveInsertable into X* means that the following expression is well-formed:
`allocator_traits<A>::construct(m, p, rv)`
 and its evaluation causes the following postcondition to hold: The value of `*p` is equivalent to the value of `rv` before the evaluation. [Note: `rv` remains a valid object. Its state is unspecified — end note]
- (15.4) — `T` is *Cpp17CopyInsertable into X* means that, in addition to `T` being *Cpp17MoveInsertable into X*, the following expression is well-formed:
`allocator_traits<A>::construct(m, p, v)`
 and its evaluation causes the following postcondition to hold: The value of `v` is unchanged and is equivalent to `*p`.

- (15.5) — T is *Cpp17EmplaceConstructible* into X from args, for zero or more arguments args, means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, args)
```

- (15.6) — T is *Cpp17Erasable* from X means that the following expression is well-formed:

```
allocator_traits<A>::destroy(m, p)
```

[Note: A container calls allocator_traits<A>::construct(m, p, args) to construct an element at p using args, with m == get_allocator(). The default construct in allocator will call ::new((void*)p) T(args), but specialized allocators may choose a different definition. — end note]

- ¹⁶ In Table 65, X denotes an allocator-aware container class with a value_type of T using allocator of type A, u denotes a variable, a and b denote non-const lvalues of type X, t denotes an lvalue or a const rvalue of type X, rv denotes a non-const rvalue of type X, and m is a value of type A.

Table 65 — Allocator-aware container requirements

Expression	Return type	Assertion/note pre-/post-condition	Complexity
allocator_- type	A	Requires: allocator_type::value_type is the same as X::value_type.	compile time
get_- allocator()	A		constant
X() X u;		Requires: A is <i>Cpp17DefaultConstructible</i> . Ensures: u.empty() returns true, u.get_allocator() == A()	constant
X(m) X u(m);		Ensures: u.empty() returns true, u.get_allocator() == m	constant
X(t, m) X u(t, m);		Requires: T is <i>Cpp17CopyInsertable</i> into X. Ensures: u == t, u.get_allocator() == m	linear
X(rv) X u(rv);		Ensures: u shall have the same elements as rv had before this construction; the value of u.get_allocator() shall be the same as the value of rv.get_allocator() before this construction.	constant
X(rv, m) X u(rv, m);		Requires: T is <i>Cpp17MoveInsertable</i> into X. Ensures: u shall have the same elements, or copies of the elements, that rv had before this construction, u.get_allocator() == m	constant if m == rv.get_- allocator(), otherwise linear
a = t	X&	Requires: T is <i>Cpp17CopyInsertable</i> into X and <i>Cpp17CopyAssignable</i> . Ensures: a == t	linear

Table 65 — Allocator-aware container requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a = rv</code>	<code>X&</code>	<p><i>Requires:</i> If <code>allocator_traits<allocator_type>::propagate_on_container_move_assignment::value</code> is <code>false</code>, <code>T</code> is <code>Cpp17MoveInsertable</code> into <code>X</code> and <code>Cpp17MoveAssignable</code>. All existing elements of <code>a</code> are either move assigned to or destroyed.</p> <p><i>Ensures:</i> <code>a</code> shall be equal to the value that <code>rv</code> had before this assignment.</p>	linear
<code>a.swap(b)</code>	<code>void</code>	exchanges the contents of <code>a</code> and <code>b</code>	constant

- ¹⁷ The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type `A` shall not qualify as an allocator unless it satisfies both of the following conditions:

- (17.1) — The *qualified-id* `A::value_type` is valid and denotes a type (12.9.2).
- (17.2) — The expression `declval<A&>().allocate(size_t{})` is well-formed when treated as an unevaluated operand.

21.2.2 Container data races

[`container.requirements.dataraces`]

- ¹ For purposes of avoiding data races (15.5.9), implementations shall consider the following functions to be `const`: `begin`, `end`, `rbegin`, `rend`, `front`, `back`, `data`, `find`, `lower_bound`, `upper_bound`, `equal_range`, `at` and, except in associative or unordered associative containers, `operator[]`.
- ² Notwithstanding 15.5.9, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting `vector<bool>`, are modified concurrently.
- ³ [Note: For a `vector<int>` `x` with a size greater than one, `x[1] = 5` and `*x.begin() = 10` can be executed concurrently without a data race, but `x[0] = 5` and `*x.begin() = 10` executed concurrently may result in a data race. As an exception to the general rule, for a `vector<bool>` `y`, `y[0] = true` may race with `y[1] = true`. — end note]

21.2.3 Sequence containers

[`sequence.reqmts`]

- ¹ A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: `vector`, `forward_list`, `list`, and `deque`. In addition, `array` is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as `stacks` or `queues`, out of the basic sequence container kinds (or out of other kinds of sequence containers that the user might define).
- ² [Note: The sequence containers offer the programmer different complexity trade-offs and should be used accordingly. `vector` is the type of sequence container that should be used by default. `array` should be used when the container has a fixed size known during translation. `list` or `forward_list` should be used when there are frequent insertions and deletions from the middle of the sequence. `deque` is the data structure of choice when most insertions and deletions take place at the beginning or at the end of the sequence. When choosing a container, remember `vector` is best; leave a comment to explain if you choose from the rest! — end note]
- ³ In Tables 66 and 67, `X` denotes a sequence container class, `a` denotes a value of type `X` containing elements of type `T`, `u` denotes the name of a variable being declared, `A` denotes `X::allocator_type` if the *qualified-id*

`X::allocator_type` is valid and denotes a type (12.9.2) and `allocator<T>` if it doesn't, `i` and `j` denote iterators satisfying input iterator requirements and refer to elements implicitly convertible to `value_type`, `[i, j)` denotes a valid range, `il` designates an object of type `initializer_list<value_type>`, `n` denotes a value of type `X::size_type`, `p` denotes a valid constant iterator to `a`, `q` denotes a valid dereferenceable constant iterator to `a`, `[q1, q2)` denotes a valid range of constant iterators in `a`, `t` denotes an lvalue or a const rvalue of `X::value_type`, and `rv` denotes a non-const rvalue of `X::value_type`. `Args` denotes a template parameter pack; `args` denotes a function parameter pack with the pattern `Args&&`.

- ⁴ The complexities of the expressions are sequence dependent.

Table 66 — Sequence container requirements (in addition to container)

Expression	Return type	Assertion/note pre-/post-condition
<code>X(n, t)</code> <code>X u(n, t);</code>		<p><i>Requires:</i> <code>T</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code>.</p> <p><i>Ensures:</i> <code>distance(begin(), end()) == n</code> Constructs a sequence container with <code>n</code> copies of <code>t</code></p>
<code>X(i, j)</code> <code>X u(i, j);</code>		<p><i>Requires:</i> <code>T</code> shall be <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>*i</code>. For <code>vector</code>, if the iterator does not meet the <i>Cpp17ForwardIterator</i> requirements (22.3.5.4), <code>T</code> shall also be <i>Cpp17MoveInsertable</i> into <code>X</code>. Each iterator in the range <code>[i, j)</code> shall be dereferenced exactly once.</p> <p><i>Ensures:</i> <code>distance(begin(), end()) == distance(i, j)</code> Constructs a sequence container equal to the range <code>[i, j)</code></p>
<code>X(il)</code>		Equivalent to <code>X(il.begin(), il.end())</code>
<code>a = il</code>	<code>X&</code>	<p><i>Requires:</i> <code>T</code> is <i>Cpp17CopyInsertable</i> into <code>X</code> and <i>Cpp17CopyAssignable</i>. Assigns the range <code>[il.begin(), il.end())</code> into <code>a</code>. All existing elements of <code>a</code> are either assigned to or destroyed.</p> <p><i>Returns:</i> <code>*this</code>.</p>
<code>a.emplace(p, args)</code>	<code>iterator</code>	<p><i>Requires:</i> <code>T</code> is <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>args</code>. For <code>vector</code> and <code>deque</code>, <code>T</code> is also <i>Cpp17MoveInsertable</i> into <code>X</code> and <i>Cpp17MoveAssignable</i>. <i>Effects:</i> Inserts an object of type <code>T</code> constructed with <code>std::forward<Args>(args)...</code> before <code>p</code>. [Note: <code>args</code> may directly or indirectly refer to a value in <code>a</code>. —end note]</p>
<code>a.insert(p, t)</code>	<code>iterator</code>	<p><i>Requires:</i> <code>T</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code>. For <code>vector</code> and <code>deque</code>, <code>T</code> shall also be <i>Cpp17CopyAssignable</i>. <i>Effects:</i> Inserts a copy of <code>t</code> before <code>p</code>.</p>
<code>a.insert(p, rv)</code>	<code>iterator</code>	<p><i>Requires:</i> <code>T</code> shall be <i>Cpp17MoveInsertable</i> into <code>X</code>. For <code>vector</code> and <code>deque</code>, <code>T</code> shall also be <i>Cpp17MoveAssignable</i>. <i>Effects:</i> Inserts a copy of <code>rv</code> before <code>p</code>.</p>
<code>a.insert(p, n, t)</code>	<code>iterator</code>	<p><i>Requires:</i> <code>T</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code> and <i>Cpp17CopyAssignable</i>. Inserts <code>n</code> copies of <code>t</code> before <code>p</code>.</p>

Table 66 — Sequence container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition
<code>a.insert(p, i, j)</code>	iterator	<p><i>Requires:</i> T shall be <i>Cpp17EmplaceConstructible</i> into X from *i.</p> <p>For <code>vector</code> and <code>deque</code>, T shall also be <i>Cpp17MoveInsertable</i> into X, <i>Cpp17MoveConstructible</i>, <i>Cpp17MoveAssignable</i>, and swappable (15.5.3.2). Each iterator in the range [i, j) shall be dereferenced exactly once.</p> <p><i>Requires:</i> i and j are not iterators into a. Inserts copies of elements in [i, j) before p</p>
<code>a.insert(p, il)</code>	iterator	<code>a.insert(p, il.begin(), il.end())</code> .
<code>a.erase(q)</code>	iterator	<p><i>Requires:</i> For <code>vector</code> and <code>deque</code>, T shall be <i>Cpp17MoveAssignable</i>.</p> <p><i>Effects:</i> Erases the element pointed to by q.</p>
<code>a.erase(q1, q2)</code>	iterator	<p><i>Requires:</i> For <code>vector</code> and <code>deque</code>, T shall be <i>Cpp17MoveAssignable</i>.</p> <p><i>Effects:</i> Erases the elements in the range [q1, q2).</p>
<code>a.clear()</code>	void	<p>Destroys all elements in a. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.</p> <p><i>Ensures:</i> <code>a.empty()</code> returns true.</p> <p><i>Complexity:</i> Linear.</p>
<code>a.assign(i, j)</code>	void	<p><i>Requires:</i> T shall be <i>Cpp17EmplaceConstructible</i> into X from *i and assignable from *i. For <code>vector</code>, if the iterator does not meet the forward iterator requirements (22.3.5.4), T shall also be <i>Cpp17MoveInsertable</i> into X.</p> <p>Each iterator in the range [i, j) shall be dereferenced exactly once.</p> <p><i>Requires:</i> i, j are not iterators into a.</p> <p>Replaces elements in a with a copy of [i, j). Invalidates all references, pointers and iterators referring to the elements of a. For <code>vector</code> and <code>deque</code>, also invalidates the past-the-end iterator.</p>
<code>a.assign(il)</code>	void	<code>a.assign(il.begin(), il.end())</code> .
<code>a.assign(n, t)</code>	void	<p><i>Requires:</i> T shall be <i>Cpp17CopyInsertable</i> into X and <i>Cpp17CopyAssignable</i>.</p> <p><i>Requires:</i> t is not a reference into a.</p> <p>Replaces elements in a with n copies of t. Invalidates all references, pointers and iterators referring to the elements of a. For <code>vector</code> and <code>deque</code>, also invalidates the past-the-end iterator.</p>

⁵ The iterator returned from `a.insert(p, t)` points to the copy of t inserted into a.

⁶ The iterator returned from `a.insert(p, rv)` points to the copy of rv inserted into a.

- 7 The iterator returned from `a.insert(p, n, t)` points to the copy of the first element inserted into `a`, or `p` if `n == 0`.
- 8 The iterator returned from `a.insert(p, i, j)` points to the copy of the first element inserted into `a`, or `p` if `i == j`.
- 9 The iterator returned from `a.insert(p, il)` points to the copy of the first element inserted into `a`, or `p` if `il` is empty.
- 10 The iterator returned from `a.emplace(p, args)` points to the new element constructed from `args` into `a`.
- 11 The iterator returned from `a.erase(q)` points to the element immediately following `q` prior to the element being erased. If no such element exists, `a.end()` is returned.
- 12 The iterator returned by `a.erase(q1, q2)` points to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.
- 13 For every sequence container defined in this Clause and in [Clause 20](#):

(13.1) — If the constructor

```
template<class InputIterator>
X(InputIterator first, InputIterator last,
  const allocator_type& alloc = allocator_type());
```

is called with a type `InputIterator` that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(13.2) — If the member functions of the forms:

```
template<class InputIterator>
return-type F(const_iterator p,
             InputIterator first, InputIterator last);      // such as insert

template<class InputIterator>
return-type F(InputIterator first, InputIterator last);      // such as append, assign

template<class InputIterator>
return-type F(const_iterator i1, const_iterator i2,
             InputIterator first, InputIterator last);      // such as replace
```

are called with a type `InputIterator` that does not qualify as an input iterator, then these functions shall not participate in overload resolution.

(13.3) — A deduction guide for a sequence container shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter, or if it has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

¹⁴ Table 67 lists operations that are provided for some types of sequence containers but not others. An implementation shall provide these operations for all container types shown in the “container” column, and shall implement them so as to take amortized constant time.

Table 67 — Optional sequence container operations

Expression	Return type	Operational semantics	Container
<code>a.front()</code>	reference; const_reference for constant <code>a</code>	<code>*a.begin()</code>	<code>basic_string</code> , <code>array</code> , <code>deque</code> , <code>forward_list</code> , <code>list</code> , <code>vector</code>
<code>a.back()</code>	reference; const_reference for constant <code>a</code>	{ auto tmp = a.end(); --tmp; return *tmp; }	<code>basic_string</code> , <code>array</code> , <code>deque</code> , <code>list</code> , <code>vector</code>

Table 67 — Optional sequence container operations (continued)

Expression	Return type	Operational semantics	Container
<code>a.emplace_< front(args)</code>	reference	Prepends an object of type T constructed with <code>std::forward<Args>(</code> <code>args)....</code> <i>Requires:</i> T shall be <i>Cpp17EmplaceConstructible</i> into X from args. <i>Returns:</i> <code>a.front()</code> .	deque, forward_list, list
<code>a.emplace_< back(args)</code>	reference	Appends an object of type T constructed with <code>std::forward<Args>(</code> <code>args)....</code> <i>Requires:</i> T shall be <i>Cpp17EmplaceConstructible</i> into X from args. For vector, T shall also be <i>Cpp17MoveInsertable</i> into X. <i>Returns:</i> <code>a.back()</code> .	deque, list, vector
<code>a.push_< front(t)</code>	void	Prepends a copy of t. <i>Requires:</i> T shall be <i>Cpp17CopyInsertable</i> into X.	deque, forward_list, list
<code>a.push_< front(rv)</code>	void	Prepends a copy of rv. <i>Requires:</i> T shall be <i>Cpp17MoveInsertable</i> into X.	deque, forward_list, list
<code>a.push_< back(t)</code>	void	Appends a copy of t. <i>Requires:</i> T shall be <i>Cpp17CopyInsertable</i> into X.	basic_string, deque, list, vector
<code>a.push_< back(rv)</code>	void	Appends a copy of rv. <i>Requires:</i> T shall be <i>Cpp17MoveInsertable</i> into X.	basic_string, deque, list, vector
<code>a.pop_< front()</code>	void	Destroys the first element. <i>Requires:</i> <code>a.empty()</code> shall be <code>false</code> .	deque, forward_list, list
<code>a.pop_back()</code>	void	Destroys the last element. <i>Requires:</i> <code>a.empty()</code> shall be <code>false</code> .	basic_string, deque, list, vector
<code>a[n]</code> for constant a	reference; const_reference	<code>*(a.begin() + n)</code>	basic_string, array, deque, vector
<code>a.at(n)</code> for constant a	reference; const_reference	<code>*(a.begin() + n)</code>	basic_string, array, deque, vector

¹⁵ The member function `at()` provides bounds-checked access to container elements. `at()` throws `out_of_range` if `n >= a.size()`.

21.2.4 Node handles

[container.node]

21.2.4.1 Overview

[container.node.overview]

- ¹ A *node handle* is an object that accepts ownership of a single element from an associative container (21.2.6) or an unordered associative container (21.2.7). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 68.
- ² If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.

Table 68 — Container types with compatible nodes

map<K, T, C1, A>	map<K, T, C2, A>
map<K, T, C1, A>	multimap<K, T, C2, A>
set<K, C1, A>	set<K, C2, A>
set<K, C1, A>	multiset<K, C2, A>
unordered_map<K, T, H1, E1, A>	unordered_map<K, T, H2, E2, A>
unordered_map<K, T, H1, E1, A>	unordered_multimap<K, T, H2, E2, A>
unordered_set<K, H1, E1, A>	unordered_set<K, H2, E2, A>
unordered_set<K, H1, E1, A>	unordered_multiset<K, H2, E2, A>

³ Class *node-handle* is for exposition only.

⁴ If a user-defined specialization of *pair* exists for *pair<const Key, T>* or *pair<Key, T>*, where *Key* is the container's *key_type* and *T* is the container's *mapped_type*, the behavior of operations involving node handles is undefined.

```
template<unspecified>
class node-handle {
public:
    // These type declarations are described in Tables 69 and 70.
    using value_type      = see below;           // not present for map containers
    using key_type        = see below;           // not present for set containers
    using mapped_type     = see below;           // not present for set containers
    using allocator_type  = see below;

private:
    using container_node_type = unspecified;
    using ator_traits = allocator_traits<allocator_type>;

    typename ator_traits::rebind_traits<container_node_type>::pointer ptr_;
    optional<allocator_type> alloc_;

public:
    // 21.2.4.2, constructors, copy, and assignment
    constexpr node-handle() noexcept : ptr_(), alloc_() {}
    node-handle(node-handle&&) noexcept;
    node-handle& operator=(node-handle&&);

    // 21.2.4.3, destructor
    ~node-handle();

    // 21.2.4.4, observers
    value_type& value() const;                  // not present for map containers
    key_type& key() const;                     // not present for set containers
    mapped_type& mapped() const;               // not present for set containers

    allocator_type get_allocator() const;
    explicit operator bool() const noexcept;
    [[nodiscard]] bool empty() const noexcept;

    // 21.2.4.5, modifiers
    void swap(node-handle&)
        noexcept(ator_traits::propagate_on_container_swap::value ||
                  ator_traits::is_always_equal::value);

    friend void swap(node-handle& x, node-handle& y) noexcept(noexcept(x.swap(y))) {
        x.swap(y);
    }
};
```

21.2.4.2 Constructors, copy, and assignment

[container.node.cons]

```
node_handle(node_handle&& nh) noexcept;
```

1 *Effects:* Constructs a `node_handle` object initializing `ptr_` with `nh.ptr_`. Move constructs `alloc_` with `nh.alloc_`. Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

```
node_handle& operator=(node_handle&& nh);
```

2 *Requires:* Either `!alloc_`, or `ator_traits::propagate_on_container_move_assignment` is `true`, or `alloc_ == nh.alloc_`.

3 *Effects:*

(3.1) — If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::rebind_traits<container_node_type>::deallocate`.

(3.2) — Assigns `nh.ptr_` to `ptr_`.

(3.3) — If `!alloc_` or `ator_traits::propagate_on_container_move_assignment` is `true`, move assigns `nh.alloc_` to `alloc_`.

(3.4) — Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

4 *Returns:* `*this`.

5 *Throws:* Nothing.

21.2.4.3 Destructor

[container.node.dtor]

```
~node_handle();
```

1 *Effects:* If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::rebind_traits<container_node_type>::deallocate`.

21.2.4.4 Observers

[container.node.observers]

```
value_type& value() const;
```

1 *Requires:* `empty() == false`.

2 *Returns:* A reference to the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

3 *Throws:* Nothing.

```
key_type& key() const;
```

4 *Requires:* `empty() == false`.

5 *Returns:* A non-const reference to the `key_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

6 *Throws:* Nothing.

7 *Remarks:* Modifying the key through the returned reference is permitted.

```
mapped_type& mapped() const;
```

8 *Requires:* `empty() == false`.

9 *Returns:* A reference to the `mapped_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

10 *Throws:* Nothing.

```
allocator_type get_allocator() const;
```

11 *Requires:* `empty() == false`.

12 *Returns:* `*alloc_`.

13 *Throws:* Nothing.

```

    explicit operator bool() const noexcept;
14     Returns: ptr_ != nullptr.

    [[nodiscard]] bool empty() const noexcept;
15     Returns: ptr_ == nullptr.

```

21.2.4.5 Modifiers

[container.node.modifiers]

```

void swap(node_handle& nh)
    noexcept(ator_traits::propagate_on_container_swap::value ||
              ator_traits::is_always_equal::value);

```

¹ *Requires:* !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap is true, or alloc_ == nh.alloc_.

² *Effects:* Calls swap(ptr_, nh.ptr_). If !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap is true calls swap(alloc_, nh.alloc_).

21.2.5 Insert return type

[container.insert.return]

¹ The associative containers with unique keys and the unordered containers with unique keys have a member function `insert` that returns a nested type `insert_return_type`. That return type is a specialization of the template specified in this subclause.

```

template<class Iterator, class NodeType>
struct insert-return-type
{
    Iterator position;
    bool inserted;
    NodeType node;
};

```

² The name `insert-return-type` is exposition only. `insert-return-type` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

21.2.6 Associative containers

[associative.reqmts]

¹ Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: `set`, `multiset`, `map` and `multimap`.

² Each associative container is parameterized on `Key` and an ordering relation `Compare` that induces a strict weak ordering (24.7) on elements of `Key`. In addition, `map` and `multimap` associate an arbitrary *mapped type* `T` with the `Key`. The object of type `Compare` is called the *comparison object* of a container.

³ The phrase “equivalence of keys” means the equivalence relation imposed by the comparison object. That is, two keys `k1` and `k2` are considered to be equivalent if for the comparison object `comp`, `comp(k1, k2) == false && comp(k2, k1) == false`. [Note: This is not necessarily the same as the result of `k1 == k2`. — end note] For any two keys `k1` and `k2` in the same container, calling `comp(k1, k2)` shall always return the same value.

⁴ An associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. The `set` and `map` classes support unique keys; the `multiset` and `multimap` classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.

⁵ For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`.

⁶ `iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type. [Note: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — end note]

⁷ The associative containers meet all the requirements of Allocator-aware containers (21.2.1), except that for `map` and `multimap`, the requirements placed on `value_type` in Table 65 apply instead to `key_type`

and `mapped_type`. [Note: For example, in some cases `key_type` and `mapped_type` are required to be `Cpp17CopyAssignable` even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not `Cpp17CopyAssignable`. — end note]

- ⁸ In Table 69, X denotes an associative container class, a denotes a value of type X, a2 denotes a value of a type with nodes compatible with type X (Table 68), b denotes a possibly `const` value of type X, u denotes the name of a variable being declared, `a_uniq` denotes a value of type X when X supports unique keys, `a_eq` denotes a value of type X when X supports multiple keys, `a_tran` denotes a possibly `const` value of type X when the *qualified-id* `X::key_compare::is_transparent` is valid and denotes a type (12.9.2), i and j satisfy input iterator requirements and refer to elements implicitly convertible to `value_type`, [i, j) denotes a valid range, p denotes a valid constant iterator to a, q denotes a valid dereferenceable constant iterator to a, r denotes a valid dereferenceable iterator to a, [q1, q2) denotes a valid range of constant iterators in a, il designates an object of type `initializer_list<value_type>`, t denotes a value of type `X::value_type`, k denotes a value of type `X::key_type` and c denotes a possibly `const` value of type `X::key_compare`; kl is a value such that a is partitioned (24.7) with respect to `c(r, kl)`, with r the key value of e and e in a; ku is a value such that a is partitioned with respect to `!c(ku, r)`; ke is a value such that a is partitioned with respect to `c(r, ke)` and `!c(ke, r)`, with `c(r, ke)` implying `!c(ke, r)`. A denotes the storage allocator used by X, if any, or `allocator<X::value_type>` otherwise, m denotes an allocator of a type convertible to A, and nh denotes a non-const rvalue of type `X::node_type`.

Table 69 — Associative container requirements (in addition to container)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>X::key_type</code>	Key		compile time
<code>X::mapped_ - type (map and multimap only)</code>	T		compile time
<code>X::value_ - type (set and multiset only)</code>	Key	<i>Requires:</i> <code>value_type</code> is <code>Cpp17Erasable</code> from X	compile time
<code>X::value_ - type (map and multimap only)</code>	<code>pair<const Key, T></code>	<i>Requires:</i> <code>value_type</code> is <code>Cpp17Erasable</code> from X	compile time
<code>X::key_ - compare</code>	Compare	<i>Requires:</i> <code>key_compare</code> is <code>Cpp17CopyConstructible</code> .	compile time
<code>X::value_ - compare</code>	a binary predicate type	is the same as <code>key_compare</code> for <code>set</code> and <code>multiset</code> ; is an ordering relation on pairs induced by the first component (i.e., <code>Key</code>) for <code>map</code> and <code>multimap</code> .	compile time
<code>X::node_ - type</code>	a specialization of a <i>node-handle</i> class template, such that the public nested types are the same types as the corresponding types in X.	see 21.2.4	compile time

Table 69 — Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
X(c) X u(c);		<i>Effects:</i> Constructs an empty container. Uses a copy of c as a comparison object.	constant
X() X u;		<i>Requires:</i> key_compare is Cpp17DefaultConstructible. <i>Effects:</i> Constructs an empty container. Uses Compare() as a comparison object	constant
X(i,j,c) X u(i,j,c);		<i>Requires:</i> value_type is Cpp17EmplaceConstructible into X from *i. <i>Effects:</i> Constructs an empty container and inserts elements from the range [i, j) into it; uses c as a comparison object.	$N \log N$ in general, where N has the value distance(i, j); linear if [i, j) is sorted with value_comp()
X(i,j) X u(i,j);		<i>Requires:</i> key_compare is Cpp17DefaultConstructible. value_type is Cpp17EmplaceConstructible into X from *i. <i>Effects:</i> Same as above, but uses Compare() as a comparison object.	same as above
X(il)		same as X(il.begin(), il.end())	same as X(il.begin(), il.end())
X(il,c)		same as X(il.begin(), il.end(), c)	same as X(il.begin(), il.end(), c)
a = il	X&	<i>Requires:</i> value_type is Cpp17CopyInsertable into X and Cpp17CopyAssignable. <i>Effects:</i> Assigns the range [il.begin(), il.end()) into a. All existing elements of a are either assigned to or destroyed.	$N \log N$ in general, where N has the value il.size() + a.size(); linear if [il.begin(), il.end()) is sorted with value_comp()
b.key_- comp()	X::key_- compare	returns the comparison object out of which b was constructed.	constant
b.value_- comp()	X::value_- compare	returns an object of value_compare constructed out of the comparison object	constant

Table 69 — Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a_uniq. emplace(args)</code>	<code>pair< iterator, bool></code>	<p><i>Requires:</i> <code>value_type</code> shall be <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>args</code>.</p> <p><i>Effects:</i> Inserts a <code>value_type</code> object <code>t</code> constructed with <code>std::forward<Args>(args)...</code> if and only if there is no element in the container with key equivalent to the key of <code>t</code>. The <code>bool</code> component of the returned pair is <code>true</code> if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of <code>t</code>.</p>	logarithmic
<code>a_eq. emplace(args)</code>	<code>iterator</code>	<p><i>Requires:</i> <code>value_type</code> shall be <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>args</code>.</p> <p><i>Effects:</i> Inserts a <code>value_type</code> object <code>t</code> constructed with <code>std::forward<Args>(args)...</code> and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to <code>t</code> exists in <code>a_eq</code>, <code>t</code> is inserted at the end of that range.</p>	logarithmic
<code>a.emplace_< hint(p, args)</code>	<code>iterator</code>	equivalent to <code>a.emplace(std::forward<Args>(args)...)</code> . Return value is an iterator pointing to the element with the key equivalent to the newly inserted element. The element is inserted as close as possible to the position just prior to <code>p</code> .	logarithmic in general, but amortized constant if the element is inserted right before <code>p</code>
<code>a_uniq. insert(t)</code>	<code>pair< iterator, bool></code>	<p><i>Requires:</i> If <code>t</code> is a non-const rvalue, <code>value_type</code> shall be <i>Cpp17MoveInsertable</i> into <code>X</code>; otherwise, <code>value_type</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code>.</p> <p><i>Effects:</i> Inserts <code>t</code> if and only if there is no element in the container with key equivalent to the key of <code>t</code>. The <code>bool</code> component of the returned pair is <code>true</code> if and only if the insertion takes place, and the <code>iterator</code> component of the pair points to the element with key equivalent to the key of <code>t</code>.</p>	logarithmic

Table 69 — Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a_eq. insert(t)</code>	iterator	<p><i>Requires:</i> If <code>t</code> is a non-const rvalue, <code>value_type</code> shall be <i>Cpp17MoveInsertable</i> into <code>X</code>; otherwise, <code>value_type</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code>.</p> <p><i>Effects:</i> Inserts <code>t</code> and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to <code>t</code> exists in <code>a_eq</code>, <code>t</code> is inserted at the end of that range.</p>	logarithmic
<code>a.insert(p, t)</code>	iterator	<p><i>Requires:</i> If <code>t</code> is a non-const rvalue, <code>value_type</code> shall be <i>Cpp17MoveInsertable</i> into <code>X</code>; otherwise, <code>value_type</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code>.</p> <p><i>Effects:</i> Inserts <code>t</code> if and only if there is no element with key equivalent to the key of <code>t</code> in containers with unique keys; always inserts <code>t</code> in containers with equivalent keys. Always returns the iterator pointing to the element with key equivalent to the key of <code>t</code>. <code>t</code> is inserted as close as possible to the position just prior to <code>p</code>.</p>	logarithmic in general, but amortized constant if <code>t</code> is inserted right before <code>p</code> .
<code>a.insert(i, j)</code>	void	<p><i>Requires:</i> <code>value_type</code> shall be <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>*i</code>.</p> <p><i>Requires:</i> <code>i, j</code> are not iterators into <code>a</code>. inserts each element from the range <code>[i, j]</code> if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.</p>	$N \log(a.size() + N)$, where N has the value <code>distance(i, j)</code>
<code>a.insert(il)</code>	void	equivalent to <code>a.insert(il.begin(), il.end())</code>	

Table 69 — Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a_uniq. insert(nh)</code>	<code>insert_- return_type</code>	<p><i>Requires:</i> nh is empty or <code>a_uniq.get_allocator() ==</code> <code>nh.get_allocator()</code>.</p> <p><i>Effects:</i> If nh is empty, has no effect. Otherwise, inserts the element owned by nh if and only if there is no element in the container with a key equivalent to <code>nh.key()</code>.</p> <p><i>Ensures:</i> If nh is empty, <code>inserted</code> is <code>false</code>, <code>position</code> is <code>end()</code>, and <code>node</code> is empty. Otherwise if the insertion took place, <code>inserted</code> is <code>true</code>, <code>position</code> points to the inserted element, and <code>node</code> is empty; if the insertion failed, <code>inserted</code> is <code>false</code>, <code>node</code> has the previous value of nh, and <code>position</code> points to an element with a key equivalent to <code>nh.key()</code>.</p>	logarithmic
<code>a_eq. insert(nh)</code>	<code>iterator</code>	<p><i>Requires:</i> nh is empty or <code>a_eq.get_allocator() ==</code> <code>nh.get_allocator()</code>.</p> <p><i>Effects:</i> If nh is empty, has no effect and returns <code>a_eq.end()</code>. Otherwise, inserts the element owned by nh and returns an iterator pointing to the newly inserted element. If a range containing elements with keys equivalent to <code>nh.key()</code> exists in <code>a_eq</code>, the element is inserted at the end of that range.</p> <p><i>Ensures:</i> nh is empty.</p>	logarithmic

Table 69 — Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a.insert(p, nh)</code>	iterator	<p><i>Requires:</i> <code>nh</code> is empty or <code>a.get_allocator() == nh.get_allocator()</code>.</p> <p><i>Effects:</i> If <code>nh</code> is empty, has no effect and returns <code>a.end()</code>. Otherwise, inserts the element owned by <code>nh</code> if and only if there is no element with key equivalent to <code>nh.key()</code> in containers with unique keys; always inserts the element owned by <code>nh</code> in containers with equivalent keys. Always returns the iterator pointing to the element with key equivalent to <code>nh.key()</code>. The element is inserted as close as possible to the position just prior to <code>p</code>.</p> <p><i>Ensures:</i> <code>nh</code> is empty if insertion succeeds, unchanged if insertion fails.</p>	logarithmic in general, but amortized constant if the element is inserted right before <code>p</code> .
<code>a.extract(k)</code>	<code>node_type</code>	removes the first element in the container with key equivalent to <code>k</code> . Returns a <code>node_type</code> owning the element if found, otherwise an empty <code>node_type</code> .	$\log(a.size())$
<code>a.extract(q)</code>	<code>node_type</code>	removes the element pointed to by <code>q</code> . Returns a <code>node_type</code> owning that element.	amortized constant
<code>a.merge(a2)</code>	void	<p><i>Requires:</i> <code>a.get_allocator() == a2.get_allocator()</code>.</p> <p>Attempts to extract each element in <code>a2</code> and insert it into <code>a</code> using the comparison object of <code>a</code>. In containers with unique keys, if there is an element in <code>a</code> with key equivalent to the key of an element from <code>a2</code>, then that element is not extracted from <code>a2</code>.</p> <p><i>Ensures:</i> Pointers and references to the transferred elements of <code>a2</code> refer to those same elements but as members of <code>a</code>. Iterators referring to the transferred elements will continue to refer to their elements, but they now behave as iterators into <code>a</code>, not into <code>a2</code>.</p> <p><i>Throws:</i> Nothing unless the comparison object throws.</p>	$N \log(a.size() + N)$, where N has the value <code>a2.size()</code> .

Table 69 — Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a.erase(k)</code>	<code>size_type</code>	erases all elements in the container with key equivalent to <code>k</code> . Returns the number of erased elements.	$\log(a.size()) + a.count(k)$
<code>a.erase(q)</code>	<code>iterator</code>	erases the element pointed to by <code>q</code> . Returns an iterator pointing to the element immediately following <code>q</code> prior to the element being erased. If no such element exists, returns <code>a.end()</code> .	amortized constant
<code>a.erase(r)</code>	<code>iterator</code>	erases the element pointed to by <code>r</code> . Returns an iterator pointing to the element immediately following <code>r</code> prior to the element being erased. If no such element exists, returns <code>a.end()</code> .	amortized constant
<code>a.erase(q1, q2)</code>	<code>iterator</code>	erases all the elements in the range $[q_1, q_2]$. Returns an iterator pointing to the element pointed to by <code>q2</code> prior to any elements being erased. If no such element exists, <code>a.end()</code> is returned.	$\log(a.size()) + N$, where N has the value <code>distance(q1, q2)</code> .
<code>a.clear()</code>	<code>void</code>	<code>a.erase(a.begin(), a.end())</code> <i>Ensures:</i> <code>a.empty()</code> returns <code>true</code> .	linear in <code>a.size()</code> .
<code>b.find(k)</code>	<code>iterator;</code> <code>const_ -</code> <code>iterator for</code> <code>constant b.</code>	returns an iterator pointing to an element with the key equivalent to <code>k</code> , or <code>b.end()</code> if such an element is not found	logarithmic
<code>a_tran.</code> <code>find(ke)</code>	<code>iterator;</code> <code>const_ -</code> <code>iterator for</code> <code>constant</code> <code>a_tran.</code>	returns an iterator pointing to an element with key <code>r</code> such that <code>!c(r, ke) && !c(ke, r)</code> , or <code>a_tran.end()</code> if such an element is not found	logarithmic
<code>b.count(k)</code>	<code>size_type</code>	returns the number of elements with key equivalent to <code>k</code>	$\log(b.size()) + b.count(k)$
<code>a_tran.</code> <code>count(ke)</code>	<code>size_type</code>	returns the number of elements with key <code>r</code> such that <code>!c(r, ke) && !c(ke, r)</code>	$\log(a_tran.size()) + a_tran.count(ke)$
<code>b.</code> <code>contains(k)</code>	<code>bool</code>	equivalent to <code>b.find(k) != b.end()</code>	logarithmic
<code>a_tran.</code> <code>contains(ke)</code>	<code>bool</code>	equivalent to <code>a_tran.find(ke) != a_tran.end()</code>	logarithmic
<code>b.lower_-</code> <code>bound(k)</code>	<code>iterator;</code> <code>const_ -</code> <code>iterator for</code> <code>constant b.</code>	returns an iterator pointing to the first element with key not less than <code>k</code> , or <code>b.end()</code> if such an element is not found.	logarithmic

Table 69 — Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
a_tran. lower_- bound(kl)	iterator; const_- iterator for constant a_tran.	returns an iterator pointing to the first element with key r such that !c(r, kl), or a_tran.end() if such an element is not found.	logarithmic
b.upper_- bound(k)	iterator; const_- iterator for constant b.	returns an iterator pointing to the first element with key greater than k, or b.end() if such an element is not found.	logarithmic
a_tran. upper_- bound(ku)	iterator; const_- iterator for constant a_tran.	returns an iterator pointing to the first element with key r such that c(ku, r), or a_tran.end() if such an element is not found.	logarithmic
b.equal_- range(k)	pair< iterator, iterator>; pair<const_- iterator, const_- iterator> for constant b.	equivalent to make_- pair(b.lower_bound(k), b.upper_bound(k)).	logarithmic
a_tran. equal_- range(ke)	pair< iterator, iterator>; pair<const_- iterator, const_- iterator> for constant a_tran.	equivalent to make_pair(a_tran.lower_bound(ke), a_tran.upper_bound(ke)).	logarithmic

- ⁹ The `insert` and `emplace` members shall not affect the validity of iterators and references to the container, and the `erase` members shall invalidate only iterators and references to the erased elements.
- ¹⁰ The `extract` members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is undefined behavior. References and pointers to an element obtained while it is owned by a `node_type` are invalidated if the element is successfully inserted.
- ¹¹ The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators `i` and `j` such that distance from `i` to `j` is positive, the following condition holds:

```
value_comp(*j, *i) == false
```
- ¹² For associative containers with unique keys the stronger condition holds:

```
value_comp(*i, *j) != false
```
- ¹³ When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, either through a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.

- ¹⁴ The member function templates `find`, `count`, `contains`, `lower_bound`, `upper_bound`, and `equal_range` shall not participate in overload resolution unless the *qualified-id* `Compare::is_transparent` is valid and denotes a type (12.9.2).
- ¹⁵ A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:
- (15.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
 - (15.2) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.
 - (15.3) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

21.2.6.1 Exception safety guarantees

[`associative.reqmts.exception`]

- ¹ For associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Compare` object (if any).
- ² For associative containers, if an exception is thrown by any operation from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.
- ³ For associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Compare` object (if any).

21.2.7 Unordered associative containers

[`unord.req`]

- ¹ Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: `unordered_set`, `unordered_map`, `unordered_multiset`, and `unordered_multimap`.
- ² Unordered associative containers conform to the requirements for Containers (21.2), except that the expressions `a == b` and `a != b` have different semantics than for the other container types.
- ³ Each unordered associative container is parameterized by `Key`, by a function object type `Hash` that meets the *Cpp17Hash* requirements (15.5.3.4) and acts as a hash function for argument values of type `Key`, and by a binary predicate `Pred` that induces an equivalence relation on values of type `Key`. Additionally, `unordered_map` and `unordered_multimap` associate an arbitrary *mapped type* `T` with the `Key`.
- ⁴ The container's object of type `Hash` — denoted by `hash` — is called the *hash function* of the container. The container's object of type `Pred` — denoted by `pred` — is called the *key equality predicate* of the container.
- ⁵ Two values `k1` and `k2` are considered equivalent if the container's key equality predicate `pred(k1, k2)` is valid and returns `true` when passed those values. If `k1` and `k2` are equivalent, the container's hash function shall return the same value for both. [Note: Thus, when an unordered associative container is instantiated with a non-default `Pred` parameter it usually needs a non-default `Hash` parameter as well. —end note] For any two keys `k1` and `k2` in the same container, calling `pred(k1, k2)` shall always return the same value. For any key `k` in a container, calling `hash(k)` shall always return the same value.
- ⁶ An unordered associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. `unordered_set` and `unordered_map` support unique keys. `unordered_multiset` and `unordered_multimap` support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into *equivalent-key groups* such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.
- ⁷ For `unordered_set` and `unordered_multiset` the value type is the same as the key type. For `unordered_map` and `unordered_multimap` it is `pair<const Key, T>`.
- ⁸ For unordered containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type. [Note: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. —end note]

- ⁹ The elements of an unordered associative container are organized into *buckets*. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For `unordered_multiset` and `unordered_multimap`, rehashing preserves the relative ordering of equivalent elements.
- ¹⁰ The unordered associative containers meet all the requirements of Allocator-aware containers (21.2.1), except that for `unordered_map` and `unordered_multimap`, the requirements placed on `value_type` in Table 65 apply instead to `key_type` and `mapped_type`. [Note: For example, `key_type` and `mapped_type` are sometimes required to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*. — end note]

¹¹ In Table 70:

- (11.1) — X denotes an unordered associative container class,
- (11.2) — a denotes a value of type X ,
- (11.3) — a_2 denotes a value of a type with nodes compatible with type X (Table 68),
- (11.4) — b denotes a possibly const value of type X ,
- (11.5) — a_{uniq} denotes a value of type X when X supports unique keys,
- (11.6) — a_{eq} denotes a value of type X when X supports equivalent keys,
- (11.7) — a_{tran} denotes a possibly const value of type X when the *qualified-id* $X::\text{hasher}::\text{transparent_key_equal}$ is valid and denotes a type (12.9.2),
- (11.8) — i and j denote input iterators that refer to `value_type`,
- (11.9) — $[i, j)$ denotes a valid range,
- (11.10) — p and q_2 denote valid constant iterators to a ,
- (11.11) — q and q_1 denote valid dereferenceable constant iterators to a ,
- (11.12) — r denotes a valid dereferenceable iterator to a ,
- (11.13) — $[q_1, q_2)$ denotes a valid range in a ,
- (11.14) — il denotes a value of type `initializer_list<value_type>`,
- (11.15) — t denotes a value of type $X::\text{value_type}$,
- (11.16) — k denotes a value of type `key_type`,
- (11.17) — hf denotes a possibly const value of type `hasher`,
- (11.18) — eq denotes a possibly const value of type `key_equal`,
- (11.19) — ke is a value such that
 - (11.19.1) — $\text{eq}(r_1, ke) == \text{eq}(ke, r_1)$
 - (11.19.2) — $hf(r_1) == hf(ke)$ if $\text{eq}(r_1, ke)$ is true, and
 - (11.19.3) — $(\text{eq}(r_1, ke) \&& \text{eq}(r_1, r_2)) == \text{eq}(r_2, ke)$
where r_1 and r_2 are keys of elements in a_{tran} ,
- (11.20) — n denotes a value of type `size_type`,
- (11.21) — z denotes a value of type `float`, and
- (11.22) — nh denotes a non-const rvalue of type $X::\text{node_type}$.

Table 70 — Unordered associative container requirements (in addition to container)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
X::key_type	Hash::transparent_- key_equal if such a <i>qualified-id</i> is valid and denotes a type (12.9.2); otherwise, Pred.		compile time
X::mapped_type (unordered_map and unordered_multimap only)	T		compile time
X::value_type (unordered_set and unordered_multiset only)	Key	Requires: value_type is Cpp17Erasable from X	compile time
X::value_type (unordered_map and unordered_multimap only)	pair<const Key, T>	Requires: value_type is Cpp17Erasable from X	compile time
X::hasher	Hash	Hash shall be a unary function object type such that the expression hf(k) has type size_t.	compile time
X::key_equal	Hash::transparent_- key_equal if such a <i>qualified-id</i> is valid and denotes a type (12.9.2); otherwise, Pred.	Requires: Pred is Cpp17CopyConstructible. Pred shall be a binary predicate that takes two arguments of type Key. Pred is an equivalence relation.	compile time
X::local_iterator	An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::iterator's.	A local_iterator object may be used to iterate through a single bucket, but may not be used to iterate across buckets.	compile time
X::const_local_ - iterator	An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::const_iterator's.	A const_local_iterator object may be used to iterate through a single bucket, but may not be used to iterate across buckets.	compile time
X::node_type	a specialization of a <i>node-handle</i> class template, such that the public nested types are the same types as the corresponding types in X.	see 21.2.4	compile time
X(n, hf, eq) X a(n, hf, eq);	X	Effects: Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate.	$\mathcal{O}(n)$

Table 70 — Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>X(n, hf) X a(n, hf);</code>	<code>X</code>	<i>Requires:</i> <code>key_equal</code> is <i>Cpp17DefaultConstructible</i> . <i>Effects:</i> Constructs an empty container with at least <code>n</code> buckets, using <code>hf</code> as the hash function and <code>key_equal()</code> as the key equality predicate.	$\mathcal{O}(n)$
<code>X(n) X a(n);</code>	<code>X</code>	<i>Requires:</i> <code>hasher</code> and <code>key_equal</code> are <i>Cpp17DefaultConstructible</i> . <i>Effects:</i> Constructs an empty container with at least <code>n</code> buckets, using <code>hasher()</code> as the hash function and <code>key_equal()</code> as the key equality predicate.	$\mathcal{O}(n)$
<code>X() X a;</code>	<code>X</code>	<i>Requires:</i> <code>hasher</code> and <code>key_equal</code> are <i>Cpp17DefaultConstructible</i> . <i>Effects:</i> Constructs an empty container with an unspecified number of buckets, using <code>hasher()</code> as the hash function and <code>key_equal()</code> as the key equality predicate.	constant
<code>X(i, j, n, hf, eq) X a(i, j, n, hf, eq);</code>	<code>X</code>	<i>Requires:</i> <code>value_type</code> is <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>*i</code> . <i>Effects:</i> Constructs an empty container with at least <code>n</code> buckets, using <code>hf</code> as the hash function and <code>eq</code> as the key equality predicate, and inserts elements from <code>[i, j)</code> into it.	Average case $\mathcal{O}(N)$ (N is <code>distance(i, j)</code>), worst case $\mathcal{O}(N^2)$
<code>X(i, j, n, hf) X a(i, j, n, hf);</code>	<code>X</code>	<i>Requires:</i> <code>key_equal</code> is <i>Cpp17DefaultConstructible</i> . <code>value_type</code> is <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>*i</code> . <i>Effects:</i> Constructs an empty container with at least <code>n</code> buckets, using <code>hf</code> as the hash function and <code>key_equal()</code> as the key equality predicate, and inserts elements from <code>[i, j)</code> into it.	Average case $\mathcal{O}(N)$ (N is <code>distance(i, j)</code>), worst case $\mathcal{O}(N^2)$

Table 70 — Unordered associative container requirements (in addition to container) (continued)

<code>X(i, j, n)</code> <code>X a(i, j, n);</code>	<code>X</code>	<p><i>Requires:</i> <code>hasher</code> and <code>key_equal</code> are <i>Cpp17DefaultConstructible</i>. <code>value_type</code> is <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>*i</code>.</p> <p><i>Effects:</i> Constructs an empty container with at least <code>n</code> buckets, using <code>hasher()</code> as the hash function and <code>key_equal()</code> as the key equality predicate, and inserts elements from <code>[i, j)</code> into it.</p>	Average case $\mathcal{O}(N)$ (<code>N</code> is <code>distance(i, j)</code>), worst case $\mathcal{O}(N^2)$
<code>X(i, j)</code> <code>X a(i, j);</code>	<code>X</code>	<p><i>Requires:</i> <code>hasher</code> and <code>key_equal</code> are <i>Cpp17DefaultConstructible</i>. <code>value_type</code> is <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>*i</code>.</p> <p><i>Effects:</i> Constructs an empty container with an unspecified number of buckets, using <code>hasher()</code> as the hash function and <code>key_equal()</code> as the key equality predicate, and inserts elements from <code>[i, j)</code> into it.</p>	Average case $\mathcal{O}(N)$ (<code>N</code> is <code>distance(i, j)</code>), worst case $\mathcal{O}(N^2)$
<code>X(il)</code>	<code>X</code>	Same as <code>X(il.begin(), il.end())</code> .	Same as <code>X(il.begin(), il.end())</code> .
<code>X(il, n)</code>	<code>X</code>	Same as <code>X(il.begin(), il.end(), n)</code> .	Same as <code>X(il.begin(), il.end(), n)</code> .
<code>X(il, n, hf)</code>	<code>X</code>	Same as <code>X(il.begin(), il.end(), n, hf)</code> .	Same as <code>X(il.begin(), il.end(), n, hf)</code> .
<code>X(il, n, hf, eq)</code>	<code>X</code>	Same as <code>X(il.begin(), il.end(), n, hf, eq)</code> .	Same as <code>X(il.begin(), il.end(), n, hf, eq)</code> .
<code>X(b)</code> <code>X a(b);</code>	<code>X</code>	Copy constructor. In addition to the requirements of Table 62, copies the hash function, predicate, and maximum load factor.	Average case linear in <code>b.size()</code> , worst case quadratic.
<code>a = b</code>	<code>X&</code>	Copy assignment operator. In addition to the requirements of Table 62, copies the hash function, predicate, and maximum load factor.	Average case linear in <code>b.size()</code> , worst case quadratic.

Table 70 — Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a = il</code>	<code>X&</code>	<p><i>Requires:</i> <code>value_type</code> is <i>Cpp17CopyInsertable</i> into <code>X</code> and <i>Cpp17CopyAssignable</i>.</p> <p><i>Effects:</i> Assigns the range <code>[il.begin(), il.end()]</code> into <code>a</code>. All existing elements of <code>a</code> are either assigned to or destroyed.</p>	Same as <code>a = X(il)</code> .
<code>b.hash_function()</code>	<code>hasher</code>	Returns <code>b</code> 's hash function.	constant
<code>b.key_eq()</code>	<code>key_equal</code>	Returns <code>b</code> 's key equality predicate.	constant
<code>a_uniq. emplace(args)</code>	<code>pair<iterator, bool></code>	<p><i>Requires:</i> <code>value_type</code> shall be <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>args</code>.</p> <p><i>Effects:</i> Inserts a <code>value_type</code> object <code>t</code> constructed with <code>std::forward<Args>(args)...</code> if and only if there is no element in the container with key equivalent to the key of <code>t</code>. The <code>bool</code> component of the returned pair is <code>true</code> if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of <code>t</code>.</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_size())$.
<code>a_eq.emplace(args)</code>	<code>iterator</code>	<p><i>Requires:</i> <code>value_type</code> shall be <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>args</code>.</p> <p><i>Effects:</i> Inserts a <code>value_type</code> object <code>t</code> constructed with <code>std::forward<Args>(args)...</code> and returns the iterator pointing to the newly inserted element.</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_size())$.
<code>a.emplace_hint(p, args)</code>	<code>iterator</code>	<p><i>Requires:</i> <code>value_type</code> shall be <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>args</code>.</p> <p><i>Effects:</i> Equivalent to <code>a.emplace(std::forward<Args>(args)...)</code>. Return value is an iterator pointing to the element with the key equivalent to the newly inserted element. The <code>const_iterator p</code> is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

Table 70 — Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a_uniq.insert(t)</code>	<code>pair<iterator, bool></code>	<p><i>Requires:</i> If <code>t</code> is a non-const rvalue, <code>value_type</code> shall be <i>Cpp17MoveInsertable</i> into <code>X</code>; otherwise, <code>value_type</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code>.</p> <p><i>Effects:</i> Inserts <code>t</code> if and only if there is no element in the container with key equivalent to the key of <code>t</code>. The <code>bool</code> component of the returned pair indicates whether the insertion takes place, and the <code>iterator</code> component points to the element with key equivalent to the key of <code>t</code>.</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_size())$.
<code>a_eq.insert(t)</code>	<code>iterator</code>	<p><i>Requires:</i> If <code>t</code> is a non-const rvalue, <code>value_type</code> shall be <i>Cpp17MoveInsertable</i> into <code>X</code>; otherwise, <code>value_type</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code>.</p> <p><i>Effects:</i> Inserts <code>t</code>, and returns an iterator pointing to the newly inserted element.</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_size())$.
<code>a.insert(p, t)</code>	<code>iterator</code>	<p><i>Requires:</i> If <code>t</code> is a non-const rvalue, <code>value_type</code> shall be <i>Cpp17MoveInsertable</i> into <code>X</code>; otherwise, <code>value_type</code> shall be <i>Cpp17CopyInsertable</i> into <code>X</code>.</p> <p><i>Effects:</i> Equivalent to <code>a.insert(t)</code>. Return value is an iterator pointing to the element with the key equivalent to that of <code>t</code>. The iterator <code>p</code> is a hint pointing to where the search should start.</p> <p>Implementations are permitted to ignore the hint.</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.
<code>a.insert(i, j)</code>	<code>void</code>	<p><i>Requires:</i> <code>value_type</code> shall be <i>Cpp17EmplaceConstructible</i> into <code>X</code> from <code>*i</code>.</p> <p><i>Requires:</i> <code>i</code> and <code>j</code> are not iterators in <code>a</code>.</p> <p><i>Effects:</i> Equivalent to <code>a.insert(t)</code> for each element in $[i, j]$.</p>	Average case $\mathcal{O}(N)$, where N is <code>distance(i, j)</code> . Worst case $\mathcal{O}(N(a.size() + 1))$.
<code>a.insert(il)</code>	<code>void</code>	Same as <code>a.insert(il.begin(), il.end())</code> .	Same as <code>a.insert(il.begin(), il.end())</code> .

Table 70 — Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
a_uniq. insert(nh)	insert_return_type	<p><i>Requires:</i> nh is empty or a_uniq.get_allocator() == nh.get_allocator().</p> <p><i>Effects:</i> If nh is empty, has no effect. Otherwise, inserts the element owned by nh if and only if there is no element in the container with a key equivalent to nh.key().</p> <p><i>Ensures:</i> If nh is empty, inserted is false, position is end(), and node is empty. Otherwise if the insertion took place, inserted is true, position points to the inserted element, and node is empty; if the insertion failed, inserted is false, node has the previous value of nh, and position points to an element with a key equivalent to nh.key().</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_{\text{uniq}}.size())$.
a_eq. insert(nh)	iterator	<p><i>Requires:</i> nh is empty or a_eq.get_allocator() == nh.get_allocator().</p> <p><i>Effects:</i> If nh is empty, has no effect and returns a_eq.end(). Otherwise, inserts the element owned by nh and returns an iterator pointing to the newly inserted element.</p> <p><i>Ensures:</i> nh is empty.</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_{\text{eq}}.size())$.

Table 70 — Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a.insert(q, nh)</code>	iterator	<p><i>Requires:</i> <code>nh</code> is empty or <code>a.get_allocator() == nh.get_allocator()</code>.</p> <p><i>Effects:</i> If <code>nh</code> is empty, has no effect and returns <code>a.end()</code>. Otherwise, inserts the element owned by <code>nh</code> if and only if there is no element with key equivalent to <code>nh.key()</code> in containers with unique keys; always inserts the element owned by <code>nh</code> in containers with equivalent keys. Always returns the iterator pointing to the element with key equivalent to <code>nh.key()</code>. The iterator <code>q</code> is a hint pointing to where the search should start.</p> <p>Implementations are permitted to ignore the hint.</p> <p><i>Ensures:</i> <code>nh</code> is empty if insertion succeeds, unchanged if insertion fails.</p>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.
<code>a.extract(k)</code>	node_type	Removes an element in the container with key equivalent to <code>k</code> . Returns a <code>node_type</code> owning the element if found, otherwise an empty <code>node_type</code> .	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.
<code>a.extract(q)</code>	node_type	Removes the element pointed to by <code>q</code> . Returns a <code>node_type</code> owning that element.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.
<code>a.merge(a2)</code>	void	<p><i>Requires:</i> <code>a.get_allocator() == a2.get_allocator()</code>.</p> <p>Attempts to extract each element in <code>a2</code> and insert it into <code>a</code> using the hash function and key equality predicate of <code>a</code>. In containers with unique keys, if there is an element in <code>a</code> with key equivalent to the key of an element from <code>a2</code>, then that element is not extracted from <code>a2</code>.</p> <p><i>Ensures:</i> Pointers and references to the transferred elements of <code>a2</code> refer to those same elements but as members of <code>a</code>. Iterators referring to the transferred elements and all iterators referring to <code>a</code> will be invalidated, but iterators to elements remaining in <code>a2</code> will remain valid.</p>	Average case $\mathcal{O}(N)$, where N is <code>a2.size()</code> . Worst case $\mathcal{O}(N*a.size() + N)$.

Table 70 — Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a.erase(k)</code>	<code>size_type</code>	Erases all elements with key equivalent to <code>k</code> . Returns the number of elements erased.	Average case $\mathcal{O}(a.\text{count}(k))$. Worst case $\mathcal{O}(a.\text{size}())$.
<code>a.erase(q)</code>	<code>iterator</code>	Erases the element pointed to by <code>q</code> . Returns the iterator immediately following <code>q</code> prior to the erasure.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.\text{size}())$.
<code>a.erase(r)</code>	<code>iterator</code>	Erases the element pointed to by <code>r</code> . Returns the iterator immediately following <code>r</code> prior to the erasure.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.\text{size}())$.
<code>a.erase(q1, q2)</code>	<code>iterator</code>	Erases all elements in the range $[q_1, q_2]$. Returns the iterator immediately following the erased elements prior to the erasure.	Average case linear in $\text{distance}(q_1, q_2)$, worst case $\mathcal{O}(a.\text{size}())$.
<code>a.clear()</code>	<code>void</code>	Erases all elements in the container. <i>Ensures:</i> <code>a.empty()</code> returns <code>true</code>	Linear in <code>a.size()</code> .
<code>b.find(k)</code>	<code>iterator;</code> <code>const_iterator</code> for const <code>b</code> .	Returns an iterator pointing to an element with key equivalent to <code>k</code> , or <code>b.end()</code> if no such element exists.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(b.\text{size}())$.
<code>a_tran.find(ke)</code>	<code>iterator;</code> <code>const_iterator</code> for const <code>a_tran</code> .	Returns an iterator pointing to an element with key equivalent to <code>ke</code> , or <code>a_tran.end()</code> if no such element exists.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_tran.\text{size}())$.
<code>b.count(k)</code>	<code>size_type</code>	Returns the number of elements with key equivalent to <code>k</code> .	Average case $\mathcal{O}(b.\text{count}(k))$, worst case $\mathcal{O}(b.\text{size}())$.
<code>a_tran.count(ke)</code>	<code>size_type</code>	Returns the number of elements with key equivalent to <code>ke</code> .	Average case $\mathcal{O}(a_tran.\text{count}(ke))$, worst case $\mathcal{O}(a_tran.\text{size}())$.
<code>b.contains(k)</code>	<code>bool</code>	Equivalent to <code>b.find(k) != b.end()</code>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(b.\text{size}())$.
<code>a_tran.contains(ke)</code>	<code>bool</code>	Equivalent to <code>a_tran.find(ke) != a_tran.end()</code>	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a_tran.\text{size}())$.
<code>b.equal_range(k)</code>	<code>pair<iterator, iterator>;</code> <code>pair<const_iterator, const_iterator></code> for const <code>b</code> .	Returns a range containing all elements with keys equivalent to <code>k</code> . Returns <code>make_pair(b.end(), b.end())</code> if no such elements exist.	Average case $\mathcal{O}(b.\text{count}(k))$. Worst case $\mathcal{O}(b.\text{size}())$.

Table 70 — Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>a_tran.equal_range(ke)</code>	<code>pair<iterator, iterator>; pair<const_iterator, const_iterator></code> for <code>const a_tran</code> .	Returns a range containing all elements with keys equivalent to <code>ke</code> . Returns <code>make_pair(a_tran.end(), a_tran.end())</code> if no such elements exist.	Average case $\mathcal{O}(a_tran.\text{count}(ke))$. Worst case $\mathcal{O}(a_tran.\text{size}())$.
<code>b.bucket_count()</code>	<code>size_type</code>	Returns the number of buckets that <code>b</code> contains.	Constant
<code>b.max_bucket_count()</code>	<code>size_type</code>	Returns an upper bound on the number of buckets that <code>b</code> might ever contain.	Constant
<code>b.bucket(k)</code>	<code>size_type</code>	<p><i>Requires:</i> <code>b.bucket_count() > 0</code>.</p> <p>Returns the index of the bucket in which elements with keys equivalent to <code>k</code> would be found, if any such element existed.</p> <p><i>Ensures:</i> the return value shall be in the range <code>[0, b.bucket_count())</code>.</p>	Constant
<code>b.bucket_size(n)</code>	<code>size_type</code>	<p><i>Requires:</i> <code>n</code> shall be in the range <code>[0, b.bucket_count())</code>.</p> <p>Returns the number of elements in the <code>nth</code> bucket.</p>	$\mathcal{O}(b.bucket_size(n))$
<code>b.begin(n)</code>	<code>local_iterator; const_local_iterator</code> for <code>const b</code> .	<p><i>Requires:</i> <code>n</code> shall be in the range <code>[0, b.bucket_count())</code>.</p> <p><code>b.begin(n)</code> returns an iterator referring to the first element in the bucket. If the bucket is empty, then <code>b.begin(n) == b.end(n)</code>.</p>	Constant
<code>b.end(n)</code>	<code>local_iterator; const_local_iterator</code> for <code>const b</code> .	<p><i>Requires:</i> <code>n</code> shall be in the range <code>[0, b.bucket_count())</code>.</p> <p><code>b.end(n)</code> returns an iterator which is the past-the-end value for the bucket.</p>	Constant
<code>b.cbegin(n)</code>	<code>const_local_iterator</code>	<p><i>Requires:</i> <code>n</code> shall be in the range <code>[0, b.bucket_count())</code>.</p> <p><code>b.cbegin(n)</code> returns an iterator referring to the first element in the bucket. If the bucket is empty, then <code>b.cbegin(n) == b.cend(n)</code>.</p>	Constant
<code>b.cend(n)</code>	<code>const_local_iterator</code>	<p><i>Requires:</i> <code>n</code> shall be in the range <code>[0, b.bucket_count())</code>.</p> <p><code>b.bucket_count()).b.cend(n)</code> returns an iterator which is the past-the-end value for the bucket.</p>	Constant
<code>b.load_factor()</code>	<code>float</code>	Returns the average number of elements per bucket.	Constant

Table 70 — Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
<code>b.max_load_factor()</code>	float	Returns a positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number.	Constant
<code>a.max_load_factor(z)</code>	void	<i>Requires:</i> <code>z</code> shall be positive. May change the container's maximum load factor, using <code>z</code> as a hint.	Constant
<code>a.rehash(n)</code>	void	<i>Ensures:</i> <code>a.bucket_count() >= a.size() / a.max_load_factor()</code> and <code>a.bucket_count() >= n</code> .	Average case linear in <code>a.size()</code> , worst case quadratic.
<code>a.reserve(n)</code>	void	Same as <code>a.rehash(ceil(n / a.max_load_factor()))</code> .	Average case linear in <code>a.size()</code> , worst case quadratic.

- ¹² Two unordered containers `a` and `b` compare equal if `a.size() == b.size()` and, for every equivalent-key group $[Ea_1, Ea_2]$ obtained from `a.equal_range(Ea1)`, there exists an equivalent-key group $[Eb_1, Eb_2]$ obtained from `b.equal_range(Ea1)`, such that `is_permutation(Ea1, Ea2, Eb1, Eb2)` returns `true`. For `unordered_set` and `unordered_map`, the complexity of `operator==` (i.e., the number of calls to the `==` operator of the `value_type`, to the predicate returned by `key_eq()`, and to the hasher returned by `hash_function()`) is proportional to N in the average case and to N^2 in the worst case, where N is `a.size()`. For `unordered_multiset` and `unordered_multimap`, the complexity of `operator==` is proportional to $\sum E_i^2$ in the average case and to N^2 in the worst case, where N is `a.size()`, and E_i is the size of the i^{th} equivalent-key group in `a`. However, if the respective elements of each corresponding pair of equivalent-key groups Ea_i and Eb_i are arranged in the same order (as is commonly the case, e.g., if `a` and `b` are unmodified copies of the same container), then the average-case complexity for `unordered_multiset` and `unordered_multimap` becomes proportional to N (but worst-case complexity remains $\mathcal{O}(N^2)$, e.g., for a pathologically bad hash function). The behavior of a program that uses `operator==` or `operator!=` on unordered containers is undefined unless the `Pred` function object has the same behavior for both containers and the equality comparison function for `Key` is a refinement²²⁸ of the partition into equivalent-key groups produced by `Pred`.
- ¹³ The iterator types `iterator` and `const_iterator` of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both `iterator` and `const_iterator` are constant iterators.
- ¹⁴ The `insert` and `emplace` members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The `erase` members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.
- ¹⁵ The `insert` and `emplace` members shall not affect the validity of iterators if $(N+n) \leq z * B$, where N is the number of elements in the container prior to the insert operation, n is the number of elements inserted, B is the container's bucket count, and z is the container's maximum load factor.
- ¹⁶ The `extract` members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is

²²⁸ Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.

undefined behavior. References and pointers to an element obtained while it is owned by a `node_type` are invalidated if the element is successfully inserted.

- 17 If the *qualified-id* `Hash::transparent_key_equal` is valid and denotes a type (12.9.2), then the program is ill-formed if either:

- (17.1) — *qualified-id* `Hash::transparent_key_equal::is_transparent` is not valid or does not denote a type, or
- (17.2) — `Pred` is a different type than `equal_to<Key>` or `Hash::transparent_key_equal`.

The member function templates `find`, `count`, `equal_range`, and `contains` shall not participate in overload resolution unless the *qualified-id* `Hash::transparent_key_equal` is valid and denotes a type (12.9.2).

- 18 A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

- (18.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
- (18.2) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.
- (18.3) — It has a `Hash` template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.
- (18.4) — It has a `Pred` template parameter and a type that qualifies as an allocator is deduced for that parameter.

21.2.7.1 Exception safety guarantees

[unord.req.exception]

- 1 For unordered associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Hash` or `Pred` object (if any).
- 2 For unordered associative containers, if an exception is thrown by any operation other than the container's hash function from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.
- 3 For unordered associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Hash` or `Pred` object (if any).
- 4 For unordered associative containers, if an exception is thrown from within a `rehash()` function other than by the container's hash function or comparison function, the `rehash()` function has no effect.

21.3 Sequence containers

[sequences]

21.3.1 In general

[sequences.general]

- 1 The headers `<array>`, `<deque>`, `<forward_list>`, `<list>`, and `<vector>` define class templates that meet the requirements for sequence containers.
- 2 The following exposition-only alias template may appear in deduction guides for sequence containers:

```
template<class InputIterator>
using iter_value_type = typename iterator_traits<InputIterator>::value_type; // exposition only
```

21.3.2 Header `<array>` synopsis

[array.syn]

```
#include <initializer_list>

namespace std {
    // 21.3.7, class template array
    template<class T, size_t N> struct array;

    template<class T, size_t N>
        constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);
    template<class T, size_t N>
        constexpr bool operator!=(const array<T, N>& x, const array<T, N>& y);
    template<class T, size_t N>
        constexpr bool operator< (const array<T, N>& x, const array<T, N>& y);
    template<class T, size_t N>
        constexpr bool operator> (const array<T, N>& x, const array<T, N>& y);
```

```

template<class T, size_t N>
constexpr bool operator<=(const array<T, N>& x, const array<T, N>& y);
template<class T, size_t N>
constexpr bool operator>=(const array<T, N>& x, const array<T, N>& y);
template<class T, size_t N>
constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
}

template<class T> class tuple_size;
template<size_t I, class T> class tuple_element;
template<class T, size_t N>
struct tuple_size<array<T, N>>;
template<size_t I, class T, size_t N>
struct tuple_element<I, array<T, N>>;
template<size_t I, class T, size_t N>
constexpr T& get(array<T, N>&) noexcept;
template<size_t I, class T, size_t N>
constexpr T&& get(array<T, N>&&) noexcept;
template<size_t I, class T, size_t N>
constexpr const T& get(const array<T, N>&) noexcept;
template<size_t I, class T, size_t N>
constexpr const T&& get(const array<T, N>&&) noexcept;
}

```

21.3.3 Header <deque> synopsis

[deque.syn]

```

#include <initializer_list>

namespace std {
// 21.3.8, class template deque
template<class T, class Allocator = allocator<T>> class deque;

template<class T, class Allocator>
bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template<class T, class Allocator>
bool operator!=(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template<class T, class Allocator>
bool operator< (const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template<class T, class Allocator>
bool operator> (const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template<class T, class Allocator>
bool operator<=(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template<class T, class Allocator>
bool operator>=(const deque<T, Allocator>& x, const deque<T, Allocator>& y);

template<class T, class Allocator>
void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));

template <class T, class Allocator, class U>
void erase(deque<T, Allocator>& c, const U& value);
template <class T, class Allocator, class Predicate>
void erase_if(deque<T, Allocator>& c, Predicate pred);

namespace pmr {
    template<class T>
    using deque = std::deque<T, polymorphic_allocator<T>>;
}
}

```

21.3.4 Header <forward_list> synopsis

[forward_list.syn]

```
#include <initializer_list>
```

```

namespace std {
    // 21.3.9, class template forward_list
    template<class T, class Allocator = allocator<T>> class forward_list;

    template<class T, class Allocator>
        bool operator==(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
    template<class T, class Allocator>
        bool operator!=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
    template<class T, class Allocator>
        bool operator< (const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
    template<class T, class Allocator>
        bool operator> (const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
    template<class T, class Allocator>
        bool operator<=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
    template<class T, class Allocator>
        bool operator>=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);

    template<class T, class Allocator>
        void swap(forward_list<T, Allocator>& x, forward_list<T, Allocator>& y)
            noexcept(noexcept(x.swap(y)));
}

template <class T, class Allocator, class U>
    void erase(forward_list<T, Allocator>& c, const U& value);
template <class T, class Allocator, class Predicate>
    void erase_if(forward_list<T, Allocator>& c, Predicate pred);

namespace pmr {
    template<class T>
        using forward_list = std::forward_list<T, polymorphic_allocator<T>>;
}
}

```

21.3.5 Header <list> synopsis

[list.syn]

```

#include <initializer_list>

namespace std {
    // 21.3.10, class template list
    template<class T, class Allocator = allocator<T>> class list;

    template<class T, class Allocator>
        bool operator==(const list<T, Allocator>& x, const list<T, Allocator>& y);
    template<class T, class Allocator>
        bool operator!=(const list<T, Allocator>& x, const list<T, Allocator>& y);
    template<class T, class Allocator>
        bool operator< (const list<T, Allocator>& x, const list<T, Allocator>& y);
    template<class T, class Allocator>
        bool operator> (const list<T, Allocator>& x, const list<T, Allocator>& y);
    template<class T, class Allocator>

    template<class T>
        using vector = std::vector<T, polymorphic_allocator<T>>;
}
}
```

21.3.7 Class template array

[array]

21.3.7.1 Overview

[array.overview]

- ¹ The header <array> defines a class template for storing fixed-size sequences of objects. An **array** is a contiguous container (21.2.1). An instance of **array**<T, N> stores N elements of type T, so that **size()** == N is an invariant.
- ² An **array** is an aggregate (9.3.1) that can be list-initialized with up to N elements whose types are convertible to T.
- ³ An **array** satisfies all of the requirements of a container and of a reversible container (21.2), except that a default constructed **array** object is not empty and that **swap** does not have constant complexity. An **array** satisfies some of the requirements of a sequence container (21.2.3). Descriptions are provided here only for operations on **array** that are not described in one of these tables and for operations where there is additional semantic information.
- ⁴ The types **iterator** and **const_iterator** satisfy the **constexpr** iterator requirements (22.3.1).

```

namespace std {
    template<class T, size_t N>
    struct array {
        // types
        using value_type      = T;
        using pointer          = T*;
        using const_pointer    = const T*;
        using reference         = T&;
        using const_reference   = const T&;
        using size_type         = size_t;
        using difference_type   = ptrdiff_t;
        using iterator          = implementation-defined; // see 21.2
        using const_iterator     = implementation-defined; // see 21.2
        using reverse_iterator   = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;

        // no explicit construct/copy/destroy for aggregate type

        constexpr void fill(const T& u);
        constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);

        // iterators
        constexpr iterator           begin() noexcept;
        constexpr const_iterator      begin() const noexcept;
        constexpr iterator           end() noexcept;
        constexpr const_iterator      end() const noexcept;

        constexpr reverse_iterator    rbegin() noexcept;
        constexpr const_reverse_iterator rbegin() const noexcept;
        constexpr reverse_iterator    rend() noexcept;
        constexpr const_reverse_iterator rend() const noexcept;

        constexpr const_iterator      cbegin() const noexcept;
        constexpr const_iterator      cend() const noexcept;
        constexpr const_reverse_iterator crbegin() const noexcept;
        constexpr const_reverse_iterator crend() const noexcept;

        // capacity
        [[nodiscard]] constexpr bool empty() const noexcept;
        constexpr size_type size() const noexcept;
        constexpr size_type max_size() const noexcept;

        // element access
        constexpr reference operator[](size_type n);
        constexpr const_reference operator[](size_type n) const;
        constexpr reference at(size_type n);
        constexpr const_reference at(size_type n) const;
        constexpr reference front();
        constexpr const_reference front() const;
        constexpr reference back();
        constexpr const_reference back() const;

        constexpr T *      data() noexcept;
        constexpr const T * data() const noexcept;
    };

    template<class T, class... U>
    array(T, U...) -> array<T, 1 + sizeof...(U)>;
}

```

21.3.7.2 Constructors, copy, and assignment

[array.cons]

¹ The conditions for an aggregate (9.3.1) shall be met. Class `array` relies on the implicitly-declared special member functions (10.3.4.1, 10.3.6, and 10.3.4.2) to conform to the container requirements table in 21.2. In

addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for `array` require that `T` be *Cpp17MoveConstructible* or *Cpp17MoveAssignable*, respectively.

```
template<class T, class... U>
    array(T, U...) -> array<T, 1 + sizeof...(U)>;
```

2 *Requires:* (`is_same_v<T, U>` $\&&$...) is true. Otherwise the program is ill-formed.

21.3.7.3 Member functions

[`array.members`]

```
constexpr size_type size() const noexcept;
```

1 *Returns:* `N`.

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

2 *Returns:* A pointer such that [`data()`, `data() + size()`] is a valid range. For a non-empty array, `data() == addressof(front())`.

```
constexpr void fill(const T& u);
```

3 *Effects:* As if by `fill_n(begin(), N, u)`.

```
constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);
```

4 *Effects:* Equivalent to `swap_ranges(begin(), end(), y.begin())`.

5 *[Note:* Unlike the `swap` function for other containers, `array::swap` takes linear time, may exit via an exception, and does not cause iterators to become associated with the other container. —end note]

21.3.7.4 Specialized algorithms

[`array.special`]

```
template<class T, size_t N>
    constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
```

1 *Remarks:* This function shall not participate in overload resolution unless `N == 0` or `is_swappable_v<T>` is true.

2 *Effects:* As if by `x.swap(y)`.

3 *Complexity:* Linear in `N`.

21.3.7.5 Zero-sized arrays

[`array.zero`]

1 `array` shall provide support for the special case `N == 0`.

2 In the case that `N == 0`, `begin() == end() ==` unique value. The return value of `data()` is unspecified.

3 The effect of calling `front()` or `back()` for a zero-sized array is undefined.

4 Member function `swap()` shall have a non-throwing exception specification.

21.3.7.6 Tuple interface

[`array.tuple`]

```
template<class T, size_t N>
    struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };
```

```
tuple_element<I, array<T, N>>::type
```

1 *Requires:* `I < N`. The program is ill-formed if `I` is out of bounds.

2 *Value:* The type `T`.

```
template<size_t I, class T, size_t N>
    constexpr T& get(array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
    constexpr T&& get(array<T, N>&& a) noexcept;
template<size_t I, class T, size_t N>
    constexpr const T& get(const array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
    constexpr const T&& get(const array<T, N>&& a) noexcept;
```

3 *Requires:* `I < N`. The program is ill-formed if `I` is out of bounds.

⁴ *Returns:* A reference to the I^{th} element of \mathbf{a} , where indexing is zero-based.

21.3.8 Class template `deque`

[`deque`]

21.3.8.1 Overview

[`deque.overview`]

- ¹ A `deque` is a sequence container that supports random access iterators (22.3.5.6). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a `deque` is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.
- ² A `deque` satisfies all of the requirements of a container, of a reversible container (given in tables in 21.2), of a sequence container, including the optional sequence container requirements (21.2.3), and of an allocator-aware container (Table 65). Descriptions are provided here only for operations on `deque` that are not described in one of these tables or for operations where there is additional semantic information.

```
namespace std {
    template<class T, class Allocator = allocator<T>>
    class deque {
        public:
            // types
            using value_type          = T;
            using allocator_type       = Allocator;
            using pointer              = typename allocator_traits<Allocator>::pointer;
            using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
            using reference             = value_type&;
            using const_reference       = const value_type&;
            using size_type             = implementation-defined; // see 21.2
            using difference_type       = implementation-defined; // see 21.2
            using iterator              = implementation-defined; // see 21.2
            using const_iterator         = implementation-defined; // see 21.2
            using reverse_iterator       = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;

            // 21.3.8.2, construct/copy/destroy
            deque() : deque(Allocator{}) { }
            explicit deque(const Allocator&);

            explicit deque(size_type n, const Allocator& = Allocator());
            deque(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
                deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
            deque(const deque& x);
            deque(deque&&);

            deque(const deque&, const Allocator&);

            deque(deque&&, const Allocator&);

            deque(initializer_list<T>, const Allocator& = Allocator());

            ~deque();
            deque& operator=(const deque& x);
            deque& operator=(deque&& x)
                noexcept(allocator_traits<Allocator>::is_always_equal::value);
            deque& operator=(initializer_list<T>);

            template<class InputIterator>
                void assign(InputIterator first, InputIterator last);
                void assign(size_type n, const T& t);
                void assign(initializer_list<T>);

            allocator_type get_allocator() const noexcept;

            // iterators
            iterator      begin() noexcept;
            const_iterator begin() const noexcept;
            iterator      end() noexcept;
            const_iterator end() const noexcept;
            reverse_iterator rbegin() noexcept;
            const_reverse_iterator rbegin() const noexcept;
            reverse_iterator rend() noexcept;
    };
}
```

```

const_reverse_iterator rend() const noexcept;

const_iterator           cbegin() const noexcept;
const_iterator           cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// 21.3.8.3, capacity
[[nodiscard]] bool empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
void      resize(size_type sz);
void      resize(size_type sz, const T& c);
void      shrink_to_fit();

// element access
reference   operator[](size_type n);
const_reference operator[](size_type n) const;
reference   at(size_type n);
const_reference at(size_type n) const;
reference   front();
const_reference front() const;
reference   back();
const_reference back() const;

// 21.3.8.4, modifiers
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);

void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);

void pop_front();
void pop_back();

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void      swap(deque&)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);
void      clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
deque(InputIterator, InputIterator, Allocator = Allocator())
    -> deque<iter-value-type<InputIterator>, Allocator>;

// swap
template<class T, class Allocator>
void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
}

}

```

21.3.8.2 Constructors, copy, and assignment

[deque.cons]

```
explicit deque(const Allocator&);
```

1 *Effects:* Constructs an empty deque, using the specified allocator.

2 *Complexity:* Constant.

```
explicit deque(size_type n, const Allocator& = Allocator());
```

3 *Effects:* Constructs a deque with n default-inserted elements using the specified allocator.

4 *Requires:* T shall be *Cpp17DefaultInsertable* into *this.

5 *Complexity:* Linear in n.

```
deque(size_type n, const T& value, const Allocator& = Allocator());
```

6 *Effects:* Constructs a deque with n copies of value, using the specified allocator.

7 *Requires:* T shall be *Cpp17CopyInsertable* into *this.

8 *Complexity:* Linear in n.

```
template<class InputIterator>
```

```
    deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects:* Constructs a deque equal to the range [first, last), using the specified allocator.

10 *Complexity:* Linear in distance(first, last).

21.3.8.3 Capacity

[deque.capacity]

```
void resize(size_type sz);
```

1 *Effects:* If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

2 *Requires:* T shall be *Cpp17MoveInsertable* and *Cpp17DefaultInsertable* into *this.

```
void resize(size_type sz, const T& c);
```

3 *Effects:* If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

4 *Requires:* T shall be *Cpp17CopyInsertable* into *this.

```
void shrink_to_fit();
```

5 *Requires:* T shall be *Cpp17MoveInsertable* into *this.

6 *Effects:* *shrink_to_fit* is a non-binding request to reduce memory use but does not change the size of the sequence. [Note: The request is non-binding to allow latitude for implementation-specific optimizations. —end note] If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* T there are no effects.

7 *Complexity:* Linear in the size of the sequence.

8 *Remarks:* *shrink_to_fit* invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator.

21.3.8.4 Modifiers

[deque.modifiers]

```
iterator insert(const_iterator position, const T& x);
```

```
iterator insert(const_iterator position, T&& x);
```

```
iterator insert(const_iterator position, size_type n, const T& x);
```

```
template<class InputIterator>
```

```
    iterator insert(const_iterator position,
```

```
                InputIterator first, InputIterator last);
```

```
iterator insert(const_iterator position, initializer_list<T>);
```

```
template<class... Args> reference emplace_front(Args&&... args);
```

```
template<class... Args> reference emplace_back(Args&&... args);
```

```
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
```

```
void push_front(const T& x);
```

```
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);
```

- 1 *Effects:* An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.
- 2 *Remarks:* If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-*Cpp17CopyInsertable* T, the effects are unspecified.
- 3 *Complexity:* The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element either at the beginning or end of a deque always takes constant time and causes a single call to a constructor of T.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();
```

- 4 *Effects:* An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.
[*Note:* `pop_front` and `pop_back` are erase operations. — *end note*]
- 5 *Complexity:* The number of calls to the destructor of T is the same as the number of elements erased, but the number of calls to the assignment operator of T is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.
- 6 *Throws:* Nothing unless an exception is thrown by the assignment operator of T.

21.3.8.5 Erasure

[**deque.erasure**]

```
template <class T, class Allocator, class U>
void erase(deque<T, Allocator>& c, const U& value);
```

- 1 *Effects:* Equivalent to: `c.erase(remove(c.begin(), c.end(), value), c.end())`;

```
template <class T, class Allocator, class Predicate>
void erase_if(deque<T, Allocator>& c, Predicate pred);
```

- 2 *Effects:* Equivalent to: `c.erase(remove_if(c.begin(), c.end(), pred), c.end())`;

21.3.9 Class template `forward_list`

[**forwardlist**]

21.3.9.1 Overview

[**forwardlist.overview**]

- 1 A `forward_list` is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported. [*Note:* It is intended that `forward_list` have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — *end note*]
- 2 A `forward_list` satisfies all of the requirements of a container (Table 62), except that the `size()` member function is not provided and `operator==` has linear complexity. A `forward_list` also satisfies all of the requirements for an allocator-aware container (Table 65). In addition, a `forward_list` provides the `assign` member functions (Table 66) and several of the optional container requirements (Table 67). Descriptions are provided here only for operations on `forward_list` that are not described in that table or for operations where there is additional semantic information.
- 3 [*Note:* Modifying any list requires access to the element preceding the first element of interest, but in a `forward_list` there is no constant-time way to access a preceding element. For this reason, ranges that are modified, such as those supplied to `erase` and `splice`, must be open at the beginning. — *end note*]

```

namespace std {
    template<class T, class Allocator = allocator<T>>
    class forward_list {
        public:
            // types
            using value_type      = T;
            using allocator_type   = Allocator;
            using pointer          = typename allocator_traits<Allocator>::pointer;
            using const_pointer     = typename allocator_traits<Allocator>::const_pointer;
            using reference         = value_type&;
            using const_reference   = const value_type&;
            using size_type         = implementation-defined; // see 21.2
            using difference_type   = implementation-defined; // see 21.2
            using iterator          = implementation-defined; // see 21.2
            using const_iterator     = implementation-defined; // see 21.2

            // 21.3.9.2, construct/copy/destroy
            forward_list() : forward_list(Allocator{}) { }
            explicit forward_list(const Allocator&);
            explicit forward_list(size_type n, const Allocator& = Allocator());
            forward_list(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>

            void push_front(T&& x);
            void pop_front();
    };
}

```

```

template<class... Args> iterator emplace_after(const_iterator position, Args&&... args);
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);

iterator insert_after(const_iterator position, size_type n, const T& x);
template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
iterator insert_after(const_iterator position, initializer_list<T> il);

iterator erase_after(const_iterator position);
iterator erase_after(const_iterator position, const_iterator last);
void swap(forward_list&)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);

void resize(size_type sz);
void resize(size_type sz, const value_type& c);
void clear() noexcept;

// 21.3.9.6, forward_list operations
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
void splice_after(const_iterator position, forward_list& x,
                  const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
                  const_iterator first, const_iterator last);

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);

void sort();
template<class Compare> void sort(Compare comp);

void reverse() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
forward_list(InputIterator, InputIterator, Allocator = Allocator())
    -> forward_list<iter-value-type<InputIterator>, Allocator>;

// swap
template<class T, class Allocator>
void swap(forward_list<T, Allocator>& x, forward_list<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
}

```

⁴ An incomplete type T may be used when instantiating `forward_list` if the allocator satisfies the allocator completeness requirements (15.5.3.5.1). T shall be complete before any member of the resulting specialization of `forward_list` is referenced.

21.3.9.2 Constructors, copy, and assignment

[`forwardlist.cons`]

`explicit forward_list(const Allocator&);`

¹ *Effects:* Constructs an empty `forward_list` object using the specified allocator.

² *Complexity:* Constant.

```

explicit forward_list(size_type n, const Allocator& = Allocator());
3   Effects: Constructs a forward_list object with n default-inserted elements using the specified allocator.
4   Requires: T shall be Cpp17DefaultInsertable into *this.
5   Complexity: Linear in n.

forward_list(size_type n, const T& value, const Allocator& = Allocator());
6   Effects: Constructs a forward_list object with n copies of value using the specified allocator.
7   Requires: T shall be Cpp17CopyInsertable into *this.
8   Complexity: Linear in n.

template<class InputIterator>
forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
9   Effects: Constructs a forward_list object equal to the range [first, last].
10  Complexity: Linear in distance(first, last).

```

21.3.9.3 Iterators

[**forwardlist.iter**]

```

iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
const_iterator cbefore_begin() const noexcept;

```

- 1 Returns: A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by **begin()**.
- 2 Effects: **cbefore_begin()** is equivalent to **const_cast<forward_list const&>(*this).before_begin()**.
- 3 Remarks: **before_begin() == end()** shall equal false.

21.3.9.4 Element access

[**forwardlist.access**]

```

reference front();
const_reference front() const;
1   Returns: *begin()

```

21.3.9.5 Modifiers

[**forwardlist.modifiers**]

- 1 None of the overloads of **insert_after** shall affect the validity of iterators and references, and **erase_after** shall invalidate only iterators and references to the erased elements. If an exception is thrown during **insert_after** there shall be no effect. Inserting n elements into a **forward_list** is linear in n, and the number of calls to the copy or move constructor of T is exactly equal to n. Erasing n elements from a **forward_list** is linear in n and the number of calls to the destructor of type T is exactly equal to n.

```

template<class... Args> reference emplace_front(Args&&... args);
2   Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args)...) at the beginning of the list.

```

```

void push_front(const T& x);
void push_front(T&& x);
3   Effects: Inserts a copy of x at the beginning of the list.

```

```

void pop_front();
4   Effects: As if by erase_after(before_begin()).

```

```

iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
5   Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()].
6   Effects: Inserts a copy of x after position.
7   Returns: An iterator pointing to the copy of x.

```

```

iterator insert_after(const_iterator position, size_type n, const T& x);
8   Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()].
9   Effects: Inserts n copies of x after position.
10  Returns: An iterator pointing to the last inserted copy of x or position if n == 0.

template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
11  Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()].
12  first and last are not iterators in *this.
13  Effects: Inserts copies of elements in [first, last) after position.
14  Returns: An iterator pointing to the last inserted element or position if first == last.

iterator insert_after(const_iterator position, initializer_list<T> il);
15  Effects: insert_after(p, il.begin(), il.end()).
16  Returns: An iterator pointing to the last inserted element or position if il is empty.

template<class... Args>
iterator emplace_after(const_iterator position, Args&&... args);
17  Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()].
18  Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args)...)) after position.
19  Returns: An iterator pointing to the new object.

iterator erase_after(const_iterator position);
20  Requires: The iterator following position is dereferenceable.
21  Effects: Erases the element pointed to by the iterator following position.
22  Returns: An iterator pointing to the element following the one that was erased, or end() if no such element exists.
23  Throws: Nothing.

iterator erase_after(const_iterator position, const_iterator last);
24  Requires: All iterators in the range (position, last) are dereferenceable.
25  Effects: Erases the elements in the range (position, last).
26  Returns: last.
27  Throws: Nothing.

void resize(size_type sz);
28  Effects: If sz < distance(begin(), end()), erases the last distance(begin(), end()) - sz elements from the list. Otherwise, inserts sz - distance(begin(), end()) default-inserted elements at the end of the list.
29  Requires: T shall be Cpp17DefaultInsertable into *this.

void resize(size_type sz, const value_type& c);
30  Effects: If sz < distance(begin(), end()), erases the last distance(begin(), end()) - sz elements from the list. Otherwise, inserts sz - distance(begin(), end()) copies of c at the end of the list.
31  Requires: T shall be Cpp17CopyInsertable into *this.

void clear() noexcept;
32  Effects: Erases all elements in the range [begin(), end()].
  Remarks: Does not invalidate past-the-end iterators.

```

21.3.9.6 Operations

[forwardlist.ops]

- 1 In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall satisfy the corresponding requirements in 24.2. For `merge` and `sort`, the definitions and requirements in 24.7 apply.

```
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
```

- 2 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end()]`. `get_allocator() == x.get_allocator().addressof(x) != this`.

- 3 *Effects:* Inserts the contents of `x` after `position`, and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

- 4 *Throws:* Nothing.

- 5 *Complexity:* $\mathcal{O}(\text{distance}(x.begin(), x.end()))$

```
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
```

- 6 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end()]`. The iterator following `i` is a dereferenceable iterator in `x`. `get_allocator() == x.get_allocator()`.

- 7 *Effects:* Inserts the element following `i` into `*this`, following `position`, and removes it from `x`. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `++i` continue to refer to the same element but as a member of `*this`. Iterators to `++i` continue to refer to the same element, but now behave as iterators into `*this`, not into `x`.

- 8 *Throws:* Nothing.

- 9 *Complexity:* $\mathcal{O}(1)$

```
void splice_after(const_iterator position, forward_list& x,
                  const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
                  const_iterator first, const_iterator last);
```

- 10 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end()]`. `(first, last)` is a valid range in `x`, and all iterators in the range `(first, last)` are dereferenceable. `position` is not an iterator in the range `(first, last)`. `get_allocator() == x.get_allocator()`.

- 11 *Effects:* Inserts elements in the range `(first, last)` after `position` and removes the elements from `x`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

- 12 *Complexity:* $\mathcal{O}(\text{distance}(first, last))$

```
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

- 13 *Effects:* Erases all the elements in the list referred to by a list iterator `i` for which the following conditions hold: `*i == value` (for `remove()`), `pred(*i)` is true (for `remove_if()`). Invalidates only the iterators and references to the erased elements.

- 14 *Returns:* The number of elements erased.

- 15 *Throws:* Nothing unless an exception is thrown by the equality comparison or the predicate.

- 16 *Remarks:* Stable (15.5.5.7).

- 17 *Complexity:* Exactly `distance(begin(), end())` applications of the corresponding predicate.

```
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate pred);
```

- 18 *Effects:* Erases all but the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first + 1, last)` for which `*i == *(i - 1)` (for the version with no arguments) or `pred(*i, *(i - 1))` (for the version with a predicate argument) holds. Invalidates only the iterators and references to the erased elements.

19 *Returns:* The number of elements erased.

20 *Throws:* Nothing unless an exception is thrown by the equality comparison or the predicate.

21 *Complexity:* If the range [first, last) is not empty, exactly (last - first) - 1 applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);
```

22 *Requires:* *this and x are both sorted with respect to the comparator operator< (for the first two overloads) or comp (for the last two overloads), and get_allocator() == x.get_allocator() is true.

23 *Effects:* Merges the two sorted ranges [begin(), end()) and [x.begin(), x.end()). x is empty after the merge. If an exception is thrown other than by a comparison there are no effects. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

24 *Remarks:* Stable (15.5.5.7). The behavior is undefined if get_allocator() != x.get_allocator().

25 *Complexity:* At most distance(begin(), end()) + distance(x.begin(), x.end()) - 1 comparisons.

```
void sort();
template<class Compare> void sort(Compare comp);
```

26 *Effects:* Sorts the list according to the operator< or the comp function object. If an exception is thrown, the order of the elements in *this is unspecified. Does not affect the validity of iterators and references.

27 *Remarks:* Stable (15.5.5.7).

28 *Complexity:* Approximately N log N comparisons, where N is distance(begin(), end()).

```
void reverse() noexcept;
```

29 *Effects:* Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

30 *Complexity:* Linear time.

21.3.9.7 Erasure

[forward_list.erasure]

```
template <class T, class Allocator, class U>
void erase(forward_list<T, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to: `erase_if(c, [&](auto& elem) { return elem == value; })`;

```
template <class T, class Allocator, class Predicate>
void erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

2 *Effects:* Equivalent to: `c.remove_if(pred)`;

21.3.10 Class template list

[list]

21.3.10.1 Overview

[list.overview]

- 1 A **list** is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (21.3.11) and deques (21.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.
- 2 A **list** satisfies all of the requirements of a container, of a reversible container (given in two tables in 21.2), of a sequence container, including most of the optional sequence container requirements (21.2.3), and of an allocator-aware container (Table 65). The exceptions are the operator[] and at member functions, which are not provided.²²⁹ Descriptions are provided here only for operations on **list** that are not described in one of these tables or for operations where there is additional semantic information.

²²⁹) These member functions are only provided by containers whose iterators are random access iterators.

```

namespace std {
    template<class T, class Allocator = allocator<T>>
    class list {
        public:
            // types
            using value_type           = T;
            using allocator_type        = Allocator;
            using pointer               = typename allocator_traits<Allocator>::pointer;
            using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
            using reference             = value_type&;
            using const_reference       = const value_type&;
            using size_type             = implementation-defined; // see 21.2
            using difference_type       = implementation-defined; // see 21.2
            using iterator              = implementation-defined; // see 21.2
            using const_iterator         = implementation-defined; // see 21.2
            using reverse_iterator       = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;

            // 21.3.10.2, construct/copy/destroy
            list() : list(Allocator{}) { }
            explicit list(const Allocator&);

            explicit list(size_type n, const Allocator& = Allocator());
            list(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
                list(InputIterator first, InputIterator last, const Allocator& = Allocator());

            reverse_iterator   rend() noexcept;
            const_reverse_iterator rend() const noexcept;

            const_iterator     cbegin() const noexcept;
            const_iterator     cend() const noexcept;
            const_reverse_iterator crbegin() const noexcept;
            const_reverse_iterator crend() const noexcept;

            // 21.3.10.3, capacity
            [[nodiscard]] bool empty() const noexcept;
            size_type size() const noexcept;
            size_type max_size() const noexcept;
            void      resize(size_type sz);
            void      resize(size_type sz, const T& c);
    };
}

```

```

// element access
reference front();
const_reference front() const;
reference back();
const_reference back() const;

// 21.3.10.4, modifiers
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void pop_front();
void push_back(const T& x);
void push_back(T&& x);
void pop_back();

template<class... Args> iterator emplace(const_iterator position, Args&&... args);
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T> il);

iterator erase(const_iterator position);
iterator erase(const_iterator position, const_iterator last);
void swap(list&) noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;

// 21.3.10.5, list operations
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
void splice(const_iterator position, list& x, const_iterator first, const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first, const_iterator last);

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

size_type unique();
template<class BinaryPredicate>
    size_type unique(BinaryPredicate binary_pred);

void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);

void sort();
template<class Compare> void sort(Compare comp);

void reverse() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
list(InputIterator, InputIterator, Allocator = Allocator())
    -> list<iter-value-type<InputIterator>, Allocator>;

// swap
template<class T, class Allocator>
void swap(list<T, Allocator>& x, list<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
}

```

- ³ An incomplete type T may be used when instantiating `list` if the allocator satisfies the allocator completeness requirements (15.5.3.5.1). T shall be complete before any member of the resulting specialization of `list` is referenced.

21.3.10.2 Constructors, copy, and assignment

[list.cons]

```
explicit list(const Allocator&);
```

¹ *Effects*: Constructs an empty `list`, using the specified allocator.

² *Complexity*: Constant.

```
explicit list(size_type n, const Allocator& = Allocator());
```

³ *Effects*: Constructs a `list` with n default-inserted elements using the specified allocator.

⁴ *Requires*: T shall be `Cpp17DefaultInsertable` into `*this`.

⁵ *Complexity*: Linear in n.

```
list(size_type n, const T& value, const Allocator& = Allocator());
```

⁶ *Effects*: Constructs a `list` with n copies of value, using the specified allocator.

⁷ *Requires*: T shall be `Cpp17CopyInsertable` into `*this`.

⁸ *Complexity*: Linear in n.

```
template<class InputIterator>
```

```
list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

⁹ *Effects*: Constructs a `list` equal to the range [first, last).

¹⁰ *Complexity*: Linear in distance(first, last).

21.3.10.3 Capacity

[list.capacity]

```
void resize(size_type sz);
```

¹ *Effects*: If `size() < sz`, appends `sz - size()` default-inserted elements to the sequence. If `sz <= size()`, equivalent to:

```
list<T>::iterator it = begin();
advance(it, sz);
erase(it, end());
```

² *Requires*: T shall be `Cpp17DefaultInsertable` into `*this`.

```
void resize(size_type sz, const T& c);
```

³ *Effects*: As if by:

```
if (sz > size())
    insert(end(), sz-size(), c);
else if (sz < size()) {
    iterator i = begin();
    advance(i, sz);
    erase(i, end());
}
else
    ; // do nothing
```

⁴ *Requires*: T shall be `Cpp17CopyInsertable` into `*this`.

21.3.10.4 Modifiers

[list.modifiers]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first,
               InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);
```

```
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);
```

- 1 *Remarks:* Does not affect the validity of iterators and references. If an exception is thrown there are no effects.
- 2 *Complexity:* Insertion of a single element into a list takes constant time and exactly one call to a constructor of T. Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of T is exactly equal to the number of elements inserted.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);

void pop_front();
void pop_back();
void clear() noexcept;
```

- 3 *Effects:* Invalidates only the iterators and references to the erased elements.
- 4 *Throws:* Nothing.
- 5 *Complexity:* Erasing a single element is a constant time operation with a single call to the destructor of T. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type T is exactly equal to the size of the range.

21.3.10.5 Operations

[list.ops]

- 1 Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them.²³⁰ In this subclause, arguments for a template parameter named **Predicate** or **BinaryPredicate** shall satisfy the corresponding requirements in 24.2. For **merge** and **sort**, the definitions and requirements in 24.7 apply.
- 2 **list** provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if `get_allocator() != x.get_allocator()`.

```
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
```

- 3 *Requires:* `addressof(x) != this`.
- 4 *Effects:* Inserts the contents of x before position and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into x.
- 5 *Throws:* Nothing.
- 6 *Complexity:* Constant time.

```
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
```

- 7 *Requires:* i is a valid dereferenceable iterator of x.
- 8 *Effects:* Inserts an element pointed to by i from list x before position and removes the element from x. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*i` continue to refer to this same element but as a member of `*this`. Iterators to `*i` (including i itself) continue to refer to the same element, but now behave as iterators into `*this`, not into x.
- 9 *Throws:* Nothing.
- 10 *Complexity:* Constant time.

²³⁰⁾ As specified in 15.5.3.5, the requirements in this Clause apply only to lists whose allocators compare equal.

```
void splice(const_iterator position, list& x, const_iterator first,
           const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first,
           const_iterator last);
```

11 *Requires:* [first, last) is a valid range in x. The program has undefined behavior if position is an iterator in the range [first, last].

12 *Effects:* Inserts elements in the range [first, last) before position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

13 *Throws:* Nothing.

14 *Complexity:* Constant time if &x == this; otherwise, linear time.

```
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

15 *Effects:* Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: *i == value, pred(*i) != false. Invalidates only the iterators and references to the erased elements.

16 *Returns:* The number of elements erased.

17 *Throws:* Nothing unless an exception is thrown by *i == value or pred(*i) != false.

18 *Remarks:* Stable (15.5.5.7).

19 *Complexity:* Exactly size() applications of the corresponding predicate.

```
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);
```

20 *Effects:* Erases all but the first element from every consecutive group of equal elements referred to by the iterator i in the range [first + 1, last) for which *i == *(i-1) (for the version of unique with no arguments) or pred(*i, *(i - 1)) (for the version of unique with a predicate argument) holds. Invalidates only the iterators and references to the erased elements.

21 *Returns:* The number of elements erased.

22 *Throws:* Nothing unless an exception is thrown by *i == *(i-1) or pred(*i, *(i - 1))

23 *Complexity:* If the range [first, last) is not empty, exactly (last - first) - 1 applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);
```

24 *Requires:* Both the list and the argument list shall be sorted with respect to the comparator operator< (for the first two overloads) or comp (for the last two overloads).

25 *Effects:* If addressof(x) == this, does nothing; otherwise, merges the two sorted ranges [begin(), end()) and [x.begin(), x.end()). The result is a range in which the elements will be sorted in non-decreasing order according to the ordering defined by comp; that is, for every iterator i, in the range other than the first, the condition comp(*i, *(i - 1)) will be false. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

26 *Remarks:* Stable (15.5.5.7). If addressof(x) != this, the range [x.begin(), x.end()) is empty after the merge. No elements are copied by this operation. The behavior is undefined if get_allocator() != x.get_allocator().

27 *Complexity:* At most size() + x.size() - 1 applications of comp if addressof(x) != this; otherwise, no applications of comp are performed. If an exception is thrown other than by a comparison there are no effects.

```

void reverse() noexcept;
28   Effects: Reverses the order of the elements in the list. Does not affect the validity of iterators and
   references.
29   Complexity: Linear time.

void sort();
template<class Compare> void sort(Compare comp);
30   Effects: Sorts the list according to the operator< or a Compare function object. If an exception is
   thrown, the order of the elements in *this is unspecified. Does not affect the validity of iterators and
   references.
31   Remarks: Stable (15.5.5.7).
32   Complexity: Approximately  $N \log N$  comparisons, where  $N == \text{size}()$ .

```

21.3.10.6 Erasure

[list.erasure]

```

template <class T, class Allocator, class U>
void erase(list<T, Allocator>& c, const U& value);

1   Effects: Equivalent to: erase_if(c, [&](auto& elem) { return elem == value; });

template <class T, class Allocator, class Predicate>
void erase_if(list<T, Allocator>& c, Predicate pred);

2   Effects: Equivalent to: c.remove_if(pred);

```

21.3.11 Class template vector

[vector]

21.3.11.1 Overview

[vector.overview]

- 1 A **vector** is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.
- 2 A **vector** satisfies all of the requirements of a container and of a reversible container (given in two tables in 21.2), of a sequence container, including most of the optional sequence container requirements (21.2.3), of an allocator-aware container (Table 65), and, for an element type other than `bool`, of a contiguous container (21.2.1). The exceptions are the `push_front`, `pop_front`, and `emplace_front` member functions, which are not provided. Descriptions are provided here only for operations on **vector** that are not described in one of these tables or for operations where there is additional semantic information.

```

namespace std {
    template<class T, class Allocator = allocator<T>>
    class vector {
        public:
            // types
            using value_type           = T;
            using allocator_type        = Allocator;
            using pointer               = typename allocator_traits<Allocator>::pointer;
            using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
            using reference             = value_type&;
            using const_reference       = const value_type&;
            using size_type             = implementation-defined; // see 21.2
            using difference_type       = implementation-defined; // see 21.2
            using iterator              = implementation-defined; // see 21.2
            using const_iterator         = implementation-defined; // see 21.2
            using reverse_iterator       = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;

            // 21.3.11.2, construct/copy/destroy
            vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { }
            explicit vector(const Allocator&) noexcept;
            explicit vector(size_type n, const Allocator& = Allocator());
            vector(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
                vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
    };
}

```

```

vector(const vector& x);
vector(vector&&) noexcept;
vector(const vector&, const Allocator&);
vector(vector&&, const Allocator&);
vector(initializer_list<T>, const Allocator& = Allocator());

template<class... Args> iterator emplace(const_iterator position, Args&&... args);
iterator insert(const_iterator position, const T& x);

```

```

iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T> il);
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(vector&)
    noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
              allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
vector(InputIterator, InputIterator, Allocator = Allocator())
    -> vector<iter-value-type<InputIterator>, Allocator>

// swap
template<class T, class Allocator>
void swap(vector<T, Allocator>& x, vector<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
}

```

- 3 An incomplete type **T** may be used when instantiating **vector** if the allocator satisfies the allocator completeness requirements (15.5.3.5.1). **T** shall be complete before any member of the resulting specialization of **vector** is referenced.

21.3.11.2 Constructors, copy, and assignment

[vector.cons]

```
explicit vector(const Allocator&) noexcept;
```

1 *Effects*: Constructs an empty **vector**, using the specified allocator.

2 *Complexity*: Constant.

```
explicit vector(size_type n, const Allocator& = Allocator());
```

3 *Effects*: Constructs a **vector** with **n** default-inserted elements using the specified allocator.

4 *Requires*: **T** shall be *Cpp17DefaultInsertable* into ***this**.

5 *Complexity*: Linear in **n**.

```
vector(size_type n, const T& value,
       const Allocator& = Allocator());
```

6 *Effects*: Constructs a **vector** with **n** copies of **value**, using the specified allocator.

7 *Requires*: **T** shall be *Cpp17CopyInsertable* into ***this**.

8 *Complexity*: Linear in **n**.

```
template<class InputIterator>
vector(InputIterator first, InputIterator last,
      const Allocator& = Allocator());
```

9 *Effects*: Constructs a **vector** equal to the range **[first, last)**, using the specified allocator.

10 *Complexity*: Makes only **N** calls to the copy constructor of **T** (where **N** is the distance between **first** and **last**) and no reallocations if iterators **first** and **last** are of forward, bidirectional, or random access categories. It makes order **N** calls to the copy constructor of **T** and order $\log N$ reallocations if they are just input iterators.

21.3.11.3 Capacity

[vector.capacity]

```
size_type capacity() const noexcept;
```

1 *Returns*: The total number of elements that the **vector** can hold without requiring reallocation.

2 *Complexity*: Constant time.

```

void reserve(size_type n);
3   Requires: T shall be Cpp17MoveInsertable into *this.
4   Effects: A directive that informs a vector of a planned change in size, so that it can manage the storage allocation accordingly. After reserve(), capacity() is greater or equal to the argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of reserve(). If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable type, there are no effects.
5   Complexity: It does not change the size of the sequence and takes at most linear time in the size of the sequence.
6   Throws: length_error if n > max_size().231
7   Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. No reallocation shall take place during insertions that happen after a call to reserve() until the time when an insertion would make the size of the vector greater than the value of capacity().
void shrink_to_fit();
8   Requires: T shall be Cpp17MoveInsertable into *this.
9   Effects: shrink_to_fit is a non-binding request to reduce capacity() to size(). [Note: The request is non-binding to allow latitude for implementation-specific optimizations. —end note] It does not increase capacity(), but may reduce capacity() by causing reallocation. If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T there are no effects.
10  Complexity: Linear in the size of the sequence.
11  Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator. If no reallocation happens, they remain valid.
void swap(vector& x)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
            allocator_traits<Allocator>::is_always_equal::value);
12  Effects: Exchanges the contents and capacity() of *this with that of x.
13  Complexity: Constant time.
void resize(size_type sz);
14  Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.
15  Requires: T shall be Cpp17MoveInsertable and Cpp17DefaultInsertable into *this.
16  Remarks: If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T there are no effects.
void resize(size_type sz, const T& c);
17  Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.
18  Requires: T shall be Cpp17CopyInsertable into *this.
19  Remarks: If an exception is thrown there are no effects.

```

21.3.11.4 Data

[vector.data]

```

T*      data() noexcept;
const T* data() const noexcept;
1   Returns: A pointer such that [data(), data() + size()] is a valid range. For a non-empty vector, data() == addressof(front()).
2   Complexity: Constant time.

```

²³¹) reserve() uses Allocator::allocate() which may throw an appropriate exception.

21.3.11.5 Modifiers

[vector.modifiers]

```

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_back(const T& x);
void push_back(T&& x);

```

- 1 *Remarks:* Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. If no reallocation happens, all the iterators and references before the insertion point remain valid. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T or by any `InputIterator` operation there are no effects. If an exception is thrown while inserting a single element at the end and T is `Cpp17CopyInsertable` or `is_nothrow_move_constructible_v<T>` is `true`, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-`Cpp17CopyInsertable` T, the effects are unspecified.

- 2 *Complexity:* The complexity is linear in the number of elements inserted plus the distance to the end of the vector.

```

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_back();

```

- 3 *Effects:* Invalidates iterators and references at or after the point of the erase.

- 4 *Complexity:* The destructor of T is called the number of times equal to the number of the elements erased, but the assignment operator of T is called the number of times equal to the number of elements in the vector after the erased elements.

- 5 *Throws:* Nothing unless an exception is thrown by the assignment operator or move assignment operator of T.

21.3.11.6 Erasure

[vector.erasure]

```

template <class T, class Allocator, class U>
void erase(vector<T, Allocator>& c, const U& value);

```

- 1 *Effects:* Equivalent to: `c.erase(remove(c.begin(), c.end(), value), c.end())`;

```

template <class T, class Allocator, class Predicate>
void erase_if(vector<T, Allocator>& c, Predicate pred);

```

- 2 *Effects:* Equivalent to: `c.erase(remove_if(c.begin(), c.end(), pred), c.end())`;

21.3.12 Class `vector<bool>`

[vector.bool]

- 1 To optimize space allocation, a specialization of `vector` for `bool` elements is provided:

```

namespace std {
    template<class Allocator>
    class vector<bool, Allocator> {
        public:
            // types
            using value_type          = bool;
            using allocator_type       = Allocator;
            using pointer              = implementation-defined;
            using const_pointer        = implementation-defined;
            using const_reference      = bool;
            using size_type             = implementation-defined; // see 21.2
            using difference_type      = implementation-defined; // see 21.2
            using iterator              = implementation-defined; // see 21.2
            using const_iterator        = implementation-defined; // see 21.2
    };
}

```

```

using reverse_iterator      = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// bit reference
class reference {
    friend class vector;
    reference() noexcept;
public:
    reference(const reference&) = default;
    ~reference();
    operator bool() const noexcept;
    reference& operator=(const bool x) noexcept;
    reference& operator=(const reference& x) noexcept;
    void flip() noexcept;           // flips the bit
};

// construct/copy/destroy
vector() : vector(Allocator{}) { }
explicit vector(const Allocator&);
explicit vector(size_type n, const Allocator& = Allocator());
vector(size_type n, const bool& value, const Allocator& = Allocator());
template<class InputIterator>
vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
vector(const vector& x);
vector(vector&& x);
vector(const vector&, const Allocator&);
vector(vector&&, const Allocator&);
vector(initializer_list<bool>, const Allocator& = Allocator());
~vector();
vector& operator=(const vector& x);
vector& operator=(vector&& x);
vector& operator=(initializer_list<bool>);
template<class InputIterator>
void assign(InputIterator first, InputIterator last);
void assign(size_type n, const bool& t);
void assign(initializer_list<bool>);
allocator_type get_allocator() const noexcept;

// iterators
iterator          begin() noexcept;
const_iterator     begin() const noexcept;
iterator          end() noexcept;
const_iterator     end() const noexcept;
reverse_iterator   rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
reverse_iterator   rend() noexcept;
const_reverse_iterator rend() const noexcept;

const_iterator     cbegin() const noexcept;
const_iterator     cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// capacity
[[nodiscard]] bool empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
size_type capacity() const noexcept;
void      resize(size_type sz, bool c = false);
void      reserve(size_type n);
void      shrink_to_fit();

// element access
reference       operator[](size_type n);

```

```

    const_reference operator[](size_type n) const;
    const_reference at(size_type n) const;
    reference      at(size_type n);
    reference      front();
    const_reference front() const;
    reference      back();
    const_reference back() const;

    // modifiers
    template<class... Args> reference emplace_back(Args&&... args);
    void push_back(const bool& x);
    void pop_back();
    template<class... Args> iterator emplace(const_iterator position, Args&&... args);
    iterator insert(const_iterator position, const bool& x);
    iterator insert(const_iterator position, size_type n, const bool& x);
    template<class InputIterator>
        iterator insert(const_iterator position, InputIterator first, InputIterator last);
    iterator insert(const_iterator position, initializer_list<bool> il);

    iterator erase(const_iterator position);
    iterator erase(const_iterator first, const_iterator last);
    void swap(vector&);
    static void swap(reference x, reference y) noexcept;
    void flip() noexcept;           // flips all bits
    void clear() noexcept;
};

}

```

- 2 Unless described below, all operations have the same requirements and semantics as the primary `vector` template, except that operations dealing with the `bool` value type map to bit values in the container storage and `allocator_traits::construct` (19.10.9.2) is not used to construct these values.
- 3 There is no requirement that the data be stored as a contiguous allocation of `bool` values. A space-optimized representation of bits is recommended instead.
- 4 `reference` is a class that simulates the behavior of references of a single bit in `vector<bool>`. The conversion function returns `true` when the bit is set, and `false` otherwise. The assignment operator sets the bit when the argument is (convertible to) `true` and clears it otherwise. `flip` reverses the state of the bit.

`void flip() noexcept;`

- 5 *Effects:* Replaces each element in the container with its complement.

`static void swap(reference x, reference y) noexcept;`

- 6 *Effects:* Exchanges the contents of `x` and `y` as if by:

```

bool b = x;
x = y;
y = b;

```

`template<class Allocator> struct hash<vector<bool, Allocator>>;`

- 7 The specialization is enabled (19.14.18).

21.4 Associative containers

[associative]

21.4.1 In general

[associative.general]

- 1 The header `<map>` defines the class templates `map` and `multimap`; the header `<set>` defines the class templates `set` and `multiset`.
- 2 The following exposition-only alias templates may appear in deduction guides for associative containers:

```

template<class InputIterator>
using iter-value-type =
    typename iterator_traits<InputIterator>::value_type;           // exposition only
template<class InputIterator>
using iter-key-type = remove_const_t<
    typename iterator_traits<InputIterator>::value_type::first_type>; // exposition only

```

```

template<class InputIterator>
using iter-mapped-type =
    typename iterator_traits<InputIterator>::value_type::second_type; // exposition only
template<class InputIterator>
using iter-to-alloc-type = pair<
    add_const_t<typename iterator_traits<InputIterator>::value_type::first_type>,
    typename iterator_traits<InputIterator>::value_type::second_type>; // exposition only

```

21.4.2 Header <map> synopsis

[associative.map.syn]

```

#include <initializer_list>

namespace std {
    // 21.4.4, class template map
    template<class Key, class T, class Compare = less<Key>,
              class Allocator = allocator<pair<const Key, T>>>
        class map;

    template<class Key, class T, class Compare, class Allocator>
        bool operator==(const map<Key, T, Compare, Allocator>& x,
                          const map<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator!=(const map<Key, T, Compare, Allocator>& x,
                          const map<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator< (const map<Key, T, Compare, Allocator>& x,
                        const map<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator> (const map<Key, T, Compare, Allocator>& x,
                        const map<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator<=(const map<Key, T, Compare, Allocator>& x,
                          const map<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator>=(const map<Key, T, Compare, Allocator>& x,
                          const map<Key, T, Compare, Allocator>& y);

    template<class Key, class T, class Compare, class Allocator>
        void swap(map<Key, T, Compare, Allocator>& x,
                  map<Key, T, Compare, Allocator>& y)
            noexcept(noexcept(x.swap(y)));
}

template <class Key, class T, class Compare, class Allocator, class Predicate>
void erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);

    // 21.4.5, class template multimap
    template<class Key, class T, class Compare = less<Key>,
              class Allocator = allocator<pair<const Key, T>>>
        class multimap;

    template<class Key, class T, class Compare, class Allocator>
        bool operator==(const multimap<Key, T, Compare, Allocator>& x,
                          const multimap<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator!=(const multimap<Key, T, Compare, Allocator>& x,
                          const multimap<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator< (const multimap<Key, T, Compare, Allocator>& x,
                        const multimap<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator> (const multimap<Key, T, Compare, Allocator>& x,
                        const multimap<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator<=(const multimap<Key, T, Compare, Allocator>& x,
                          const multimap<Key, T, Compare, Allocator>& y);
    template<class Key, class T, class Compare, class Allocator>
        bool operator>=(const multimap<Key, T, Compare, Allocator>& x,
                          const multimap<Key, T, Compare, Allocator>& y);

```

```

template<class Key, class T, class Compare, class Allocator>
bool operator>=(const multimap<Key, T, Compare, Allocator>& x,
                  const multimap<Key, T, Compare, Allocator>& y);

template<class Key, class T, class Compare, class Allocator>
void swap(multimap<Key, T, Compare, Allocator>& x,
          multimap<Key, T, Compare, Allocator>& y)
    noexcept(noexcept(x.swap(y))));

template <class Key, class T, class Compare, class Allocator, class Predicate>
void erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);

namespace pmr {
    template<class Key, class Compare = less<Key>>
    using map = std::map<Key, T, Compare,
                         polymorphic_allocator<pair<const Key, T>>>;
    template<class Key, class Compare = less<Key>>
    using multimap = std::multimap<Key, T, Compare,
                                    polymorphic_allocator<pair<const Key, T>>>;
}
}

```

21.4.3 Header <set> synopsis

[associative.set.syn]

```

#include <initializer_list>

namespace std {
    // 21.4.6, class template set
    template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
    class set;

    template<class Key, class Compare, class Allocator>

template <class Key, class Compare, class Allocator, class Predicate>
    void erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

namespace pmr {
    template<class Key, class Compare = less<Key>>
        using set = std::set<Key, Compare, polymorphic_allocator<Key>>;
    template<class Key, class Compare = less<Key>>
        using multiset = std::multiset<Key, Compare, polymorphic_allocator<Key>>;
}
}

```

21.4.4 Class template `map`

[map]

21.4.4.1 Overview

[map.overview]

- ¹ A `map` is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of values of another type `T` based on the keys. The `map` class supports bidirectional iterators.
- ² A `map` satisfies all of the requirements of a container, of a reversible container (21.2), of an associative container (21.2.6), and of an allocator-aware container (Table 65). A `map` also provides most operations described in 21.2.6 for unique keys. This means that a `map` supports the `a_uniq` operations in 21.2.6 but not the `a_eq` operations. For a `map<Key, T>` the `key_type` is `Key` and the `value_type` is `pair<const Key, T>`. Descriptions are provided here only for operations on `map` that are not described in one of those tables or for operations where there is additional semantic information.

```

namespace std {
    template<class Key, class T, class Compare = less<Key>,
              class Allocator = allocator<pair<const Key, T>>>
    class map {
    public:
        // types
        using key_type           = Key;
        using mapped_type         = T;
        using value_type          = pair<const Key, T>;
        using key_compare         = Compare;
        using allocator_type      = Allocator;
        using pointer              = typename allocator_traits<Allocator>::pointer;
        using const_pointer        = typename allocator_traits<Allocator>::const_pointer;
        using reference            = value_type&;
    }
}

```

```

using const_reference      = const value_type&;
using size_type           = implementation-defined; // see 21.2
using difference_type    = implementation-defined; // see 21.2
using iterator            = implementation-defined; // see 21.2
using const_iterator      = implementation-defined; // see 21.2
using reverse_iterator    = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;
using node_type           = unspecified;
using insert_return_type   = insert-return-type<iterator, node_type>;
```

```

class value_compare {
    friend class map;
protected:
    Compare comp;
    value_compare(Compare c) : comp(c) {}
public:
    bool operator()(const value_type& x, const value_type& y) const {
        return comp(x.first, y.first);
    }
};
```

```
// 21.4.4.2, construct/copy/destroy
map() : map(Compare()) { }
explicit map(const Compare& comp, const Allocator& = Allocator());
template<class InputIterator>
    map(InputIterator first, InputIterator last,
         const Compare& comp = Compare(), const Allocator& = Allocator());
map(const map& x);
map(map&& x);
explicit map(const Allocator&);
map(const map&, const Allocator&);
map(map&&, const Allocator&);
map(initializer_list<value_type>,
     const Compare& = Compare(),
     const Allocator& = Allocator());

    noexcept(noexcept(x.swap(y)));
}

21.4.4.2 Constructors, copy, and assignment [map.cons]

```

`explicit map(const Compare& comp, const Allocator& = Allocator());`

¹ *Effects:* Constructs an empty `map` using the specified comparison object and allocator.

2 *Complexity:* Constant.

```
template<class InputIterator>
map(InputIterator first, InputIterator last,
     const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects:* Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity:* Linear in N if the range `[first, last)` is already sorted using `comp` and otherwise $N \log N$, where N is `last - first`.

21.4.4.3 Element access

[`map.access`]

```
mapped_type& operator[](const key_type& x);
```

1 *Effects:* Equivalent to: `return try_emplace(x).first->second;`

```
mapped_type& operator[](key_type&& x);
```

2 *Effects:* Equivalent to: `return try_emplace(move(x)).first->second;`

```
mapped_type& at(const key_type& x);
const mapped_type& at(const key_type& x) const;
```

3 *Returns:* A reference to the `mapped_type` corresponding to `x` in `*this`.

4 *Throws:* An exception object of type `out_of_range` if no such element is present.

5 *Complexity:* Logarithmic.

21.4.4.4 Modifiers

[`map.modifiers`]

```
template<class P>
pair<iterator, bool> insert(P&& x);
template<class P>
iterator insert(const_iterator position, P&& x);
```

1 *Effects:* The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

2 *Remarks:* These signatures shall not participate in overload resolution unless `is_constructible_v<value_type, P&&>` is `true`.

```
template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

3 *Requires:* `value_type` shall be *Cpp17EmplaceConstructible* into `map` from `piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...)`.

4 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...)`.

5 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

6 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

7 *Requires:* `value_type` shall be *Cpp17EmplaceConstructible* into `map` from `piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...)`.

8 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...)`.

9 >Returns: In the first overload, the `bool` component of the returned pair is `true` if and only if the
 insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.
 10 Complexity: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);

11     Requires: is_assignable_v<mapped_type&, M&&> shall be true. value_type shall be Cpp17EmplaceConstructible into map from k, forward<M>(obj).
```

12 Effects: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `std::forward<M>(obj)`.

13 >Returns: In the first overload, the `bool` component of the returned pair is `true` if and only if the
 insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

14 Complexity: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);

15     Requires: is_assignable_v<mapped_type&, M&&> shall be true. value_type shall be Cpp17EmplaceConstructible into map from move(k), forward<M>(obj).
```

16 Effects: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

17 >Returns: In the first overload, the `bool` component of the returned pair is `true` if and only if the
 insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

18 Complexity: The same as `emplace` and `emplace_hint`, respectively.

21.4.4.5 Erasure

[map.erasure]

```
template <class Key, class T, class Compare, class Allocator, class Predicate>
void erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);
```

1 Effects: Equivalent to:

```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

21.4.5 Class template `multimap`

[multimap]

21.4.5.1 Overview

[multimap.overview]

- 1 A `multimap` is an associative container that supports equivalent keys (possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type `T` based on the keys. The `multimap` class supports bidirectional iterators.
- 2 A `multimap` satisfies all of the requirements of a container and of a reversible container (21.2), of an associative container (21.2.6), and of an allocator-aware container (Table 65). A `multimap` also provides most operations described in 21.2.6 for equal keys. This means that a `multimap` supports the `a_eq` operations in 21.2.6 but not the `a_uniq` operations. For a `multimap<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key,T>`. Descriptions are provided here only for operations on `multimap` that are not described in one of those tables or for operations where there is additional semantic information.

```

namespace std {
    template<class Key, class T, class Compare = less<Key>,
              class Allocator = allocator<pair<const Key, T>>>
    class multimap {

21.4.5.2 Constructors

[[multimap.cons](#)]

```
explicit multimap(const Compare& comp, const Allocator& = Allocator());
```

¹ *Effects:* Constructs an empty `multimap` using the specified comparison object and allocator.

² *Complexity:* Constant.

```
template<class InputIterator>
multimap(InputIterator first, InputIterator last,
         const Compare& comp = Compare(),
         const Allocator& = Allocator());
```

³ *Effects:* Constructs an empty `multimap` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

- ⁴ *Complexity:* Linear in N if the range $[\text{first}, \text{last})$ is already sorted using `comp` and otherwise $N \log N$, where N is $\text{last} - \text{first}$.

21.4.5.3 Modifiers

[`multimap.modifiers`]

```
template<class P> iterator insert(P&& x);
template<class P> iterator insert(const_iterator position, P&& x);
```

- ¹ *Effects:* The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

- ² *Remarks:* These signatures shall not participate in overload resolution unless `is_constructible_v<value_type, P&&>` is `true`.

21.4.5.4 Erasure

[`multimap.erasure`]

```
template <class Key, class T, class Compare, class Allocator, class Predicate>
void erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);
```

- ¹ *Effects:* Equivalent to:

```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

21.4.6 Class template set

[`set`]

21.4.6.1 Overview

[`set.overview`]

- ¹ A `set` is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of the keys themselves. The `set` class supports bidirectional iterators.
- ² A `set` satisfies all of the requirements of a container, of a reversible container (21.2), of an associative container (21.2.6), and of an allocator-aware container (Table 65). A `set` also provides most operations described in 21.2.6 for unique keys. This means that a `set` supports the `a_uniq` operations in 21.2.6 but not the `a_eq` operations. For a `set<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `set` that are not described in one of these tables and for operations where there is additional semantic information.

```
namespace std {
    template<class Key, class Compare = less<Key>,
              class Allocator = allocator<Key>>
    class set {
    public:
        // types
        using key_type           = Key;
        using key_compare         = Compare;
        using value_type          = Key;
        using value_compare        = Compare;
        using allocator_type      = Allocator;
        using pointer              = typename allocator_traits<Allocator>::pointer;
        using const_pointer        = typename allocator_traits<Allocator>::const_pointer;
        using reference            = value_type&;

}

```

21.4.6.2 Constructors, copy, and assignment

[set.cons]

```
explicit set(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `set` using the specified comparison objects and allocator.

2 *Complexity*: Constant.

```

template<class InputIterator>
set(InputIterator first, InputIterator last,
    const Compare& comp = Compare(), const Allocator& = Allocator());

```

3 *Effects*: Constructs an empty `set` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity*: Linear in N if the range `[first, last)` is already sorted using `comp` and otherwise $N \log N$, where N is `last - first`.

21.4.6.3 Erasure

[set.erasure]

```
template <class Key, class Compare, class Allocator, class Predicate>
void erase_if(set<Key, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```

for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}

```

21.4.7 Class template `multiset`

[multiset]

21.4.7.1 Overview

[multiset.overview]

- 1 A `multiset` is an associative container that supports equivalent keys (possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The `multiset` class supports bidirectional iterators.
- 2 A `multiset` satisfies all of the requirements of a container, of a reversible container (21.2), of an associative container (21.2.6), and of an allocator-aware container (Table 65). `multiset` also provides most operations described in 21.2.6 for duplicate keys. This means that a `multiset` supports the `a_eq` operations in 21.2.6 but not the `a_uniq` operations. For a `multiset<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `multiset` that are not described in one of these tables and for operations where there is additional semantic information.

```

namespace std {
    template<class Key, class Compare = less<Key>,
              class Allocator = allocator<Key>>
    class multiset {
    public:
        // types
        using key_type             = Key;

```

```

```

21.4.7.2 Constructors

[multiset.cons]

```
explicit multiset(const Compare& comp, const Allocator& = Allocator());
```

¹ *Effects:* Constructs an empty `multiset` using the specified comparison object and allocator.

² *Complexity:* Constant.

```
template<class InputIterator>
multiset(InputIterator first, InputIterator last,
         const Compare& comp = Compare(), const Allocator& = Allocator());
```

³ *Effects:* Constructs an empty `multiset` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

⁴ *Complexity:* Linear in N if the range `[first, last)` is already sorted using `comp` and otherwise $N \log N$, where N is `last - first`.

21.4.7.3 Erasure

[multiset.erasure]

```
template <class Key, class Compare, class Allocator, class Predicate>
void erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);
```

¹ *Effects:* Equivalent to:

```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

21.5 Unordered associative containers

[unord]

21.5.1 In general

[unord.general]

¹ The header `<unordered_map>` defines the class templates `unordered_map` and `unordered_multimap`; the header `<unordered_set>` defines the class templates `unordered_set` and `unordered_multiset`.

- ² The exposition-only alias templates *iter-value-type*, *iter-key-type*, *iter-mapped-type*, and *iter-to-alloc-type* defined in 21.4.1 may appear in deduction guides for unordered containers.

21.5.2 Header <unordered_map> synopsis

[unord.map.syn]

```
#include <initializer_list>

namespace std {
    // 21.5.4, class template unordered_map
    template<class Key,
              class T,
              class Hash = hash<Key>,
              class Pred = equal_to<Key>,
              class Alloc = allocator<pair<const Key, T>>>
    class unordered_map;

    // 21.5.5, class template unordered_multimap
    template<class Key,
              class T,
              class Hash = hash<Key>,
              class Pred = equal_to<Key>,
              class Alloc = allocator<pair<const Key, T>>>
    class unordered_multimap;

}
}

```

21.5.4 Class template `unordered_map`

[unord.map]

21.5.4.1 Overview

[unord.map.overview]

- 1 An `unordered_map` is an unordered associative container that supports unique keys (an `unordered_map` contains at most one of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_map` class supports forward iterators.
- 2 An `unordered_map` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 65). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_map` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_map<Key, T>` the key type is `Key`, the mapped type is `T`, and the value type is `pair<const Key, T>`.
- 3 This subclause only describes operations on `unordered_map` that are not described in one of the requirement tables, or for which there is additional semantic information.

```

}

```

- ⁴ A `size_type` parameter type in an `unordered_map` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

21.5.4.2 Constructors

[unord.map.cnstr]

```

unordered_map() : unordered_map(size_type(see below)) { }
explicit unordered_map(size_type n,
                      const hasher& hf = hasher(),
                      const key_equal& eql = key_equal(),
                      const allocator_type& a = allocator_type());

```

- ¹ *Effects:* Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

- ² *Complexity:* Constant.

```

template<class InputIterator>
unordered_map(InputIterator f, InputIterator l,
             size_type n = see below,
             const hasher& hf = hasher(),
             const key_equal& eql = key_equal(),
             const allocator_type& a = allocator_type());
unordered_map(initializer_list<value_type> il,
             size_type n = see below,
             const hasher& hf = hasher(),
             const key_equal& eql = key_equal(),
             const allocator_type& a = allocator_type());

```

- ³ *Effects:* Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.

- ⁴ *Complexity:* Average case linear, worst case quadratic.

21.5.4.3 Element access

[unord.map.elem]

```
mapped_type& operator[](const key_type& k);
```

- ¹ *Effects:* Equivalent to: `return try_emplace(k).first->second;`

```
mapped_type& operator[](key_type&& k);
```

- ² *Effects:* Equivalent to: `return try_emplace(move(k)).first->second;`

```
mapped_type& at(const key_type& k);
const mapped_type& at(const key_type& k) const;
```

3 *Returns:* A reference to `x.second`, where `x` is the (unique) element whose key is equivalent to `k`.

4 *Throws:* An exception object of type `out_of_range` if no such element is present.

21.5.4.4 Modifiers

[`unord.map.modifiers`]

```
template<class P>
pair<iterator, bool> insert(P&& obj);
```

1 *Effects:* Equivalent to: `return emplace(std::forward<P>(obj));`

2 *Remarks:* This signature shall not participate in overload resolution unless `is_constructible_v<value_type, P&&>` is true.

```
template<class P>
iterator insert(const_iterator hint, P&& obj);
```

3 *Effects:* Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

4 *Remarks:* This signature shall not participate in overload resolution unless `is_constructible_v<value_type, P&&>` is true.

```
template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
```

```
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

5 *Requires:* `value_type` shall be *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args))...`.

6 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args))...`.

7 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

8 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
```

```
template<class... Args>
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

9 *Requires:* `value_type` shall be *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args))...`.

10 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args))...`.

11 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

12 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
```

```
template<class M>
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

13 *Requires:* `is assignable_v<mapped_type&, M&&>` shall be `true`. `value_type` shall be *Cpp17EmplaceConstructible* into `unordered_map` from `k, std::forward<M>(obj)`.

14 *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k, std::forward<M>(obj)`.

15 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

16 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

17 *Requires:* `is_assignable_v<mapped_type&, M&&>` shall be `true`. `value_type` shall be *Cpp17EmplaceConstructible* into `unordered_map` from `std::move(k)`, `std::forward<M>(obj)`.

18 *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

19 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

20 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

21.5.4.5 Erasure

[unord.map.erasure]

```
template <class K, class T, class H, class P, class A, class Predicate>
void erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

1 *Effects:* Equivalent to:

```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

21.5.5 Class template `unordered_multimap`

[unord.multimap]

21.5.5.1 Overview

[unord.multimap.overview]

- 1 An `unordered_multimap` is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.
- 2 An `unordered_multimap` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 65). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the key type is `Key`, the mapped type is `T`, and the value type is `pair<const Key, T>`.
- 3 This subclause only describes operations on `unordered_multimap` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
    template<class Key,
             class T,
             class Hash = hash<Key>,
             class Pred = equal_to<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class unordered_multimap {

```

```

template<class Key, class T, class Hash, class Allocator>
unordered_multimap(initializer_list<pair<Key, T>>, typename see below::size_type,
                   Hash, Allocator)
    -> unordered_multimap<Key, T, Hash, equal_to<Key>, Allocator>;

// swap
template<class Key, class T, class Hash, class Pred, class Alloc>
void swap(unordered_multimap<Key, T, Hash, Pred, Alloc>& x,
          unordered_multimap<Key, T, Hash, Pred, Alloc>& y)
    noexcept(noexcept(x.swap(y)));
}

```

- ⁴ A `size_type` parameter type in an `unordered_multimap` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

21.5.5.2 Constructors

[unord.multimap.cnstr]

```

unordered_multimap() : unordered_multimap(size_type(see below)) {}
explicit unordered_multimap(size_type n,
                           const hasher& hf = hasher(),
                           const key_equal& eql = key_equal(),
                           const allocator_type& a = allocator_type());

```

- ¹ *Effects:* Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.
- ² *Complexity:* Constant.

```

template<class InputIterator>
unordered_multimap(InputIterator f, InputIterator l,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());
unordered_multimap(initializer_list<value_type> il,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());

```

- ³ *Effects:* Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.

- ⁴ *Complexity:* Average case linear, worst case quadratic.

21.5.5.3 Modifiers

[unord.multimap.modifiers]

```

template<class P>
iterator insert(P&& obj);

```

- ¹ *Effects:* Equivalent to: `return emplace(std::forward<P>(obj));`

- ² *Remarks:* This signature shall not participate in overload resolution unless `is_constructible_v<value_type, P&&>` is true.

```

template<class P>
iterator insert(const_iterator hint, P&& obj);

```

- ³ *Effects:* Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

- ⁴ *Remarks:* This signature shall not participate in overload resolution unless `is_constructible_v<value_type, P&&>` is true.

21.5.5.4 Erasure

[unord.multimap.erasure]

```
template <class K, class T, class H, class P, class A, class Predicate>
void erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);
```

¹ Effects: Equivalent to:

```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

21.5.6 Class template unordered_set

[unord.set]

21.5.6.1 Overview

[unord.set.overview]

- ¹ An `unordered_set` is an unordered associative container that supports unique keys (an `unordered_set` contains at most one of each key value) and in which the elements' keys are the elements themselves. The `unordered_set` class supports forward iterators.
- ² An `unordered_set` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 65). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_set` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_set<Key>` the key type and the value type are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.
- ³ This subclause only describes operations on `unordered_set` that are not described in one of the requirement tables, or for which there is additional semantic information.

```

}

```

⁴ A `size_type` parameter type in an `unordered_set` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

21.5.6.2 Constructors

[unord.set.cnstr]

```

unordered_set() : unordered_set(size_type(see below)) { }
explicit unordered_set(size_type n,
                      const hasher& hf = hasher(),
                      const key_equal& eql = key_equal(),
                      const allocator_type& a = allocator_type());

```

¹ *Effects:* Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

² *Complexity:* Constant.

```
template<class InputIterator>
unordered_set(InputIterator f, InputIterator l,
             size_type n = see below,
             const hasher& hf = hasher(),
             const key_equal& eql = key_equal(),
             const allocator_type& a = allocator_type());
unordered_set(initializer_list<value_type> il,
             size_type n = see below,
             const hasher& hf = hasher(),
             const key_equal& eql = key_equal(),
             const allocator_type& a = allocator_type());
```

3 *Effects:* Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.

4 *Complexity:* Average case linear, worst case quadratic.

21.5.6.3 Erasure

[`unord.set.erasure`]

```
template <class K, class H, class P, class A, class Predicate>
void erase_if(unordered_set<K, H, P, A>& c, Predicate pred);
```

1 *Effects:* Equivalent to:

```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

21.5.7 Class template `unordered_multiset`

[`unord.multiset`]

21.5.7.1 Overview

[`unord.multiset.overview`]

- 1 An `unordered_multiset` is an unordered associative container that supports equivalent keys (an instance of `unordered_multiset` may contain multiple copies of the same key value) and in which each element's key is the element itself. The `unordered_multiset` class supports forward iterators.
- 2 An `unordered_multiset` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 65). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multiset` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multiset<Key>` the key type and the value type are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.
- 3 This subclause only describes operations on `unordered_multiset` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
    template<class Key,
              class Hash = hash<Key>,
              class Pred = equal_to<Key>,
              class Allocator = allocator<Key>>
    class unordered_multiset {
        public:
            // types
            using key_type           = Key;
            using value_type          = Key;
            using hasher              = Hash;
            using key_equal           = see 21.2.7;
            using allocator_type      = Allocator;
            using pointer              = typename allocator_traits<Allocator>::pointer;
            using const_pointer        = typename allocator_traits<Allocator>::const_pointer;
            using reference            = value_type&;
    };
}
```

unordered_multiset(InputIterator, InputIterator, typename see below::size_type,
                  Hash, Allocator)
-> unordered_multiset<iter-value-type<InputIterator>, Hash,
                     equal_to<iter-value-type<InputIterator>>,
                     Allocator>;

template<class T, class Allocator>
unordered_multiset(initializer_list<T>, typename see below::size_type, Allocator)
-> unordered_multiset<T, hash<T>, equal_to<T>, Allocator>;

template<class T, class Hash, class Allocator>
unordered_multiset(initializer_list<T>, typename see below::size_type, Hash, Allocator)
-> unordered_multiset<T, Hash, equal_to<T>, Allocator>;

// swap
template<class Key, class Hash, class Pred, class Alloc>
void swap(unordered_multiset<Key, Hash, Pred, Alloc>& x,
          unordered_multiset<Key, Hash, Pred, Alloc>& y)
noexcept(noexcept(x.swap(y)));
}

```

- ⁴ A `size_type` parameter type in an `unordered_multiset` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

21.5.7.2 Constructors

[unord.multiset.cnstr]

```
unordered_multiset() : unordered_multiset(size_type(see below)) { }
explicit unordered_multiset(size_type n,
                           const hasher& hf = hasher(),
                           const key_equal& eql = key_equal(),
                           const allocator_type& a = allocator_type());
```

- 1 *Effects:* Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.
- 2 *Complexity:* Constant.

```
template<class InputIterator>
unordered_multiset(InputIterator f, InputIterator l,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());
```

- 3 *Effects:* Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.
- 4 *Complexity:* Average case linear, worst case quadratic.

21.5.7.3 Erasure

[unord.multiset.erasure]

```
template <class K, class H, class P, class A, class Predicate>
void erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);
```

- 1 *Effects:* Equivalent to:

```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

21.6 Container adaptors

[container.adaptors]

21.6.1 In general

[container.adaptors.general]

- 1 The headers `<queue>` and `<stack>` define the container adaptors `queue`, `priority_queue`, and `stack`.
- 2 The container adaptors each take a `Container` template parameter, and each constructor takes a `Container` reference argument. This container is copied into the `Container` member of each adaptor. If the container takes an allocator, then a compatible allocator may be passed in to the adaptor's constructor. Otherwise, normal copy or move construction is used for the container argument. The first template parameter `T` of the container adaptors shall denote the same type as `Container::value_type`.
- 3 For container adaptors, no `swap` function throws an exception unless that exception is thrown by the swap of the adaptor's `Container` or `Compare` object (if any).
- 4 A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:

- (4.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
- (4.2) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.
- (4.3) — It has a `Container` template parameter and a type that qualifies as an allocator is deduced for that parameter.
- (4.4) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.
- (4.5) — It has both `Container` and `Allocator` template parameters, and `uses_allocator_v<Container, Allocator>` is false.

21.6.2 Header <queue> synopsis

[queue.syn]

```
#include <initializer_list>

namespace std {
    template<class T, class Container = deque<T>> class queue;
    template<class T, class Container = vector<T>,
             class Compare = less<typename Container::value_type>>
        class priority_queue;

    template<class T, class Container>
        bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
    template<class T, class Container>
        bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
    template<class T, class Container>
        bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
    template<class T, class Container>
        bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
    template<class T, class Container>
        bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
    template<class T, class Container>
        bool operator>=(const queue<T, Container>& x, const queue<T, Container>& y);

    template<class T, class Container>
        void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
    template<class T, class Container, class Compare>
        void swap(priority_queue<T, Container, Compare>& x,
                  priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
}
```

21.6.3 Header <stack> synopsis

[stack.syn]

```
#include <initializer_list>

namespace std {
    template<class T, class Container = deque<T>> class stack;

    template<class T, class Container>
        bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
    template<class T, class Container>
        bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
    template<class T, class Container>
        bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);
    template<class T, class Container>
        bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
    template<class T, class Container>
        bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
    template<class T, class Container>
        bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
```

```
template<class T, class Container>
void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
}
```

21.6.4 Class template queue

[queue]

21.6.4.1 Definition

[queue.defn]

- ¹ Any sequence container supporting operations `front()`, `back()`, `push_back()` and `pop_front()` can be used to instantiate `queue`. In particular, `list` (21.3.10) and `deque` (21.3.8) can be used.

```
namespace std {
    template<class T, class Container = deque<T>>
    class queue {
public:
    using value_type      = typename Container::value_type;
    using reference       = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type        = typename Container::size_type;
    using container_type   =           Container;

protected:
    Container c;

public:
    queue() : queue(Container()) {}
    explicit queue(const Container&);
    explicit queue(Container&&);

    template<class Alloc> explicit queue(const Alloc&);
    template<class Alloc> queue(const Container&, const Alloc&);
    template<class Alloc> queue(Container&&, const Alloc&);
    template<class Alloc> queue(const queue&, const Alloc&);
    template<class Alloc> queue(queue&&, const Alloc&);

    [[nodiscard]] bool empty() const    { return c.empty(); }
    size_type          size() const     { return c.size(); }
    reference         front()          { return c.front(); }
    const_reference   front() const    { return c.front(); }
    reference         back()           { return c.back(); }
    const_reference   back() const    { return c.back(); }
    void push(const value_type& x)    { c.push_back(x); }
    void push(value_type&& x)        { c.push_back(std::move(x)); }

    template<class... Args>
    decltype(auto) emplace(Args&&... args)
        { return c.emplace_back(std::forward<Args>(args)...); }

    void pop()                      { c.pop_front(); }

    void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
        { using std::swap; swap(c, q.c); }

};

template<class Container>
queue(Container) -> queue<typename Container::value_type, Container>;

template<class Container, class Allocator>
queue(Container, Allocator) -> queue<typename Container::value_type, Container>;

template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

template<class T, class Container, class Alloc>
struct uses_allocator<queue<T, Container>, Alloc>
    : uses_allocator<Container, Alloc>::type { };

}
```

21.6.4.2 Constructors

[queue.cons]

```
explicit queue(const Container& cont);
1      Effects: Initializes c with cont.

explicit queue(Container&& cont);
2      Effects: Initializes c with std::move(cont).
```

21.6.4.3 Constructors with allocators

[queue.cons.alloc]

- 1 If `uses_allocator_v<container_type, Alloc>` is `false` the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit queue(const Alloc& a);
2      Effects: Initializes c with a.

template<class Alloc> queue(const container_type& cont, const Alloc& a);
3      Effects: Initializes c with cont as the first argument and a as the second argument.

template<class Alloc> queue(container_type&& cont, const Alloc& a);
4      Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

template<class Alloc> queue(const queue& q, const Alloc& a);
5      Effects: Initializes c with q.c as the first argument and a as the second argument.

template<class Alloc> queue(queue&& q, const Alloc& a);
6      Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument.
```

21.6.4.4 Operators

[queue.ops]

```
template<class T, class Container>
bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
```

- 1 Returns: `x.c == y.c`.

```
template<class T, class Container>
bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
2      Returns: x.c != y.c.
```

```
template<class T, class Container>
bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
3      Returns: x.c < y.c.
```

```
template<class T, class Container>
bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
4      Returns: x.c > y.c.
```

```
template<class T, class Container>
bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
5      Returns: x.c <= y.c.
```

```
template<class T, class Container>
bool operator>=(const queue<T, Container>& x,
                 const queue<T, Container>& y);
6      Returns: x.c >= y.c.
```

21.6.4.5 Specialized algorithms

[queue.special]

```
template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
1      Remarks: This function shall not participate in overload resolution unless is_swappable_v<Container> is true.
```

² *Effects:* As if by `x.swap(y)`.

21.6.5 Class template `priority_queue`

[`priority.queue`]

21.6.5.1 Overview

[`priqueue.overview`]

- ¹ Any sequence container with random access iterator and supporting operations `front()`, `push_back()` and `pop_back()` can be used to instantiate `priority_queue`. In particular, `vector` (21.3.11) and `deque` (21.3.8) can be used. Instantiating `priority_queue` also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (24.7).

```
namespace std {
    template<class T, class Container = vector<T>,
              class Compare = less<typename Container::value_type>>
    class priority_queue {
public:
    using value_type      = typename Container::value_type;
    using reference       = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type        = typename Container::size_type;
    using container_type   = Container;
    using value_compare    = Compare;

protected:
    Container c;
    Compare comp;

public:

struct uses_allocator<priority_queue<T, Container, Compare>, Alloc>
    : uses_allocator<Container, Alloc>::type { };

}

```

21.6.5.2 Constructors

[priqueue.cons]

```

priority_queue(const Compare& x, const Container& y);
priority_queue(const Compare& x, Container&& y);

```

1 *Requires:* x shall define a strict weak ordering (24.7).

2 *Effects:* Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls make_heap(c.begin(), c.end(), comp).

```

template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x, const Container& y);
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare(),
              Container&& y = Container());

```

3 *Requires:* x shall define a strict weak ordering (24.7).

4 *Effects:* Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

21.6.5.3 Constructors with allocators

[priqueue.cons.alloc]

1 If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit priority_queue(const Alloc& a);
```

2 *Effects:* Initializes c with a and value-initializes comp.

```
template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);
```

3 *Effects:* Initializes c with a and initializes comp with compare.

```
template<class Alloc>
priority_queue(const Compare& compare, const Container& cont, const Alloc& a);
```

4 *Effects:* Initializes c with cont as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

```
template<class Alloc>
priority_queue(const Compare& compare, Container&& cont, const Alloc& a);
```

5 *Effects:* Initializes c with std::move(cont) as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

```
template<class Alloc> priority_queue(const priority_queue& q, const Alloc& a);
```

6 *Effects:* Initializes c with q.c as the first argument and a as the second argument, and initializes comp with q.compare.

`template<class Alloc> priority_queue(priority_queue&& q, const Alloc& a);`

7 *Effects:* Initializes `c` with `std::move(q.c)` as the first argument and `a` as the second argument, and initializes `comp` with `std::move(q.comp)`.

21.6.5.4 Members

[priqueue.members]

`void push(const value_type& x);`

1 *Effects:* As if by:

```
c.push_back(x);
push_heap(c.begin(), c.end(), comp);
```

`void push(value_type&& x);`

2 *Effects:* As if by:

```
c.push_back(std::move(x));
push_heap(c.begin(), c.end(), comp);
```

`template<class... Args> void emplace(Args&&... args)`

3 *Effects:* As if by:

```
c.emplace_back(std::forward<Args>(args)...);
push_heap(c.begin(), c.end(), comp);
```

`void pop();`

4 *Effects:* As if by:

```
pop_heap(c.begin(), c.end(), comp);
c.pop_back();
```

21.6.5.5 Specialized algorithms

[priqueue.special]

`template<class T, class Container, class Compare>
void swap(priority_queue<T, Container, Compare>& x,
 priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));`

1 *Remarks:* This function shall not participate in overload resolution unless `is_swappable_v<Container>` is true and `is_swappable_v<Compare>` is true.

2 *Effects:* As if by `x.swap(y)`.

21.6.6 Class template stack

[stack]

1 Any sequence container supporting operations `back()`, `push_back()` and `pop_back()` can be used to instantiate `stack`. In particular, `vector` (21.3.11), `list` (21.3.10) and `deque` (21.3.8) can be used.

21.6.6.1 Definition

[stack.defn]

```
namespace std {
    template<class T, class Container = deque<T>>
    class stack {
        public:
            using value_type      = typename Container::value_type;
            using reference       = typename Container::reference;
            using const_reference = typename Container::const_reference;
            using size_type        = typename Container::size_type;
            using container_type   = Container;

        protected:
            Container c;

        public:
            stack() : stack(Container{}) {}
            explicit stack(const Container&);
            explicit stack(Container&&);

            template<class Alloc> explicit stack(const Alloc&);
            template<class Alloc> stack(const Container&, const Alloc&);
            template<class Alloc> stack(Container&&, const Alloc&);
```

```

template<class Alloc> stack(const stack&, const Alloc&);
template<class Alloc> stack(stack&&, const Alloc&);

[[nodiscard]] bool empty() const { return c.empty(); }
size_type size() const { return c.size(); }
reference top() { return c.back(); }
const_reference top() const { return c.back(); }
void push(const value_type& x) { c.push_back(x); }
void push(value_type&& x) { c.push_back(std::move(x)); }
template<class... Args>
 decltype(auto) emplace(Args&&... args)
 { return c.emplace_back(std::forward<Args>(args)...); }
void pop() { c.pop_back(); }
void swap(stack& s) noexcept(is_nothrow_swappable_v<Container>)
 { using std::swap; swap(c, s.c); }
};

template<class Container>
stack(Container) -> stack<typename Container::value_type, Container>;

template<class Container, class Allocator>
stack(Container, Allocator) -> stack<typename Container::value_type, Container>;

template<class T, class Container, class Alloc>
struct uses_allocator<stack<T, Container>, Alloc>
: uses_allocator<Container, Alloc>::type { };
}

```

21.6.6.2 Constructors

[stack.cons]

```
explicit stack(const Container& cont);
```

- 1 *Effects:* Initializes *c* with *cont*.

```
explicit stack(Container&& cont);
```

- 2 *Effects:* Initializes *c* with *std::move(cont)*.

21.6.6.3 Constructors with allocators

[stack.cons.alloc]

- 1 If *uses_allocator_v<container_type, Alloc>* is *false* the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit stack(const Alloc& a);
```

- 2 *Effects:* Initializes *c* with *a*.

```
template<class Alloc> stack(const container_type& cont, const Alloc& a);
```

- 3 *Effects:* Initializes *c* with *cont* as the first argument and *a* as the second argument.

```
template<class Alloc> stack(container_type&& cont, const Alloc& a);
```

- 4 *Effects:* Initializes *c* with *std::move(cont)* as the first argument and *a* as the second argument.

```
template<class Alloc> stack(const stack& s, const Alloc& a);
```

- 5 *Effects:* Initializes *c* with *s.c* as the first argument and *a* as the second argument.

```
template<class Alloc> stack(stack&& s, const Alloc& a);
```

- 6 *Effects:* Initializes *c* with *std::move(s.c)* as the first argument and *a* as the second argument.

21.6.6.4 Operators

[stack.ops]

```
template<class T, class Container>
bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
```

- 1 *Returns:* *x.c == y.c*.

```

template<class T, class Container>
bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
2   Returns: x.c != y.c.

template<class T, class Container>
bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);
3   Returns: x.c < y.c.

template<class T, class Container>
bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
4   Returns: x.c > y.c.

template<class T, class Container>
bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
5   Returns: x.c <= y.c.

template<class T, class Container>
bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
6   Returns: x.c >= y.c.

```

21.6.6.5 Specialized algorithms

[stack.special]

```

template<class T, class Container>
void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
1   Remarks: This function shall not participate in overload resolution unless is_swappable_v<Container> is true.
2   Effects: As if by x.swap(y).

```

21.7 Views

[views]

21.7.1 General

[views.general]

¹ The header `` defines the view `span`.

21.7.2 Header `` synopsis

[span.syn]

```

namespace std {
    // constants
    inline constexpr ptrdiff_t dynamic_extent = -1;

    // 21.7.3, class template span
    template<class ElementType, ptrdiff_t Extent = dynamic_extent>
        class span;

    // 21.7.3.7, views of object representation
    template<class ElementType, ptrdiff_t Extent>
        span<const byte,
            Extent == dynamic_extent ? dynamic_extent
                : static_cast<ptrdiff_t>(sizeof(ElementType)) * Extent>
        as_bytes(span<ElementType, Extent> s) noexcept;

    template<class ElementType, ptrdiff_t Extent>
        span<byte,
            Extent == dynamic_extent ? dynamic_extent
                : static_cast<ptrdiff_t>(sizeof(ElementType)) * Extent>
        as_writable_bytes(span<ElementType, Extent> s) noexcept;
}

```

21.7.3 Class template `span`

[views.span]

21.7.3.1 Overview

[span.overview]

¹ A `span` is a view over a contiguous sequence of objects, the storage of which is owned by some other object.

- ² The iterator types `span::iterator` and `span::const_iterator` model `ContiguousIterator` (22.3.4.14), meet the *Cpp17RandomAccessIterator* requirements (22.3.5.6), and meet the requirements for `constexpr` iterators (22.3.1). All requirements on container iterators (21.2) apply to `span::iterator` and `span::const_iterator` as well.

- ³ All member functions of `span` have constant time complexity.

```

namespace std {
    template<class ElementType, ptrdiff_t Extent = dynamic_extent>
    class span {
        public:
            // constants and types
            using element_type = ElementType;
            using value_type = remove_cv_t<ElementType>;
            using index_type = ptrdiff_t;
            using difference_type = ptrdiff_t;
            using pointer = element_type*;
            using reference = element_type&;
            using iterator = implementation-defined;
            using const_iterator = implementation-defined;
            using reverse_iterator = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;
            static constexpr index_type extent = Extent;

            // 21.7.3.2, constructors, copy, and assignment
            constexpr span() noexcept;
            constexpr span(pointer ptr, index_type count);
            constexpr span(pointer first, pointer last);

}

```

⁴ ElementType is required to be a complete object type that is not an abstract class type.

⁵ If Extent is negative and not equal to dynamic_extent, the program is ill-formed.

21.7.3.2 Constructors, copy, and assignment

[span.cons]

constexpr span() noexcept;

¹ *Ensures:* size() == 0 && data() == nullptr.

² *Remarks:* This constructor shall not participate in overload resolution unless Extent <= 0 is true.

constexpr span(pointer ptr, index_type count);

³ *Requires:* [ptr, ptr + count) shall be a valid range. If extent is not equal to dynamic_extent, then count shall be equal to extent.

⁴ *Effects:* Constructs a span that is a view over the range [ptr, ptr + count).

⁵ *Ensures:* size() == count && data() == ptr.

⁶ *Throws:* Nothing.

constexpr span(pointer first, pointer last);

⁷ *Requires:* [first, last) shall be a valid range. If extent is not equal to dynamic_extent, then last - first shall be equal to extent.

⁸ *Effects:* Constructs a span that is a view over the range [first, last).

⁹ *Ensures:* size() == last - first && data() == first.

¹⁰ *Throws:* Nothing.

```

template<size_t N> constexpr span(element_type (&arr)[N]) noexcept;
template<size_t N> constexpr span(array<value_type, N>& arr) noexcept;

```

```

template<size_t N> constexpr span(const array<value_type, N>& arr) noexcept;
11   Effects: Constructs a span that is a view over the supplied array.
12   Ensures: size() == N && data() == data(arr).
13   Remarks: These constructors shall not participate in overload resolution unless:
(13.1)   — extent == dynamic_extent || N == extent is true, and
(13.2)   — remove_pointer_t<decltype(data(arr))>(*) [] is convertible to ElementType(*) [].

template<class Container> constexpr span(Container& cont);
template<class Container> constexpr span(const Container& cont);
14   Requires: [data(cont), data(cont) + size(cont)) shall be a valid range. If extent is not equal
              to dynamic_extent, then size(cont) shall be equal to extent.
15   Effects: Constructs a span that is a view over the range [data(cont), data(cont) + size(cont)).
16   Ensures: size() == size(cont) && data() == data(cont).
17   Throws: What and when data(cont) and size(cont) throw.
18   Remarks: These constructors shall not participate in overload resolution unless:
(18.1)   — Container is not a specialization of span,
(18.2)   — Container is not a specialization of array,
(18.3)   — is_array_v<Container> is false,
(18.4)   — data(cont) and size(cont) are both well-formed, and
(18.5)   — remove_pointer_t<decltype(data(cont))>(*) [] is convertible to ElementType(*) [].

constexpr span(const span& other) noexcept = default;
19   Ensures: other.size() == size() && other.data() == data().

template<class OtherElementType, ptrdiff_t OtherExtent>
constexpr span(const span<OtherElementType, OtherExtent>& s) noexcept;
20   Effects: Constructs a span that is a view over the range [s.data(), s.data() + s.size()].
21   Ensures: size() == s.size() && data() == s.data().
22   Remarks: This constructor shall not participate in overload resolution unless:
(22.1)   — Extent == dynamic_extent || Extent == OtherExtent is true, and
(22.2)   — OtherElementType(*) [] is convertible to ElementType(*) [].

constexpr span& operator=(const span& other) noexcept = default;
23   Ensures: size() == other.size() && data() == other.data().

```

21.7.3.3 Subviews

[span.sub]

```

template<ptrdiff_t Count> constexpr span<element_type, Count> first() const;
1   Requires: 0 <= Count && Count <= size().
2   Effects: Equivalent to: return {data(), Count};

template<ptrdiff_t Count> constexpr span<element_type, Count> last() const;
3   Requires: 0 <= Count && Count <= size().
4   Effects: Equivalent to: return {data() + (size() - Count), Count};

template<ptrdiff_t Offset, ptrdiff_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;
5   Requires:
      (0 <= Offset && Offset <= size())
      && (Count == dynamic_extent || Count >= 0 && Offset + Count <= size())
6   Effects: Equivalent to:

```

```

        return span<ElementType, see below>(
            data() + Offset, Count != dynamic_extent ? Count : size() - Offset);
7   Remarks: The second template argument of the returned span type is:
    Count != dynamic_extent ? Count
                            : (Extent != dynamic_extent ? Extent - Offset
                            : dynamic_extent)

constexpr span<element_type, dynamic_extent> first(index_type count) const;
8   Requires: 0 <= count && count <= size().
9   Effects: Equivalent to: return {data(), count};

constexpr span<element_type, dynamic_extent> last(index_type count) const;
10  Requires: 0 <= count 0 && count <= size().
11  Effects: Equivalent to: return {data() + (size() - count), count};

constexpr span<element_type, dynamic_extent> subspan(
    index_type offset, index_type count = dynamic_extent) const;
12  Requires:
    (0 <= offset && offset <= size())
    && (count == dynamic_extent || count >= 0 && offset + count <= size())
13  Effects: Equivalent to:
    return {data() + offset, count == dynamic_extent ? size() - offset : count};

```

21.7.3.4 Observers

[span.obs]

```

constexpr index_type size() const noexcept;
1   Effects: Equivalent to: return size_;

constexpr index_type size_bytes() const noexcept;
2   Effects: Equivalent to: return size() * sizeof(element_type);

constexpr bool empty() const noexcept;
3   Effects: Equivalent to: return size() == 0;

```

21.7.3.5 Element access

[span.elem]

```

constexpr reference operator[](index_type idx) const;
constexpr reference operator()(index_type idx) const;
1   Requires: 0 <= idx && idx < size().
2   Effects: Equivalent to: return *(data() + idx);

constexpr pointer data() const noexcept;
3   Effects: Equivalent to: return data_;

```

21.7.3.6 Iterator support

[span.iterators]

```

constexpr iterator begin() const noexcept;
1   Returns: An iterator referring to the first element in the span. If empty() is true, then it returns the
   same value as end().

constexpr iterator end() const noexcept;
2   Returns: An iterator which is the past-the-end value.

constexpr reverse_iterator rbegin() const noexcept;
3   Effects: Equivalent to: return reverse_iterator(end());

constexpr reverse_iterator rend() const noexcept;
4   Returns: Equivalent to: return reverse_iterator(begin());

```

```

constexpr const_iterator cbegin() const noexcept;
5   Returns: A constant iterator referring to the first element in the span. If empty() is true, then it
      returns the same value as cend().

constexpr const_iterator cend() const noexcept;
6   Returns: A constant iterator which is the past-the-end value.

constexpr const_reverse_iterator crbegin() const noexcept;
7   Effects: Equivalent to: return const_reverse_iterator(cend());

constexpr const_reverse_iterator crend() const noexcept;
8   Effects: Equivalent to: return const_reverse_iterator(cbegin());

```

21.7.3.7 Views of object representation

[span.objectrep]

```

template<class ElementType, ptrdiff_t Extent>
span<const byte,
     Extent == dynamic_extent ? dynamic_extent
                               : static_cast<ptrdiff_t>(sizeof(ElementType)) * Extent>
as_bytes(span<ElementType, Extent> s) noexcept;
1   Effects: Equivalent to: return {reinterpret_cast<const byte*>(s.data()), s.size_bytes()};

template<class ElementType, ptrdiff_t Extent>
span<byte,
     Extent == dynamic_extent ? dynamic_extent
                               : static_cast<ptrdiff_t>(sizeof(ElementType)) * Extent>
as_writable_bytes(span<ElementType, Extent> s) noexcept;
2   Effects: Equivalent to: return {reinterpret_cast<byte*>(s.data()), s.size_bytes()};

3   Remarks: This function shall not participate in overload resolution unless is_const_v<ElementType>
      is false.

```

22 Iterators library

[**iterators**]

22.1 General

[**iterators.general**]

- ¹ This Clause describes components that C++ programs may use to perform iterations over containers ([Clause 21](#)), streams ([28.7](#)), stream buffers ([28.6](#)), and other ranges ([Clause 23](#)).
- 2 The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table [71](#).

Table 71 — Iterators library summary

Subclause	Header(s)
22.3 Iterator requirements	<iterator>
22.4 Iterator primitives	
22.5 Iterator adaptors	
22.6 Stream iterators	
22.7 Range access	
22.8 Container and view access	

22.2 Header <iterator> synopsis

[**iterator.synopsis**]

```
#include <concepts>

namespace std {
    template<class T> using with_reference = T&; // exposition only
    template<class T> concept can_reference // exposition only
        = requires { typename with_reference<T>; };
    template<class T> concept dereferenceable // exposition only
        = requires(T& t) {
            { *t } -> can_reference; // not required to be equality-preserving
        };

```

22.3 Iterator requirements

[[iterator.requirements](#)]

22.3.1 In general

[[iterator.requirements.general](#)]

- ¹ Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator *i* supports the expression **i*, resulting in a value of some object type *T*, called the *value type* of the iterator. An output iterator *i* has a

non-empty set of types that are *writable* to the iterator; for each such type T, the expression $*i = o$ is valid where o is a value of type T. For every iterator type X, there is a corresponding signed integer type called the *difference type* of the iterator.

- ² Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: *input iterators*, *output iterators*, *forward iterators*, *bidirectional iterators*, *random access iterators*, and *contiguous iterators*, as shown in Table 72.

Table 72 — Relations among iterator categories

- ³ The six categories of iterators correspond to the iterator concepts **InputIterator** (22.3.4.9), **OutputIterator** (22.3.4.10), **ForwardIterator** (22.3.4.11), **BidirectionalIterator** (22.3.4.12) **RandomAccessIterator** (22.3.4.13), and **ContiguousIterator** (22.3.4.14), respectively. The generic term *iterator* refers to any type that models the **Iterator** concept (22.3.4.6).
- ⁴ Forward iterators satisfy all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also satisfy all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also satisfy all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also satisfy all the requirements of random access iterators and can be used whenever a random access iterator is specified.
- ⁵ Iterators that further satisfy the requirements of output iterators are called *mutable iterators*. Nonmutable iterators are referred to as *constant iterators*.
- ⁶ In addition to the requirements in this subclause, the nested *typedef-names* specified in 22.3.2.3 shall be provided for the iterator type. [Note: Either the iterator type must provide the *typedef-names* directly (in which case **iterator_traits** pick them up automatically), or an **iterator_traits** specialization must provide them. — end note]
- ⁷ Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. These values are called *past-the-end* values. Values of an iterator i for which the expression $*i$ is defined are called *dereferenceable*. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. [Example: After the declaration of an uninitialized pointer x (as with `int* x;`), x must always be assumed to have a singular value of a pointer. — end example] Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that satisfy the *Cpp17DefaultConstructible* requirements, using a value-initialized iterator as the source of a copy or move operation. [Note: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — end note] In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.
- ⁸ Most of the library's algorithmic templates that operate on data structures have interfaces that use ranges. A *range* is an iterator and a *sentinel* that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.²³²
- ⁹ An iterator and a sentinel denoting a range are comparable. A range $[i, s)$ is empty if $i == s$; otherwise, $[i, s)$ refers to the elements in the data structure starting with the element pointed to by i and up to but not including the element, if any, pointed to by the first iterator j such that $j == s$.
- ¹⁰ A sentinel s is called *reachable* from an iterator i if and only if there is a finite sequence of applications of the expression $++i$ that makes $i == s$. If s is reachable from i, $[i, s)$ denotes a valid range.
- ¹¹ A counted range $[i, n)$ is empty if $n == 0$; otherwise, $[i, n)$ refers to the n elements in the data structure starting with the element pointed to by i and up to but not including the element, if any, pointed to by the

²³²) The sentinel denoting the end of a range may have the same type as the iterator denoting the beginning of the range, or a different type.

result of n applications of `++i`. A counted range `[i, n)` is valid if and only if $n == 0$; or n is positive, i is dereferenceable, and `[++i, --n)` is valid.

- 12 The result of the application of library functions to invalid ranges is undefined.
- 13 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.
- 14 Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.
- 15 An *invalid* iterator is an iterator that may be singular.²³³
- 16 Iterators are called *constexpr iterators* if all operations provided to meet iterator category requirements are `constexpr` functions, except for
 - (16.1) — a pseudo-destructor call (7.5.4.3), and
 - (16.2) — the construction of an iterator with a singular value.

[*Note*: For example, the types “pointer to `int`” and `reverse_iterator<int*>` are `constexpr` iterators. — *end note*]

22.3.2 Associated types

[iterator.assoc.types]

22.3.2.1 Incrementable traits

[incrementable.traits]

- 1 To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if `WI` is the name of a type that models the `WeaklyIncrementable` concept (22.3.4.4), the type

```
iter_difference_t<WI>
```

be defined as the incrementable type’s difference type.

```
namespace std {
    template<class> struct incrementable_traits { };

    template<class T>
    requires is_object_v<T>
    struct incrementable_traits<T*> {
        using difference_type = ptrdiff_t;
    };

    template<class I>
    struct incrementable_traits<const I>
        : incrementable_traits<I> { };

    template<class T>
    requires requires { typename T::difference_type; }
    struct incrementable_traits<T> {
        using difference_type = typename T::difference_type;
    };

    template<class T>
    requires (!requires { typename T::difference_type; } &&
              requires(const T& a, const T& b) { { a - b } -> Integral; })
    struct incrementable_traits<T> {
        using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
    };

    template<class T>
    using iter_difference_t = see below;
}
```

- 2 The type `iter_difference_t<I>` denotes

²³³) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.

- (2.1) — `incrementable_traits<I>::difference_type` if `iterator_traits<I>` names a specialization generated from the primary template, and
 - (2.2) — `iterator_traits<I>::difference_type` otherwise.
- 3 Users may specialize `incrementable_traits` on program-defined types.

22.3.2.2 Readable traits

[`readable.traits`]

- 1 To implement algorithms only in terms of readable types, it is often necessary to determine the value type that corresponds to a particular readable type. Accordingly, it is required that if `R` is the name of a type that models the `Readable` concept (22.3.4.2), the type

`iter_value_t<R>`

be defined as the readable type's value type.

```
template<class> struct cond-value-type { }; // exposition only
template<class T>
requires is_object_v<T>
struct cond-value-type {
    using value_type = remove_cv_t<T>;
};

template<class> struct readable_traits { };

template<class T>
struct readable_traits<T*>
: cond-value-type<T> { };

template<class I>
requires is_array_v<I>
struct readable_traits<I> {
    using value_type = remove_cv_t<remove_extent_t<I>>;
};

template<class I>
struct readable_traits<const I>
: readable_traits<I> { };

template<class T>
requires requires { typename T::value_type; }
struct readable_traits<T>
: cond-value-type<typename T::value_type> { };

template<class T>
requires requires { typename T::element_type; }
struct readable_traits<T>
: cond-value-type<typename T::element_type> { };

template<class T> using iter_value_t = see below;
```

- 2 The type `iter_value_t<I>` denotes
- (2.1) — `readable_traits<I>::value_type` if `iterator_traits<I>` names a specialization generated from the primary template, and
 - (2.2) — `iterator_traits<I>::value_type` otherwise.
- 3 Class template `readable_traits` may be specialized on program-defined types.
- 4 [Note: Some legacy output iterators define a nested type named `value_type` that is an alias for `void`. These types are not `Readable` and have no associated value types. — end note]
- 5 [Note: Smart pointers like `shared_ptr<int>` are `Readable` and have an associated value type, but a smart pointer like `shared_ptr<void>` is not `Readable` and has no associated value type. — end note]

22.3.2.3 Iterator traits

[**iterator.traits**]

- ¹ To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator category that corresponds to a particular iterator type. Accordingly, it is required that if *I* is the type of an iterator, the type

```
iterator_traits<I>::iterator_category
```

be defined as the iterator's iterator category. In addition, the types

```
iterator_traits<I>::pointer
iterator_traits<I>::reference
```

shall be defined as the iterator's pointer and reference types; that is, for an iterator object *a* of class type, the same type as `decltype(a.operator->())` and `decltype(*a)`, respectively. The type `iterator_traits<I>::pointer` shall be `void` for an iterator of class type *I* that does not support `operator->`. Additionally, in the case of an output iterator, the types

```
iterator_traits<I>::value_type
iterator_traits<I>::difference_type
iterator_traits<I>::reference
```

may be defined as `void`.

- ² The definitions in this subclause make use of the following exposition-only concepts:

```
template<class I>
concept cpp17-iterator =
    Copyable<I> && requires(I i) {
        { *i } -> can-reference;
        { ++i } -> Same<I&>;
        { *i++ } -> can-reference;
    };

template<class I>
concept cpp17-input-iterator =
    cpp17-iterator<I> && EqualityComparable<I> && requires(I i) {
        typename incrementable_traits<I>::difference_type;
        typename readable_traits<I>::value_type;
        typename common_reference_t<iter_reference_t<I> &&
            typename readable_traits<I>::value_type &>;
        *i++;
        typename common_reference_t<decltype(*i++) &&
            typename readable_traits<I>::value_type &>;
        requires SignedIntegral<typename incrementable_traits<I>::difference_type>;
    };

template<class I>
concept cpp17-forward-iterator =
    cpp17-input-iterator<I> && Constructible<I> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    Same<remove_cvref_t<iter_reference_t<I>>, typename readable_traits<I>::value_type> &&
    requires(I i) {
        { i++ } -> const I&;
        requires Same<iter_reference_t<I>, decltype(*i++)>;
    };

template<class I>
concept cpp17-bidirectional-iterator =
    cpp17-forward-iterator<I> && requires(I i) {
        { --i } -> Same<I&>;
        { i-- } -> const I&;
        { *i-- } -> Same<iter_reference_t<I>>;
    };

template<class I>
concept cpp17-random-access-iterator =
    cpp17-bidirectional-iterator<I> && StrictTotallyOrdered<I> &&
```

```

requires(I i, typename incrementable_traits<I>::difference_type n) {
    { i += n } -> Same<I&>;
    { i -= n } -> Same<I&>;
    { i + n } -> Same<I>;
    { n + i } -> Same<I>;
    { i - n } -> Same<I>;
    { i - i } -> Same<decltype(n)>;
    { i[n] } -> iter_reference_t<I>;
};

```

- ³ The members of a specialization `iterator_traits<I>` generated from the `iterator_traits` primary template are computed as follows:

- (3.1) — If `I` has valid (12.9.2) member types `difference_type`, `value_type`, `reference`, and `iterator_category`, then `iterator_traits<I>` has the following publicly accessible members:

```

using iterator_category = typename I::iterator_category;
using value_type      = typename I::value_type;
using difference_type = typename I::difference_type;
using pointer          = see below;
using reference        = typename I::reference;

```

If the *qualified-id* `I::pointer` is valid and denotes a type, then `iterator_traits<I>::pointer` names that type; otherwise, it names `void`.

- (3.2) — Otherwise, if `I` satisfies the exposition-only concept `cpp17-input-iterator`, `iterator_traits<I>` has the following publicly accessible members:

```

using iterator_category = see below;
using value_type      = typename readable_traits<I>::value_type;
using difference_type = typename incrementable_traits<I>::difference_type;
using pointer          = see below;
using reference        = see below;

```

- (3.2.1) — If the *qualified-id* `I::pointer` is valid and denotes a type, `pointer` names that type. Otherwise, if `decltype(declval<I&>().operator->())` is well-formed, then `pointer` names that type. Otherwise, `pointer` names `void`.

- (3.2.2) — If the *qualified-id* `I::reference` is valid and denotes a type, `reference` names that type. Otherwise, `reference` names `iter_reference_t<I>`.

- (3.2.3) — If the *qualified-id* `I::iterator_category` is valid and denotes a type, `iterator_category` names that type. Otherwise, `iterator_category` names:

- (3.2.3.1) — `random_access_iterator_tag` if `I` satisfies `cpp17-random-access-iterator`, or otherwise
- (3.2.3.2) — `bidirectional_iterator_tag` if `I` satisfies `cpp17-bidirectional-iterator`, or otherwise
- (3.2.3.3) — `forward_iterator_tag` if `I` satisfies `cpp17-forward-iterator`, or otherwise
- (3.2.3.4) — `input_iterator_tag`.

- (3.3) — Otherwise, if `I` satisfies the exposition-only concept `cpp17-iterator`, then `iterator_traits<I>` has the following publicly accessible members:

```

using iterator_category = output_iterator_tag;
using value_type      = void;
using difference_type = see below;
using pointer          = void;
using reference        = void;

```

If the *qualified-id* `incrementable_traits<I>::difference_type` is valid and denotes a type, then `difference_type` names that type; otherwise, it names `void`.

- (3.4) — Otherwise, `iterator_traits<I>` has no members by any of the above names.

⁴ Explicit or partial specializations of `iterator_traits` may have a member type `iterator_concept` that is used to indicate conformance to the iterator concepts (22.3.4).

⁵ `iterator_traits` is specialized for pointers as

```

namespace std {
template<class T>

```

```

    requires is_object_v<T>
    struct iterator_traits<T*> {
        using iterator_concept = contiguous_iterator_tag;
        using iterator_category = random_access_iterator_tag;
        using value_type = remove_cv_t<T>;
        using difference_type = ptrdiff_t;
        using pointer = T*;
        using reference = T&;
    };
}

```

- ⁶ [Example: To implement a generic `reverse` function, a C++ program can do the following:

```

template<class BI>
void reverse(BI first, BI last) {
    typename iterator_traits<BI>::difference_type n =
        distance(first, last);
    --n;
    while(n > 0) {
        typename iterator_traits<BI>::value_type
        tmp = *first;
        *first++ = *--last;
        *last = tmp;
        n -= 2;
    }
}
— end example]

```

22.3.3 Customization points

[[iterator.cust](#)]

22.3.3.1 iter_move

[[iterator.cust.move](#)]

- ¹ The name `iter_move` denotes a customization point object ([15.4.2.1.6](#)). The expression `ranges::iter_move(E)` for some subexpression E is expression-equivalent to the following:
- (1.1) — `iter_move(E)`, if that expression is valid, with overload resolution performed in a context that does not include a declaration of `ranges::iter_move`.
 - (1.2) — Otherwise, if the expression `*E` is well-formed:
 - (1.2.1) — if `*E` is an lvalue, `std::move(*E)`;
 - (1.2.2) — otherwise, `*E`.
 - (1.3) — Otherwise, `ranges::iter_move(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::iter_move(E)` appears in the immediate context of a template instantiation. — *end note*]
- ² If `ranges::iter_move(E)` is not equal to `*E`, the program is ill-formed with no diagnostic required.

22.3.3.2 iter_swap

[[iterator.cust.swap](#)]

- ¹ The name `iter_swap` denotes a customization point object ([15.4.2.1.6](#)) that exchanges the values ([17.4.9](#)) denoted by its arguments.
- ² Let `iter-exchange-move` be the exposition-only function:

```

template<class X, class Y>
constexpr iter_value_t<remove_reference_t<X>> iter-exchange-move(X&& x, Y&& y)
    noexcept(noexcept(iter_value_t<remove_reference_t<X>>(iter_move(x))) &&
              noexcept(*x = iter_move(y)));

```

- ³ Effects: Equivalent to:

```

    iter_value_t<remove_reference_t<X>> old_value(iter_move(x));
    *x = iter_move(y);
    return old_value;

```

- ⁴ The expression `ranges::iter_swap(E1, E2)` for some subexpressions E1 and E2 is expression-equivalent to the following:

- (4.1) — `(void)iter_swap(E1, E2)`, if that expression is valid, with overload resolution performed in a context that includes the declaration

```
template<class I1, class I2>
void iter_swap(I1, I2) = delete;
```

and does not include a declaration of `ranges::iter_swap`. If the function selected by overload resolution does not exchange the values denoted by `E1` and `E2`, the program is ill-formed with no diagnostic required.

- (4.2) — Otherwise, if the types of `E1` and `E2` each model `Readable`, and if the reference types of `E1` and `E2` model `SwappableWith` (17.4.9), then `ranges::swap(*E1, *E2)`.
- (4.3) — Otherwise, if the types `T1` and `T2` of `E1` and `E2` model `IndirectlyMovableStorable<T1, T2>` and `IndirectlyMovableStorable<T2, T1>`, then `(void)(*E1 = iter-exchange-move(E2, E1))`, except that `E1` is evaluated only once.
- (4.4) — Otherwise, `ranges::iter_swap(E1, E2)` is ill-formed. [Note: This case can result in substitution failure when `ranges::iter_swap(E1, E2)` appears in the immediate context of a template instantiation. — end note]

22.3.4 Iterator concepts

[[iterator.concepts](#)]

22.3.4.1 General

[[iterator.concepts.general](#)]

- ¹ For a type `I`, let `ITER_TRAITS(I)` denote the type `I` if `iterator_traits<I>` names a specialization generated from the primary template. Otherwise, `ITER_TRAITS(I)` denotes `iterator_traits<I>`.
- (1.1) — If the *qualified-id* `ITER_TRAITS(I)::iterator_concept` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.
- (1.2) — Otherwise, if the *qualified-id* `ITER_TRAITS(I)::iterator_category` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.
- (1.3) — Otherwise, if `iterator_traits<I>` names a specialization generated from the primary template, then `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`.
- (1.4) — Otherwise, `ITER_CONCEPT(I)` does not denote a type.

- ² [Note: `ITER_TRAITS` enables independent syntactic determination of an iterator's category and concept. — end note] [Example:

```
struct I {
    using value_type = int;
    using difference_type = int;

    int operator*() const;
    I& operator++();
    I operator++(int);
    I& operator--();
    I operator--(int);

    bool operator==(I) const;
    bool operator!=(I) const;
};
```

`iterator_traits<I>::iterator_category` denotes `input_iterator_tag`, and `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`. — end example]

22.3.4.2 Concept Readable

[[iterator.concept.readable](#)]

- ¹ Types that are readable by applying `operator*` model the `Readable` concept, including pointers, smart pointers, and iterators.

```
template<class In>
concept Readable =
    requires {
        typename iter_value_t<In>;
        typename iter_reference_t<In>;
        typename iter_rvalue_reference_t<In>;
    } &&
```

```
CommonReference<iter_reference_t<In>&&, iter_value_t<In>&> &&
CommonReference<iter_reference_t<In>&&, iter_rvalue_reference_t<In>&&> &&
CommonReference<iter_rvalue_reference_t<In>&&, const iter_value_t<In>&>;
```

- 2 Given a value i of type I , I models **Readable** only if the expression $*i$ (which is indirectly required to be valid via the exposition-only *dereferenceable* concept (22.2)) is equality-preserving.

22.3.4.3 Concept Writable

[**iterator.concept.writable**]

- 1 The **Writable** concept specifies the requirements for writing a value into an iterator's referenced object.

```
template<class Out, class T>
concept Writable =
    requires(Out&& o, T&& t) {
        *o = std::forward<T>(t); // not required to be equality-preserving
        *std::forward<Out>(o) = std::forward<T>(t); // not required to be equality-preserving
        const_cast<const iter_reference_t<Out>&&>(*o) =
            std::forward<T>(t); // not required to be equality-preserving
        const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
            std::forward<T>(t); // not required to be equality-preserving
    };
```

- 2 Let E be an expression such that `decltype((E))` is T , and let o be a dereferenceable object of type `Out`. Out and T model **Writable**< Out , T > only if

- (2.1) — If Out and T model **Readable**< Out > && **Same**< $iter_value_t<Out>$, $\text{decay_t}<T>$, then $*o$ after any above assignment is equal to the value of E before the assignment.
- 3 After evaluating any above assignment expression, o is not required to be dereferenceable.
- 4 If E is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (15.5.5.15).
- 5 [Note: The only valid use of an `operator*` is on the left side of the assignment statement. Assignment through the same value of the writable type happens only once. — end note]
- 6 [Note: **Writable** has the awkward `const_cast` expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit `const` rvalue assignment. Consequently, an iterator type I that returns `std::string` by value does not model **Writable**< I , `std::string`>. — end note]

22.3.4.4 Concept WeaklyIncrementable

[**iterator.concept.winc**]

- 1 The **WeaklyIncrementable** concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be **EqualityComparable**.

```
template<class I>
concept WeaklyIncrementable =
    Semiregular<I> &&
    requires(I i) {
        typename iter_difference_t<I>;
        requires SignedIntegral<iter_difference_t<I>>;
        { ++i } -> Same<I&>; // not required to be equality-preserving
        i++; // not required to be equality-preserving
    };
```

- 2 Let i be an object of type I . When i is in the domain of both pre- and post-increment, i is said to be *incrementable*. I models **WeaklyIncrementable**< I > only if

- (2.1) — The expressions $++i$ and $i++$ have the same domain.
- (2.2) — If i is incrementable, then both $++i$ and $i++$ advance i to the next element.
- (2.3) — If i is incrementable, then `addressof`($++i$) is equal to `addressof`(i).
- 3 [Note: For **WeaklyIncrementable** types, a equals b does not imply that $++a$ equals $++b$. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on weakly incrementable types should never attempt to pass through the same incrementable value twice. They should be single-pass algorithms. These algorithms can be used with `istream_iterator` class template. — end note]

22.3.4.5 Concept Incrementable

[iterator.concept.inc]

- ¹ The **Incrementable** concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be **EqualityComparable**. [Note: This supersedes the annotations on the increment expressions in the definition of **WeaklyIncrementable**. — end note]

```
template<class I>
concept Incrementable =
    Regular<I> &&
    WeaklyIncrementable<I> &&
    requires(I i) {
        { i++ } -> Same<I>;
    };
```

- ² Let **a** and **b** be incrementable objects of type **I**. **I** models **Incrementable** only if

- (2.1) — If **bool(a == b)** then **bool(a++ == b)**.
- (2.2) — If **bool(a == b)** then **bool((void)a++, a) == ++b)**.

- ³ [Note: The requirement that **a** equals **b** implies **++a** equals **++b** (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model **Incrementable**. — end note]

22.3.4.6 Concept Iterator

[iterator.concept.iterator]

- ¹ The **Iterator** concept forms the basis of the iterator concept taxonomy; every iterator models **Iterator**. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (22.3.4.7), to read (22.3.4.9) or write (22.3.4.10) values, or to provide a richer set of iterator movements (22.3.4.11, 22.3.4.12, 22.3.4.13).)

```
template<class I>
concept Iterator =
    requires(I i) {
        { *i } -> can-reference;
    } &&
    WeaklyIncrementable<I>;
```

22.3.4.7 Concept Sentinel

[iterator.concept.sentinel]

- ¹ The **Sentinel** concept specifies the relationship between an **Iterator** type and a **Semiregular** type whose values denote a range.

```
template<class S, class I>
concept Sentinel =
    Semiregular<S> &&
    Iterator<I> &&
    weakly-equality-comparable-with<S, I>; // See 17.5.3
```

- ² Let **s** and **i** be values of type **S** and **I** such that **[i, s)** denotes a range. Types **S** and **I** model **Sentinel<S, I>** only if

- (2.1) — **i == s** is well-defined.
- (2.2) — If **bool(i != s)** then **i** is dereferenceable and **[++i, s)** denotes a range.

- ³ The domain of **==** is not static. Given an iterator **i** and sentinel **s** such that **[i, s)** denotes a range and **i != s**, **i** and **s** are not required to continue to denote a range after incrementing any other iterator equal to **i**. Consequently, **i == s** is no longer required to be well-defined.

22.3.4.8 Concept SizedSentinel

[iterator.concept.sizedsentinel]

- ¹ The **SizedSentinel** concept specifies requirements on an **Iterator** and a **Sentinel** that allow the use of the **-** operator to compute the distance between them in constant time.

```
template<class S, class I>
concept SizedSentinel =
    Sentinel<S, I> &&
    !disable_sized_sentinel<remove_cv_t<S>, remove_cv_t<I>> &&
    requires(const I& i, const S& s) {
```

```

{ s - i } -> Same<iter_difference_t<I>>;
{ i - s } -> Same<iter_difference_t<I>>;
};

```

- 2 Let *i* be an iterator of type *I*, and *s* a sentinel of type *S* such that [*i*, *s*) denotes a range. Let *N* be the smallest number of applications of *++i* necessary to make *bool(i == s)* be *true*. *S* and *I* model *SizedSentinel<S, I>* only if

(2.1) — If *N* is representable by *iter_difference_t<I>*, then *s - i* is well-defined and equals *N*.

(2.2) — If *-N* is representable by *iter_difference_t<I>*, then *i - s* is well-defined and equals *-N*.

- 3 [Note: *disable_sized_sentinel* allows use of sentinels and iterators with the library that satisfy but do not in fact model *SizedSentinel*. — end note]

- 4 [Example: The *SizedSentinel* concept is modeled by pairs of *RandomAccessIterators* (22.3.4.13) and by counted iterators and their sentinels (22.5.6.1). — end example]

22.3.4.9 Concept InputIterator

[*iterator.concept.input*]

- 1 The *InputIterator* concept defines requirements for a type whose referenced values can be read (from the requirement for *Readable* (22.3.4.2)) and which can be both pre- and post-incremented. [Note: Unlike the *Cpp17InputIterator* requirements (22.3.5.2), the *InputIterator* concept does not need equality comparison since iterators are typically compared to sentinels. — end note]

```

template<class I>
concept InputIterator =
    Iterator<I> &&
    Readable<I> &&
    requires { typename ITER_CONCEPT(I); } &&
    DerivedFrom<ITER_CONCEPT(I), input_iterator_tag>;

```

22.3.4.10 Concept OutputIterator

[*iterator.concept.output*]

- 1 The *OutputIterator* concept defines requirements for a type that can be used to write values (from the requirement for *Writable* (22.3.4.3)) and which can be both pre- and post-incremented. [Note: Output iterators are not required to model *EqualityComparable*. — end note]

```

template<class I, class T>
concept OutputIterator =
    Iterator<I> &&
    Writable<I, T> &&
    requires(I i, T& t) {
        *i++ = std::forward<T>(t); // not required to be equality-preserving
    };

```

- 2 Let *E* be an expression such that *decltype((E))* is *T*, and let *i* be a dereferenceable object of type *I*. *I* and *T* model *OutputIterator<I, T>* only if **i++ = E*; has effects equivalent to:

```

*i = E;
++i;

```

- 3 [Note: Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be single-pass algorithms. — end note]

22.3.4.11 Concept ForwardIterator

[*iterator.concept.forward*]

- 1 The *ForwardIterator* concept adds equality comparison and the multi-pass guarantee, specified below.

```

template<class I>
concept ForwardIterator =
    InputIterator<I> &&
    DerivedFrom<ITER_CONCEPT(I), forward_iterator_tag> &&
    Incrementable<I> &&
    Sentinel<I, I>;

```

- 2 The domain of == for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type. [Note: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

³ Pointers and references obtained from a forward iterator into a range $[i, s)$ shall remain valid while $[i, s)$ continues to denote a range.

⁴ Two dereferenceable iterators a and b of type X offer the *multi-pass guarantee* if:

(4.1) — $a == b$ implies $++a == ++b$ and

(4.2) — The expression $((void)[](X x)\{++x;\}(a), *a)$ is equivalent to the expression $*a$.

⁵ [Note: The requirement that $a == b$ implies $++a == ++b$ and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. —end note]

22.3.4.12 Concept BidirectionalIterator

[**iterator.concept.bidir**]

¹ The **BidirectionalIterator** concept adds the ability to move an iterator backward as well as forward.

```
template<class I>
concept BidirectionalIterator =
    ForwardIterator<I> &&
    DerivedFrom<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
    requires(I i) {
        { --i } -> Same<I&>;
        { i-- } -> Same<I>;
    };
```

² A bidirectional iterator r is decrementable if and only if there exists some q such that $++q == r$. Decrementable iterators r shall be in the domain of the expressions $--r$ and $r--$.

³ Let a and b be equal objects of type I . I models **BidirectionalIterator** only if:

(3.1) — If a and b are decrementable, then all of the following are **true**:

(3.1.1) — **addressof(--a) == addressof(a)**

(3.1.2) — **bool(a-- == b)**

(3.1.3) — after evaluating both $a--$ and $--b$ **bool(a == b)** is still **true**

(3.1.4) — **bool(++(--a) == b)**

(3.2) — If a and b are incrementable, then **bool(--(++)a == b)**.

22.3.4.13 Concept RandomAccessIterator

[**iterator.concept.random.access**]

¹ The **RandomAccessIterator** concept adds support for constant-time advancement with $+=$, $+$, $-=$, and $-$, as well as the computation of distance in constant time with $-$. Random access iterators also support array notation via subscripting.

```
template<class I>
concept RandomAccessIterator =
    BidirectionalIterator<I> &&
    DerivedFrom<ITER_CONCEPT(I), random_access_iterator_tag> &&
    StrictTotallyOrdered<I> &&
    SizedSentinel<I, I> &&
    requires(I i, const I j, const iter_difference_t<I> n) {
        { i += n } -> Same<I&>;
        { j + n } -> Same<I>;
        { n + j } -> Same<I>;
        { i -= n } -> Same<I&>;
        { j - n } -> Same<I>;
        { j[n] } -> Same<iter_reference_t<I>>;
    };
```

² Let a and b be valid iterators of type I such that b is reachable from a after n applications of $++a$, let D be **iter_difference_t<I>**, and let n denote a value of type D . I models **RandomAccessIterator** only if

(2.1) — $(a += n)$ is equal to b .

(2.2) — **addressof(a += n)** is equal to **addressof(a)**.

(2.3) — $(a + n)$ is equal to $(a += n)$.

(2.4) — For any two positive values x and y of type D , if $(a + D(x + y))$ is valid, then $(a + D(x + y))$ is equal to $((a + x) + y)$.

- (2.5) — $(a + D(0))$ is equal to a .
- (2.6) — If $(a + D(n - 1))$ is valid, then $(a + n)$ is equal to $++(a + D(n - 1))$.
- (2.7) — $(b += -n)$ is equal to a .
- (2.8) — $(b -= n)$ is equal to a .
- (2.9) — `addressof(b -= n)` is equal to `addressof(b)`.
- (2.10) — $(b - n)$ is equal to $(b -= n)$.
- (2.11) — If b is dereferenceable, then $a[n]$ is valid and is equal to $*b$.
- (2.12) — `bool(a <= b)` is `true`.

22.3.4.14 Concept ContiguousIterator

[`iterator.concept.contiguous`]

- ¹ The `ContiguousIterator` concept provides a guarantee that the denoted elements are stored contiguously in memory.

```
template<class I>
concept ContiguousIterator =
    RandomAccessIterator<I> &&
    DerivedFrom<ITER_CONCEPT(I), contiguous_iterator_tag> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    Same<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>>;
```

- ² Let a and b be dereferenceable iterators of type I such that b is reachable from a , and let D be `iter_difference_t<I>`. The type I models `ContiguousIterator` only if `addressof(*((a + D(b - a)))` is equal to `addressof(*a) + D(b - a)`.

22.3.5 C++17 iterator requirements

[`iterator.cpp17`]

- ¹ In the following sections, a and b denote values of type X or `const X`, `difference_type` and `reference` refer to the types `iterator_traits<X>::difference_type` and `iterator_traits<X>::reference`, respectively, n denotes a value of `difference_type`, u , tmp , and m denote identifiers, r denotes a value of $X\&$, t denotes a value of value type T , \circ denotes a value of some type that is writable to the output iterator. [Note: For an iterator type X there must be an instantiation of `iterator_traits<X>` (22.3.2.3). — end note]

22.3.5.1 Cpp17Iterator

[`iterator.iterators`]

- ¹ The `Cpp17Iterator` requirements form the basis of the iterator taxonomy; every iterator satisfies the `Cpp17Iterator` requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (22.3.5.2) or write (22.3.5.3) values, or to provide a richer set of iterator movements (22.3.5.4, 22.3.5.5, 22.3.5.6).
- ² A type X satisfies the `Cpp17Iterator` requirements if:
 - (2.1) — X satisfies the `Cpp17CopyConstructible`, `Cpp17CopyAssignable`, and `Cpp17Destructible` requirements (15.5.3.1) and lvalues of type X are swappable (15.5.3.2), and
 - (2.2) — the expressions in Table 73 are valid and have the indicated semantics.

Table 73 — `Cpp17Iterator` requirements

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
<code>*r</code>	unspecified		<i>Requires:</i> r is dereferenceable.
<code>++r</code>	$X\&$		

22.3.5.2 Input iterators

[`input.iterators`]

- ¹ A class or pointer type X satisfies the requirements of an input iterator for the value type T if X satisfies the `Cpp17Iterator` (22.3.5.1) and `Cpp17EqualityComparable` (Table 23) requirements and the expressions in Table 74 are valid and have the indicated semantics.
- ² In Table 74, the term *the domain of ==* is used in the ordinary mathematical sense to denote the set of values over which == is (required to be) defined. This set can change over time. Each algorithm places additional requirements on the domain of == for the iterator values it uses. These requirements can be inferred from

the uses that algorithm makes of `==` and `!=`. [Example: The call `find(a,b,x)` is defined only if the value of `a` has the property `p` defined as follows: `b` has property `p` and a value `i` has property `p` if (`*i==x`) or if (`*i!=x` and `++i` has property `p`). — end example]

Table 74 — *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
<code>a != b</code>	contextually convertible to <code>bool</code>	<code>!(a == b)</code>	<i>Requires:</i> <code>(a, b)</code> is in the domain of <code>==</code> .
<code>*a</code>	reference, convertible to <code>T</code>		<i>Requires:</i> <code>a</code> is dereferenceable. The expression <code>(void)*a, *a</code> is equivalent to <code>*a</code> . If <code>a == b</code> and <code>(a, b)</code> is in the domain of <code>==</code> then <code>*a</code> is equivalent to <code>*b</code> .
<code>a->m</code>		<code>(*a).m</code>	<i>Requires:</i> <code>a</code> is dereferenceable.
<code>++r</code>	<code>X&</code>		<i>Requires:</i> <code>r</code> is dereferenceable. <i>Ensures:</i> <code>r</code> is dereferenceable or <code>r</code> is past-the-end; any copies of the previous value of <code>r</code> are no longer required to be dereferenceable nor to be in the domain of <code>==</code> .
<code>(void)r++</code>			equivalent to <code>(void)++r</code>
<code>*r++</code>	convertible to <code>T</code>	<code>{ T tmp = *r; ++r; return tmp; }</code>	

³ [Note: For input iterators, `a == b` does not imply `++a == ++b`. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on input iterators should never attempt to pass through the same iterator twice. They should be *single pass* algorithms. Value type `T` is not required to be a *Cpp17CopyAssignable* type (Table 29). These algorithms can be used with istreams as the source of the input data through the `istream_iterator` class template. — end note]

22.3.5.3 Output iterators

[[output.iterators](#)]

¹ A class or pointer type `X` satisfies the requirements of an output iterator if `X` satisfies the *Cpp17Iterator* requirements (22.3.5.1) and the expressions in Table 75 are valid and have the indicated semantics.

Table 75 — *Cpp17OutputIterator* requirements (in addition to *Cpp17Iterator*)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
<code>*r = o</code>	result is not used		<i>Remarks:</i> After this operation <code>r</code> is not required to be dereferenceable. <i>Ensures:</i> <code>r</code> is incrementable.

Table 75 — *Cpp17OutputIterator* requirements (in addition to *Cpp17Iterator*) (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
<code>++r</code>	<code>X&</code>		<code>addressof(r) == addressof(++r).</code> <i>Remarks:</i> After this operation <code>r</code> is not required to be dereferenceable. <i>Ensures:</i> <code>r</code> is incrementable.
<code>r++</code>	convertible to <code>const X&</code>	{ <code>X tmp = r;</code> <code>++r;</code> <code>return tmp; }</code>	<i>Remarks:</i> After this operation <code>r</code> is not required to be dereferenceable. <i>Ensures:</i> <code>r</code> is incrementable.
<code>*r++ = o</code>	result is not used		<i>Remarks:</i> After this operation <code>r</code> is not required to be dereferenceable. <i>Ensures:</i> <code>r</code> is incrementable.

- ² [Note: The only valid use of an `operator*` is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be single-pass algorithms. Equality and inequality might not be defined. —end note]

22.3.5.4 Forward iterators

[[forward.iterators](#)]

- ¹ A class or pointer type `X` satisfies the requirements of a forward iterator if

- (1.1) — `X` satisfies the *Cpp17InputIterator* requirements ([22.3.5.2](#)),
- (1.2) — `X` satisfies the *Cpp17DefaultConstructible* requirements ([15.5.3.1](#)),
- (1.3) — if `X` is a mutable iterator, `reference` is a reference to `T`; if `X` is a constant iterator, `reference` is a reference to `const T`,
- (1.4) — the expressions in Table 76 are valid and have the indicated semantics, and
- (1.5) — objects of type `X` offer the multi-pass guarantee, described below.

- ² The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type. [Note: Value-initialized iterators behave as if they refer past the end of the same empty sequence. —end note]

- ³ Two dereferenceable iterators `a` and `b` of type `X` offer the *multi-pass guarantee* if:

- (3.1) — `a == b` implies `++a == ++b` and
- (3.2) — `X` is a pointer type or the expression `(void)++X(a)`, `*a` is equivalent to the expression `*a`.

- ⁴ [Note: The requirement that `a == b` implies `++a == ++b` (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. —end note]

Table 76 — *Cpp17ForwardIterator* requirements (in addition to *Cpp17InputIterator*)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
<code>r++</code>	convertible to <code>const X&</code>	{ <code>X tmp = r;</code> <code>++r;</code> <code>return tmp; }</code>	
<code>*r++</code>	<code>reference</code>		

- ⁵ If a and b are equal, then either a and b are both dereferenceable or else neither is dereferenceable.
- ⁶ If a and b are both dereferenceable, then $a == b$ if and only if $*a$ and $*b$ are bound to the same object.

22.3.5.5 Bidirectional iterators

[bidirectional.iterator]

- ¹ A class or pointer type X satisfies the requirements of a bidirectional iterator if, in addition to satisfying the *Cpp17ForwardIterator* requirements, the following expressions are valid as shown in Table 77.

Table 77 — *Cpp17BidirectionalIterator* requirements (in addition to *Cpp17ForwardIterator*)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
$--r$	$X\&$		<p><i>Requires:</i> there exists s such that $r == ++s$.</p> <p><i>Ensures:</i> r is dereferenceable.</p> $--(++r) == r.$ $--r == --s$ implies $r == s$. $\text{addressof}(r) == \text{addressof}(--r).$
$r--$	convertible to $\text{const } X\&$	{ $X \text{ tmp} = r;$ $--r;$ return tmp; }	
$*r--$	reference		

- ² [Note: Bidirectional iterators allow algorithms to move iterators backward as well as forward. — end note]

22.3.5.6 Random access iterators

[random.access.iterator]

- ¹ A class or pointer type X satisfies the requirements of a random access iterator if, in addition to satisfying the *Cpp17BidirectionalIterator* requirements, the following expressions are valid as shown in Table 78.

Table 78 — *Cpp17RandomAccessIterator* requirements (in addition to *Cpp17BidirectionalIterator*)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
$r += n$	$X\&$	{ $\text{difference_type } m = n;$ $\text{if } (m >= 0)$ $\text{while } (m--)$ $++r;$ else $\text{while } (m++)$ $--r;$ return r; }	
$a + n$	X	{ $X \text{ tmp} = a;$ $\text{return tmp} += n; $ }	$a + n == n + a.$
$n + a$			
$r -= n$	$X\&$	$\text{return r} += -n;$	<p><i>Requires:</i> the absolute value of n is in the range of representable values of <i>difference_type</i>.</p>
$a - n$	X	{ $X \text{ tmp} = a;$ $\text{return tmp} -= n; $ }	
$b - a$	<i>difference_-_type</i>	return n	<p><i>Requires:</i> there exists a value n of type <i>difference_type</i> such that $a + n == b$.</p> $b == a + (b - a).$
$a[n]$	convertible to reference	$*(\text{a} + n)$	

Table 78 — *Cpp17RandomAccessIterator* requirements (in addition to *Cpp17BidirectionalIterator*) (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
$a < b$	contextually convertible to <code>bool</code>	$b - a > 0$	$<$ is a total ordering relation
$a > b$	contextually convertible to <code>bool</code>	$b < a$	$>$ is a total ordering relation opposite to $<$.
$a \geq b$	contextually convertible to <code>bool</code>	$!(a < b)$	
$a \leq b$	contextually convertible to <code>bool</code> .	$!(a > b)$	

22.3.6 Indirect callable requirements

[`indirectcallable`]

22.3.6.1 General

[`indirectcallable.general`]

- ¹ There are several concepts that group requirements of algorithms that take callable objects (19.14.3) as arguments.

22.3.6.2 Indirect callables

[`indirectcallable.indirectinvocable`]

- ¹ The indirect callable concepts are used to constrain those algorithms that accept callable objects (19.14.2) as arguments.

```
namespace std {
    template<class F, class I>
    concept IndirectUnaryInvocable =
        Readable<I> &&
        CopyConstructible<F> &&
        Invocable<F&, iter_value_t<I>&> &&
        Invocable<F&, iter_reference_t<I>> &&
        Invocable<F&, iter_common_reference_t<I>> &&
        CommonReference<
            invoke_result_t<F&, iter_value_t<I>&>,
            invoke_result_t<F&, iter_reference_t<I>>>;
}

template<class F, class I>
concept IndirectRegularUnaryInvocable =
    Readable<I> &&
    CopyConstructible<F> &&
    RegularInvocable<F&, iter_value_t<I>&> &&
    RegularInvocable<F&, iter_reference_t<I>> &&
    RegularInvocable<F&, iter_common_reference_t<I>> &&
    CommonReference<
        invoke_result_t<F&, iter_value_t<I>&>,
        invoke_result_t<F&, iter_reference_t<I>>>;
}

template<class F, class I>
concept IndirectUnaryPredicate =
    Readable<I> &&
    CopyConstructible<F> &&
    Predicate<F&, iter_value_t<I>&> &&
    Predicate<F&, iter_reference_t<I>> &&
    Predicate<F&, iter_common_reference_t<I>>;
```

```

template<class F, class I1, class I2 = I1>
concept IndirectRelation =
    Readable<I1> && Readable<I2> &&
    CopyConstructible<F> &&
    Relation<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
    Relation<F&, iter_value_t<I1>&, iter_reference_t<I2>&> &&
    Relation<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
    Relation<F&, iter_reference_t<I1>, iter_reference_t<I2>&> &&
    Relation<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;
}

template<class F, class I1, class I2 = I1>
concept IndirectStrictWeakOrder =
    Readable<I1> && Readable<I2> &&
    CopyConstructible<F> &&
    StrictWeakOrder<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
    StrictWeakOrder<F&, iter_value_t<I1>&, iter_reference_t<I2>&> &&
    StrictWeakOrder<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
    StrictWeakOrder<F&, iter_reference_t<I1>, iter_reference_t<I2>&> &&
    StrictWeakOrder<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;
}

```

22.3.6.3 Class template projected

[projected]

- ¹ Class template `projected` is used to constrain algorithms that accept callable objects and projections (15.3.21). It combines a `Readable` type `I` and a callable object type `Proj` into a new `Readable` type whose `reference` type is the result of applying `Proj` to the `iter_reference_t` of `I`.

```

namespace std {
    template<Readable I, IndirectRegularUnaryInvocable<I> Proj>
    struct projected {
        using value_type = remove_cvref_t<indirect_result_t<Proj&, I>>;
        indirect_result_t<Proj&, I> operator*() const; // not defined
    };

    template<WeaklyIncrementable I, class Proj>
    struct incrementable_traits<projected<I, Proj>> {
        using difference_type = iter_difference_t<I>;
    };
}

```

22.3.7 Common algorithm requirements

[alg.req]

22.3.7.1 General

[alg.req.general]

- ¹ There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between `Readable` and `Writable` types: `IndirectlyMovable`, `IndirectlyCopyable`, and `IndirectlySwappable`. There are three relational concepts for rearrangements: `Permutable`, `Mergeable`, and `Sortable`. There is one relational concept for comparing values from different sequences: `IndirectlyComparable`.
- ² [Note: The `ranges::less` function object type used in the concepts below imposes constraints on the concepts' arguments in addition to those that appear in the concepts' bodies (19.14.8). — end note]

22.3.7.2 Concept `IndirectlyMovable`

[alg.req.ind.move]

- ¹ The `IndirectlyMovable` concept specifies the relationship between a `Readable` type and a `Writable` type between which values may be moved.

```

template<class In, class Out>
concept IndirectlyMovable =
    Readable<In> &&
    Writable<Out, iter_rvalue_reference_t<In>>;

```

- ² The `IndirectlyMovableStorable` concept augments `IndirectlyMovable` with additional requirements enabling the transfer to be performed through an intermediate object of the `Readable` type's value type.

```
template<class In, class Out>
concept IndirectlyMovableStorable =
    IndirectlyMovable<In, Out> &&
    Writable<Out, iter_value_t<In>> &&
    Movable<iter_value_t<In>> &&
    Constructible<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
    Assignable<iter_value_t<In>&, iter_rvalue_reference_t<In>>;
```

- ³ Let *i* be a dereferenceable value of type *In*. *In* and *Out* model *IndirectlyMovableStorable*<*In*, *Out*> only if after the initialization of the object *obj* in

```
    iter_value_t<In> obj(ranges::iter_move(i));
```

obj is equal to the value previously denoted by **i*. If *iter_rvalue_reference_t<In>* is an rvalue reference type, the resulting state of the value denoted by **i* is valid but unspecified (15.5.5.15).

22.3.7.3 Concept IndirectlyCopyable

[alg.req.ind.copy]

- ¹ The *IndirectlyCopyable* concept specifies the relationship between a *Readable* type and a *Writable* type between which values may be copied.

```
template<class In, class Out>
concept IndirectlyCopyable =
    Readable<In> &&
    Writable<Out, iter_reference_t<In>>;
```

- ² The *IndirectlyCopyableStorable* concept augments *IndirectlyCopyable* with additional requirements enabling the transfer to be performed through an intermediate object of the *Readable* type's value type. It also requires the capability to make copies of values.

```
template<class In, class Out>
concept IndirectlyCopyableStorable =
    IndirectlyCopyable<In, Out> &&
    Writable<Out, const iter_value_t<In>&> &&
    Copyable<iter_value_t<In>> &&
    Constructible<iter_value_t<In>, iter_reference_t<In>> &&
    Assignable<iter_value_t<In>&, iter_reference_t<In>>;
```

- ³ Let *i* be a dereferenceable value of type *In*. *In* and *Out* model *IndirectlyCopyableStorable*<*In*, *Out*> only if after the initialization of the object *obj* in

```
    iter_value_t<In> obj(*i);
```

obj is equal to the value previously denoted by **i*. If *iter_reference_t<In>* is an rvalue reference type, the resulting state of the value denoted by **i* is valid but unspecified (15.5.5.15).

22.3.7.4 Concept IndirectlySwappable

[alg.req.ind.swap]

- ¹ The *IndirectlySwappable* concept specifies a swappable relationship between the values referenced by two *Readable* types.

```
template<class I1, class I2 = I1>
concept IndirectlySwappable =
    Readable<I1> && Readable<I2> &&
    requires(I1& i1, I2& i2) {
        ranges::iter_swap(i1, i1);
        ranges::iter_swap(i2, i2);
        ranges::iter_swap(i1, i2);
        ranges::iter_swap(i2, i1);
    };
```

22.3.7.5 Concept IndirectlyComparable

[alg.req.ind.cmp]

- ¹ The *IndirectlyComparable* concept specifies the common requirements of algorithms that compare values from two different sequences.

```
template<class I1, class I2, class R, class P1 = identity,
         class P2 = identity>
concept IndirectlyComparable =
    IndirectRelation<R, projected<I1, P1>, projected<I2, P2>>;
```

22.3.7.6 Concept Permutable

[alg.req.permutable]

- ¹ The **Permutable** concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```
template<class I>
concept Permutable =
    ForwardIterator<I> &&
    IndirectlyMovableStorable<I, I> &&
    IndirectlySwappable<I, I>;
```

22.3.7.7 Concept Mergeable

[alg.req.mergeable]

- ¹ The **Mergeable** concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```
template<class I1, class I2, class Out, class R = ranges::less<>,
         class P1 = identity, class P2 = identity>
concept Mergeable =
    InputIterator<I1> &&
    InputIterator<I2> &&
    WeaklyIncrementable<Out> &&
    IndirectlyCopyable<I1, Out> &&
    IndirectlyCopyable<I2, Out> &&
    IndirectStrictWeakOrder<R, projected<I1, P1>, projected<I2, P2>>;
```

22.3.7.8 Concept Sortable

[alg.req.sortable]

- ¹ The **Sortable** concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., `sort`).

```
template<class I, class R = ranges::less<>, class P = identity>
concept Sortable =
    Permutable<I> &&
    IndirectStrictWeakOrder<R, projected<I, P>>;
```

22.4 Iterator primitives

[iterator.primitives]

- ¹ To simplify the task of defining iterators, the library provides several classes and functions:

22.4.1 Standard iterator tags

[std.iterator.tags]

- ¹ It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces *category tag* classes which are used as compile time tags for algorithm selection. They are: `output_iterator_tag`, `input_iterator_tag`, `forward_iterator_tag`, `bidirectional_iterator_tag`, `random_access_iterator_tag`, and `contiguous_iterator_tag`. For every iterator of type `I`, `iterator_traits<I>::iterator_category` shall be defined to be a category tag that describes the iterator's behavior. Additionally, `iterator_traits<I>::iterator_concept` may be used to indicate conformance to the iterator concepts (22.3.4).

```
namespace std {
    struct output_iterator_tag { };
    struct input_iterator_tag { };
    struct forward_iterator_tag: public input_iterator_tag { };
    struct bidirectional_iterator_tag: public forward_iterator_tag { };
    struct random_access_iterator_tag: public bidirectional_iterator_tag { };
    struct contiguous_iterator_tag: public random_access_iterator_tag { };
}
```

- ² [Example: For a program-defined iterator `BinaryTreeIterator`, it could be included into the bidirectional iterator category by specializing the `iterator_traits` template:

```
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
    using iterator_category = bidirectional_iterator_tag;
    using difference_type = ptrdiff_t;
    using value_type = T;
    using pointer = T*;
    using reference = T&;
};
```

— end example]

- 3 [Example: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```
template<class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
    evolve(first, last,
        typename iterator_traits<BidirectionalIterator>::iterator_category());
}

template<class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
    bidirectional_iterator_tag) {
    // more generic, but less efficient algorithm
}

template<class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
    random_access_iterator_tag) {
    // more efficient, but less generic algorithm
}

— end example]
```

22.4.2 Iterator operations

[**iterator.operations**]

- 1 Since only random access iterators provide + and - operators, the library provides two function templates `advance` and `distance`. These function templates use + and - for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use ++ to provide linear time implementations.

```
template<class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);
```

- 2 *Requires:* n is negative only for bidirectional iterators.

- 3 *Effects:* Increments i by n if n is non-negative, and decrements i by -n otherwise.

```
template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);
```

- 4 *Requires:* last is reachable from first, or InputIterator meets the `Cpp17RandomAccessIterator` requirements and first is reachable from last.

- 5 *Effects:* If InputIterator meets the `Cpp17RandomAccessIterator` requirements, returns (last - first); otherwise, returns the number of increments needed to get from first to last.

```
template<class InputIterator>
constexpr InputIterator next(InputIterator x,
    typename iterator_traits<InputIterator>::difference_type n = 1);
```

- 6 *Effects:* Equivalent to: `advance(x, n); return x;`

```
template<class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x,
    typename iterator_traits<BidirectionalIterator>::difference_type n = 1);
```

- 7 *Effects:* Equivalent to: `advance(x, -n); return x;`

22.4.3 Range iterator operations

[**range.iter.ops**]

- 1 The library includes the function templates `ranges::advance`, `ranges::distance`, `ranges::next`, and `ranges::prev` to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type. [Example: `ranges::advance` uses the + operator to move a `RandomAccessIterator` forward n steps in constant time. For an iterator type that does not model `RandomAccessIterator`, `ranges::advance` instead performs n individual increments with the ++ operator. — end example]

- ² The function templates defined in this subclause are not found by argument-dependent name lookup (6.4.2). When found by unqualified (6.4.1) name lookup for the *postfix-expression* in a function call (7.6.1.2), they inhibit argument-dependent name lookup.

[*Example*:

```
void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1,2,3};
    distance(begin(vec), end(vec));      // #1
}
```

The function call expression at #1 invokes `std::ranges::distance`, not `std::distance`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::distance` is more specialized (12.6.6.2) than `std::ranges::distance` since the former requires its first two parameters to have the same type. — *end example*]

- ³ The number and order of deducible template parameters for the function templates defined in this subclause is unspecified, except where explicitly stated otherwise.

22.4.3.1 `ranges::advance`

[`range.iter.op.advance`]

```
template<Iterator I>
constexpr void advance(I& i, iter_difference_t<I> n);
```

1 *Expects:* If `I` does not model `BidirectionalIterator`, `n` is not negative.

2 *Effects:*

- (2.1) — If `I` models `RandomAccessIterator`, equivalent to `i += n`.
- (2.2) — Otherwise, if `n` is non-negative, increments `i` by `n`.
- (2.3) — Otherwise, decrements `i` by `-n`.

```
template<Iterator I, Sentinel<I> S>
constexpr void advance(I& i, S bound);
```

3 *Expects:* `[i, bound]` denotes a range.

4 *Effects:*

- (4.1) — If `I` and `S` model `Assignable<I&, S>`, equivalent to `i = std::move(bound)`.
- (4.2) — Otherwise, if `S` and `I` model `SizedSentinel<S, I>`, equivalent to `ranges::advance(i, bound - i)`.
- (4.3) — Otherwise, while `bool(i != bound)` is `true`, increments `i`.

```
template<Iterator I, Sentinel<I> S>
constexpr iter_difference_t<I> advance(I& i, iter_difference_t<I> n, S bound);
```

5 *Expects:* If `n > 0`, `[i, bound]` denotes a range. If `n == 0`, `[i, bound]` or `[bound, i]` denotes a range. If `n < 0`, `[bound, i]` denotes a range, `I` models `BidirectionalIterator`, and `I` and `S` model `Same<I, S>`.

6 *Effects:*

- (6.1) — If `S` and `I` model `SizedSentinel<S, I>`:
 - (6.1.1) — If $|n| \geq |bound - i|$, equivalent to `ranges::advance(i, bound)`.
 - (6.1.2) — Otherwise, equivalent to `ranges::advance(i, n)`.
- (6.2) — Otherwise,
 - (6.2.1) — if `n` is non-negative, while `bool(i != bound)` is `true`, increments `i` but at most `n` times.
 - (6.2.2) — Otherwise, while `bool(i != bound)` is `true`, decrements `i` but at most `-n` times.

7 *Returns:* `n - M`, where `M` is the difference between the ending and starting positions of `i`.

22.4.3.2 `ranges::distance`

[`range.iter.op.distance`]

```
template<Iterator I, Sentinel<I> S>
```

```
constexpr iter_difference_t<I> distance(I first, S last);
1   Effects: [first, last) denotes a range, or [last, first) denotes a range and S and I model
      Same<S, I> && SizedSentinel<S, I>.
2   Effects: If S and I model SizedSentinel<S, I>, returns (last - first); otherwise, returns the
      number of increments needed to get from first to last.
```

```
template<Range R>
constexpr iter_difference_t<iterator_t<R>> distance(R&& r);
3   Effects: If R models SizedRange, equivalent to:
      return ranges::size(r);                                     // 23.4.1
      Otherwise, equivalent to:
      return ranges::distance(ranges::begin(r), ranges::end(r)); // 23.3
```

22.4.3.3 ranges::next [range.iter.op.next]

```
template<Iterator I>
constexpr I next(I x);
1   Effects: Equivalent to: ++x; return x;

template<Iterator I>
constexpr I next(I x, iter_difference_t<I> n);
2   Effects: Equivalent to: ranges::advance(x, n); return x;

template<Iterator I, Sentinel<I> S>
constexpr I next(I x, S bound);
3   Effects: Equivalent to: ranges::advance(x, bound); return x;

template<Iterator I, Sentinel<I> S>
constexpr I next(I x, iter_difference_t<I> n, S bound);
4   Effects: Equivalent to: ranges::advance(x, n, bound); return x;
```

22.4.3.4 ranges::prev [range.iter.op.prev]

```
template<BidirectionalIterator I>
constexpr I prev(I x);
1   Effects: Equivalent to: --x; return x;

template<BidirectionalIterator I>
constexpr I prev(I x, iter_difference_t<I> n);
2   Effects: Equivalent to: ranges::advance(x, -n); return x;

template<BidirectionalIterator I>
constexpr I prev(I x, iter_difference_t<I> n, I bound);
3   Effects: Equivalent to: ranges::advance(x, -n, bound); return x;
```

22.5 Iterator adaptors

[predef.iterator]

22.5.1 Reverse iterators

[reverse.iterator]

- 1 Class template `reverse_iterator` is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

22.5.1.1 Class template reverse_iterator

[reverse.iterator]

```
namespace std {
    template<class Iterator>
    class reverse_iterator {
        public:
            using iterator_type      = Iterator;
            using iterator_concept   = see below;
            using iterator_category  = see below;
            using value_type         = iter_value_t<Iterator>;
```

```

using difference_type    = iter_difference_t<Iterator>;
using pointer            = typename iterator_traits<Iterator>::pointer;
using reference          = iter_reference_t<Iterator>;

constexpr reverse_iterator();
constexpr explicit reverse_iterator(Iterator x);
template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

constexpr Iterator base() const;
constexpr reference operator*() const;
constexpr pointer operator->() const requires see below;

constexpr reverse_iterator& operator++();
constexpr reverse_iterator operator++(int);
constexpr reverse_iterator& operator--();
constexpr reverse_iterator operator--(int);

constexpr reverse_iterator operator+ (difference_type n) const;
constexpr reverse_iterator& operator+=(difference_type n);
constexpr reverse_iterator operator- (difference_type n) const;
constexpr reverse_iterator& operator-=(difference_type n);
constexpr unspecified operator[](difference_type n) const;

friend constexpr iter_rvalue_reference_t<Iterator>
    iter_move(const reverse_iterator& i) noexcept(see below);
template<IndirectlySwappable<Iterator> Iterator2>
    friend constexpr void
        iter_swap(const reverse_iterator& x,
                  const reverse_iterator<Iterator2>& y) noexcept(see below);

protected:
    Iterator current;
};

template<class Iterator1, class Iterator2>
constexpr bool operator==(

    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator!=(

    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator<(

    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator>(

    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator<=(

    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator>=(

    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr auto operator-(

    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());

```

```

template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(
    typename reverse_iterator<Iterator>::difference_type n,
    const reverse_iterator<Iterator>& x);

template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);

template<class Iterator1, class Iterator2>
requires (!SizedSentinel<Iterator1, Iterator2>)
inline constexpr bool disable_sized_sentinel<reverse_iterator<Iterator1>,
                           reverse_iterator<Iterator2>> = true;
}

```

¹ The member *typedef-name iterator_concept* denotes

- (1.1) — *random_access_iterator_tag* if *Iterator* models *RandomAccessIterator*, and
- (1.2) — *bidirectional_iterator_tag* otherwise.

² The member *typedef-name iterator_category* denotes

- (2.1) — *random_access_iterator_tag* if the type *iterator_traits<Iterator>::iterator_category* models *DerivedFrom<random_access_iterator_tag>*, and
- (2.2) — *iterator_traits<Iterator>::iterator_category* otherwise.

22.5.1.2 Requirements

[reverse.iter.requirements]

- 1 The template parameter *Iterator* shall either meet the requirements of a *Cpp17BidirectionalIterator* (22.3.5.5) or model *BidirectionalIterator* (22.3.4.12).
- 2 Additionally, *Iterator* shall either meet the requirements of a *Cpp17RandomAccessIterator* (22.3.5.6) or model *RandomAccessIterator* (22.3.4.13) if the definitions of any of the members
 - (2.1) — *operator+*, *operator-*, *operator+=*, *operator-=* (22.5.1.6), or
 - (2.2) — *operator[]* (22.5.1.5),
or the non-member operators (22.5.1.7)
- (2.3) — *operator<*, *operator>*, *operator<=*, *operator>=*, *operator-*, or *operator+* (22.5.1.8)
are instantiated (12.8.1).

22.5.1.3 Construction and assignment

[reverse.iter.cons]

```
constexpr reverse_iterator();
```

¹ *Effects:* Value-initializes *current*. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type *Iterator*.

```
constexpr explicit reverse_iterator(Iterator x);
```

² *Effects:* Initializes *current* with *x*.

```
template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
```

³ *Effects:* Initializes *current* with *u.current*.

```
template<class U>
constexpr reverse_iterator&
operator=(const reverse_iterator<U>& u);
```

⁴ *Effects:* Assigns *u.base()* to *current*.

⁵ *Returns:* **this*.

22.5.1.4 Conversion

[reverse.iter.conv]

```
constexpr Iterator base() const; // explicit
```

¹ *Returns:* *current*.

22.5.1.5 Element access

[reverse.iter.elem]

```
constexpr reference operator*() const;
```

1 *Effects:* As if by:

```
    Iterator tmp = current;
    return *--tmp;
```

```
constexpr pointer operator->() const
    requires (is_pointer_v<Iterator> || 
              requires (const Iterator i) { i.operator->(); });
```

2 *Effects:*

- (2.1) — If `Iterator` is a pointer type, equivalent to: `return prev(current);`
- (2.2) — Otherwise, equivalent to: `return prev(current).operator->();`

```
constexpr unspecified operator[](difference_type n) const;
```

3 *Returns:* `current[-n-1].`

22.5.1.6 Navigation

[reverse.iter.nav]

```
constexpr reverse_iterator operator+(difference_type n) const;
```

1 *Returns:* `reverse_iterator(current+n).`

```
constexpr reverse_iterator operator-(difference_type n) const;
```

2 *Returns:* `reverse_iterator(current-n).`

```
constexpr reverse_iterator& operator++();
```

3 *Effects:* As if by: `--current;`

4 *Returns:* `*this.`

```
constexpr reverse_iterator operator++(int);
```

5 *Effects:* As if by:

```
    reverse_iterator tmp = *this;
    --current;
    return tmp;
```

```
constexpr reverse_iterator& operator--();
```

6 *Effects:* As if by `++current.`

7 *Returns:* `*this.`

```
constexpr reverse_iterator operator--(int);
```

8 *Effects:* As if by:

```
    reverse_iterator tmp = *this;
    ++current;
    return tmp;
```

```
constexpr reverse_iterator& operator+=(difference_type n);
```

9 *Effects:* As if by: `current -= n;`

10 *Returns:* `*this.`

```
constexpr reverse_iterator& operator-=(difference_type n);
```

11 *Effects:* As if by: `current += n;`

12 *Returns:* `*this.`

22.5.1.7 Comparisons

[reverse.iter.cmp]

```
template<class Iterator1, class Iterator2>
constexpr bool operator==(
```

```
    const reverse_iterator<Iterator1>& x,
```

```

    const reverse_iterator<Iterator2>& y);
1   Constraints: The expression x.current == y.current shall be valid and convertible to bool.
2   Returns: x.current == y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator!=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
3   Constraints: The expression x.current != y.current shall be valid and convertible to bool.
4   Returns: x.current != y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator<(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
5   Constraints: The expression x.current > y.current shall be valid and convertible to bool.
6   Returns: x.current > y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator>(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
7   Constraints: The expression x.current < y.current shall be valid and convertible to bool.
8   Returns: x.current < y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator<=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
9   Constraints: The expression x.current >= y.current shall be valid and convertible to bool.
10  Returns: x.current >= y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator>=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
11  Constraints: The expression x.current <= y.current shall be valid and convertible to bool.
12  Returns: x.current <= y.current.

```

22.5.1.8 Non-member functions

[reverse.iterator.nonmember]

```

template<class Iterator1, class Iterator2>
constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
1   Returns: y.current - x.current.

template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(
    typename reverse_iterator<Iterator>::difference_type n,
    const reverse_iterator<Iterator>& x);
2   Returns: reverse_iterator<Iterator> (x.current - n).

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const reverse_iterator& i) noexcept(see below);
3   Effects: Equivalent to:
        auto tmp = i.current;
        return ranges::iter_move(--tmp);

```

4 *Remarks:* The expression in `noexcept` is equivalent to:

```
is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_move(--declval<Iterator>()))

template<IndirectlySwappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const reverse_iterator& x,
          const reverse_iterator<Iterator2>& y) noexcept(see below);
```

5 *Effects:* Equivalent to:

```
auto xtmp = x.current;
auto ytmp = y.current;
ranges::iter_swap(--xtmp, --ytmp);
```

6 *Remarks:* The expression in `noexcept` is equivalent to:

```
is_nothrow_copy_constructible_v<Iterator> &&
is_nothrow_copy_constructible_v<Iterator2> &&
noexcept(ranges::iter_swap(--declval<Iterator>(), --declval<Iterator2>()))
```

```
template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);
```

7 *Returns:* `reverse_iterator<Iterator>(i)`.

22.5.2 Insert iterators

[[insert.iterators](#)]

1 To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called *insert iterators*, are provided in the library. With regular iterator classes,

```
while (first != last) *result++ = *first++;
```

causes a range `[first, last)` to be copied into a range starting with `result`. The same code with `result` being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the *insert mode* instead of the *regular overwrite mode*.

2 An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators satisfy the requirements of output iterators. `operator*` returns the insert iterator itself. The assignment operator=(`const T& x`) is defined on insert iterators to allow writing into them, it inserts `x` right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. `back_insert_iterator` inserts elements at the end of a container, `front_insert_iterator` inserts elements at the beginning of a container, and `insert_iterator` inserts elements where the iterator points to in a container. `back_inserter`, `front_inserter`, and `inserter` are three functions making the insert iterators out of a container.

22.5.2.1 Class template `back_insert_iterator`

[[back.insert.iterator](#)]

```
namespace std {
    template<class Container>
    class back_insert_iterator {
protected:
    Container* container = nullptr;

public:
    using iterator_category = output_iterator_tag;
    using value_type      = void;
    using difference_type = ptrdiff_t;
    using pointer         = void;
    using reference       = void;
    using container_type  = Container;

    constexpr back_insert_iterator() noexcept = default;
    constexpr explicit back_insert_iterator(Container& x);
    constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
    constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
};
```

```

    constexpr back_insert_iterator& operator*();
    constexpr back_insert_iterator& operator++();
    constexpr back_insert_iterator operator++(int);
};

template<class Container>
constexpr back_insert_iterator<Container> back_inserter(Container& x);
}

```

22.5.2.1.1 Operations

[back.insert.iter.ops]

```
constexpr explicit back_insert_iterator(Container& x);
```

1 *Effects:* Initializes container with addressof(x).

```
constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects:* As if by: container->push_back(value);

3 *Returns:* *this.

```
constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects:* As if by: container->push_back(std::move(value));

5 *Returns:* *this.

```
constexpr back_insert_iterator& operator*();
```

6 *Returns:* *this.

```
constexpr back_insert_iterator& operator++();
```

```
constexpr back_insert_iterator operator++(int);
```

7 *Returns:* *this.

22.5.2.1.2 back_inserter

[back.inserter]

```
template<class Container>
constexpr back_insert_iterator<Container> back_inserter(Container& x);
```

1 *Returns:* back_insert_iterator<Container>(x).

22.5.2.2 Class template front_insert_iterator

[front.insert.iterator]

```

namespace std {
    template<class Container>
    class front_insert_iterator {
protected:
    Container* container = nullptr;

public:
    using iterator_category = output_iterator_tag;
    using value_type      = void;
    using difference_type = ptrdiff_t;
    using pointer          = void;
    using reference        = void;
    using container_type   = Container;

    constexpr front_insert_iterator(Container& x) noexcept = default;
    constexpr explicit front_insert_iterator(Container& x);
    constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
    constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

    constexpr front_insert_iterator& operator*();
    constexpr front_insert_iterator& operator++();
    constexpr front_insert_iterator operator++(int);
};

```

```
template<class Container>
    constexpr front_insert_iterator<Container> front_inserter(Container& x);
}
```

22.5.2.2.1 Operations

[front.insert.iter.ops]

```
constexpr explicit front_insert_iterator(Container& x);
```

1 *Effects:* Initializes container with addressof(x).

```
constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects:* As if by: container->push_front(value);

3 *Returns:* *this.

```
constexpr front_insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects:* As if by: container->push_front(std::move(value));

5 *Returns:* *this.

```
constexpr front_insert_iterator& operator*();
```

6 *Returns:* *this.

```
constexpr front_insert_iterator& operator++();
```

```
constexpr front_insert_iterator operator++(int);
```

7 *Returns:* *this.

22.5.2.2 front_inserter

[front.inserter]

```
template<class Container>
    constexpr front_insert_iterator<Container> front_inserter(Container& x);
```

1 *Returns:* front_insert_iterator<Container>(x).

22.5.2.3 Class template insert_iterator

[insert.iterator]

```
namespace std {
    template<class Container>
    class insert_iterator {
protected:
    Container* container = nullptr;
    iterator_t<Container> iter = iterator_t<Container>();

public:
    using iterator_category = output_iterator_tag;
    using value_type = void;
    using difference_type = ptrdiff_t;
    using pointer = void;
    using reference = void;
    using container_type = Container;

    insert_iterator() = default;
    constexpr insert_iterator(Container& x, iterator_t<Container> i);
    constexpr insert_iterator& operator=(const typename Container::value_type& value);
    constexpr insert_iterator& operator=(typename Container::value_type&& value);

    constexpr insert_iterator& operator*();
    constexpr insert_iterator& operator++();
    constexpr insert_iterator& operator++(int);
};

template<class Container>
constexpr insert_iterator<Container>
    inserter(Container& x, iterator_t<Container> i);
}
```

22.5.2.3.1 Operations

[insert.iter.ops]

```
constexpr insert_iterator(Container& x, iterator_t<Container> i);
1   Effects: Initializes container with addressof(x) and iter with i.

constexpr insert_iterator& operator=(const typename Container::value_type& value);
2   Effects: As if by:
        iter = container->insert(iter, value);
        ++iter;

3   Returns: *this.

constexpr insert_iterator& operator=(typename Container::value_type&& value);
4   Effects: As if by:
        iter = container->insert(iter, std::move(value));
        ++iter;

5   Returns: *this.

constexpr insert_iterator& operator*();
6   Returns: *this.

constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);
7   Returns: *this.
```

22.5.2.3.2 inserter

[inserter]

```
template<class Container>
constexpr insert_iterator<Container>
inserter(Container& x, iterator_t<Container> i);
1   Returns: insert_iterator<Container>(x, i).
```

22.5.3 Move iterators and sentinels

[move.iterators]

- 1 Class template `move_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.
- 2 [Example:

```
list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end());           // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
                  make_move_iterator(s.end())); // moves strings into v2
— end example]
```

22.5.3.1 Class template `move_iterator`

[move.iterator]

```
namespace std {
    template<class Iterator>
    class move_iterator {
    public:
        using iterator_type      = Iterator;
        using iterator_concept   = input_iterator_tag;
        using iterator_category  = see below;
        using value_type         = iter_value_t<Iterator>;
        using difference_type   = iter_difference_t<Iterator>;
        using pointer            = Iterator;
        using reference          = iter_rvalue_reference_t<Iterator>;
```

```

constexpr move_iterator();
constexpr explicit move_iterator(Iterator i);

```

¹ The member *typedef-name iterator_category* denotes

- (1.1) — *random_access_iterator_tag* if the type *iterator_traits<Iterator>::iterator_category* models *DerivedFrom<random_access_iterator_tag>*, and
- (1.2) — *iterator_traits<Iterator>::iterator_category* otherwise.

22.5.3.2 Requirements

[move.iter.requirements]

- 1 The template parameter *Iterator* shall either meet the *Cpp17InputIterator* requirements (22.3.5.2) or model *InputIterator* (22.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the *Cpp17BidirectionalIterator* requirements (22.3.5.5) or model *BidirectionalIterator* (22.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the *Cpp17RandomAccessIterator* requirements (22.3.5.6) or model *RandomAccessIterator* (22.3.4.13).

22.5.3.3 Construction and assignment

[move.iter.cons]

```
constexpr move_iterator();
```

- 1 *Effects:* Constructs a *move_iterator*, value-initializing *current*. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type *Iterator*.

```
constexpr explicit move_iterator(Iterator i);
```

- 2 *Effects:* Constructs a *move_iterator*, initializing *current* with *i*.

```
template<class U> constexpr move_iterator(const move_iterator<U>& u);
```

- 3 *Effects:* Constructs a *move_iterator*, initializing *current* with *u.base()*.

- 4 *Requires:* *U* shall be convertible to *Iterator*.

```
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);
```

- 5 *Effects:* Assigns *u.base()* to *current*.

- 6 *Requires:* *U* shall be convertible to *Iterator*.

22.5.3.4 Conversion

[move.iter.op.conv]

```
constexpr Iterator base() const;
```

- 1 *Returns:* *current*.

22.5.3.5 Element access

[move.iter.elem]

```
constexpr reference operator*() const;
```

- 1 *Effects:* Equivalent to: `return ranges::iter_move(current);`

```
constexpr pointer operator->() const;
2     Returns: current.

constexpr reference operator[](difference_type n) const;
3     Effects: Equivalent to: ranges::iter_move(current + n);
```

22.5.3.6 Navigation

[move.iter.nav]

```
constexpr move_iterator& operator++();
1     Effects: As if by ++current.
2     Returns: *this.

constexpr auto operator++(int);
3     Effects: If Iterator models ForwardIterator, equivalent to:
        move_iterator tmp = *this;
        ++current;
        return tmp;
```

Otherwise, equivalent to ++current.

```
constexpr move_iterator& operator--();
```

```
4     Effects: As if by --current.
5     Returns: *this.
```

```
constexpr move_iterator operator--(int);
```

```
6     Effects: As if by:
        move_iterator tmp = *this;
        --current;
        return tmp;
```

```
constexpr move_iterator operator+(difference_type n) const;
```

```
7     Returns: move_iterator(current + n).
```

```
constexpr move_iterator& operator+=(difference_type n);
```

```
8     Effects: As if by: current += n;
9     Returns: *this.
```

```
constexpr move_iterator operator-(difference_type n) const;
```

```
10    Returns: move_iterator(current - n).
```

```
constexpr move_iterator& operator-=(difference_type n);
```

```
11    Effects: As if by: current -= n;
12    Returns: *this.
```

22.5.3.7 Comparisons

[move.iter.op.comp]

```
template<class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x,
                           const move_iterator<Iterator2>& y);
template<Sentinel<Iterator> S>
friend constexpr bool operator==(const move_iterator& x,
                                 const move_sentinel<S>& y);
template<Sentinel<Iterator> S>
friend constexpr bool operator==(const move_sentinel<S>& x,
                                 const move_iterator& y);
```

1 Constraints: The expression x.base() == y.base() shall be valid and convertible to `bool`.

2 Returns: x.base() == y.base().

```

template<class Iterator1, class Iterator2>
constexpr bool operator!=(const move_iterator<Iterator1>& x,
                           const move_iterator<Iterator2>& y);
template<Sentinel<Iterator> S>
friend constexpr bool operator!=(const move_iterator& x,
                                 const move_sentinel<S>& y);
template<Sentinel<Iterator> S>
friend constexpr bool operator!=(const move_sentinel<S>& x,
                                 const move_iterator& y);

3   Constraints: The expression x.base() == y.base() shall be valid and convertible to bool.
4   Returns: !(x == y).

template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

5   Constraints: The expression x.base() < y.base() shall be valid and convertible to bool.
6   Returns: x.base() < y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

7   Constraints: The expression y.base() < x.base() shall be valid and convertible to bool.
8   Returns: y < x.

template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

9   Constraints: The expression y.base() < x.base() shall be valid and convertible to bool.
10  Returns: !(y < x).

template<class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

11  Constraints: The expression x.base() < y.base() shall be valid and convertible to bool.
12  Returns: !(x < y).

```

22.5.3.8 Non-member functions

[move.iter.nonmember]

```

template<class Iterator1, class Iterator2>
constexpr auto operator-(const move_iterator<Iterator1>& x,
                         const move_iterator<Iterator2>& y)
    -> decltype(x.base() - y.base());
template<SizedSentinel<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_sentinel<S>& x, const move_iterator& y);
template<SizedSentinel<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_iterator& x, const move_sentinel<S>& y);

1   Returns: x.base() - y.base().

template<class Iterator>
constexpr move_iterator<Iterator>
operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);

2   Constraints: The expression x + n shall be valid and have type Iterator.
3   Returns: x + n.

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
    noexcept(noexcept(ranges::iter_move(i.current)));
4   Effects: Equivalent to: return ranges::iter_move(i.current);

```

```

template<IndirectlySwappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
    noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
5   Effects: Equivalent to: ranges::iter_swap(x.current, y.current).

template<class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);
6   Returns: move_iterator<Iterator>(i).

```

22.5.3.9 Class template move_sentinel

[move.sentinel]

- 1 Class template `move_sentinel` is a sentinel adaptor useful for denoting ranges together with `move_iterator`. When an input iterator type `I` and sentinel type `S` model `Sentinel<S, I>`, `move_sentinel<S>` and `move_iterator<I>` model `Sentinel<move_sentinel<S>, move_iterator<I>>` as well.
- 2 [Example: A `move_if` algorithm is easily implemented with `copy_if` using `move_iterator` and `move_sentinel`:

```

template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O,
         IndirectUnaryPredicate<I> Pred>
requires IndirectlyMovable<I, O>
void move_if(I first, S last, O out, Pred pred) {
    std::ranges::copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}

— end example]

namespace std {
    template<Semiregular S>
    class move_sentinel {
        public:
            constexpr move_sentinel();
            constexpr explicit move_sentinel(S s);
            template<class S2>
            requires ConvertibleTo<const S2&, S>
            constexpr move_sentinel(const move_sentinel<S2>& s);
            template<class S2>
            requires Assignable<S&, const S2&>
            constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

            constexpr S base() const;
        private:
            S last;      // exposition only
    };
}

```

22.5.3.10 Operations

[move.sent.ops]

- ```
constexpr move_sentinel();
```
- 1 Effects: Value-initializes `last`. If `is_trivially_default_constructible_v<S>` is `true`, then this constructor is a `constexpr` constructor.

```
constexpr explicit move_sentinel(S s);
```

- 2 Effects: Initializes `last` with `std::move(s)`.

- ```
template<class S2>
requires ConvertibleTo<const S2&, S>
constexpr move_sentinel(const move_sentinel<S2>& s);
```
- 3 Effects: Initializes `last` with `s.last`.
- ```
template<class S2>
requires Assignable<S&, const S2&>
constexpr move_sentinel& operator=(const move_sentinel<S2>& s);
```
- 4 Effects: Equivalent to: `last = s.last; return *this;`

## 22.5.4 Common iterators

[**iterators.common**]

### 22.5.4.1 Class template common\_iterator

[**common.iterator**]

- 1 Class template `common_iterator` is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.
- 2 [Note: The `common_iterator` type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. —end note]
- 3 [Example:

```
template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);

list<int> s;
// populate the list s
using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
// call fun on a range of 10 ints
fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));
— end example]

namespace std {
 template<Iterator I, Sentinel<I> S>
 requires (!Same<I, S>)
 class common_iterator {
 public:
 constexpr common_iterator() = default;
 constexpr common_iterator(I i);
 constexpr common_iterator(S s);
 template<class I2, class S2>
 requires ConvertibleTo<const I2&, I> && ConvertibleTo<const S2&, S>
 constexpr common_iterator(const common_iterator<I2, S2>& x);

 template<class I2, class S2>
 requires ConvertibleTo<const I2&, I> && ConvertibleTo<const S2&, S> &&
 Assignable<I&, const I2&> && Assignable<S&, const S2&>
 common_iterator& operator=(const common_iterator<I2, S2>& x);

 decltype(auto) operator*();
 decltype(auto) operator*() const
 requires dereferenceable<const I>;
 decltype(auto) operator->() const
 requires see below;

 common_iterator& operator++();
 decltype(auto) operator++(int);

 template<class I2, Sentinel<I> S2>
 requires Sentinel<S, I2>
 friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
 template<class I2, Sentinel<I> S2>
 requires Sentinel<S, I2> && EqualityComparableWith<I, I2>
 friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
 template<class I2, Sentinel<I> S2>
 requires Sentinel<S, I2>
 friend bool operator!=(const common_iterator& x, const common_iterator<I2, S2>& y);

 template<SizedSentinel<I> I2, SizedSentinel<I> S2>
 requires SizedSentinel<S, I2>
 friend iter_difference_t<I2> operator-(
```

```

 const common_iterator& x, const common_iterator<I2, S2>& y);

friend iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
 noexcept(noexcept(ranges::iter_move(declval<const I&>())))
 requires InputIterator<I>;
template<IndirectlySwappable<I> I2, class S2>
friend void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
 noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));

private:
 variant<I, S> v_; // exposition only
};

template<class I, class S>
struct incrementable_traits<common_iterator<I, S>> {
 using difference_type = iter_difference_t<I>;
};

template<InputIterator I, class S>
struct iterator_traits<common_iterator<I, S>> {
 using iterator_concept = see below;
 using iterator_category = see below;
 using value_type = iter_value_t<I>;
 using difference_type = iter_difference_t<I>;
 using pointer = see below;
 using reference = iter_reference_t<I>;
};
}

```

#### 22.5.4.2 Associated types

[common.iter.types]

- 1 The nested *typedef-names* of the specialization of `iterator_traits` for `common_iterator<I, S>` are defined as follows.
  - (1.1) — `iterator_concept` denotes `forward_iterator_tag` if `I` models `ForwardIterator`; otherwise it denotes `input_iterator_tag`.
  - (1.2) — `iterator_category` denotes `forward_iterator_tag` if `iterator_traits<I>::iterator_category` models `DerivedFrom<forward_iterator_tag>`; otherwise it denotes `input_iterator_tag`.
  - (1.3) — If the expression `a.operator->()` is well-formed, where `a` is an lvalue of type `const common_iterator<I, S>`, then `pointer` denotes the type of that expression. Otherwise, `pointer` denotes `void`.

#### 22.5.4.3 Constructors and conversions

[common.iter.const]

```
constexpr common_iterator(I i);
```

- 1 *Effects:* Initializes `v_` as if by `v_{in_place_type<I>, std::move(i)}`.

```
constexpr common_iterator(S s);
```

- 2 *Effects:* Initializes `v_` as if by `v_{in_place_type<S>, std::move(s)}`.

```
template<class I2, class S2>
requires ConvertibleTo<const I2&, I> && ConvertibleTo<const S2&, S>
constexpr common_iterator(const common_iterator<I2, S2>& x);
```

- 3 *Expects:* `x.v_.valueless_by_exception()` is false.

- 4 *Effects:* Initializes `v_` as if by `v_{in_place_index<i>, get<i>(x.v_)}`, where `i` is `x.v_.index()`.

```
template<class I2, class S2>
requires ConvertibleTo<const I2&, I> && ConvertibleTo<const S2&, S> &&
 Assignable<I&, const I2&> && Assignable<S&, const S2&>
 common_iterator& operator=(const common_iterator<I2, S2>& x);
```

- 5 *Expects:* `x.v_.valueless_by_exception()` is false.

- 6 *Effects:* Equivalent to:

- (6.1) — If  $v_{\_}.index() == x.v_{\_}.index()$ , then  $\text{get}^{<i>}(v_{\_}) = \text{get}^{<i>}(x.v_{\_})$ .  
 (6.2) — Otherwise,  $v_{\_}.\text{emplace}^{<i>}(\text{get}^{<i>}(x.v_{\_}))$ .  
 where  $i$  is  $x.v_{\_}.index()$ .
- 7     *Returns*:  $*this$

#### 22.5.4.4 Accessors

[common.iter.access]

```
decltype(auto) operator*();
decltype(auto) operator*() const
 requires dereferenceable<const I>;
1 Expects: holds_alternative<I>(v_{_}).

2 Effects: Equivalent to: return *get<I>(v_{_});

decltype(auto) operator->() const
 requires see below;
```

3     The expression in the requires clause is equivalent to:

```
Readable<const I> &&
(requires(const I& i) { i.operator->(); } ||
 is_reference_v<iter_reference_t<I>> ||
 Constructible<iter_value_t<I>, iter_reference_t<I>>)
```

4     *Expects*: holds\_alternative<I>(v\_{\\_}).

5     *Effects*:

- (5.1) — If  $I$  is a pointer type or if the expression  $\text{get}^{<I>}(v_{\_}).operator->()$  is well-formed, equivalent to: `return get<I>(v_{\_});`

- (5.2) — Otherwise, if  $\text{iter\_reference\_t}<I>$  is a reference type, equivalent to:

```
auto&& tmp = *get<I>(v_{_});
return addressof(tmp);
```

- (5.3) — Otherwise, equivalent to: `return proxy(*get<I>(v_{\_}));` where  $\text{proxy}$  is the exposition-only class:

```
class proxy {
 iter_value_t<I> keep_;
 proxy(iter_reference_t<I>&& x)
 : keep_(std::move(x)) {}
public:
 const iter_value_t<I>* operator->() const {
 return addressof(keep_);
 }
};
```

#### 22.5.4.5 Navigation

[common.iter.nav]

```
common_iterator& operator++();
1 Expects: holds_alternative<I>(v_{_}).

2 Effects: Equivalent to ++get<I>(v_{_}).

3 Returns: $*this$.
```

```
decltype(auto) operator++(int);
4 Expects: holds_alternative<I>(v_{_}).

5 Effects: If I models ForwardIterator, equivalent to:

 common_iterator tmp = *this;
 +++this;
 return tmp;
```

Otherwise, equivalent to: `return get<I>(v_{\_})++;`

### 22.5.4.6 Comparisons

[common.iter.getCmp]

```

template<class I2, Sentinel<I> S2>
 requires Sentinel<S, I2>
friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
1 Requires: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
2 Returns: true if i == j, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index()
 and j is y.v_.index().

template<class I2, Sentinel<I> S2>
 requires Sentinel<S, I2> && EqualityComparableWith<I, I2>
friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
3 Requires: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
4 Returns: true if i and j are each 1, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is
 x.v_.index() and j is y.v_.index().

template<class I2, Sentinel<I> S2>
 requires Sentinel<S, I2>
friend bool operator!=(const common_iterator& x, const common_iterator<I2, S2>& y);
5 Effects: Equivalent to: return !(x == y);

template<SizedSentinel<I> I2, SizedSentinel<I> S2>
 requires SizedSentinel<S, I2>
friend iter_difference_t<I2> operator-(const common_iterator& x, const common_iterator<I2, S2>& y);
6 Requires: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
7 Returns: 0 if i and j are each 1, and otherwise get<i>(x.v_) - get<j>(y.v_), where i is x.v_.index()
 and j is y.v_.index().

```

### 22.5.4.7 Customization

[common.iter.cust]

```

friend iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
 noexcept(noexcept(ranges::iter_move(declval<const I&>())))
 requires InputIterator<I>;
1 Requires: holds_alternative<I>(v_).
2 Effects: Equivalent to: return ranges::iter_move(get<I>(i.v_));

template<IndirectlySwappable<I> I2, class S2>
 friend void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
 noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));
3 Requires: holds_alternative<I>(x.v_) and holds_alternative<I2>(y.v_) are each true.
4 Effects: Equivalent to ranges::iter_swap(get<I>(x.v_), get<I2>(y.v_)).

```

### 22.5.5 Default sentinels

[default.sentinels]

```

namespace std {
 struct default_sentinel_t { };
}

```

<sup>1</sup> Class `default_sentinel_t` is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., `counted_iterator` (22.5.6.1)).

### 22.5.6 Counted iterators

[iterators.counted]

#### 22.5.6.1 Class template `counted_iterator`

[counted.iterator]

<sup>1</sup> Class template `counted_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with `default_-`

`sentinel` in calls to generic algorithms to operate on a range of  $N$  elements starting at a given position without needing to know the end position a priori.

2 [Example:

```
list<string> s;
// populate the list s with at least 10 strings
vector<string> v;
// copies 10 strings into v:
ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
— end example]
```

- 3 Two values  $i_1$  and  $i_2$  of types `counted_iterator<I1>` and `counted_iterator<I2>` refer to elements of the same sequence if and only if `next(i1.base(), i1.count())` and `next(i2.base(), i2.count())` refer to the same (possibly past-the-end) element.

```
namespace std {
 template<Iterator I>
 class counted_iterator {
 public:
 using iterator_type = I;

```

### 22.5.6.2 Constructors and conversions

[counted.iter.const]

```
constexpr counted_iterator(I i, iter_difference_t<I> n);
```

1      *Requires:*  $n \geq 0$ .

2      *Effects:* Initializes *current* with *i* and *length* with *n*.

```
template<class I2>
 requires ConvertibleTo<const I2&, I>
 constexpr counted_iterator(const counted_iterator<I2>& x);
```

3     *Effects:* Initializes `current` with `x.current` and `length` with `x.length`.

```
template<class I2>
 requires Assignable<I&, const I2&>
 constexpr counted_iterator& operator=(const counted_iterator<I2>& x);
```

4     *Effects:* Assigns `x.current` to `current` and `x.length` to `length`.

5     *Returns:* `*this`.

### 22.5.6.3 Accessors

[counted.iter.access]

```
constexpr I base() const;
```

1     *Effects:* Equivalent to: `return current;`

```
constexpr iter_difference_t<I> count() const noexcept;
```

2     *Effects:* Equivalent to: `return length;`

### 22.5.6.4 Element access

[counted.iter.elem]

```
constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
 requires dereferenceable<const I>;
```

1     *Effects:* Equivalent to: `return *current;`

```
constexpr decltype(auto) operator[](iter_difference_t<I> n) const
 requires RandomAccessIterator<I>;
```

2     *Expects:* `n < length`.

3     *Effects:* Equivalent to: `return current[n];`

### 22.5.6.5 Navigation

[counted.iter.nav]

```
constexpr counted_iterator& operator++();
```

1     *Expects:* `length > 0`.

2     *Effects:* Equivalent to:

```
 ++current;
 --length;
 return *this;
```

```
decltype(auto) operator++(int);
```

3     *Expects:* `length > 0`.

4     *Effects:* Equivalent to:

```
 --length;
 try { return current++; }
 catch(...) { ++length; throw; }
```

```
constexpr counted_iterator operator++(int)
 requires ForwardIterator<I>;
```

5     *Effects:* Equivalent to:

```
 counted_iterator tmp = *this;
 +++this;
 return tmp;
```

```
constexpr counted_iterator& operator--();
```

6     *Expects:* `BidirectionalIterator<I>`

6     *Effects:* Equivalent to:

```
 --current;
```

```

 ++length;
 return *this;

constexpr counted_iterator operator--(int)
 requires BidirectionalIterator<I>;
7 Effects: Equivalent to:
 counted_iterator tmp = *this;
 --*this;
 return tmp;

constexpr counted_iterator operator+(iter_difference_t<I> n) const
 requires RandomAccessIterator<I>;
8 Effects: Equivalent to: return counted_iterator(current + n, length - n);

friend constexpr counted_iterator operator+(
 iter_difference_t<I> n, const counted_iterator& x)
 requires RandomAccessIterator<I>;
9 Effects: Equivalent to: return x + n;

constexpr counted_iterator& operator+=(iter_difference_t<I> n)
 requires RandomAccessIterator<I>;
10 Expects: n <= length.
11 Effects: Equivalent to:
 current += n;
 length -= n;
 return *this;

constexpr counted_iterator operator-(iter_difference_t<I> n) const
 requires RandomAccessIterator<I>;
12 Effects: Equivalent to: return counted_iterator(current - n, length + n);

template<Common<I> I2>
 friend constexpr iter_difference_t<I2> operator-(
 const counted_iterator& x, const counted_iterator<I2>& y);
13 Expects: x and y refer to elements of the same sequence (22.5.6.1).
14 Effects: Equivalent to: return y.length - x.length;

friend constexpr iter_difference_t<I> operator-(
 const counted_iterator& x, default_sentinel_t);
15 Effects: Equivalent to: return -x.length;

friend constexpr iter_difference_t<I> operator-(
 default_sentinel_t, const counted_iterator& y);
16 Effects: Equivalent to: return y.length;

constexpr counted_iterator& operator-=(iter_difference_t<I> n)
 requires RandomAccessIterator<I>;
17 Expects: -n <= length.
18 Effects: Equivalent to:
 current -= n;
 length += n;
 return *this;

```

## 22.5.6.6 Comparisons

[[counted.iter.cmp](#)]

```

template<Common<I> I2>
 friend constexpr bool operator==(

 const counted_iterator& x, const counted_iterator<I2>& y);
1 Expects: x and y refer to elements of the same sequence (22.5.6.1).

```

2       *Effects:* Equivalent to: `return x.length == y.length;`

```
friend constexpr bool operator==(
 const counted_iterator& x, default_sentinel_t);
friend constexpr bool operator==(
 default_sentinel_t, const counted_iterator& x);
```

3       *Effects:* Equivalent to: `return x.length == 0;`

```
template<Common<I> I2>
friend constexpr bool operator!=(
 const counted_iterator& x, const counted_iterator<I2>& y);
friend constexpr bool operator!=(
 const counted_iterator& x, default_sentinel_t y);
friend constexpr bool operator!=(
 default_sentinel_t x, const counted_iterator& y);
```

4       *Effects:* Equivalent to: `return !(x == y);`

```
template<Common<I> I2>
friend constexpr bool operator<(
 const counted_iterator& x, const counted_iterator<I2>& y);
```

5       *Requires:* `x` and `y` refer to elements of the same sequence ([22.5.6.1](#)).

6       *Effects:* Equivalent to: `return y.length < x.length;`

7       *[Note:* The argument order in the *Effects* element is reversed because `length` counts down, not up.  
— end note]

```
template<Common<I> I2>
friend constexpr bool operator>(
 const counted_iterator& x, const counted_iterator<I2>& y);
```

8       *Effects:* Equivalent to: `return y < x;`

```
template<Common<I> I2>
friend constexpr bool operator<=(
 const counted_iterator& x, const counted_iterator<I2>& y);
```

9       *Effects:* Equivalent to: `return !(y < x);`

```
template<Common<I> I2>
friend constexpr bool operator>=(
 const counted_iterator& x, const counted_iterator<I2>& y);
```

10      *Effects:* Equivalent to: `return !(x < y);`

## 22.5.6.7 Customizations

[counted.iter.cust]

```
friend constexpr iter_rvalue_reference_t<I>
iter_move(const counted_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current)))
 requires InputIterator<I>;
```

1       *Effects:* Equivalent to: `return ranges::iter_move(i.current);`

```
template<IndirectlySwappable<I> I2>
friend constexpr void
iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
 noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
```

2       *Effects:* Equivalent to `ranges::iter_swap(x.current, y.current).`

## 22.5.7 Unreachable sentinel

[unreachable.sentinels]

### 22.5.7.1 Class `unreachable_sentinel_t`

[unreachable.sentinel]

<sup>1</sup> Class `unreachable_sentinel_t` can be used with any `WeaklyIncrementable` type to denote the “upper bound” of an open interval.

<sup>2</sup> [Example:

```
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable_sentinel, '\n');
```

Provided a newline character really exists in the buffer, the use of `unreachable_sentinel` above potentially makes the call to `find` more efficient since the loop test against the sentinel does not require a conditional branch. — end example]

```
namespace std {
 struct unreachable_sentinel_t {
 template<WeaklyIncrementable I>
 friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept;
 template<WeaklyIncrementable I>
 friend constexpr bool operator==(const I&, unreachable_sentinel_t) noexcept;
 template<WeaklyIncrementable I>
 friend constexpr bool operator!=(unreachable_sentinel_t, const I&) noexcept;
 template<WeaklyIncrementable I>
 friend constexpr bool operator!=(const I&, unreachable_sentinel_t) noexcept;
 };
}
```

### 22.5.7.2 Comparisons

[`unreachable.sentinel.cmp`]

```
template<WeaklyIncrementable I>
 friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept;
template<WeaklyIncrementable I>
 friend constexpr bool operator==(const I&, unreachable_sentinel_t) noexcept;
```

<sup>1</sup> Returns: false.

```
template<WeaklyIncrementable I>
 friend constexpr bool operator!=(unreachable_sentinel_t, const I&) noexcept;
template<WeaklyIncrementable I>
 friend constexpr bool operator!=(const I&, unreachable_sentinel_t) noexcept;
```

<sup>2</sup> Returns: true.

## 22.6 Stream iterators

[`stream.iterators`]

<sup>1</sup> To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[Example:

```
partial_sum(istream_iterator<double, char>(cin),
 istream_iterator<double, char>(),
 ostream_iterator<double, char>(cout, "\n"));
```

reads a file containing floating-point numbers from `cin`, and prints the partial sums onto `cout`. — end example]

### 22.6.1 Class template `istream_iterator`

[`istream.iterator`]

- <sup>1</sup> The class template `istream_iterator` is an input iterator (22.3.5.2) that reads (using `operator>>`) successive elements from the input stream for which it was constructed. After it is constructed, and every time `++` is used, the iterator reads and stores a value of `T`. If the iterator fails to read and store a value of `T` (`fail()` on the stream returns `true`), the iterator becomes equal to the *end-of-stream* iterator value. The constructor with no arguments `istream_iterator()` always constructs an end-of-stream input iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-stream iterator is not defined. For any other iterator value a `const T&` is returned. The result of `operator->` on an end-of-stream iterator is not defined. For any other iterator value a `const T*` is returned. The behavior of a program that applies `operator++()` to an end-of-stream iterator is undefined. It is impossible to store things into `istream` iterators. The type `T` shall satisfy the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and *Cpp17CopyAssignable* requirements.
- <sup>2</sup> Two end-of-stream iterators are always equal. An end-of-stream iterator is not equal to a non-end-of-stream iterator. Two non-end-of-stream iterators are equal when they are constructed from the same stream.

```

namespace std {
 template<class T, class charT = char, class traits = char_traits<charT>,
 class Distance = ptrdiff_t>
 class istream_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = T;
 using difference_type = Distance;
 using pointer = const T*;
 using reference = const T&;
 using char_type = charT;
 using traits_type = traits;
 using istream_type = basic_istream<charT,traits>;

 constexpr istream_iterator();
 constexpr istream_iterator(default_sentinel_t);
 istream_iterator(istream_type& s);
 istream_iterator(const istream_iterator& x) = default;
 ~istream_iterator() = default;
 istream_iterator& operator=(const istream_iterator&) = default;

 const T& operator*() const;
 const T* operator->() const;
 istream_iterator& operator++();
 istream_iterator operator++(int);

 friend bool operator==(const istream_iterator& i, default_sentinel_t);
 friend bool operator==(default_sentinel_t, const istream_iterator& i);
 friend bool operator!=(const istream_iterator& x, default_sentinel_t y);
 friend bool operator!=(default_sentinel_t x, const istream_iterator& y);

 private:
 basic_istream<charT,traits>* in_stream; // exposition only
 T value; // exposition only
 };
}

template<class T, class charT, class traits, class Distance>
bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
 const istream_iterator<T,charT,traits,Distance>& y);
template<class T, class charT, class traits, class Distance>
bool operator!=(const istream_iterator<T,charT,traits,Distance>& x,
 const istream_iterator<T,charT,traits,Distance>& y);
}

```

### 22.6.1.1 Constructors and destructor

[istream.iterator.cons]

```
constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
```

<sup>1</sup> *Effects:* Constructs the end-of-stream iterator. If `is_trivially_default_constructible_v<T>` is true, then these constructors are `constexpr` constructors.

<sup>2</sup> *Ensures:* `in_stream == 0`.

```
istream_iterator(istream_type& s);
```

<sup>3</sup> *Effects:* Initializes `in_stream` with `addressof(s)`. `value` may be initialized during construction or the first time it is referenced.

<sup>4</sup> *Ensures:* `in_stream == addressof(s)`.

```
istream_iterator(const istream_iterator& x) = default;
```

<sup>5</sup> *Effects:* Constructs a copy of `x`. If `is_trivially_copy_constructible_v<T>` is true, then this constructor is a trivial copy constructor.

<sup>6</sup> *Ensures:* `in_stream == x.in_stream`.

`~istream_iterator() = default;`

7     *Effects:* The iterator is destroyed. If `is_trivially_destructible_v<T>` is `true`, then this destructor is trivial.

### 22.6.1.2 Operations

[`istream.iterator.ops`]

```
const T& operator*() const;
1 Returns: value.

const T* operator->() const;
2 Returns: addressof(operator*()).

istream_iterator& operator++();
3 Requires: in_stream != 0.
4 Effects: As if by: *in_stream >> value;
5 Returns: *this.

istream_iterator operator++(int);
6 Requires: in_stream != 0.
7 Effects: As if by:
 istream_iterator tmp = *this;
 *in_stream >> value;
 return (tmp);

template<class T, class charT, class traits, class Distance>
bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
 const istream_iterator<T,charT,traits,Distance>& y);
8 Returns: x.in_stream == y.in_stream.

friend bool operator==(default_sentinel_t, const istream_iterator& i);
friend bool operator==(const istream_iterator& i, default_sentinel_t);
9 Returns: !i.in_stream.

template<class T, class charT, class traits, class Distance>
bool operator!=(const istream_iterator<T,charT,traits,Distance>& x,
 const istream_iterator<T,charT,traits,Distance>& y);
friend bool operator!=(default_sentinel_t x, const istream_iterator& y);
friend bool operator!=(const istream_iterator& x, default_sentinel_t y);
10 Returns: !(x == y)
```

### 22.6.2 Class template `ostream_iterator`

[`ostream.iterator`]

1 `ostream_iterator` writes (using `operator<<`) successive elements onto the output stream from which it was constructed. If it was constructed with `charT*` as a constructor argument, this string, called a *delimiter string*, is written to the stream after every `T` is written. It is not possible to get a value out of the output iterator. Its only use is as an output iterator in situations like

```
while (first != last)
 *result++ = *first++;
2 ostream_iterator is defined as:
namespace std {
 template<class T, class charT = char, class traits = char_traits<charT>>
 class ostream_iterator {
 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using char_type = char;
```

```

using traits_type = traits;
using ostream_type = basic_ostream<charT,traits>;

constexpr ostreambuf_iterator() noexcept = default;
ostream_iterator(ostream_type& s);
ostream_iterator(ostream_type& s, const charT* delimiter);
ostream_iterator(const ostream_iterator& x);
~ostream_iterator();
ostream_iterator& operator=(const ostream_iterator&) = default;
ostream_iterator& operator=(const T& value);

ostream_iterator& operator*();
ostream_iterator& operator++();
ostream_iterator& operator++(int);

private:
 basic_ostream<charT,traits>* out_stream = nullptr; // exposition only
 const charT* delim = nullptr; // exposition only
};

}

```

### 22.6.2.1 Constructors and destructor

[ostream.iterator.cons.des]

`ostream_iterator(ostream_type& s);`

1 *Effects:* Initializes `out_stream` with `addressof(s)` and `delim` with null.

`ostream_iterator(ostream_type& s, const charT* delimiter);`

2 *Effects:* Initializes `out_stream` with `addressof(s)` and `delim` with `delimiter`.

`ostream_iterator(const ostream_iterator& x);`

3 *Effects:* Constructs a copy of `x`.

`~ostream_iterator();`

4 *Effects:* The iterator is destroyed.

### 22.6.2.2 Operations

[ostream.iterator.ops]

`ostream_iterator& operator=(const T& value);`

1 *Effects:* As if by:

```

*out_stream << value;
if (delim != 0)
 *out_stream << delim;
return *this;

```

`ostream_iterator& operator*();`

2 *Returns:* `*this`.

`ostream_iterator& operator++();`  
`ostream_iterator& operator++(int);`

3 *Returns:* `*this`.

### 22.6.3 Class template istreambuf\_iterator

[istreambuf.iterator]

1 The class template `istreambuf_iterator` defines an input iterator (22.3.5.2) that reads successive *characters* from the `streambuf` for which it was constructed. `operator*` provides access to the current input character, if any. Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`streambuf_type::sgetc()` returns `traits::eof()`), the iterator becomes equal to the *end-of-stream* iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(0)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.

- <sup>2</sup> The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class istreambuf_iterator {
public:
 using iterator_category = input_iterator_tag;
 using value_type = charT;
 using difference_type = typename traits::off_type;
 using pointer = unspecified;
 using reference = charT;
 using char_type = charT;
 using traits_type = traits;
 using int_type = typename traits::int_type;
 using streambuf_type = basic_streambuf<charT,traits>;
 using istream_type = basic_istream<charT,traits>;

 class proxy; // exposition only

 constexpr istreambuf_iterator() noexcept;
 constexpr istreambuf_iterator(default_sentinel_t) noexcept;
 istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
 ~istreambuf_iterator() = default;
 istreambuf_iterator(istream_type& s) noexcept;
 istreambuf_iterator(streambuf_type* s) noexcept;
 istreambuf_iterator(const proxy& p) noexcept;
 istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
 charT operator*() const;
 istreambuf_iterator& operator++();
 proxy operator++(int);
 bool equal(const istreambuf_iterator& b) const;

 friend bool operator==(default_sentinel_t s, const istreambuf_iterator& i);
 friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
 friend bool operator!=(default_sentinel_t a, const istreambuf_iterator& b);
 friend bool operator!=(const istreambuf_iterator& a, default_sentinel_t b);

private:
 streambuf_type* sbuf_; // exposition only
};

template<class charT, class traits>
bool operator==(const istreambuf_iterator<charT,traits>& a,
 const istreambuf_iterator<charT,traits>& b);
template<class charT, class traits>
bool operator!=(const istreambuf_iterator<charT,traits>& a,
 const istreambuf_iterator<charT,traits>& b);
}

```

### 22.6.3.1 Class `istreambuf_iterator::proxy`

[`istreambuf.iterator.proxy`]

```

namespace std {
 template<class charT, class traits>
 class istreambuf_iterator<charT, traits>::proxy { // exposition only
 charT keep_;
 basic_streambuf<charT,traits>* sbuf_;
 proxy(charT c, basic_streambuf<charT,traits>* sbuf)
 : keep_(c), sbuf_(sbuf) {}
 public:
 charT operator*() { return keep_; }
 };
}

```

<sup>1</sup> Class `istreambuf_iterator<charT,traits>::proxy` is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_-`

`iterator<charT, traits>::proxy` provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

### 22.6.3.2 Constructors

[`istreambuf.iterator.cons`]

- 1 For each `istreambuf_iterator` constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member `sbuf_` is initialized with a null pointer value.

```
constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel_t) noexcept;
```

- 2 *Effects:* Initializes `sbuf_` with `nullptr`.

```
istreambuf_iterator(istream_type& s) noexcept;
```

- 3 *Effects:* Initializes `sbuf_` with `s.rdbuf()`.

```
istreambuf_iterator(streambuf_type* s) noexcept;
```

- 4 *Effects:* Initializes `sbuf_` with `s`.

```
istreambuf_iterator(const proxy& p) noexcept;
```

- 5 *Effects:* Initializes `sbuf_` with `p.sbuf_`.

### 22.6.3.3 Operations

[`istreambuf.iterator.ops`]

```
charT operator*() const
```

- 1 *Returns:* The character obtained via the `streambuf` member `sbuf_->sgetc()`.

```
istreambuf_iterator& operator++();
```

- 2 *Effects:* As if by `sbuf_->sbumpc()`.

- 3 *Returns:* `*this`.

```
proxy operator++(int);
```

- 4 *Returns:* `proxy(sbuf_->sbumpc(), sbuf_)`.

```
bool equal(const istreambuf_iterator& b) const;
```

- 5 *Returns:* `true` if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what `streambuf` object they use.

```
template<class charT, class traits>
```

```
bool operator==(const istreambuf_iterator<charT,traits>& a,
 const istreambuf_iterator<charT,traits>& b);
```

- 6 *Returns:* `a.equal(b)`.

```
friend bool operator==(default_sentinel_t s, const istreambuf_iterator& i);
```

```
friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
```

- 7 *Returns:* `i.equal(s)`.

```
template<class charT, class traits>
```

```
bool operator!=(const istreambuf_iterator<charT,traits>& a,
 const istreambuf_iterator<charT,traits>& b);
```

```
friend bool operator!=(default_sentinel_t a, const istreambuf_iterator& b);
```

```
friend bool operator!=(const istreambuf_iterator& a, default_sentinel_t b);
```

- 8 *Returns:* `!a.equal(b)`.

### 22.6.4 Class template `ostreambuf_iterator`

[`ostreambuf.iterator`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class ostreambuf_iterator {
 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
```

```

using difference_type = ptrdiff_t;
using pointer = void;
using reference = void;
using char_type = charT;
using traits_type = traits;
using streambuf_type = basic_streambuf<charT,traits>;
using ostream_type = basic_ostream<charT,traits>;

constexpr ostreambuf_iterator() noexcept = default;
ostreambuf_iterator(ostream_type& s) noexcept;
ostreambuf_iterator(streambuf_type* s) noexcept;
ostreambuf_iterator& operator=(charT c);

ostreambuf_iterator& operator*();
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
bool failed() const noexcept;

private:
 streambuf_type* sbuf_ = nullptr; // exposition only
};

}

```

- <sup>1</sup> The class template `ostreambuf_iterator` writes successive *characters* onto the output stream from which it was constructed. It is not possible to get a character value out of the output iterator.

#### 22.6.4.1 Constructors

[`ostreambuf.iter.cons`]

```

ostreambuf_iterator(ostream_type& s) noexcept;
1 Requires: s.rdbuf() shall not be a null pointer.
2 Effects: Initializes sbuff_ with s.rdbuf().
ostreambuf_iterator(streambuf_type* s) noexcept;
3 Requires: s shall not be a null pointer.
4 Effects: Initializes sbuff_ with s.

```

#### 22.6.4.2 Operations

[`ostreambuf.iter.ops`]

```

ostreambuf_iterator& operator=(charT c);
1 Effects: If failed() yields false, calls sbuff_->sputc(c); otherwise has no effect.
2 Returns: *this.
ostreambuf_iterator& operator*();
3 Returns: *this.
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
4 Returns: *this.
bool failed() const noexcept;
5 Returns: true if in any prior use of member operator=, the call to sbuff_->sputc() returned
 traits::eof(); or false otherwise.

```

### 22.7 Range access

[`iterator.range`]

- <sup>1</sup> In addition to being available via inclusion of the `<iterator>` header, the function templates in 22.7 are available when any of the following headers are included: `<array>`, `<deque>`, `<forward_list>`, `<list>`, `<map>`, `<regex>`, `<set>`, `<span>`, `<string>`, `<string_view>`, `<unordered_map>`, `<unordered_set>`, and `<vector>`. Each of these templates is a designated customization point (15.5.4.2.1).

```
template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
```

```

template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());
2 Returns: c.begin().

template<class C> constexpr auto end(C& c) -> decltype(c.end());
template<class C> constexpr auto end(const C& c) -> decltype(c.end());
3 Returns: c.end().

template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
4 Returns: array.

template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;
5 Returns: array + N.

template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
-> decltype(std::begin(c));
6 Returns: std::begin(c).

template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
-> decltype(std::end(c));
7 Returns: std::end(c).

template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template<class C> constexpr auto rbegin(const C& c) -> decltype(c.rbegin());
8 Returns: c.rbegin().

template<class C> constexpr auto rend(C& c) -> decltype(c.rend());
template<class C> constexpr auto rend(const C& c) -> decltype(c.rend());
9 Returns: c.rend().

template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);
10 Returns: reverse_iterator<T*>(array + N).

template<class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);
11 Returns: reverse_iterator<T*>(array).

template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);
12 Returns: reverse_iterator<const E*>(il.end()).

template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);
13 Returns: reverse_iterator<const E*>(il.begin()).

template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));
14 Returns: std::rbegin(c).

template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));
15 Returns: std::rend(c).

```

## 22.8 Container and view access

[[iterator.container](#)]

- <sup>1</sup> In addition to being available via inclusion of the `<iterator>` header, the function templates in [22.8](#) are available when any of the following headers are included: `<array>`, `<deque>`, `<forward_list>`, `<list>`, `<map>`, `<regex>`, `<set>`, `<span>`, `<string>`, `<string_view>`, `<unordered_map>`, `<unordered_set>`, and `<vector>`. Each of these templates is a designated customization point ([15.5.4.2.1](#)).

```

template<class C> constexpr auto size(const C& c) -> decltype(c.size());
2 Returns: c.size().

template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
3 Returns: N.

```

```
template<class C> [[nodiscard]] constexpr auto empty(const C& c) -> decltype(c.empty());
4 Returns: c.empty().

template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
5 Returns: false.

template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;
6 Returns: il.size() == 0.

template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());
7 Returns: c.data().

template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
8 Returns: array.

template<class E> constexpr const E* data(initializer_list<E> il) noexcept;
9 Returns: il.begin().
```

# 23 Ranges library

# [ranges]

## 23.1 General

[ranges.general]

- <sup>1</sup> This clause describes components for dealing with ranges of elements.
- 2 The following subclauses describe range and view requirements, and components for range primitives as summarized in Table 79.

Table 79 — Ranges library summary

| Subclause | Header(s)             |
|-----------|-----------------------|
| 23.3      | Range access <ranges> |
| 23.4      | Range primitives      |
| 23.5      | Requirements          |
| 23.6      | Range utilities       |
| 23.7      | Range adaptors        |

- 3 Several places in this clause use the expression *DECAY\_COPY(x)* with semantics as defined in 31.2.6.

## 23.2 Header <ranges> synopsis

[ranges.syn]

```
#include <initializer_list>
#include <iterator>

namespace std::ranges {
 inline namespace unspecified {
 // 23.3, range access
 inline constexpr unspecified begin = unspecified;
 inline constexpr unspecified end = unspecified;
 inline constexpr unspecified cbegin = unspecified;

```

### 23.3 Range access

[range.access]

- <sup>1</sup> In addition to being available via inclusion of the `<ranges>` header, the customization point objects in 23.3 are available when `<iterator>` is included.

#### 23.3.1 ranges::begin

[range.access.begin]

- <sup>1</sup> The name `ranges::begin` denotes a customization point object (15.4.2.1.6). The expression `ranges::begin(E)` for some subexpression `E` is expression-equivalent to:
  - (1.1) — `E + 0` if `E` is an lvalue of array type (6.7.2).
  - (1.2) — Otherwise, if `E` is an lvalue, `DECAY_COPY(E.begin())` if it is a valid expression and its type `I` models `Iterator`.
  - (1.3) — Otherwise, `DECAY_COPY(begin(E))` if it is a valid expression and its type `I` models `Iterator` with overload resolution performed in a context that includes the declarations:

```

template<class T> void begin(T&&) = delete;
template<class T> void begin(initializer_list<T>&&) = delete;

```

and does not include a declaration of `ranges::begin`.

- (1.4) — Otherwise, `ranges::begin(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::begin(E)` appears in the immediate context of a template instantiation. — end note]
- <sup>2</sup> [Note: Whenever `ranges::begin(E)` is a valid expression, its type models `Iterator`. — end note]

#### 23.3.2 ranges::end

[range.access.end]

- <sup>1</sup> The name `ranges::end` denotes a customization point object (15.4.2.1.6). The expression `ranges::end(E)` for some subexpression `E` is expression-equivalent to:
  - (1.1) — `E + extent_v<T>` if `E` is an lvalue of array type (6.7.2) `T`.
  - (1.2) — Otherwise, if `E` is an lvalue, `DECAY_COPY(E.end())` if it is a valid expression and its type `S` models `Sentinel<decltype(ranges::begin(E))>`.

- (1.3) — Otherwise, *DECAY\_COPY(end(E))* if it is a valid expression and its type S models `Sentinel<decltype(ranges::begin(E))>` with overload resolution performed in a context that includes the declarations:

```
template<class T> void end(T&&) = delete;
template<class T> void end(initializer_list<T>&&) = delete;
```

and does not include a declaration of `ranges::end`.

- (1.4) — Otherwise, `ranges::end(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::end(E)` appears in the immediate context of a template instantiation. — *end note*]

- 2 [Note: Whenever `ranges::end(E)` is a valid expression, the types S and I of `ranges::end(E)` and `ranges::begin(E)` model `Sentinel<S, I>`. — *end note*]

### 23.3.3 `ranges::cbegin`

[range.access.cbegin]

- 1 The name `ranges::cbegin` denotes a customization point object (15.4.2.1.6). The expression `ranges::cbegin(E)` for some subexpression E of type T is expression-equivalent to:

- (1.1) — `ranges::begin(static_cast<const T&>(E))` if E is an lvalue.  
 (1.2) — Otherwise, `ranges::begin(static_cast<const T&&>(E))`.

- 2 [Note: Whenever `ranges::cbegin(E)` is a valid expression, its type models `Iterator`. — *end note*]

### 23.3.4 `ranges::cend`

[range.access.cend]

- 1 The name `ranges::cend` denotes a customization point object (15.4.2.1.6). The expression `ranges::cend(E)` for some subexpression E of type T is expression-equivalent to:

- (1.1) — `ranges::end(static_cast<const T&>(E))` if E is an lvalue.  
 (1.2) — Otherwise, `ranges::end(static_cast<const T&&>(E))`.

- 2 [Note: Whenever `ranges::cend(E)` is a valid expression, the types S and I of `ranges::cend(E)` and `ranges::cbegin(E)` model `Sentinel<S, I>`. — *end note*]

### 23.3.5 `ranges::rbegin`

[range.access.rbegin]

- 1 The name `ranges::rbegin` denotes a customization point object (15.4.2.1.6). The expression `ranges::rbegin(E)` for some subexpression E is expression-equivalent to:

- (1.1) — If E is an lvalue, *DECAY\_COPY(E.rbegin())* if it is a valid expression and its type I models `Iterator`.  
 (1.2) — Otherwise, *DECAY\_COPY(rbegin(E))* if it is a valid expression and its type I models `Iterator` with overload resolution performed in a context that includes the declaration:

```
template<class T> void rbegin(T&&) = delete;
```

and does not include a declaration of `ranges::rbegin`.

- (1.3) — Otherwise, `make_reverse_iterator(ranges::end(E))` if both `ranges::begin(E)` and `ranges::end(E)` are valid expressions of the same type I which models `BidirectionalIterator` (22.3.4.12).  
 (1.4) — Otherwise, `ranges::rbegin(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation. — *end note*]

- 2 [Note: Whenever `ranges::rbegin(E)` is a valid expression, its type models `Iterator`. — *end note*]

### 23.3.6 `ranges::rend`

[range.access.rend]

- 1 The name `ranges::rend` denotes a customization point object (15.4.2.1.6). The expression `ranges::rend(E)` for some subexpression E is expression-equivalent to:

- (1.1) — If E is an lvalue, *DECAY\_COPY(E.rend())* if it is a valid expression and its type S models `Sentinel<decltype(ranges::rbegin(E))>`.  
 (1.2) — Otherwise, *DECAY\_COPY(rend(E))* if it is a valid expression and its type S models `Sentinel<decltype(ranges::rbegin(E))>` with overload resolution performed in a context that includes the declaration:

```
template<class T> void rend(T&&) = delete;
```

and does not include a declaration of `ranges::rend`.

- (1.3) — Otherwise, `make_reverse_iterator(ranges::begin(E))` if both `ranges::begin(E)` and `ranges::end(E)` are valid expressions of the same type I which models `BidirectionalIterator` (22.3.4.12).
  - (1.4) — Otherwise, `ranges::rend(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::rend(E)` appears in the immediate context of a template instantiation. — end note]
- 2 [Note: Whenever `ranges::rend(E)` is a valid expression, the types S and I of `ranges::rend(E)` and `ranges::rbegin(E)` model `Sentinel<S, I>`. — end note]

### 23.3.7 `ranges::crbegin`

[range.access.crbegin]

- 1 The name `ranges::crbegin` denotes a customization point object (15.4.2.1.6). The expression `ranges::crbegin(E)` for some subexpression E of type T is expression-equivalent to:
    - (1.1) — `ranges::rbegin(static_cast<const T&>(E))` if E is an lvalue.
    - (1.2) — Otherwise, `ranges::rbegin(static_cast<const T&&>(E))`.
- 2 [Note: Whenever `ranges::crbegin(E)` is a valid expression, its type models `Iterator`. — end note]

### 23.3.8 `ranges::crend`

[range.access.crend]

- 1 The name `ranges::crend` denotes a customization point object (15.4.2.1.6). The expression `ranges::crend(E)` for some subexpression E of type T is expression-equivalent to:
    - (1.1) — `ranges::rend(static_cast<const T&>(E))` if E is an lvalue.
    - (1.2) — Otherwise, `ranges::rend(static_cast<const T&&>(E))`.
- 2 [Note: Whenever `ranges::crend(E)` is a valid expression, the types S and I of `ranges::crend(E)` and `ranges::crbegin(E)` model `Sentinel<S, I>`. — end note]

## 23.4 Range primitives

[range.prim]

- 1 In addition to being available via inclusion of the `<ranges>` header, the customization point objects in 23.4 are available when `<iterator>` is included.

### 23.4.1 `size`

[range.prim.size]

- 1 The name `size` denotes a customization point object (15.4.2.1.6). The expression `ranges::size(E)` for some subexpression E with type T is expression-equivalent to:
  - (1.1) — `DECAY_COPY(extent_v<T>)` if T is an array type (6.7.2).
  - (1.2) — Otherwise, if `disable_sized_range<remove_cv_t<T>` (23.5.3) is `false`:
    - (1.2.1) — `DECAY_COPY(E.size())` if it is a valid expression and its type I models `Integral`.
    - (1.2.2) — Otherwise, `DECAY_COPY(size(E))` if it is a valid expression and its type I models `Integral` with overload resolution performed in a context that includes the declaration:

```
template<class T> void size(T&&) = delete;
```

and does not include a declaration of `ranges::size`.

- (1.3) — Otherwise, `(ranges::end(E) - ranges::begin(E))` if it is a valid expression and the types I and S of `ranges::begin(E)` and `ranges::end(E)` model `SizedSentinel<S, I>` (22.3.4.8) and `ForwardIterator<I>`. However, E is evaluated only once.
  - (1.4) — Otherwise, `ranges::size(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::size(E)` appears in the immediate context of a template instantiation. — end note]
- 2 [Note: Whenever `ranges::size(E)` is a valid expression, its type models `Integral`. — end note]

### 23.4.2 `empty`

[range.prim.empty]

- 1 The name `empty` denotes a customization point object (15.4.2.1.6). The expression `ranges::empty(E)` for some subexpression E is expression-equivalent to:
  - (1.1) — `bool((E).empty())` if it is a valid expression.
  - (1.2) — Otherwise, `(ranges::size(E) == 0)` if it is a valid expression.
  - (1.3) — Otherwise, EQ, where EQ is `bool(ranges::begin(E) == ranges::end(E))` except that E is only evaluated once, if EQ is a valid expression and the type of `ranges::begin(E)` models `ForwardIterator`.

- (1.4) — Otherwise, `ranges::empty(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::empty(E)` appears in the immediate context of a template instantiation. — end note]
- 2 [Note: Whenever `ranges::empty(E)` is a valid expression, it has type `bool`. — end note]

### 23.4.3 data

[range.prim.data]

- 1 The name `data` denotes a customization point object (15.4.2.1.6). The expression `ranges::data(E)` for some subexpression `E` is expression-equivalent to:
- (1.1) — If `E` is an lvalue, `DECAY_COPY(E.data())` if it is a valid expression of pointer to object type.
  - (1.2) — Otherwise, if `ranges::begin(E)` is a valid expression whose type models `ContiguousIterator`,

```
ranges::begin(E) == ranges::end(E) ? nullptr : addressof(*ranges::begin(E))
```

except that `E` is evaluated only once.

- (1.3) — Otherwise, `ranges::data(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::data(E)` appears in the immediate context of a template instantiation. — end note]
- 2 [Note: Whenever `ranges::data(E)` is a valid expression, it has pointer to object type. — end note]

### 23.4.4 cdata

[range.prim.cdata]

- 1 The name `cdata` denotes a customization point object (15.4.2.1.6). The expression `ranges::cdata(E)` for some subexpression `E` of type `T` is expression-equivalent to:
- (1.1) — `ranges::data(static_cast<const T&>(E))` if `E` is an lvalue.
  - (1.2) — Otherwise, `ranges::data(static_cast<const T&&>(E))`.
- 2 [Note: Whenever `ranges::cdata(E)` is a valid expression, it has pointer to object type. — end note]

## 23.5 Range requirements

[range.req]

### 23.5.1 General

[range.req.general]

- 1 Ranges are an abstraction that allow a C++ program to operate on elements of data structures uniformly. Calling `ranges::begin` on a range returns an object whose type models `Iterator` (22.3.4.6). Calling `ranges::end` on a range returns an object whose type `S`, together with the type `I` of the object returned by `ranges::begin`, models `Sentinel<S, I>`. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.
- 2 The Range concept requires that `ranges::begin` and `ranges::end` return an iterator and a sentinel, respectively. The `SizedRange` concept refines Range with the requirement that the number of elements in the range can be determined in constant time using the `ranges::size` function. The View concept specifies requirements on a Range type with constant-time copy and assign operations.
- 3 Several refinements of Range group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which `ranges::begin` and `ranges::end` return objects of the same type. Random access ranges are ranges for which `ranges::begin` returns a type that models `RandomAccessIterator` (22.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

### 23.5.2 Ranges

[range.range]

- 1 The Range concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```
template<class T>
concept range-impl = // exposition only
 requires(T&& t) {
 ranges::begin(std::forward<T>(t)); // sometimes equality-preserving (see below)
 ranges::end(std::forward<T>(t));
 };
template<class T>
concept Range = range-impl<T&>;
```

```
template<class T>
concept forwarding-range = // exposition only
 Range<T> && range-impl<T>;
```

2     The required expressions `ranges::begin(std::forward<T>(t))` and `ranges::end(std::forward<T>(t))` of the *range-impl* concept do not require implicit expression variations (17.2).

3     Given an expression E such that `decltype((E))` is T, T models *range-impl* only if

(3.1)     — [`ranges::begin(E)`, `ranges::end(E)`] denotes a range (22.3.1),

(3.2)     — both `ranges::begin(E)` and `ranges::end(E)` are amortized constant time and non-modifying, and

(3.3)     — if the type of `ranges::begin(E)` models `ForwardIterator`, `ranges::begin(E)` is equality-preserving.

4     [*Note*: Equality preservation of both `ranges::begin` and `ranges::end` enables passing a `Range` whose iterator type models `ForwardIterator` to multiple algorithms and making multiple passes over the range by repeated calls to `ranges::begin` and `ranges::end`. Since `ranges::begin` is not required to be equality-preserving when the return type does not model `ForwardIterator`, repeated calls might not return equal values or might not be well-defined; `ranges::begin` should be called at most once for such a range. — *end note*]

5     Given an expression E such that `decltype((E))` is T and an lvalue t that denotes the same object as E, T models *forwarding-range* only if

(5.1)     — `ranges::begin(E)` and `ranges::begin(t)` are expression-equivalent,

(5.2)     — `ranges::end(E)` and `ranges::end(t)` are expression-equivalent, and

(5.3)     — the validity of iterators obtained from the object denoted by E is not tied to the lifetime of that object.

6     [*Note*: Since the validity of iterators is not tied to the lifetime of an object whose type models *forwarding-range*, a function can accept arguments of such a type by value and return iterators obtained from it without danger of dangling. — *end note*]

7     [*Example*: Specializations of class template `subrange` (23.6.3) model *forwarding-range*. `subrange` provides non-member rvalue overloads of `begin` and `end` with the same semantics as its member lvalue overloads, and `subrange`'s iterators - since they are “borrowed” from some other range - do not have validity tied to the lifetime of a `subrange` object. — *end example*]

### 23.5.3 Sized ranges

[`range.sized`]

- 1     The `SizedRange` concept specifies the requirements of a `Range` type that knows its size in constant time with the `size` function.

```
template<class T>
concept SizedRange =
 Range<T> &&
 !disable_sized_range<remove_cvref_t<T>> &&
 requires(T& t) { ranges::size(t); };
```

- 2     Given an lvalue t of type `remove_reference_t<T>`, T models `SizedRange` only if
- (2.1)     — `ranges::size(t)` is  $\mathcal{O}(1)$ , does not modify t, and is equal to `ranges::distance(t)`, and
- (2.2)     — if `iterator_t<T>` models `ForwardIterator`, `ranges::size(t)` is well-defined regardless of the evaluation of `ranges::begin(t)`. [*Note*: `ranges::size(t)` is otherwise not required to be well-defined after evaluating `ranges::begin(t)`. For example, `ranges::size(t)` might be well-defined for a `SizedRange` whose iterator type does not model `ForwardIterator` only if evaluated before the first call to `ranges::begin(t)`. — *end note*]
- 3     [*Note*: The complexity requirement for the evaluation of `ranges::size` is non-amortized, unlike the case for the complexity of the evaluations of `ranges::begin` and `ranges::end` in the `Range` concept. — *end note*]
- 4     [*Note*: `disable_sized_range` allows use of range types with the library that satisfy but do not in fact model `SizedRange`. — *end note*]

### 23.5.4 Views

[range.view]

- 1 The View concept specifies the requirements of a Range type that has constant time copy, move, and assignment operators; that is, the cost of these operations is not proportional to the number of elements in the View.
- 2 [Example: Examples of Views are:
  - (2.1) — A Range type that wraps a pair of iterators.
  - (2.2) — A Range type that holds its elements by `shared_ptr` and shares ownership with all its copies.
  - (2.3) — A Range type that generates its elements on demand.

Most containers ([Clause 21](#)) are not views since copying the container copies the elements, which cannot be done in constant time. —end example]

```
template<class T>
inline constexpr bool enable_view = see below;
```

```
template<class T>
concept View =
 Range<T> && Semiregular<T> && enable_view<T>;
```

- 3 Since the difference between Range and View is largely semantic, the two are differentiated with the help of `enable_view`.
- 4 For a type T, the default value of `enable_view<T>` is:
  - (4.1) — If `DerivedFrom<T, view_base>` is true, true.
  - (4.2) — Otherwise, if T is a specialization of class template `initializer_list` ([16.10](#)), `set` ([21.4.6](#)), `multiset` ([21.4.7](#)), `unordered_set` ([21.5.6](#)), `unordered_multiset` ([21.5.7](#)), or `match_results` ([29.10](#)), false.
  - (4.3) — Otherwise, if both T and const T model Range and `iter_reference_t<iterator_t<T>>` is not the same type as `iter_reference_t<iterator_t<const T>>`, false. [Note: Deep const-ness implies element ownership, whereas shallow const-ness implies reference semantics. —end note]
  - (4.4) — Otherwise, true.
- 5 Pursuant to [15.5.4.2.1](#), users may specialize `enable_view` to true for types which model View, and false for types which do not.

### 23.5.5 Common range refinements

[range.refinements]

- 1 The OutputRange concept specifies requirements of a Range type for which `ranges::begin` returns a model of OutputIterator ([22.3.4.10](#)). InputRange, ForwardRange, BidirectionalRange, and RandomAccessRange are defined similarly.

```
template<class R, class T>
concept OutputRange =
 Range<R> && OutputIterator<iterator_t<R>, T>;

template<class T>
concept InputRange =
 Range<T> && InputIterator<iterator_t<T>>;

template<class T>
concept ForwardRange =
 InputRange<T> && ForwardIterator<iterator_t<T>>;

template<class T>
concept BidirectionalRange =
 ForwardRange<T> && BidirectionalIterator<iterator_t<T>>;

template<class T>
concept RandomAccessRange =
 BidirectionalRange<T> && RandomAccessIterator<iterator_t<T>>;
```

- <sup>2</sup> `ContiguousRange` additionally requires that the `ranges::data` customization point (23.4.3) is usable with the range.

```
template<class T>
concept ContiguousRange =
 RandomAccessRange<T> && ContiguousIterator<iterator_t<T>> &&
 requires(T& t) {
 { ranges::data(t) } -> Same<add_pointer_t<iter_reference_t<iterator_t<T>>>;
 };
```

- <sup>3</sup> The `CommonRange` concept specifies requirements of a Range type for which `ranges::begin` and `ranges::end` return objects of the same type. [Example: The standard containers (Clause 21) model `CommonRange`. — end example]

```
template<class T>
concept CommonRange =
 Range<T> && Same<iterator_t<T>, sentinel_t<T>>;
```

- <sup>4</sup> The `ViewableRange` concept specifies the requirements of a Range type that can be converted to a View safely.

```
template<class T>
concept ViewableRange =
 Range<T> && (forwarding-range<T> || View<decay_t<T>>);
```

## 23.6 Range utilities

[range.utility]

- <sup>1</sup> The components in this subclause are general utilities for representing and manipulating ranges.

### 23.6.1 Helper concepts

[range.utility.helpers]

- <sup>1</sup> Many of the types in this subclause are specified in terms of the following exposition-only concepts:

```
template<class R>
concept simple_view =
 View<R> && Range<const R> &&
 Same<iterator_t<R>, iterator_t<const R>> &&
 Same<sentinel_t<R>, sentinel_t<const R>>;
```

```
template<InputIterator I>
concept has-arrow =
 is_pointer_v<I> || requires(I i) { i.operator->(); };
```

```
template<class T, class U>
concept not-same-as =
 !Same<remove_cvref_t<T>, remove_cvref_t<U>>;
```

### 23.6.2 View interface

[view.interface]

- <sup>1</sup> The class template `view_interface` is a helper for defining View-like types that offer a container-like interface. It is parameterized with the type that inherits from it.

```
namespace std::ranges {
 template<Range R>
 struct range-common-iterator-impl { // exposition only
 using type = common_iterator<iterator_t<R>, sentinel_t<R>>;
 };
 template<CommonRange R>
 struct range-common-iterator-impl<R> { // exposition only
 using type = iterator_t<R>;
 };
 template<Range R>
 using range-common-iterator = // exposition only
 typename range-common-iterator-impl<R>::type;
```

```

template<class D>
 requires is_class_v<D> && Same<D, remove_cv_t<D>>
class view_interface : public view_base {
private:
 constexpr D& derived() noexcept { // exposition only
 return static_cast<D&>(*this);
 }
 constexpr const D& derived() const noexcept { // exposition only
 return static_cast<const D&>(*this);
 }
public:
 constexpr bool empty() requires ForwardRange<D> {
 return ranges::begin(derived()) == ranges::end(derived());
 }
 constexpr bool empty() const requires ForwardRange<const D> {
 return ranges::begin(derived()) == ranges::end(derived());
 }

 constexpr explicit operator bool()
 requires requires { ranges::empty(derived()); } {
 return !ranges::empty(derived());
 }
 constexpr explicit operator bool() const
 requires requires { ranges::empty(derived()); } {
 return !ranges::empty(derived());
 }

 constexpr auto data() requires ContiguousIterator<iterator_t<D>> {
 return ranges::empty(derived()) ? nullptr : addressof(*ranges::begin(derived()));
 }
 constexpr auto data() const
 requires Range<const D> && ContiguousIterator<iterator_t<const D>> {
 return ranges::empty(derived()) ? nullptr : addressof(*ranges::begin(derived()));
 }

 constexpr auto size() requires ForwardRange<D> &&
 SizedSentinel<sentinel_t<D>, iterator_t<D>> {
 return ranges::end(derived()) - ranges::begin(derived());
 }
 constexpr auto size() const requires ForwardRange<const D> &&
 SizedSentinel<sentinel_t<const D>, iterator_t<const D>> {
 return ranges::end(derived()) - ranges::begin(derived());
 }

 constexpr decltype(auto) front() requires ForwardRange<D>;
 constexpr decltype(auto) front() const requires ForwardRange<const D>;

 constexpr decltype(auto) back() requires BidirectionalRange<D> && CommonRange<D>;
 constexpr decltype(auto) back() const
 requires BidirectionalRange<const D> && CommonRange<const D>;

 template<RandomAccessRange R = D>
 constexpr decltype(auto) operator[](iter_difference_t<iterator_t<R>> n) {
 return ranges::begin(derived())[n];
 }
 template<RandomAccessRange R = const D>
 constexpr decltype(auto) operator[](iter_difference_t<iterator_t<R>> n) const {
 return ranges::begin(derived())[n];
 }
 };
}

```

- <sup>2</sup> The template parameter D for `view_interface` may be an incomplete type. Before any member of the resulting specialization of `view_interface` other than special member functions is referenced, D shall be complete, and model both `DerivedFrom<view_interface<D>>` and `View`.

### 23.6.2.1 Members

[`view.interface.members`]

```
constexpr decltype(auto) front() requires ForwardRange<D>;
constexpr decltype(auto) front() const requires ForwardRange<const D>;
1 Requires: !empty().
2 Effects: Equivalent to: return *ranges::begin(derived());
constexpr decltype(auto) back() requires BidirectionalRange<D> && CommonRange<D>;
constexpr decltype(auto) back() const
 requires BidirectionalRange<const D> && CommonRange<const D>;
3 Requires: !empty().
4 Effects: Equivalent to: return *ranges::prev(ranges::end(derived()));
```

### 23.6.3 Sub-ranges

[`range.subrange`]

- <sup>1</sup> The `subrange` class template combines together an iterator and a sentinel into a single object that models the `View` concept. Additionally, it models the `SizedRange` concept when the final template parameter is `subrange_kind::sized`.

```
namespace std::ranges {
 template<class T>
 concept pair-like = // exposition only
 !is_reference_v<T> && requires(T t) {
 typename tuple_size<T>::type; // ensures tuple_size<T> is complete
 requires DerivedFrom<tuple_size<T>, integral_constant<size_t, 2>>;
 typename tuple_element_t<0, remove_const_t<T>>;
 typename tuple_element_t<1, remove_const_t<T>>;
 { get<0>(t) } -> const tuple_element_t<0, T>&;
 { get<1>(t) } -> const tuple_element_t<1, T>&;
 };
 template<class T, class U, class V>
 concept pair-like-convertible-to = // exposition only
 !Range<T> && pair-like<remove_reference_t<T>> &&
 requires(T&& t) {
 { get<0>(std::forward<T>(t)) } -> ConvertibleTo<U>;
 { get<1>(std::forward<T>(t)) } -> ConvertibleTo<V>;
 };
 template<class T, class U, class V>
 concept pair-like-convertible-from = // exposition only
 !Range<T> && pair-like<T> && Constructible<T, U, V>;
 template<class T>
 concept iterator-sentinel-pair = // exposition only
 !Range<T> && pair-like<T> &&
 Sentinel<tuple_element_t<1, T>, tuple_element_t<0, T>>;
 template<Iterator I, Sentinel<I> S = I, subrange_kind K =
 SizedSentinel<S, I> ? subrange_kind::sized : subrange_kind::unsized>
 requires (K == subrange_kind::sized || !SizedSentinel<S, I>)
 class subrange : public view_interface<subrange<I, S, K>> {
 private:
 static constexpr bool StoreSize = // exposition only
 K == subrange_kind::sized && !SizedSentinel<S, I>;
 I begin_ = I(); // exposition only
 S end_ = S(); // exposition only
 iter_difference_t<I> size_ = 0; // exposition only; present only

```

```
// when StoreSize is true
public:
 subrange() = default;

 constexpr subrange(I i, S s) requires (!StoreSize);

 constexpr subrange(I i, S s, iter_difference_t<I> n)
 requires (K == subrange_kind::sized);

 template<not-same-as<subrange> R>
 requires forwarding-range<R> &&
 ConvertibleTo<iterator_t<R>, I> && ConvertibleTo<sentinel_t<R>, S>
 constexpr subrange(R&& r) requires (!StoreSize || SizedRange<R>);

 template<forwarding-range R>
 requires ConvertibleTo<iterator_t<R>, I> && ConvertibleTo<sentinel_t<R>, S>
 constexpr subrange(R&& r, iter_difference_t<I> n)
 requires (K == subrange_kind::sized)
 : subrange{ranges::begin(r), ranges::end(r), n}
 {}

 template<not-same-as<subrange> PairLike>
 requires pair-like-convertible-to<PairLike, I, S>
 constexpr subrange(PairLike&& r) requires (!StoreSize)
 : subrange{std::get<0>(std::forward<PairLike>(r)),
 std::get<1>(std::forward<PairLike>(r))}
 {}

 template<pair-like-convertible-to<I, S> PairLike>
 constexpr subrange(PairLike&& r, iter_difference_t<I> n)
 requires (K == subrange_kind::sized)
 : subrange{std::get<0>(std::forward<PairLike>(r)),
 std::get<1>(std::forward<PairLike>(r)), n}
 {}

 template<not-same-as<subrange> PairLike>
 requires pair-like-convertible-from<PairLike, const I&, const S&>
 constexpr operator PairLike() const;

 constexpr I begin() const;
 constexpr S end() const;

 constexpr bool empty() const;
 constexpr iter_difference_t<I> size() const
 requires (K == subrange_kind::sized);

 [[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const;
 [[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
 requires BidirectionalIterator<I>;
 constexpr subrange& advance(iter_difference_t<I> n);

 friend constexpr I begin(subrange&& r) { return r.begin(); }
 friend constexpr S end(subrange&& r) { return r.end(); }
};

template<Iterator I, Sentinel<I> S>
 subrange(I, S, iter_difference_t<I>) -> subrange<I, S, subrange_kind::sized>;

template<iterator-sentinel-pair P>
 subrange(P) -> subrange<tuple_element_t<0, P>, tuple_element_t<1, P>>;

template<iterator-sentinel-pair P>
 subrange(P, iter_difference_t<tuple_element_t<0, P>>) ->
 subrange<tuple_element_t<0, P>, tuple_element_t<1, P>, subrange_kind::sized>;
```

```

template<forwarding-range R>
subrange(R&&) ->
 subrange<iterator_t<R>, sentinel_t<R>,
 (SizedRange<R> || SizedSentinel<sentinel_t<R>, iterator_t<R>>)
 ? subrange_kind::sized : subrange_kind::unsized>;

template<forwarding-range R>
subrange(R&&, iter_difference_t<iterator_t<R>>) ->
 subrange<iterator_t<R>, sentinel_t<R>, subrange_kind::sized>;

template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(const subrange<I, S, K>& r);
}

namespace std {
 using ranges::get;
}

```

### 23.6.3.1 Constructors and conversions

[range.subrange.ctor]

```
constexpr subrange(I i, S s) requires (!StoreSize);
```

1     *Effects:* Initializes `begin_` with `i` and `end_` with `s`.

```
constexpr subrange(I i, S s, iter_difference_t<I> n)
 requires (K == subrange_kind::sized);
```

2     *Effects:* `n == ranges::distance(i, s)`.

3     *Effects:* Initializes `begin_` with `i` and `end_` with `s`. If `StoreSize` is `true`, initializes `size_` with `n`.

4     *[Note:* Accepting the length of the range and storing it to later return from `size()` enables `subrange` to model `SizedRange` even when it stores an iterator and sentinel that do not model `SizedSentinel`. — *end note*]

```

template<not-same-as<subrange> R>
 requires forwarding-range<R> &&
 ConvertibleTo<iterator_t<R>, I> && ConvertibleTo<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || SizedRange<R>);
```

5     *Effects:* Equivalent to:

(5.1)     — If `StoreSize` is `true`, `subrange{ranges::begin(r), ranges::end(r), ranges::size(r)}`.

(5.2)     — Otherwise, `subrange{ranges::begin(r), ranges::end(r)}`.

```

template<not-same-as<subrange> PairLike>
 requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;
```

6     *Effects:* Equivalent to: `return PairLike(begin_, end_);`

### 23.6.3.2 Accessors

[range.subrange.access]

```
constexpr I begin() const;
```

1     *Effects:* Equivalent to: `return begin_;`

```
constexpr S end() const;
```

2     *Effects:* Equivalent to: `return end_;`

```
constexpr bool empty() const;
```

3     *Effects:* Equivalent to: `return begin_ == end_;`

```
constexpr iter_difference_t<I> size() const
 requires (K == subrange_kind::sized);
```

4     *Effects:*

(4.1)     — If `StoreSize` is `true`, equivalent to: `return size_;`

(4.2) — Otherwise, equivalent to: `return end_ - begin_;`

```
[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const;
```

5     *Effects:* Equivalent to:

```
auto tmp = *this;
tmp.advance(n);
return tmp;
```

6     [*Note:* If I does not model `ForwardIterator`, `next` can invalidate `*this`. — *end note*]

```
[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
 requires BidirectionalIterator<I>;
```

7     *Effects:* Equivalent to:

```
auto tmp = *this;
tmp.advance(-n);
return tmp;
```

```
constexpr subrange& advance(iter_difference_t<I> n);
```

8     *Effects:* Equivalent to:

(8.1)     — If `StoreSize` is `true`,

```
size_ -= n - ranges::advance(begin_, n, end_);
return *this;
```

(8.2)     — Otherwise,

```
ranges::advance(begin_, n, end_);
return *this;
```

```
template<size_t N, class I, class S, subrange_kind K>
 requires (N < 2)
constexpr auto get(const subrange<I, S, K>& r);
```

9     *Effects:* Equivalent to:

```
if constexpr (N == 0)
 return r.begin();
else
 return r.end();
```

## 23.7 Range adaptors

[range.adaptors]

- <sup>1</sup> This subclause defines *range adaptors*, which are utilities that transform a `Range` into a `View` with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.
- <sup>2</sup> Range adaptors are declared in namespace `std::ranges::view`.
- <sup>3</sup> The bitwise or operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.
- <sup>4</sup> [*Example:*

```
vector<int> ints{0,1,2,3,4,5};
auto even = [] (int i){ return 0 == i % 2; };
auto square = [] (int i) { return i * i; };
for (int i : ints | view::filter(even) | view::transform(square)) {
 cout << i << ' ';
}
assert(ranges::equal(ints | view::filter(even), view::filter(ints, even)));
— end example]
```

### 23.7.1 Range adaptor objects

[range.adaptor.object]

- <sup>1</sup> A *range adaptor closure object* is a unary function object that accepts a `ViewableRange` argument and returns a `View`. For a range adaptor closure object C and an expression R such that `decltype((R))` models `ViewableRange`, the following expressions are equivalent and yield a `View`:

$$\begin{array}{c} C(R) \\ R \mid C \end{array}$$

Given an additional range adaptor closure object D, the expression C | D is well-formed and produces another range adaptor closure object such that the following two expressions are equivalent:

$$\begin{array}{c} R \mid C \mid D \\ R \mid (C \mid D) \end{array}$$

- 2 A *range adaptor object* is a customization point object (15.4.2.1.6) that accepts a `ViewableRange` as its first argument and returns a `View`.

- 3 If a range adaptor object accepts only one argument, then it is a range adaptor closure object.

- 4 If a range adaptor object accepts more than one argument, then the following expressions are equivalent:

```
adaptor(range, args...)
adaptor(args...)(range)
range | adaptor(args...)
```

In this case, `adaptor(args...)` is a range adaptor closure object.

### 23.7.2 Semiregular wrapper

[range.semi.wrap]

- 1 Many of the types in this subclause are specified in terms of an exposition-only class template `semiregular`. `semiregular<T>` behaves exactly like `optional<T>` with the following differences:

(1.1) — `semiregular<T>` constrains its type parameter T with `CopyConstructible<T> && is_object_v<T>`.

(1.2) — If T models `DefaultConstructible`, the default constructor of `semiregular<T>` is equivalent to:

```
constexpr semiregular() noexcept(is_nothrow_default_constructible_v<T>
: semiregular{in_place})
{ }
```

(1.3) — If `Assignable<T&, const T&>` is not satisfied, the copy assignment operator is equivalent to:

```
semiregular& operator=(const semiregular& that)
noexcept(is_nothrow_copy_constructible_v<T>
{
 if (that) emplace(*that);
 else reset();
 return *this;
}
```

(1.4) — If `Assignable<T&, T>` is not satisfied, the move assignment operator is equivalent to:

```
semiregular& operator=(semiregular&& that)
noexcept(is_nothrow_move_constructible_v<T>
{
 if (that) emplace(std::move(*that));
 else reset();
 return *this;
}
```

### 23.7.3 All view

[range.all]

- 1 `view::all` returns a `View` that includes all elements of its `Range` argument.

- 2 The name `view::all` denotes a range adaptor object (23.7.1). For some subexpression E, the expression `view::all(E)` is expression-equivalent to:

(2.1) — `DECAY_COPY(E)` if the decayed type of E models `View`.

(2.2) — Otherwise, `ref-view{E}` if that expression is well-formed, where `ref-view` is the exposition-only `View` specified below.

(2.3) — Otherwise, `subrange{E}`.

#### 23.7.3.1 ref-view

[range.view.ref]

```
namespace std::ranges {
template<Range R>
requires is_object_v<R>
class ref-view : public view_interface<ref-view<R>> {
```

```

private:
 R* r_ = nullptr; // exposition only
public:
 constexpr ref-view() noexcept = default;

template<not-same-as<ref-view> T>
 requires see below
constexpr ref-view(T&& t);

constexpr R& base() const { return *r_; }

constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

constexpr bool empty() const
 requires requires { ranges::empty(*r_); }
{ return ranges::empty(*r_); }

constexpr auto size() const requires SizedRange<R>
{ return ranges::size(*r_); }

constexpr auto data() const requires ContiguousRange<R>
{ return ranges::data(*r_); }

friend constexpr iterator_t<R> begin(ref-view r)
{ return r.begin(); }

friend constexpr sentinel_t<R> end(ref-view r)
{ return r.end(); }
};

}

template<not-same-as<ref-view> T>
 requires see below
constexpr ref-view(T&& t);

```

<sup>1</sup> *Remarks:* Let *FUN* denote the exposition-only functions

```

void FUN(R&);
void FUN(R&&) = delete;

```

The expression in the *requires-clause* is equivalent to

```
ConvertibleTo<T, R&> && requires { FUN(declval<T>()); }
```

<sup>2</sup> *Effects:* Initializes *r\_* with `addressof(static_cast<R&>(std::forward<T>(t)))`.

### 23.7.4 Filter view

[range.filter]

#### 23.7.4.1 Overview

[range.filter.overview]

<sup>1</sup> `filter_view` presents a *View* of an underlying sequence without the elements that fail to satisfy a predicate.

<sup>2</sup> [Example:

```

vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };
filter_view evens{is, [](int i) { return 0 == i % 2; }};
for (int i : evens)
 cout << i << ' '; // prints: 0 2 4 6
— end example]

```

#### 23.7.4.2 Class template filter\_view

[range.filter.view]

```

namespace std::ranges {
 template<InputRange V, IndirectUnaryPredicate<iterator_t<V>> Pred>
 requires View<V> && is_object_v<Pred>
 class filter_view : public view_interface<filter_view<V, Pred>> {
 private:
 V base_ = V(); // exposition only
 semiregular<Pred> pred_; // exposition only

```

```

 class iterator; // exposition only
 class sentinel; // exposition only

public:
 filter_view() = default;
 constexpr filter_view(V base, Pred pred);
 template<InputRange R>
 requires ViewableRange<R> && Constructible<V, all_view<R>>
 constexpr filter_view(R&& r, Pred pred);

 constexpr V base() const;

 constexpr iterator begin();
 constexpr auto end() {
 if constexpr (CommonRange<V>)
 return iterator{*this, ranges::end(base_)};
 else
 return sentinel{*this};
 }
};

template<class R, class Pred>
filter_view(R&&, Pred) -> filter_view<all_view<R>, Pred>;
}

```

1      *Effects:* Initializes `base_` with `std::move(base)` and initializes `pred_` with `std::move(pred)`.

```

template<InputRange R>
 requires ViewableRange<R> && Constructible<V, all_view<R>>
constexpr filter_view(R&& r, Pred pred);

```

2      *Effects:* Initializes `base_` with `view::all(std::forward<R>(r))` and initializes `pred_` with `std::move(pred)`.

constexpr V base() const;

3      *Effects:* Equivalent to: `return base_;`

constexpr iterator begin();

4      *Requires:* `pred_.has_value()`.

5      *Returns:* `{*this, ranges::find_if(base_, ref(*pred_))}`.

6      *Remarks:* In order to provide the amortized constant time complexity required by the Range concept, this function caches the result within the `filter_view` for use on subsequent calls.

### 23.7.4.3 Class `filter_view::iterator`

[range.filter.iterator]

```

namespace std::ranges {
 template<class V, class Pred>
 class filter_view<V, Pred>::iterator {
private:
 iterator_t<V> current_ = iterator_t<V>(); // exposition only
 filter_view* parent_ = nullptr; // exposition only
public:
 using iterator_concept = see below;
 using iterator_category = see below;
 using value_type = iter_value_t<iterator_t<V>>;
 using difference_type = iter_difference_t<iterator_t<V>>;

 iterator() = default;
 constexpr iterator(filter_view& parent, iterator_t<V> current);

 constexpr iterator_t<V> base() const;
 constexpr iter_reference_t<iterator_t<V>> operator*() const;
}

```

```

constexpr iterator_t<V> operator->() const
 requires has-arrow<iterator_t<V>>;

constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires ForwardRange<V>;

constexpr iterator& operator--() requires BidirectionalRange<V>;
constexpr iterator operator--(int) requires BidirectionalRange<V>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires EqualityComparable<iterator_t<V>>;
friend constexpr bool operator!=(const iterator& x, const iterator& y)
 requires EqualityComparable<iterator_t<V>>;

friend constexpr iter_rvalue_reference_t<iterator_t<V>> iter_move(const iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current_)));
friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
 requires IndirectlySwappable<iterator_t<V>>;
};

}

```

1 Modification of the element a `filter_view::iterator` denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

2 `iterator::iterator_concept` is defined as follows:

- (2.1) — If V models `BidirectionalRange`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
- (2.2) — Otherwise, if V models `ForwardRange`, then `iterator_concept` denotes `forward_iterator_tag`.
- (2.3) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

3 `iterator::iterator_category` is defined as follows:

- (3.1) — Let C denote the type `iterator_traits<iterator_t<V>>::iterator_category`.
- (3.2) — If C models `DerivedFrom<bidirectional_iterator_tag>`, then `iterator_category` denotes `bidirectional_iterator_tag`.
- (3.3) — Otherwise, if C models `DerivedFrom<forward_iterator_tag>`, then `iterator_category` denotes `forward_iterator_tag`.
- (3.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(filter_view& parent, iterator_t<V> current);
```

4 *Effects*: Initializes `current_` with `current` and `parent_` with `addressof(parent)`.

```
constexpr iterator_t<V> base() const;
```

5 *Effects*: Equivalent to: `return current_;`

```
constexpr iter_rvalue_reference_t<iterator_t<V>> operator*() const;
```

6 *Effects*: Equivalent to: `return *current_;`

```
constexpr iterator_t<V> operator->() const
 requires has-arrow<iterator_t<V>>;
```

7 *Effects*: Equivalent to: `return current_;`

```
constexpr iterator& operator++();
```

8 *Effects*: Equivalent to:

```
 current_ = ranges::find_if(++current_, ranges::end(parent_->base_), ref(*parent_->pred_));
 return *this;
```

```
constexpr void operator++(int);
```

9 *Effects*: Equivalent to `++*this`.

```

constexpr iterator operator++(int) requires ForwardRange<V>;
10 Effects: Equivalent to:
 auto tmp = *this;
 ***this;
 return tmp;

constexpr iterator& operator--() requires BidirectionalRange<V>;
11 Effects: Equivalent to:
 do
 --current_;
 while (!invoke(*parent_->pred_, *current_));
 return *this;

constexpr iterator operator--(int) requires BidirectionalRange<V>;
12 Effects: Equivalent to:
 auto tmp = *this;
 --*this;
 return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires EqualityComparable<iterator_t<V>>;
13 Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr bool operator!=(const iterator& x, const iterator& y)
 requires EqualityComparable<iterator_t<V>>;
14 Effects: Equivalent to: return !(x == y);

friend constexpr iter_rvalue_reference_t<iterator_t<V>> iter_move(const iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current_)));
15 Effects: Equivalent to: return ranges::iter_move(i.current_);

friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
 requires IndirectlySwappable<iterator_t<V>>;
16 Effects: Equivalent to ranges::iter_swap(x.current_, y.current_).

```

#### 23.7.4.4 Class filter\_view::sentinel

[range.filter.sentinel]

```

namespace std::ranges {
 template<class V, class Pred>
 class filter_view<V, Pred>::sentinel {
 private:
 sentinel_t<V> end_ = sentinel_t<V>(); // exposition only
 public:
 sentinel() = default;
 constexpr explicit sentinel(filter_view& parent);

 constexpr sentinel_t<V> base() const;

 friend constexpr bool operator==(const iterator& x, const sentinel& y);
 friend constexpr bool operator==(const sentinel& x, const iterator& y);
 friend constexpr bool operator!=(const iterator& x, const sentinel& y);
 friend constexpr bool operator!=(const sentinel& x, const iterator& y);
 };
}

constexpr explicit sentinel(filter_view& parent);
1 Effects: Initializes end_ with ranges::end(parent).

constexpr sentinel_t<V> base() const;
2 Effects: Equivalent to: return end_;

```

```

friend constexpr bool operator==(const iterator& x, const sentinel& y);
3 Effects: Equivalent to: return x.current_ == y.end_;
friend constexpr bool operator==(const sentinel& x, const iterator& y);
4 Effects: Equivalent to: return y == x;
friend constexpr bool operator!=(const iterator& x, const sentinel& y);
5 Effects: Equivalent to: return !(x == y);
friend constexpr bool operator!=(const sentinel& x, const iterator& y);
6 Effects: Equivalent to: return !(y == x);

```

**23.7.4.5 view::filter**

[range.filter.adaptor]

- <sup>1</sup> The name `view::filter` denotes a range adaptor object (23.7.1). For some subexpressions `E` and `P`, the expression `view::filter(E, P)` is expression-equivalent to `filter_view{E, P}`.

**23.7.5 Transform view**

[range.transform]

**23.7.5.1 Overview**

[range.transform.overview]

- <sup>1</sup> `transform_view` presents a `View` of an underlying sequence after applying a transformation function to each element.

- <sup>2</sup> [Example:

```

vector<int> is{ 0, 1, 2, 3, 4 };
transform_view squares{is, [](int i) { return i * i; }};
for (int i : squares)
 cout << i << ' '; // prints: 0 1 4 9 16
— end example]

```

**23.7.5.2 Class template transform\_view**

[range.transform.view]

```

namespace std::ranges {
 template<InputRange V, CopyConstructible F>
 requires View<V> && is_object_v<F> &&
 RegularInvocable<F&, iter_reference_t<iterator_t<V>>>
 class transform_view : public view_interface<transform_view<V, F>> {
 private:
 template<bool> struct iterator; // exposition only
 template<bool> struct sentinel; // exposition only

 V base_ = V(); // exposition only
 semiregular<F> fun_; // exposition only

 public:
 transform_view() = default;
 constexpr transform_view(V base, F fun);
 template<InputRange R>
 requires ViewableRange<R> && Constructible<V, all_view<R>>
 constexpr transform_view(R&& r, F fun);

 constexpr V base() const;

 constexpr iterator<false> begin();
 constexpr iterator<true> begin() const
 requires Range<const V> &&
 RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
 constexpr sentinel<false> end();
 constexpr iterator<false> end() requires CommonRange<V>;
 constexpr sentinel<true> end() const
 requires Range<const V> &&
 RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
 };
}

```

```

 constexpr iterator<true> end() const
 requires CommonRange<const V> &&
 RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
}

constexpr auto size() requires SizedRange<V> { return ranges::size(base_); }
constexpr auto size() const requires SizedRange<const V>
{ return ranges::size(base_); }
};

template<class R, class F>
 transform_view(R&&, F) -> transform_view<all_view<R>, F>;
}

constexpr transform_view(V base, F fun);

1 Effects: Initializes base_ with std::move(base) and fun_ with std::move(fun).

template<InputRange R>
 requires ViewableRange<R> && Constructible<V, all_view<R>>
constexpr transform_view(R&& r, F fun);

2 Effects: Initializes base_ with view::all(std::forward<R>(r)) and fun_ with std::move(fun).

constexpr V base() const;

3 Effects: Equivalent to: return base_;

constexpr iterator<false> begin();

4 Effects: Equivalent to:
 return iterator<false>{*this, ranges::begin(base_)};

constexpr iterator<true> begin() const
 requires Range<const V> &&
 RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
5 Effects: Equivalent to:
 return iterator<true>{*this, ranges::begin(base_)};

constexpr sentinel<false> end();

6 Effects: Equivalent to:
 return sentinel<false>{ranges::end(base_)};

constexpr iterator<false> end() requires CommonRange<V>;
7 Effects: Equivalent to:
 return iterator<false>{*this, ranges::end(base_)};

constexpr sentinel<true> end() const
 requires Range<const V> &&
 RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
8 Effects: Equivalent to:
 return sentinel<true>{ranges::end(base_)};

constexpr iterator<true> end() const
 requires CommonRange<const V> &&
 RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
9 Effects: Equivalent to:
 return iterator<true>{*this, ranges::end(base_)};

```

### 23.7.5.3 Class template transform\_view::iterator

[range.transform.iterator]

```

namespace std::ranges {
 template<class V, class F>
 template<bool Const>
 class transform_view<V, F>::iterator {

```

```

private:

friend constexpr bool operator!=(const iterator<Const>& x, const sentinel& y);
6 Effects: Equivalent to: return !(x == y);

friend constexpr bool operator!=(const sentinel& x, const iterator<Const>& y);
7 Effects: Equivalent to: return !(y == x);

friend constexpr iter_difference_t<iterator_t<Base>>
 operator-(const iterator<Const>& x, const sentinel& y)
 requires SizedSentinel<sentinel_t<Base>, iterator_t<Base>>;
8 Effects: Equivalent to: return x.current_ - y.end_;

friend constexpr iter_difference_t<iterator_t<Base>>
 operator-(const sentinel& y, const iterator<Const>& x)
 requires SizedSentinel<sentinel_t<Base>, iterator_t<Base>>;
9 Effects: Equivalent to: return x.end_ - y.current_;

```

**23.7.5.5 view::transform****[range.transform.adaptor]**

- <sup>1</sup> The name `view::transform` denotes a range adaptor object (23.7.1). For some subexpressions E and F, the expression `view::transform(E, F)` is expression-equivalent to `transform_view{E, F}`.

**23.7.6 Iota view****[range.iota]****23.7.6.1 Overview****[range.iota.overview]**

- <sup>1</sup> `iota_view` generates a sequence of elements by repeatedly incrementing an initial value.

- <sup>2</sup> [Example:

```
for (int i : iota_view{1, 10})
 cout << i << ' ';
// prints: 1 2 3 4 5 6 7 8 9
— end example]
```

**23.7.6.2 Class template iota\_view****[range.iota.view]**

```
namespace std::ranges {
template<class I>
concept Decrementable = // exposition only
 see below;
template<class I>
concept Advanceable = // exposition only
 see below;

template<WeaklyIncrementable W, Semiregular Bound = unreachable_sentinel_t>
 requires weakly-equality-comparable-with<W, Bound>
class iota_view : public view_interface<iota_view<W, Bound>> {
private:
 struct iterator; // exposition only
 struct sentinel; // exposition only
 W value_ = W(); // exposition only
 Bound bound_ = Bound(); // exposition only
public:
 iota_view() = default;
 constexpr explicit iota_view(W value);
 constexpr iota_view(type_identity_t<W> value,
 type_identity_t<Bound> bound);

 constexpr iterator begin() const;
 constexpr sentinel end() const;
 constexpr iterator end() const requires Same<W, Bound>;

 constexpr auto size() const
 requires (Same<W, Bound> && Advanceable<W>) ||
 (Integral<W> && Integral<Bound>) ||
 SizedSentinel<Bound, W>
 { return bound_ - value_; }
};

template<class W, class Bound>
 requires (!Integral<W> || !Integral<Bound> || is_signed_v<W> == is_signed_v<Bound>)
iota_view(W, Bound) -> iota_view<W, Bound>;
}
```

- <sup>1</sup> The exposition-only `Decrementable` concept is equivalent to:

```
template<class I>
concept Decrementable =
 Incrementable<I> && requires(I i) {
 { --i } -> Same<I&>;
 { i-- } -> Same<I>;
 };
}
```

- <sup>2</sup> When an object is in the domain of both pre- and post-decrement, the object is said to be *decrementable*.  
<sup>3</sup> Let `a` and `b` be equal objects of type `I`. `I` models `Decrementable` only if

- (3.1) — If **a** and **b** are decrementable, then the following are all true:
  - (3.1.1) — `addressof(--a) == addressof(a)`
  - (3.1.2) — `bool(a-- == b)`
  - (3.1.3) — `bool(((void)a--, a) == --b)`
  - (3.1.4) — `bool(++(--a) == b)`.
- (3.2) — If **a** and **b** are incrementable, then `bool(--(++a) == b)`.

<sup>4</sup> The exposition-only *Advanceable* concept is equivalent to:

```
template<class I>
concept Advanceable =
 Decrementable<I> && StrictTotallyOrdered<I> &&
 requires(I i, const I j, const iter_difference_t<I> n) {
 { i += n } -> Same<I&>;
 { i -= n } -> Same<I&>;
 { j + n } -> Same<I>;
 { n + j } -> Same<I>;
 { j - n } -> Same<I>;
 { j - j } -> Same<iter_difference_t<I>>;
 };
```

Let **a** and **b** be objects of type **I** such that **b** is reachable from **a** after **n** applications of `++a`, for some value **n** of type `iter_difference_t<I>`, and let **D** be `iter_difference_t<I>`. **I** models *Advanceable* only if

- (4.1) —  $(a += n)$  is equal to **b**.
- (4.2) — `addressof(a += n)` is equal to `addressof(a)`.
- (4.3) —  $(a + n)$  is equal to  $(a += n)$ .
- (4.4) — For any two positive values **x** and **y** of type **D**, if  $(a + D(x + y))$  is well-defined, then  $(a + D(x + y))$  is equal to  $((a + x) + y)$ .
- (4.5) —  $(a + D(0))$  is equal to **a**.
- (4.6) — If  $(a + D(n - 1))$  is well-defined, then  $(a + n)$  is equal to `++(a + D(n - 1))`.
- (4.7) —  $(b += -n)$  is equal to **a**.
- (4.8) —  $(b -= n)$  is equal to **a**.
- (4.9) — `addressof(b -= n)` is equal to `addressof(b)`.
- (4.10) —  $(b - n)$  is equal to  $(b -= n)$ .
- (4.11) —  $(b - a)$  is equal to **n**.
- (4.12) —  $(a - b)$  is equal to **-n**.
- (4.13) — `bool(a <= b)` is **true**.

```
constexpr explicit iota_view(W value);
```

<sup>5</sup> *Expects*: Bound denotes `unreachable_sentinel_t` or `Bound()` is reachable from `value`.

<sup>6</sup> *Effects*: Initializes `value_` with `value`.

```
constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
```

<sup>7</sup> *Expects*: Bound denotes `unreachable_sentinel_t` or `bound` is reachable from `value`.

<sup>8</sup> *Effects*: Initializes `value_` with `value` and `bound_` with `bound`.

```
constexpr iterator begin() const;
```

<sup>9</sup> *Effects*: Equivalent to: `return iterator{value_};`

```
constexpr sentinel end() const;
```

<sup>10</sup> *Effects*: Equivalent to: `return sentinel{bound_};`

```
constexpr iterator end() const requires Same<W, Bound>;
```

<sup>11</sup> *Effects*: Equivalent to: `return iterator{bound_};`

## 23.7.6.3 Class iota\_view::iterator

[range.iota.iterator]

```

namespace std::ranges {
 template<class W, class Bound>
 struct iota_view<W, Bound>::iterator {
 private:
 W value_ = W(); // exposition only
 public:
 using iterator_category = see below;
 using value_type = W;
 using difference_type = iter_difference_t<W>;
 iterator() = default;
 constexpr explicit iterator(W value);

 constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);

 constexpr iterator& operator++();
 constexpr void operator++(int);
 constexpr iterator operator++(int) requires Incrementable<W>;

 constexpr iterator& operator--() requires Decrementable<W>;
 constexpr iterator operator--(int) requires Decrementable<W>;

 constexpr iterator& operator+=(difference_type n)
 requires Advanceable<W>;
 constexpr iterator& operator-=(difference_type n)
 requires Advanceable<W>;
 constexpr W operator[](difference_type n) const
 requires Advanceable<W>;

 friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires EqualityComparable<W>;
 friend constexpr bool operator!=(const iterator& x, const iterator& y)
 requires EqualityComparable<W>;

 friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires StrictTotallyOrdered<W>;
 friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires StrictTotallyOrdered<W>;
 friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires StrictTotallyOrdered<W>;
 friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires StrictTotallyOrdered<W>;

 friend constexpr iterator operator+(iterator i, difference_type n)
 requires Advanceable<W>;
 friend constexpr iterator operator+(difference_type n, iterator i)
 requires Advanceable<W>;

 friend constexpr iterator operator-(iterator i, difference_type n)
 requires Advanceable<W>;
 friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires Advanceable<W>;
 };
}

```

<sup>1</sup> iterator::iterator\_category is defined as follows:

- (1.1) — If W models *Advanceable*, then iterator\_category is random\_access\_iterator\_tag.
- (1.2) — Otherwise, if W models *Decrementable*, then iterator\_category is bidirectional\_iterator\_tag.
- (1.3) — Otherwise, if W models *Incrementable*, then iterator\_category is forward\_iterator\_tag.
- (1.4) — Otherwise, iterator\_category is input\_iterator\_tag.

<sup>2</sup> [Note: Overloads for iter\_move and iter\_swap are omitted intentionally. — end note]

```

constexpr explicit iterator(W value);
3 Effects: Initializes value_ with value.
constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);
4 Effects: Equivalent to: return value_;
5 [Note: The noexcept clause is needed by the default iter_move implementation. — end note]

constexpr iterator& operator++();
6 Effects: Equivalent to:
 ++value_;
 return *this;

constexpr void operator++(int);
7 Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires Incrementable<W>;
8 Effects: Equivalent to:
 auto tmp = *this;
 +++this;
 return tmp;

constexpr iterator& operator--() requires Decrementable<W>;
9 Effects: Equivalent to:
 --value_;
 return *this;

constexpr iterator operator--(int) requires Decrementable<W>;
10 Effects: Equivalent to:
 auto tmp = *this;
 --*this;
 return tmp;

constexpr iterator& operator+=(difference_type n)
 requires Advanceable<W>;
11 Effects: Equivalent to:
 value_ += n;
 return *this;

constexpr iterator& operator-=(difference_type n)
 requires Advanceable<W>;
12 Effects: Equivalent to:
 value_ -= n;
 return *this;

constexpr W operator[](difference_type n) const
 requires Advanceable<W>;
13 Effects: Equivalent to: return value_ + n;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires EqualityComparable<W>;
14 Effects: Equivalent to: return x.value_ == y.value_;

friend constexpr bool operator!=(const iterator& x, const iterator& y)
 requires EqualityComparable<W>;
15 Effects: Equivalent to: return !(x == y);

```

```

friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires StrictTotallyOrdered<W>;
16 Effects: Equivalent to: return x.value_ < y.value_;
friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires StrictTotallyOrdered<W>;
17 Effects: Equivalent to: return y < x;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires StrictTotallyOrdered<W>;
18 Effects: Equivalent to: return !(y < x);
friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires StrictTotallyOrdered<W>;
19 Effects: Equivalent to: return !(x < y);
friend constexpr iterator operator+(iterator i, difference_type n)
 requires Advanceable<W>;
20 Effects: Equivalent to: return iterator{i.value_ + n};
friend constexpr iterator operator+(difference_type n, iterator i)
 requires Advanceable<W>;
21 Effects: Equivalent to: return i + n;
friend constexpr iterator operator-(iterator i, difference_type n)
 requires Advanceable<W>;
22 Effects: Equivalent to: return i + -n;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires Advanceable<W>;
23 Effects: Equivalent to: return x.value_ - y.value_;

```

### 23.7.6.4 Class iota\_view::sentinel

[range.iota.sentinel]

```

namespace std::ranges {
 template<class W, class Bound>
 struct iota_view<W, Bound>::sentinel {
 private:
 Bound bound_ = Bound(); // exposition only
 public:
 sentinel() = default;
 constexpr explicit sentinel(Bound bound);

 friend constexpr bool operator==(const iterator& x, const sentinel& y);
 friend constexpr bool operator==(const sentinel& x, const iterator& y);
 friend constexpr bool operator!=(const iterator& x, const sentinel& y);
 friend constexpr bool operator!=(const sentinel& x, const iterator& y);
 };
}

constexpr explicit sentinel(Bound bound);
1 Effects: Initializes bound_ with bound.

friend constexpr bool operator==(const iterator& x, const sentinel& y);
2 Effects: Equivalent to: return x.value_ == y.bound_;

friend constexpr bool operator==(const sentinel& x, const iterator& y);
3 Effects: Equivalent to: return y == x;

friend constexpr bool operator!=(const iterator& x, const sentinel& y);
4 Effects: Equivalent to: return !(x == y);

```

```
friend constexpr bool operator!=(const sentinel& x, const iterator& y);
5 Effects: Equivalent to: return !(y == x);
```

### 23.7.6.5 view::iota

[range.iota.adaptor]

- <sup>1</sup> The name `view::iota` denotes a customization point object (15.4.2.1.6). For some subexpressions E and F, the expressions `view::iota(E)` and `view::iota(E, F)` are expression-equivalent to `iota_view{E}` and `iota_view{E, F}`, respectively.

### 23.7.7 Take view

[range.take]

#### 23.7.7.1 Overview

[range.take.overview]

- <sup>1</sup> `take_view` produces a `View` of the first  $N$  elements from another `View`, or all the elements if the adapted `View` contains fewer than  $N$ .

- <sup>2</sup> [Example:

```
vector<int> is{0,1,2,3,4,5,6,7,8,9};
take_view few{is, 5};
for (int i : few)
 cout << i << ' '; // prints: 0 1 2 3 4
— end example]
```

#### 23.7.7.2 Class template take\_view

[range.take.view]

```
namespace std::ranges {
 template<View V>
 class take_view : public view_interface<take_view<V>> {
 private:
 V base_ = V(); // exposition only
 iter_difference_t<iterator_t<V>> count_ = 0; // exposition only
 template<bool> struct sentinel; // exposition only
 public:
 take_view() = default;
 constexpr take_view(V base, iter_difference_t<iterator_t<V>> count);
 template<ViewableRange R>
 requires Constructible<V, all_view<R>>
 constexpr take_view(R&& r, iter_difference_t<iterator_t<V>> count);

 constexpr V base() const;

 constexpr auto begin() requires (!simple_view<V>) {
 if constexpr (SizedRange<V>) {
 if constexpr (RandomAccessRange<V>)
 return ranges::begin(base_);
 else
 return counted_iterator{ranges::begin(base_), size()};
 } else
 return counted_iterator{ranges::begin(base_), count_};
 }

 constexpr auto begin() const requires Range<const V> {
 if constexpr (SizedRange<const V>) {
 if constexpr (RandomAccessRange<const V>)
 return ranges::begin(base_);
 else
 return counted_iterator{ranges::begin(base_), size()};
 } else
 return counted_iterator{ranges::begin(base_), count_};
 }

 constexpr auto end() requires (!simple_view<V>) {
 if constexpr (SizedRange<V>) {
 if constexpr (RandomAccessRange<V>)
 return ranges::begin(base_) + size();
 else
 return counted_iterator{ranges::begin(base_), count_ + 1};
 }
 }
 };
}
```

```

 else
 return default_sentinel;
 } else
 return sentinel<false>{ranges::end(base_)};
}

constexpr auto end() const requires Range<const V> {
 if constexpr (SizedRange<const V>) {
 if constexpr (RandomAccessRange<const V>)
 return ranges::begin(base_) + size();
 else
 return default_sentinel;
 } else
 return sentinel<true>{ranges::end(base_)};
}

constexpr auto size() requires SizedRange<V> {
 auto n = ranges::size(base_);
 return ranges::min(n, static_cast<decltype(n)>(count_));
}

constexpr auto size() const requires SizedRange<const V> {
 auto n = ranges::size(base_);
 return ranges::min(n, static_cast<decltype(n)>(count_));
}
};

template<Range R>
take_view(R&&, iter_difference_t<iterator_t<R>>)
 -> take_view<all_view<R>>;
}

constexpr take_view(V base, iter_difference_t<iterator_t<V>> count);
1 Effects: Initializes base_ with std::move(base) and count_ with count.

template<ViewableRange R>
 requires Constructible<V, all_view<R>>
constexpr take_view(R&& r, iter_difference_t<iterator_t<V>> count);
2 Effects: Initializes base_ with view::all(std::forward<R>(r)) and count_ with count.

constexpr V base() const;
3 Effects: Equivalent to: return base_;

```

### 23.7.7.3 Class template take\_view::sentinel

[range.take.sentinel]

```

namespace std::ranges {
 template<class V>
 template<bool Const>
 class take_view<V>::sentinel {
 private:
 using Base = conditional_t<Const, const V, V>; // exposition only
 using CI = counted_iterator<iterator_t<Base>>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
 public:
 sentinel() = default;
 constexpr explicit sentinel(sentinel_t<Base> end);
 constexpr sentinel(sentinel<!Const> s)
 requires Const && ConvertibleTo<sentinel_t<V>, sentinel_t<Base>>;
 constexpr sentinel_t<Base> base() const;

 friend constexpr bool operator==(const sentinel& x, const CI& y);
 friend constexpr bool operator==(const CI& y, const sentinel& x);
 friend constexpr bool operator!=(const sentinel& x, const CI& y);

```

```

 friend constexpr bool operator!=(const CI& y, const sentinel& x);
 };
}

constexpr explicit sentinel(sentinel_t<Base> end);

1 Effects: Initializes end_ with end.

constexpr sentinel(sentinel<!Const> s)
 requires Const && ConvertibleTo<sentinel_t<V>, sentinel_t<Base>>;
2 Effects: Initializes end_ with std::move(s.end_).

constexpr sentinel_t<Base> base() const;
3 Effects: Equivalent to: return end_;

friend constexpr bool operator==(const sentinel& x, const CI& y);
friend constexpr bool operator==(const CI& y, const sentinel& x);
4 Effects: Equivalent to: return y.count() == 0 || y.base() == x.end_;

friend constexpr bool operator!=(const sentinel& x, const CI& y);
friend constexpr bool operator!=(const CI& y, const sentinel& x);
5 Effects: Equivalent to: return !(x == y);

```

### 23.7.7.4 view::take

[range.take.adaptor]

- 1 The name `view::take` denotes a range adaptor object (23.7.1). For some subexpressions E and F, the expression `view::take(E, F)` is expression-equivalent to `take_view{E, F}`.

## 23.7.8 Join view

[range.join]

### 23.7.8.1 Overview

[range.join.overview]

- 1 `join_view` flattens a `View` of ranges into a `View`.  
 2 [Example:

```

vector<string> ss{"hello", " ", "world", "!"};
join_view greeting{ss};
for (char ch : greeting)
 cout << ch; // prints: hello world!
— end example]

```

### 23.7.8.2 Class template join\_view

[range.join.view]

```

namespace std::ranges {
 template<InputRange V>
 requires View<V> && InputRange<iter_reference_t<iterator_t<V>>> &&
 (is_reference_v<iter_reference_t<iterator_t<V>>> ||
 View<iter_value_t<iterator_t<V>>>)
 class join_view : public view_interface<join_view<V>> {
 private:
 using InnerRng = // exposition only
 iter_reference_t<iterator_t<V>>;
 template<bool Const>
 struct iterator; // exposition only
 template<bool Const>
 struct sentinel; // exposition only

 V base_ = V(); // exposition only
 all_view<InnerRng> inner_ = // exposition only, present only when !is_reference_v<InnerRng>
 all_view<InnerRng>();
 public:
 join_view() = default;
 constexpr explicit join_view(V base);
 };
}

```

```

template<InputRange R>
 requires ViewableRange<R> && Constructible<V, all_view<R>>
constexpr explicit join_view(R&& r);

constexpr auto begin() {
 return iterator<simple_view<V>>{*this, ranges::begin(base_)};
}

constexpr auto begin() const
requires InputRange<const V> &&
 is_reference_v<iter_reference_t<iterator_t<const V>>> {
 return iterator<true>{*this, ranges::begin(base_)};
}

constexpr auto end() {
 if constexpr (ForwardRange<V> &&
 is_reference_v<InnerRng> && ForwardRange<InnerRng> &&
 CommonRange<V> && CommonRange<InnerRng>)
 return iterator<simple_view<V>>{*this, ranges::end(base_)};
 else
 return sentinel<simple_view<V>>{*this};
}

constexpr auto end() const
requires InputRange<const V> &&
 is_reference_v<iter_reference_t<iterator_t<const V>>> {
 if constexpr (ForwardRange<const V> &&
 is_reference_v<iter_reference_t<iterator_t<const V>>> &&
 ForwardRange<iter_reference_t<iterator_t<const V>>> &&
 CommonRange<const V> &&
 CommonRange<iter_reference_t<iterator_t<const V>>>)
 return iterator<true>{*this, ranges::end(base_)};
 else
 return sentinel<true>{*this};
}
};

template<class R>
 explicit join_view(R&&) -> join_view<all_view<R>>;
}

constexpr explicit join_view(V base);

```

1      *Effects:* Initializes `base_` with `std::move(base)`.

```

template<InputRange R>
 requires ViewableRange<R> && Constructible<V, all_view<R>>
constexpr explicit join_view(R&& r);

```

2      *Effects:* Initializes `base_` with `view::all(std::forward<R>(r))`.

### 23.7.8.3 Class template `join_view::iterator`

[range.join.iterator]

```

1
namespace std::ranges {
template<class V>
 template<bool Const>
 struct join_view<V>::iterator {
private:
 using Parent = conditional_t<Const, const join_view, join_view>; // exposition only
 using Base = conditional_t<Const, const V, V>; // exposition only

 static constexpr bool ref_is_gvalue = is_reference_v<iter_reference_t<iterator_t<Base>>>; // exposition only

```

```

iterator_t<Base> outer_ = iterator_t<Base>(); // exposition only
iterator_t<iter_reference_t<iterator_t<Base>>> inner_ = // exposition only
 iterator_t<iter_reference_t<iterator_t<Base>>>();
Parent* parent_ = nullptr; // exposition only

constexpr void satisfy(); // exposition only

public:
 using iterator_concept = see below;
 using iterator_category = see below;
 using value_type =
 iter_value_t<iterator_t<iter_reference_t<iterator_t<Base>>>;
 using difference_type = see below;

 iterator() = default;
 constexpr iterator(Parent& parent, iterator_t<V> outer);
 constexpr iterator(iterator<!Const> i)
 requires Const &&
 ConvertibleTo<iterator_t<V>, iterator_t<Base>> &&
 ConvertibleTo<iterator_t<InnerRng>,
 iterator_t<iter_reference_t<iterator_t<Base>>>;
}

constexpr decltype(auto) operator*() const { return *inner_; }

constexpr iterator_t<Base> operator->() const
 requires has-arrow<iterator_t<Base>>;

constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int)
 requires ref_is_lvalue && ForwardRange<Base> &&
 ForwardRange<iter_reference_t<iterator_t<Base>>>;

constexpr iterator& operator--()
 requires ref_is_lvalue && BidirectionalRange<Base> &&
 BidirectionalRange<iter_reference_t<iterator_t<Base>>>;

constexpr iterator operator--(int)
 requires ref_is_lvalue && BidirectionalRange<Base> &&
 BidirectionalRange<iter_reference_t<iterator_t<Base>>>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires ref_is_lvalue && EqualityComparable<iterator_t<Base>> &&
 EqualityComparable<iterator_t<iter_reference_t<iterator_t<Base>>>>;

friend constexpr bool operator!=(const iterator& x, const iterator& y)
 requires ref_is_lvalue && EqualityComparable<iterator_t<Base>> &&
 EqualityComparable<iterator_t<iter_reference_t<iterator_t<Base>>>>;

friend constexpr decltype(auto) iter_move(const iterator& i)
 noexcept(noexcept(ranges::iter_move(i.inner_))) {
 return ranges::iter_move(i.inner_);
}

friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)));
};

}

2 iterator::iterator_concept is defined as follows:
(2.1) — If ref_is_lvalue is true,
(2.1.1) — If Base and iter_reference_t<iterator_t<Base>> each model BidirectionalRange, then
 iterator_concept denotes bidirectional_iterator_tag.

```

(2.1.2) — Otherwise, if `Base` and `iter_reference_t<iterator_t<Base>>` each model `ForwardRange`, then `iterator_concept` denotes `forward_iterator_tag`.

(2.2) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

3 `iterator::iterator_category` is defined as follows:

(3.1) — Let `OUTERC` denote `iterator_traits<iterator_t<Base>>::iterator_category`, and let `INNERC` denote `iterator_traits<iterator_t<iter_reference_t<iterator_t<Base>>>::iterator_category`.

(3.2) — If `ref_is_gvalue` is `true`,

(3.2.1) — If `OUTERC` and `INNERC` each model `DerivedFrom<bidirectional_iterator_tag>`, `iterator_category` denotes `bidirectional_iterator_tag`.

(3.2.2) — Otherwise, if `OUTERC` and `INNERC` each model `DerivedFrom<forward_iterator_tag>`, `iterator_category` denotes `forward_iterator_tag`.

(3.3) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

4 `iterator::difference_type` denotes the type:

```
common_type_t<
 iter_difference_t<iterator_t<Base>>,
 iter_difference_t<iterator_t<iter_reference_t<iterator_t<Base>>>>>
```

5 `join_view` iterators use the `satisfy` function to skip over empty inner ranges.

```
constexpr void satisfy(); // exposition only
```

6 *Effects:* Equivalent to:

```
auto update_inner = [this](iter_reference_t<iterator_t<Base>> x) -> decltype(auto) {
 if constexpr (ref_is_gvalue) // x is a reference
 return (x); // (x) is an lvalue
 else
 return (parent_->inner_ = view::all(x));
};

for (; outer_ != ranges::end(parent_->base_); ++outer_) {
 auto& inner = update_inner(*outer_);
 inner_ = ranges::begin(inner);
 if (inner_ != ranges::end(inner))
 return;
}
if constexpr (ref_is_gvalue)
 inner_ = iterator_t<iter_reference_t<iterator_t<Base>>>();
```

`constexpr iterator(Parent& parent, iterator_t<V> outer)`

7 *Effects:* Initializes `outer_` with `outer` and `parent_` with `addressof(parent)`; then calls `satisfy()`.

```
constexpr iterator(iterator<!Const> i)
 requires Const &&
 ConvertibleTo<iterator_t<V>, iterator_t<Base>> &&
 ConvertibleTo<iterator_t<InnerRng>,
 iterator_t<iter_reference_t<iterator_t<Base>>>;
```

8 *Effects:* Initializes `outer_` with `std::move(i.outer_)`, `inner_` with `std::move(i.inner_)`, and `parent_` with `i.parent_`.

```
constexpr iterator_t<Base> operator->() const
 requires has-arrow<iterator_t<Base>>;
```

9 *Effects:* Equivalent to `return inner_;`

```
constexpr iterator& operator++();
```

10 Let `inner-range` be:

(10.1) — If `ref_is_gvalue` is `true`, `*outer_`.

(10.2) — Otherwise, `parent_->inner_`.

11     *Effects:* Equivalent to:

```
auto&& inner_rng = inner-range;
if (++inner_ == ranges::end(inner_rng)) {
 ++outer_;
 satisfy();
}
return *this;
```

constexpr void operator++(int);

12     *Effects:* Equivalent to: `+++this.`

```
constexpr iterator operator++(int)
requires ref_is_lvalue && ForwardRange<Base> &&
ForwardRange<iter_reference_t<iterator_t<Base>>>;
```

13     *Effects:* Equivalent to:

```
auto tmp = *this;
+++this;
return tmp;
```

```
constexpr iterator& operator--()
requires ref_is_lvalue && BidirectionalRange<Base> &&
BidirectionalRange<iter_reference_t<iterator_t<Base>>>;
```

14     *Effects:* Equivalent to:

```
if (outer_ == ranges::end(parent_->base_))
 inner_ = ranges::end(*--outer_);
while (inner_ == ranges::begin(*outer_))
 inner_ = ranges::end(*--outer_);
--inner_;
return *this;
```

```
constexpr iterator operator--(int)
requires ref_is_lvalue && BidirectionalRange<Base> &&
BidirectionalRange<iter_reference_t<iterator_t<Base>>>;
```

15     *Effects:* Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
requires ref_is_lvalue && EqualityComparable<iterator_t<Base>> &&
EqualityComparable<iterator_t<iter_reference_t<iterator_t<Base>>>;
```

16     *Effects:* Equivalent to: `return x.outer_ == y.outer_ && x.inner_ == y.inner_;`

```
friend constexpr bool operator!=(const iterator& x, const iterator& y)
requires ref_is_lvalue && EqualityComparable<iterator_t<Base>> &&
EqualityComparable<iterator_t<iter_reference_t<iterator_t<Base>>>;
```

17     *Effects:* Equivalent to: `return !(x == y);`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)));
```

18     *Effects:* Equivalent to: `return ranges::iter_swap(x.inner_, y.inner_);`

### 23.7.8.4 Class template join\_view::sentinel

[range.join.sentinel]

```
namespace std::ranges {
 template<class V>
 template<bool Const>
 struct join_view<V>::sentinel {
 private:
 using Parent =
 conditional_t<Const, const join_view, join_view>;
 // exposition only
```

```

 using Base = conditional_t<Const, const V, V>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
public:
 sentinel() = default;

 constexpr explicit sentinel(Parent& parent);
 constexpr sentinel(sentinel<!Const> s)
 requires Const && ConvertibleTo<sentinel_t<V>, sentinel_t<Base>>;
}

};

constexpr explicit sentinel(Parent& parent);

```

1     *Effects:* Initializes `end_` with `ranges::end(parent.base_)`.

```

 constexpr sentinel(sentinel<!Const> s)
 requires Const && ConvertibleTo<sentinel_t<V>, sentinel_t<Base>>;

```

2     *Effects:* Initializes `end_` with `std::move(s.end_)`.

```

 friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);

```

3     *Effects:* Equivalent to: `return x.outer_ == y.end_;`

```

 friend constexpr bool operator==(const sentinel& x, const iterator<Const>& y);

```

4     *Effects:* Equivalent to: `return y == x;`

```

 friend constexpr bool operator!=(const iterator<Const>& x, const sentinel& y);

```

5     *Effects:* Equivalent to: `return !(x == y);`

```

 friend constexpr bool operator!=(const sentinel& x, const iterator<Const>& y);

```

6     *Effects:* Equivalent to: `return !(y == x);`

### 23.7.8.5 `view::join`

[range.join.adaptor]

1 The name `view::join` denotes a range adaptor object (23.7.1). For some subexpression E, the expression `view::join(E)` is expression-equivalent to `join_view{E}`.

### 23.7.9 Empty view

[range.empty]

#### 23.7.9.1 Overview

[range.empty.overview]

1 `empty_view` produces a `View` of no elements of a particular type.

2 [Example:

```

empty_view<int> e;
static_assert(ranges::empty(e));
static_assert(0 == e.size());

```

— end example]

#### 23.7.9.2 Class template `empty_view`

[range.empty.view]

```

namespace std::ranges {
 template<class T>
 requires is_object_v<T>
 class empty_view : public view_interface<empty_view<T>> {
 public:
 static constexpr T* begin() noexcept { return nullptr; }
 static constexpr T* end() noexcept { return nullptr; }
 static constexpr T* data() noexcept { return nullptr; }
 static constexpr ptrdiff_t size() noexcept { return 0; }
 static constexpr bool empty() noexcept { return true; }
 };
}

```

```

 friend constexpr T* begin(empty_view) noexcept { return nullptr; }
 friend constexpr T* end(empty_view) noexcept { return nullptr; }
 };
}

```

### 23.7.10 Single view

[range.single]

#### 23.7.10.1 Overview

[range.single.overview]

<sup>1</sup> `single_view` produces a `View` that contains exactly one element of a specified value.

<sup>2</sup> [Example:

```

single_view s{4};
for (int i : s)
 cout << i; // prints 4
— end example]

```

#### 23.7.10.2 Class template `single_view`

[range.single.view]

```

namespace std::ranges {
 template<CopyConstructible T>
 requires is_object_v<T>
 class single_view : public view_interface<single_view<T>> {
 private:
 semiregular<T> value_; // exposition only
 public:
 single_view() = default;
 constexpr explicit single_view(const T& t);
 constexpr explicit single_view(T&& t);
 template<class... Args>
 requires Constructible<T, Args...>
 constexpr single_view(in_place_t, Args&&... args);

 constexpr T* begin() noexcept;
 constexpr const T* begin() const noexcept;
 constexpr T* end() noexcept;
 constexpr const T* end() const noexcept;
 static constexpr ptrdiff_t size() noexcept;
 constexpr T* data() noexcept;
 constexpr const T* data() const noexcept;
 };
}

```

constexpr explicit single\_view(const T& t);

<sup>1</sup> Effects: Initializes `value_` with `t`.

constexpr explicit single\_view(T&& t);

<sup>2</sup> Effects: Initializes `value_` with `std::move(t)`.

template<class... Args>
constexpr single\_view(in\_place\_t, Args&&... args);

<sup>3</sup> Effects: Initializes `value_` as if by `value_{in_place, std::forward<Args>(args)...}`.

constexpr T\* begin() noexcept;
constexpr const T\* begin() const noexcept;

<sup>4</sup> Effects: Equivalent to: `return data();`

constexpr T\* end() noexcept;
constexpr const T\* end() const noexcept;

<sup>5</sup> Effects: Equivalent to: `return data() + 1;`

static constexpr ptrdiff\_t size() noexcept;

<sup>6</sup> Effects: Equivalent to: `return 1;`

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
7 Effects: Equivalent to: return value_.operator->();
```

### 23.7.10.3 view::single

[range.single.adaptor]

- <sup>1</sup> The name `view::single` denotes a customization point object (15.4.2.1.6). For some subexpression `E`, the expression `view::single(E)` is expression-equivalent to `single_view{E}`.

### 23.7.11 Split view

[range.split]

#### 23.7.11.1 Overview

[range.split.overview]

- <sup>1</sup> `split_view` takes a View and a delimiter, and splits the View into subranges on the delimiter. The delimiter can be a single element or a View of elements.

- <sup>2</sup> [Example:

```
string str{"the quick brown fox"};
split_view sentence{str, ' '};
for (auto word : sentence) {
 for (char ch : word)
 cout << ch;
 cout << '*';
}
// The above prints: the*quick*brown*fox*
— end example]
```

#### 23.7.11.2 Class template split\_view

[range.split.view]

```
namespace std::ranges {
 template<auto> struct require-constant; // exposition only

 template<class R>
 concept tiny-range = // exposition only
 SizedRange<R> &&
 requires { typename require-constant<remove_reference_t<R>::size()>; } &&
 (remove_reference_t<R>::size() <= 1);

 template<InputRange V, ForwardRange Pattern>
 requires View<V> && View<Pattern> &&
 IndirectlyComparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to<>> &&
 (ForwardRange<V> || tiny-range<Pattern>)
 class split_view : public view_interface<split_view<V, Pattern>> {
 private:
 V base_ = V(); // exposition only
 Pattern pattern_ = Pattern(); // exposition only
 iterator_t<V> current_ = iterator_t<V>(); // exposition only, present only if !ForwardRange<V>
 template<bool> struct outer_iterator; // exposition only
 template<bool> struct inner_iterator; // exposition only
 public:
 split_view() = default;
 constexpr split_view(V base, Pattern pattern);

 template<InputRange R, ForwardRange P>
 requires Constructible<V, all_view<R>> &&
 Constructible<Pattern, all_view<P>>
 constexpr split_view(R&& r, P&& p);

 template<InputRange R>
 requires Constructible<V, all_view<R>> &&
 Constructible<Pattern, single_view<iter_value_t<iterator_t<R>>>>>
 constexpr split_view(R&& r, iter_value_t<iterator_t<R>> e);
```

```

constexpr auto begin() {
 if constexpr (ForwardRange<V>
 return outer_iterator<simple_view<V>>{*this, ranges::begin(base_)};
 else {
 current_ = ranges::begin(base_);
 return outer_iterator<false>{*this};
 }
}

constexpr auto begin() const requires ForwardRange<V> && ForwardRange<const V> {
 return outer_iterator<true>{*this, ranges::begin(base_)};
}

constexpr auto end() requires ForwardRange<V> && CommonRange<V> {
 return outer_iterator<simple_view<V>>{*this, ranges::end(base_)};
}

constexpr auto end() const {
 if constexpr (ForwardRange<V> && ForwardRange<const V> && CommonRange<const V>)
 return outer_iterator<true>{*this, ranges::end(base_)};
 else
 return default_sentinel;
}
};

template<class R, class P>
split_view(R&&, P&&) -> split_view<all_view<R>, all_view<P>>;

template<InputRange R>
split_view(R&&, iter_value_t<iterator_t<R>>)
-> split_view<all_view<R>, single_view<iter_value_t<iterator_t<R>>>;
```

`constexpr split_view(V base, Pattern pattern);`

1      *Effects:* Initializes `base_` with `std::move(base)`, and `pattern_` with `std::move(pattern)`.

```
template<InputRange R, ForwardRange P>
requires Constructible<V, all_view<R>> &&
Constructible<Pattern, all_view<P>>
constexpr split_view(R&& r, P&& p);
```

2      *Effects:* Initializes `base_` with `view::all(std::forward<R>(r))` and `pattern_` with `view::all(std::forward<P>(p))`.

```
template<InputRange R>
requires Constructible<V, all_view<R>> &&
Constructible<Pattern, single_view<iter_value_t<iterator_t<R>>>>
constexpr split_view(R&& r, iter_value_t<iterator_t<R>> e);
```

3      *Effects:* Initializes `base_` with `view::all(std::forward<R>(r))` and `pattern_` with `single_view{std::move(e)}`.

### 23.7.11.3 Class template `split_view::outer_iterator`

[range.split.outer]

```
namespace std::ranges {
 template<class V, class Pattern>
 template<bool Const>
 struct split_view<V, Pattern>::outer_iterator {
 private:
 using Parent = conditional_t<Const, const split_view, split_view>; // exposition only
 using Base = conditional_t<Const, const V, V>; // exposition only
 Parent* parent_ = nullptr; // exposition only
 iterator_t<Base> current_ = iterator_t<Base>(); // exposition only, present only if V models ForwardRange
```

```

public:
 using iterator_concept =
 conditional_t<ForwardRange<Base>, forward_iterator_tag, input_iterator_tag>;
 using iterator_category = input_iterator_tag;
 struct value_type; // see 23.7.11.4
 using difference_type = iter_difference_t<iterator_t<Base>>;

 outer_iterator() = default;
 constexpr explicit outer_iterator(Parent& parent)
 requires (!ForwardRange<Base>);
 constexpr outer_iterator(Parent& parent, iterator_t<Base> current)
 requires ForwardRange<Base>;
 constexpr outer_iterator(outer_iterator<!Const> i)
 requires Const && ConvertibleTo<iterator_t<V>, iterator_t<const V>>;
 constexpr value_type operator*() const;

 constexpr outer_iterator& operator++();
 constexpr decltype(auto) operator++(int) {
 if constexpr (ForwardRange<Base>) {
 auto tmp = *this;
 ***this;
 return tmp;
 } else
 ***this;
 }

 friend constexpr bool operator==(const outer_iterator& x, const outer_iterator& y)
 requires ForwardRange<Base>;
 friend constexpr bool operator!=(const outer_iterator& x, const outer_iterator& y)
 requires ForwardRange<Base>;
 friend constexpr bool operator==(const outer_iterator& x, default_sentinel_t);
 friend constexpr bool operator==(default_sentinel_t, const outer_iterator& x);
 friend constexpr bool operator!=(const outer_iterator& x, default_sentinel_t y);
 friend constexpr bool operator!=(default_sentinel_t y, const outer_iterator& x);
};

}

```

<sup>1</sup> Many of the following specifications refer to the notional member *current* of *outer\_iterator*. *current* is equivalent to *current\_* if *V* models *ForwardRange*, and *parent\_->current\_* otherwise.

- constexpr explicit outer\_iterator(Parent& parent)
 requires (!ForwardRange<Base>);
- Effects:* Initializes *parent\_* with *addressof(parent)*.
- constexpr outer\_iterator(Parent& parent, iterator\_t<Base> current)
 requires ForwardRange<Base>;
- Effects:* Initializes *parent\_* with *addressof(parent)* and *current\_* with *current*.
- constexpr outer\_iterator(outer\_iterator<!Const> i)
 requires Const && ConvertibleTo<iterator\_t<V>, iterator\_t<const V>>;
- Effects:* Initializes *parent\_* with *i.parent\_* and *current\_* with *std::move(i.current\_)*.
- constexpr value\_type operator\*() const;
- Effects:* Equivalent to: *return value\_type{\*this};*
- constexpr outer\_iterator& operator++();
- Effects:* Equivalent to:
 

```

 const auto end = ranges::end(parent_->base_);
 if (current == end) return *this;
 const auto [pbegin, pend] = subrange{parent_->pattern_};

```

```

 if (pbegin == pend) ++current;
 else {
 do {
 const auto [b, p] = ranges::mismatch(current, end, pbegin, pend);
 if (p == pend) {
 current = b; // The pattern matched; skip it
 break;
 }
 } while (++current != end);
 }
 return *this;
}

friend constexpr bool operator==(const outer_iterator& x, const outer_iterator& y)
 requires ForwardRange<Base>;
7 Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr bool operator!=(const outer_iterator& x, const outer_iterator& y)
 requires ForwardRange<Base>;
8 Effects: Equivalent to: return !(x == y);

friend constexpr bool operator==(const outer_iterator& x, default_sentinel_t);
friend constexpr bool operator==(default_sentinel_t, const outer_iterator& x);
9 Effects: Equivalent to: return x.current == ranges::end(x.parent_->base_);

friend constexpr bool operator!=(const outer_iterator& x, default_sentinel_t y);
friend constexpr bool operator!=(default_sentinel_t y, const outer_iterator& x);
10 Effects: Equivalent to: return !(x == y);

```

#### 23.7.11.4 Class `split_view::outer_iterator::value_type` [range.split.outer.value]

```

namespace std::ranges {
 template<class V, class Pattern>
 template<bool Const>
 struct split_view<V, Pattern>::outer_iterator<Const>::value_type {
 private:
 outer_iterator i_ = outer_iterator(); // exposition only
 public:
 value_type() = default;
 constexpr explicit value_type(outer_iterator i);

 constexpr inner_iterator<Const> begin() const;
 constexpr default_sentinel_t end() const;
 };
}

```

1 Effects: Initializes `i_` with `i`.

constexpr inner\_iterator<Const> begin() const;

2 Effects: Equivalent to: return inner\_iterator<Const>{`i_`};

constexpr default\_sentinel\_t end() const;

3 Effects: Equivalent to: return default\_sentinel;

#### 23.7.11.5 Class template `split_view::inner_iterator`

[range.split.inner]

```

namespace std::ranges {
 template<class V, class Pattern>
 template<bool Const>
 struct split_view<V, Pattern>::inner_iterator {
 private:
 using Base =
 conditional_t<Const, const V, V>; // exposition only
 outer_iterator<Const> i_ = outer_iterator<Const>(); // exposition only

```

```

 bool incremented_ = false; // exposition only
public:
 using iterator_concept = typename outer_iterator<Const>::iterator_concept;
 using iterator_category = see below;
 using value_type = iter_value_t<iterator_t<Base>>;
 using difference_type = iter_difference_t<iterator_t<Base>>;

 inner_iterator() = default;
 constexpr explicit inner_iterator(outer_iterator<Const> i);

 constexpr decltype(auto) operator*() const { return *i_.current; }

 constexpr inner_iterator& operator++();
 constexpr decltype(auto) operator++(int) {
 if constexpr (ForwardRange<V>) {
 auto tmp = *this;
 +++this;
 return tmp;
 } else
 +++this;
 }

 friend constexpr bool operator==(const inner_iterator& x, const inner_iterator& y)
 requires ForwardRange<Base>;
 friend constexpr bool operator!=(const inner_iterator& x, const inner_iterator& y)
 requires ForwardRange<Base>;

 friend constexpr bool operator==(const inner_iterator& x, default_sentinel_t);
 friend constexpr bool operator==(default_sentinel_t, const inner_iterator& x);
 friend constexpr bool operator!=(const inner_iterator& x, default_sentinel_t y);
 friend constexpr bool operator!=(default_sentinel_t y, const inner_iterator& x);

 friend constexpr decltype(auto) iter_move(const inner_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.i_.current))) {
 return ranges::iter_move(i.i_.current);
 }

 friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
 requires IndirectlySwappable<iterator_t<Base>>;
};

}

```

<sup>1</sup> The *typedef-name* `iterator_category` denotes `forward_iterator_tag` if `iterator_traits<iterator_t<Base>>::iterator_category` models `DerivedFrom<forward_iterator_tag>`, and `input_iterator_tag` otherwise.

`constexpr explicit inner_iterator(outer_iterator<Const> i);`

<sup>2</sup> *Effects:* Initializes `i_` with `i`.

`constexpr inner_iterator& operator++() const;`

<sup>3</sup> *Effects:* Equivalent to:

```

 incremented_ = true;
 if constexpr (!ForwardRange<Base>) {
 if constexpr (Pattern::size() == 0) {
 return *this;
 }
 }
 ++i_.current;
 return *this;

```

```

friend constexpr bool operator==(const inner_iterator& x, const inner_iterator& y)
 requires ForwardRange<Base>;
4 Effects: Equivalent to: return x.i_.current_ == y.i_.current_;
friend constexpr bool operator!=(const inner_iterator& x, const inner_iterator& y)
 requires ForwardRange<Base>;
5 Effects: Equivalent to: return !(x == y);
friend constexpr bool operator==(const inner_iterator& x, default_sentinel_t);
friend constexpr bool operator==(default_sentinel_t, const inner_iterator& x);
6 Effects: Equivalent to:
 auto cur = x.i_.current_;
 auto end = ranges::end(x.i_.parent_->base_);
 if (cur == end) return true;
 auto [pcur, pend] = subrange{x.i_.parent_->pattern_};
 if (pcur == pend) return x.incremented_;
 do {
 if (*cur != *pcur) return false;
 if (++pcur == pend) return true;
 } while (++cur != end);
 return false;

friend constexpr bool operator!=(const inner_iterator& x, default_sentinel_t y);
friend constexpr bool operator!=(default_sentinel_t y, const inner_iterator& x);
7 Effects: Equivalent to: return !(x == y);

friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.i_.current_, y.i_.current_)))
 requires IndirectlySwappable<iterator_t<Base>>;
8 Effects: Equivalent to ranges::iter_swap(x.i_.current_, y.i_.current_).

```

**23.7.11.6 view::split**

[range.split.adaptor]

- <sup>1</sup> The name `view::split` denotes a range adaptor object (23.7.1). For some subexpressions E and F, the expression `view::split(E, F)` is expression-equivalent to `split_view{E, F}`.

**23.7.12 Counted view**

[range.counted]

- <sup>1</sup> The name `view::counted` denotes a customization point object (15.4.2.1.6). Let E and F be expressions, and let T be `decay_t<decltype((E))>`. Then the expression `view::counted(E, F)` is expression-equivalent to:
- (1.1) — If T models `Iterator` and `decltype((F))` models `ConvertibleTo<iter_difference_t<T>>`,
    - (1.1.1) — `subrange{E, E + static_cast<iter_difference_t<T>>(F)}` if T models `RandomAccessIterator`.
    - (1.1.2) — Otherwise, `subrange{counted_iterator{E, F}, default_sentinel}`.  - (1.2) — Otherwise, `view::counted(E, F)` is ill-formed. [Note: This case can result in substitution failure when `view::counted(E, F)` appears in the immediate context of a template instantiation. — end note]

**23.7.13 Common view**

[range.common]

**23.7.13.1 Overview**

[range.common.overview]

- <sup>1</sup> `common_view` takes a `View` which has different types for its iterator and sentinel and turns it into a `View` of the same elements with an iterator and sentinel of the same type.
- <sup>2</sup> [Note: `common_view` is useful for calling legacy algorithms that expect a range's iterator and sentinel types to be the same. — end note]
- <sup>3</sup> [Example:  
`// Legacy algorithm:`  
`template<class ForwardIterator>`  
`size_t count(ForwardIterator first, ForwardIterator last);`

```

template<ForwardRange R>
void my_algo(R&& r) {
 auto&& common = common_view{r};
 auto cnt = count(common.begin(), common.end());
 // ...
}

— end example]

```

### 23.7.13.2 Class template common\_view

[range.common.view]

```

namespace std::ranges {
 template<View V>
 requires (!CommonRange<V>)
 class common_view : public view_interface<common_view<V>> {
 private:
 V base_ = V(); // exposition only
 public:
 common_view() = default;

 constexpr explicit common_view(V r);

 template<ViewableRange R>
 requires (!CommonRange<R> && Constructible<V, all_view<R>>)
 constexpr explicit common_view(R&& r);

 constexpr V base() const;

 constexpr auto size() requires SizedRange<V> {
 return ranges::size(base_);
 }
 constexpr auto size() const requires SizedRange<const V> {
 return ranges::size(base_);
 }

 constexpr auto begin() {
 if constexpr (RandomAccessRange<V> && SizedRange<V>)
 return ranges::begin(base_);
 else
 return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
 }

 constexpr auto begin() const requires Range<const V> {
 if constexpr (RandomAccessRange<const V> && SizedRange<const V>)
 return ranges::begin(base_);
 else
 return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
 }

 constexpr auto end() {
 if constexpr (RandomAccessRange<V> && SizedRange<V>)
 return ranges::begin(base_) + ranges::size(base_);
 else
 return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
 }

 constexpr auto end() const requires Range<const V> {
 if constexpr (RandomAccessRange<const V> && SizedRange<const V>)
 return ranges::begin(base_) + ranges::size(base_);
 else
 return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
 }
 };
}
```

```

 template<class R>
 common_view(R&&) -> common_view<all_view<R>>;
}

constexpr explicit common_view(V base);

1 Effects: Initializes base_ with std::move(base).

template<ViewableRange R>
 requires (!CommonRange<R> && Constructible<V, all_view<R>>)
constexpr explicit common_view(R&& r);

2 Effects: Initializes base_ with view::all(std::forward<R>(r)).

constexpr V base() const;

3 Effects: Equivalent to: return base_;

```

**23.7.13.3 view::common**

[range.common.adaptor]

- <sup>1</sup> The name `view::common` denotes a range adaptor object (23.7.1). For some subexpression `E`, the expression `view::common(E)` is expression-equivalent to:
- (1.1) — `view::all(E)`, if `decltype((E))` models `CommonRange` and `view::all(E)` is a well-formed expression.
  - (1.2) — Otherwise, `common_view{E}`.

**23.7.14 Reverse view**

[range.reverse]

**23.7.14.1 Overview**

[range.reverse.overview]

- <sup>1</sup> `reverse_view` takes a bidirectional View and produces another View that iterates the same elements in reverse order.
- <sup>2</sup> [Example:

```

vector<int> is {0,1,2,3,4};
reverse_view rv {is};
for (int i : rv)
 cout << i << ' '; // prints: 4 3 2 1 0
— end example]

```

**23.7.14.2 Class template reverse\_view**

[range.reverse.view]

```

namespace std::ranges {
 template<View V>
 requires BidirectionalRange<V>
 class reverse_view : public view_interface<reverse_view<V>> {
 private:
 V base_ = V(); // exposition only
 public:
 reverse_view() = default;

 constexpr explicit reverse_view(V r);

 template<ViewableRange R>
 requires BidirectionalRange<R> && Constructible<V, all_view<R>>
 constexpr explicit reverse_view(R&& r);

 constexpr V base() const;

 constexpr reverse_iterator<iterator_t<V>> begin();
 constexpr reverse_iterator<iterator_t<V>> begin() requires CommonRange<V>;
 constexpr reverse_iterator<iterator_t<const V>> begin() const
 requires CommonRange<const V>;

 constexpr reverse_iterator<iterator_t<V>> end();
 constexpr reverse_iterator<iterator_t<const V>> end() const
 requires CommonRange<const V>;
 };
}

```

```

 constexpr auto size() requires SizedRange<V> {
 return ranges::size(base_);
 }
 constexpr auto size() const requires SizedRange<const V> {
 return ranges::size(base_);
 }
};

template<class R>
reverse_view(R&&) -> reverse_view<all_view<R>>;
}

```

**constexpr explicit reverse\_view(V base);**

1     *Effects:* Initializes `base_` with `std::move(base)`.

```

template<ViewableRange R>
requires BidirectionalRange<R> && Constructible<V, all_view<R>>
constexpr explicit reverse_view(R&& r);

```

2     *Effects:* Initializes `base_` with `view::all(std::forward<R>(r))`.

**constexpr V base() const;**

3     *Effects:* Equivalent to: `return base_`;

**constexpr reverse\_iterator<iterator\_t<V>> begin();**

4     *Returns:*

```
 make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))

```

5     *Remarks:* In order to provide the amortized constant time complexity required by the Range concept, this function caches the result within the `reverse_view` for use on subsequent calls.

```

constexpr reverse_iterator<iterator_t<V>> begin() requires CommonRange<V>;
constexpr reverse_iterator<iterator_t<const V>> begin() const
 requires CommonRange<const V>;

```

6     *Effects:* Equivalent to: `return make_reverse_iterator(ranges::end(base_))`;

```

constexpr reverse_iterator<iterator_t<V>> end();
constexpr reverse_iterator<iterator_t<const V>> end() const
 requires CommonRange<const V>;

```

7     *Effects:* Equivalent to: `return make_reverse_iterator(ranges::begin(base_))`;

### 23.7.14.3 view::reverse

[range.reverse.adaptor]

1 The name `view::reverse` denotes a range adaptor object (23.7.1). For some subexpression E, the expression `view::reverse(E)` is expression-equivalent to `reverse_view{E}`.

# 24 Algorithms library

# [algorithms]

## 24.1 General

## [algorithms.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform algorithmic operations on containers ([Clause 21](#)) and other sequences.
- <sup>2</sup> The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 80.

Table 80 — Algorithms library summary

| Subclause                                              | Header(s)                      |
|--------------------------------------------------------|--------------------------------|
| <a href="#">24.5</a> Non-modifying sequence operations |                                |
| <a href="#">24.6</a> Mutating sequence operations      | <code>&lt;algorithm&gt;</code> |
| <a href="#">24.7</a> Sorting and related operations    |                                |
| <a href="#">24.9</a> Generalized numeric operations    | <code>&lt;numeric&gt;</code>   |
| <a href="#">24.10</a> C library algorithms             | <code>&lt;cstdlib&gt;</code>   |

## 24.2 Algorithms requirements

## [algorithms.requirements]

- <sup>1</sup> All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.
- <sup>2</sup> The entities defined in the `std::ranges` namespace in this Clause are not found by argument-dependent name lookup ([6.4.2](#)). When found by unqualified ([6.4.1](#)) name lookup for the *postfix-expression* in a function call ([7.6.1.2](#)), they inhibit argument-dependent name lookup.

[Example:

```
void foo() {
 using namespace std::ranges;
 std::vector<int> vec{1,2,3};
 find(begin(vec), end(vec), 2); // #1
}
```

The function call expression at #1 invokes `std::ranges::find`, not `std::find`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::find` is more specialized ([12.6.6.2](#)) than `std::ranges::find` since the former requires its first two parameters to have the same type. — *end example*

- <sup>3</sup> For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.
- <sup>4</sup> Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.
  - (4.1) — If an algorithm's template parameter is named `InputIterator`, `InputIterator1`, or `InputIterator2`, the template argument shall satisfy the *Cpp17InputIterator* requirements ([22.3.5.2](#)).
  - (4.2) — If an algorithm's template parameter is named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, the template argument shall satisfy the *Cpp17OutputIterator* requirements ([22.3.5.3](#)).
  - (4.3) — If an algorithm's template parameter is named `ForwardIterator`, `ForwardIterator1`, or `ForwardIterator2`, the template argument shall satisfy the *Cpp17ForwardIterator* requirements ([22.3.5.4](#)).
  - (4.4) — If an algorithm's template parameter is named `BidirectionalIterator`, `BidirectionalIterator1`, or `BidirectionalIterator2`, the template argument shall satisfy the *Cpp17BidirectionalIterator* requirements ([22.3.5.5](#)).
  - (4.5) — If an algorithm's template parameter is named `RandomAccessIterator`, `RandomAccessIterator1`, or `RandomAccessIterator2`, the template argument shall satisfy the *Cpp17RandomAccessIterator* requirements ([22.3.5.6](#)).

- 5 If an algorithm's *Effects*: element specifies that a value pointed to by any iterator passed as an argument is modified, then that algorithm has an additional type requirement: The type of that argument shall satisfy the requirements of a mutable iterator (22.3). [Note: This requirement does not affect arguments that are named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, because output iterators must always be mutable, nor does it affect arguments that are constrained, for which mutability requirements are expressed explicitly. — end note]
- 6 Both in-place and copying versions are provided for certain algorithms.<sup>234</sup> When such a version is provided for *algorithm* it is called `algorithm_copy`. Algorithms that take predicates end with the suffix `_if` (which follows the suffix `_copy`).
- 7 When not otherwise constrained, the `Predicate` parameter is used whenever an algorithm expects a function object (19.14) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as `true`. In other words, if an algorithm takes `Predicate pred` as its argument and `first` as its iterator argument with value type `T`, it should work correctly in the construct `pred(*first)` contextually converted to `bool` (7.3). The function object `pred` shall not apply any non-constant function through the dereferenced iterator. Given a gvalue `u` of type (possibly `const`) `T` that designates the same object as `*first`, `pred(u)` shall be a valid expression that is equal to `pred(*first)`.
- 8 When not otherwise constrained, the `BinaryPredicate` parameter is used whenever an algorithm expects a function object that when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature returns a value testable as `true`. In other words, if an algorithm takes `BinaryPredicate binary_pred` as its argument and `first1` and `first2` as its iterator arguments with respective value types `T1` and `T2`, it should work correctly in the construct `binary_pred(*first1, *first2)` contextually converted to `bool` (7.3). Unless otherwise specified, `BinaryPredicate` always takes the first iterator's `value_type` as its first argument, that is, in those cases when `T` value is part of the signature, it should work correctly in the construct `binary_pred(*first1, value)` contextually converted to `bool` (7.3). `binary_pred` shall not apply any non-constant function through the dereferenced iterators. Given a gvalue `u` of type (possibly `const`) `T1` that designates the same object as `*first1`, and a gvalue `v` of type (possibly `const`) `T2` that designates the same object as `*first2`, `binary_pred(u, *first2)`, `binary_pred(*first1, v)`, and `binary_pred(u, v)` shall each be a valid expression that is equal to `binary_pred(*first1, *first2)`, and `binary_pred(u, value)` shall be a valid expression that is equal to `binary_pred(*first1, value)`.
- 9 The parameters `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, and `BinaryOperation2` are used whenever an algorithm expects a function object (19.14).
- 10 [Note: Unless otherwise specified, algorithms that take function objects as arguments are permitted to copy those function objects freely. Programmers for whom object identity is important should consider using a wrapper class that points to a noncopied implementation object such as `reference_wrapper<T>` (19.14.5), or some equivalent solution. — end note]
- 11 When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either `true` or `false` in boolean contexts.
- 12 In the description of the algorithms, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as those of

```
auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;
```

Similarly, operator `-` is used for some combinations of iterators and sentinel types for which it does not have to be defined. If `[a, b)` denotes a range, the semantics of `b - a` in these cases are the same as those of

```
iter_difference_t<remove_reference_t<decltype(a)>> n = 0;
for (auto tmp = a; tmp != b; ++tmp) ++n;
return n;
```

and if `[b, a)` denotes a range, the same as those of

```
iter_difference_t<remove_reference_t<decltype(b)>> n = 0;
for (auto tmp = b; tmp != a; ++tmp) --n;
```

<sup>234)</sup> The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users might as well do `copy` followed by `sort`.

```
return n;
```

- <sup>13</sup> In the description of algorithm return values, a sentinel value `s` denoting the end of a range `[i, s)` is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using `ranges::next(i, s)`.
- <sup>14</sup> Overloads of algorithms that take `Range` arguments (23.5.2) behave as if they are implemented by calling `ranges::begin` and `ranges::end` on the `Range(s)` and dispatching to the overload in namespace `ranges` that takes separate iterator and sentinel arguments.
- <sup>15</sup> The number and order of deducible template parameters for algorithm declarations are unspecified, except where explicitly stated otherwise. [Note: Consequently, the algorithms may not be called with explicitly-specified template argument lists. — end note]
- <sup>16</sup> The class templates `binary_transform_result`, `for_each_result`, `minmax_result`, `mismatch_result`, `copy_result`, and `partition_copy_result` have the template parameters, data members, and special members specified above. They have no base classes or members other than those specified.

## 24.3 Parallel algorithms

[algorithms.parallel]

- <sup>1</sup> This subclause describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

### 24.3.1 Terms and definitions

[algorithms.parallel.defns]

- <sup>1</sup> A *parallel algorithm* is a function template listed in this document with a template parameter named `ExecutionPolicy`.
- <sup>2</sup> Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:
  - (2.1) — All operations of the categories of the iterators that the algorithm is instantiated with.
  - (2.2) — Operations on those sequence elements that are required by its specification.
  - (2.3) — User-provided function objects to be applied during the execution of the algorithm, if required by the specification.
  - (2.4) — Operations on those function objects required by the specification. [Note: See 24.2. — end note]

These functions are herein called *element access functions*. [Example: The `sort` function may invoke the following element access functions:

- (2.5) — Operations of the random-access iterator of the actual template argument (as per 22.3.5.6), as implied by the name of the template parameter `RandomAccessIterator`.
- (2.6) — The `swap` function on the elements of the sequence (as per the preconditions specified in 24.7.1.1).
- (2.7) — The user-provided `Compare` function object.

— end example]

### 24.3.2 Requirements on user-provided function objects

[algorithms.parallel.user]

- <sup>1</sup> Unless otherwise specified, function objects passed into parallel algorithms as objects of type `Predicate`, `BinaryPredicate`, `Compare`, `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, `BinaryOperation2`, and the operators used by the analogous overloads to these parallel algorithms that could be formed by the invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

### 24.3.3 Effect of execution policies on algorithm execution

[algorithms.parallel.exec]

- <sup>1</sup> Parallel algorithms have template parameters named `ExecutionPolicy` (19.18) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.
- <sup>2</sup> If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object. [Note: For example, `swap()`, `++`, `--`, `@=`, and assignments modify the object. For the assignment and `@=` operators, only the left argument is modified. — end note]
- <sup>3</sup> Unless otherwise stated, implementations may make arbitrary copies of elements (with type `T`) from sequences where `is_trivially_copy_constructible_v<T>` and `is_trivially_destructible_v<T>` are `true`. [Note:

This implies that user-supplied function objects should not rely on object identity of arguments for such input sequences. Users for whom the object identity of the arguments to these function objects is important should consider using a wrapping iterator that returns a non-copied implementation object such as `reference_wrapper<T>` (19.14.5) or some equivalent solution. — *end note*

- <sup>4</sup> The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::sequenced_policy` all occur in the calling thread of execution. [Note: The invocations are not interleaved; see 6.8.1. — *end note*]
- <sup>5</sup> The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_policy` are permitted to execute in either the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by `thread` (31.3.2) provide concurrent forward progress guarantees (6.8.2.2), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other. [Note: It is the caller's responsibility to ensure that the invocation does not introduce data races or deadlocks. — *end note*] [Example:

```
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
 v.push_back(i*2+1); // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — *end example*] [Example:

```
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
 x.fetch_add(1, std::memory_order::relaxed);
 // spin wait for another iteration to change the value of x
 while (x.load(std::memory_order::relaxed) == 1) {} // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — *end example*] [Example:

```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
 std::lock_guard<mutex> guard(m);
 ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — *end example*]

- <sup>6</sup> The invocations of element access functions in parallel algorithms invoked with an execution policy of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees. [Note: This means that multiple function object invocations may be interleaved on a single thread of execution, which overrides the usual guarantee from 6.8.1 that function executions do not interleave with one another. — *end note*] Since `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. Thus, the synchronization with `execution::parallel_unsequenced_policy` is restricted as follows: A standard library function is *vectorization-unsafe* if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function. Vectorization-unsafe standard library functions may not be invoked by user code called from `execution::parallel_unsequenced_policy` algorithms. [Note: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. — *end note*] [Example:

```

int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&](int) {
 std::lock_guard<mutex> guard(m); // incorrect: lock_guard constructor calls m.lock()
 ++x;
});

```

The above program may result in two consecutive calls to `m.lock()` on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution. — *end example*] [Note: The semantics of the `execution::parallel_policy` or the `execution::parallel_unsequenced_policy` invocation allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation due to lack of resources. — *end note*]

- 7 If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

- (7.1) — temporarily block with forward progress guarantee delegation (6.8.2.2) on the completion of these library-managed threads of execution, or
- (7.2) — eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished. [Note: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — *end note*]

- 8 The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

#### 24.3.4 Parallel algorithm exceptions

[`algorithms.parallel.exceptions`]

- 1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.
- 2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the `ExecutionPolicy`.

#### 24.3.5 ExecutionPolicy algorithm overloads

[`algorithms.parallel.overloads`]

- 1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter. [Note: Not all algorithms have parallel algorithm overloads. — *end note*]
- 2 Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.
- 3 Unless otherwise specified, the complexity requirements of `ExecutionPolicy` algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says “at most *expr*” or “exactly *expr*” and does not specify the number of assignments or swaps, and *expr* is not already expressed with  $\mathcal{O}()$  notation, the complexity of the algorithm shall be  $\mathcal{O}(\text{expr})$ .
- 4 Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<remove_cvref_t<ExecutionPolicy>>` is true.

#### 24.4 Header <algorithm> synopsis

 template<BidirectionalIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr bool
 prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});
 template<BidirectionalRange R, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr bool
 prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
}
}
```

## 24.5 Non-modifying sequence operations

[alg.nonmodifying]

### 24.5.1 All of

[alg.all\_of]

```
template<class InputIterator, class Predicate>
constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool all_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 Predicate pred);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 constexpr bool all_of(I first, S last, Pred pred, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr bool all_of(R&& r, Pred pred, Proj proj = {});
}
```

<sup>1</sup> Let  $E$  be  $\text{pred}(*i)$  and  $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i))$  for the overloads in namespace `std` and `std::ranges`, respectively.

<sup>2</sup> Returns: false if  $E$  is false for some iterator  $i$  in the range  $[\text{first}, \text{last})$ , and true otherwise.

3        *Complexity:* At most `last - first` applications of the predicate and any projection.

### 24.5.2 Any of

[`alg.any_of`]

```
template<class InputIterator, class Predicate>
constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 Predicate pred);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 constexpr bool any_of(I first, S last, Pred pred, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr bool any_of(R&& r, Pred pred, Proj proj = {});
}
```

1        Let  $E$  be `pred(*i)` and `invoke(pred, invoke(proj, *i))` for the overloads in namespace `std` and `std::ranges`, respectively. *Returns:* `true` if  $E$  is `true` for some iterator  $i$  in the range `[first, last)`, and `false` otherwise.

3        *Complexity:* At most `last - first` applications of the predicate and any projection.

### 24.5.3 None of

[`alg.none_of`]

```
template<class InputIterator, class Predicate>
constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 Predicate pred);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 constexpr bool none_of(I first, S last, Pred pred, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr bool none_of(R&& r, Pred pred, Proj proj = {});
}
```

1        Let  $E$  be `pred(*i)` and `invoke(pred, invoke(proj, *i))` for the overloads in namespace `std` and `std::ranges`, respectively.

2        *Returns:* `false` if  $E$  is `true` for some iterator  $i$  in the range `[first, last)`, and `true` otherwise.

3        *Complexity:* At most `last - first` applications of the predicate and any projection.

### 24.5.4 For each

[`alg.foreach`]

```
template<class InputIterator, class Function>
constexpr Function for_each(InputIterator first, InputIterator last, Function f);
```

1        *Requires:* `Function` shall satisfy the *Cpp17MoveConstructible* requirements (Table 26). [*Note:* `Function` need not meet the requirements of *Cpp17CopyConstructible* (Table 27). — *end note*]

2        *Effects:* Applies `f` to the result of dereferencing every iterator in the range `[first, last)`, starting from `first` and proceeding to `last - 1`. [*Note:* If the type of `first` satisfies the requirements of a mutable iterator, `f` may apply non-constant functions through the dereferenced iterator. — *end note*]

3        *Returns:* `f`.

4        *Complexity:* Applies `f` exactly `last - first` times.

5        *Remarks:* If `f` returns a result, the result is ignored.

```

template<class ExecutionPolicy, class ForwardIterator, class Function>
void for_each(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Function f);

```

6     *Requires:* Function shall satisfy the *Cpp17CopyConstructible* requirements.

7     *Effects:* Applies f to the result of dereferencing every iterator in the range [first, last). [Note: If the type of first satisfies the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — *end note*]

8     *Complexity:* Applies f exactly last - first times.

9     *Remarks:* If f returns a result, the result is ignored. Implementations do not have the freedom granted under [24.3.3](#) to make arbitrary copies of elements from the input sequence.

10    [Note: Does not return a copy of its Function parameter, since parallelization may not permit efficient state accumulation. — *end note*]

```

namespace ranges {
 template<InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryInvocable<projected<I, Proj>> Fun>
 constexpr for_each_result<I, Fun>
 for_each(I first, S last, Fun f, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectUnaryInvocable<projected<iterator_t<R>, Proj>> Fun>
 constexpr for_each_result<safe_iterator_t<R>, Fun>
 for_each(R&& r, Fun f, Proj proj = {});
}

```

11    *Effects:* Calls invoke(f, invoke(proj, \*i)) for every iterator i in the range [first, last), starting from first and proceeding to last - 1. [Note: If the result of invoke(proj, \*i) is a mutable reference, f may apply non-constant functions. — *end note*]

12    *Returns:* {last, std::move(f)}.

13    *Complexity:* Applies f and proj exactly last - first times.

14    *Remarks:* If f returns a result, the result is ignored.

15    [Note: The overloads in namespace ranges require Fun to model CopyConstructible. — *end note*]

```

template<class InputIterator, class Size, class Function>
constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);

```

16    *Requires:* Function shall satisfy the *Cpp17MoveConstructible* requirements [Note: Function need not meet the requirements of *Cpp17CopyConstructible*. — *end note*]

17    *Requires:* n >= 0.

18    *Effects:* Applies f to the result of dereferencing every iterator in the range [first, first + n) in order. [Note: If the type of first satisfies the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — *end note*]

19    *Returns:* first + n.

20    *Remarks:* If f returns a result, the result is ignored.

```

template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n,
 Function f);

```

21    *Requires:* Function shall satisfy the *Cpp17CopyConstructible* requirements.

22    *Requires:* n >= 0.

23    *Effects:* Applies f to the result of dereferencing every iterator in the range [first, first + n). [Note: If the type of first satisfies the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — *end note*]

24    *Returns:* first + n.

25    *Remarks:* If f returns a result, the result is ignored. Implementations do not have the freedom granted under [24.3.3](#) to make arbitrary copies of elements from the input sequence.

### 24.5.5 Find

[alg.find]

```

template<class InputIterator, class T>
 constexpr InputIterator find(InputIterator first, InputIterator last,
 const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
 ForwardIterator find(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 const T& value);

template<class InputIterator, class Predicate>
 constexpr InputIterator find_if(InputIterator first, InputIterator last,
 Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
 ForwardIterator find_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 Predicate pred);

template<class InputIterator, class Predicate>
 constexpr InputIterator find_if_not(InputIterator first, InputIterator last,
 Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
 ForwardIterator find_if_not(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Predicate pred);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, class T, class Proj = identity>
 requires IndirectRelation<ranges::equal_to<>, projected<I, Proj>, const T*>
 constexpr I find(I first, S last, const T& value, Proj proj = {});
 template<InputRange R, class T, class Proj = identity>
 requires IndirectRelation<ranges::equal_to<>, projected<iterator_t<R>, Proj>, const T*>
 constexpr safe_iterator_t<R>
 find(R&& r, const T& value, Proj proj = {});
 template<InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 constexpr I find_if(I first, S last, Pred pred, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr safe_iterator_t<R>
 find_if(R&& r, Pred pred, Proj proj = {});
 template<InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 constexpr I find_if_not(I first, S last, Pred pred, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr safe_iterator_t<R>
 find_if_not(R&& r, Pred pred, Proj proj = {});
}

```

1 Let  $E$  be:

- (1.1) —  $*i == \text{value}$  for `find`,
- (1.2) —  $\text{pred}(*i) != \text{false}$  for `find_if`,
- (1.3) —  $\text{pred}(*i) == \text{false}$  for `find_if_not`,
- (1.4) —  $\text{invoke}(\text{proj}, *i) == \text{value}$  for `ranges::find`,
- (1.5) —  $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)) != \text{false}$  for `ranges::find_if`,
- (1.6) —  $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)) == \text{false}$  for `ranges::find_if_not`.

2 *Returns:* The first iterator  $i$  in the range  $[\text{first}, \text{last})$  for which  $E$  is true. Returns  $\text{last}$  if no such iterator is found.

3 *Complexity:* At most  $\text{last} - \text{first}$  applications of the corresponding predicate and any projection.

## 24.5.6 Find end

[alg.find.end]

```

template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
 find_end(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
 find_end(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
constexpr ForwardIterator1
 find_end(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
ForwardIterator1
 find_end(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

namespace ranges {
 template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2, Sentinel<I2> S2,
 class Pred = ranges::equal_to{}, class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
 constexpr subrange<I1>
 find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
 template<ForwardRange R1, ForwardRange R2,
 class Pred = ranges::equal_to{}, class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyComparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
 constexpr safe_subrange_t<R1>
 find_end(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

1 Let:

- (1.1) — `pred` be `equal_to{}` for the overloads with no parameter `pred`.
- (1.2) — `E` be:
  - (1.2.1) — `pred(*((i + n), *(first2 + n))` for the overloads in namespace `std`,
  - (1.2.2) — `invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n)))` for the overloads in namespace `ranges`.
- (1.3) — `i` be `last1` if  $[first2, last2]$  is empty, or if  $(last2 - first2) > (last1 - first1)$  is true, or if there is no iterator in the range  $[first1, last1 - (last2 - first2)]$  such that for every non-negative integer  $n < (last2 - first2)$ , `E` is true. Otherwise `i` is the last such iterator in  $[first1, last1 - (last2 - first2)]$ .

2 Returns:

- (2.1) — `i` for the overloads in namespace `std`, and
- (2.2) — `{i, i + (i == last1 ? 0 : last2 - first2)}` for the overloads in namespace `ranges`.

3 Complexity: At most  $(last2 - first2) * (last1 - first1 - (last2 - first2) + 1)$  applications of the corresponding predicate and any projections.

## 24.5.7 Find first

[alg.find.first.of]

```
template<class InputIterator, class ForwardIterator>
```

```

constexpr InputIterator
find_first_of(InputIterator first1, InputIterator last1,
 ForwardIterator first2, ForwardIterator last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
find_first_of(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator, class ForwardIterator,
 class BinaryPredicate>
constexpr InputIterator
find_first_of(InputIterator first1, InputIterator last1,
 ForwardIterator first2, ForwardIterator last2,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
ForwardIterator1
find_first_of(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

namespace ranges {
template<InputIterator I1, Sentinel<I1> S1, ForwardIterator I2, Sentinel<I2> S2,
 class Proj1 = identity, class Proj2 = identity,
 IndirectRelation<projected<I1, Proj1>,
 projected<I2, Proj2>> Pred = ranges::equal_to<>>
constexpr I1 find_first_of(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<InputRange R1, ForwardRange R2, class Proj1 = identity,
 class Proj2 = identity,
 IndirectRelation<projected<iterator_t<R1>, Proj1>,
 projected<iterator_t<R2>, Proj2>> Pred = ranges::equal_to<>>
constexpr safe_iterator_t<R1>
find_first_of(R1&& r1, R2&& r2,
 Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

1 Let  $E$  be:

- (1.1) —  $*i == *j$  for the overloads with no parameter  $pred$ ,
- (1.2) —  $pred(*i, *j) != \text{false}$  for the overloads with a parameter  $pred$  and no parameter  $proj1$ ,
- (1.3) —  $\text{invoke}(pred, \text{invoke}(proj1, *i), \text{invoke}(proj2, *j)) != \text{false}$  for the overloads with parameters  $pred$  and  $proj1$ .

2 *Effects*: Finds an element that matches one of a set of values.

3 *Returns*: The first iterator  $i$  in the range  $[first1, last1]$  such that for some iterator  $j$  in the range  $[first2, last2]$   $E$  holds. Returns  $last1$  if  $[first2, last2]$  is empty or if no such iterator is found.

4 *Complexity*: At most  $(last1-first1) * (last2-first2)$  applications of the corresponding predicate and any projections.

#### 24.5.8 Adjacent find

[alg.adjacent.find]

```

template<class ForwardIterator>
constexpr ForwardIterator
adjacent_find(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

```

```

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator
adjacent_find(ForwardIterator first, ForwardIterator last,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 BinaryPredicate pred);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
 IndirectRelation<projected<I, Proj>> Pred = ranges::equal_to<>>
 constexpr I adjacent_find(I first, S last, Pred pred = {}, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectRelation<projected<iterator_t<R>, Proj>> Pred = ranges::equal_to<>>
 constexpr safe_iterator_t<R>
 adjacent_find(R&& r, Pred pred = {}, Proj proj = {});
}

```

1 Let  $E$  be:

- (1.1) —  $*i == *(i + 1)$  for the overloads with no parameter `pred`,
- (1.2) —  $\text{pred}(*i, *(i + 1)) != \text{false}$  for the overloads with a parameter `pred` and no parameter `proj`,
- (1.3) —  $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i), \text{invoke}(\text{proj}, *(i + 1))) != \text{false}$  for the overloads with both parameters `pred` and `proj`.

2 *Returns*: The first iterator  $i$  such that both  $i$  and  $i + 1$  are in the range  $[\text{first}, \text{last}]$  for which  $E$  holds. Returns `last` if no such iterator is found.

3 *Complexity*: For the overloads with no `ExecutionPolicy`, exactly  $\min((i - \text{first}) + 1, (\text{last} - \text{first}) - 1)$  applications of the corresponding predicate, where  $i$  is `adjacent_find`'s return value. For the overloads with an `ExecutionPolicy`,  $\mathcal{O}(\text{last} - \text{first})$  applications of the corresponding predicate, and no more than twice as many applications of any projection.

#### 24.5.9 Count

[`alg.count`]

```

template<class InputIterator, class T>
constexpr typename iterator_traits<InputIterator>::difference_type
count(InputIterator first, InputIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
typename iterator_traits<ForwardIterator>::difference_type
count(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr typename iterator_traits<InputIterator>::difference_type
count_if(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
typename iterator_traits<ForwardIterator>::difference_type
count_if(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, Predicate pred);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, class T, class Proj = identity>
 requires IndirectRelation<ranges::equal_to<>, projected<I, Proj>, const T*>
 constexpr iter_difference_t<I>
 count(I first, S last, const T& value, Proj proj = {});
 template<InputRange R, class T, class Proj = identity>
 requires IndirectRelation<ranges::equal_to<>, projected<iterator_t<R>, Proj>, const T*>
 constexpr iter_difference_t<iterator_t<R>>
 count(R&& r, const T& value, Proj proj = {});
}

```

```

template<InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
constexpr iter_difference_t<I>
count_if(I first, S last, Pred pred, Proj proj = {});
template<InputRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
constexpr iter_difference_t<iterator_t<R>>
count_if(R&& r, Pred pred, Proj proj = {});
}

```

1 Let  $E$  be:

- (1.1) —  $*i == \text{value}$  for the overloads with no parameter  $\text{pred}$  or  $\text{proj}$ ,
- (1.2) —  $\text{pred}(*i) != \text{false}$  for the overloads with a parameter  $\text{pred}$  but no parameter  $\text{proj}$ ,
- (1.3) —  $\text{invoke}(\text{proj}, *i) == \text{value}$  for the overloads with a parameter  $\text{proj}$  but no parameter  $\text{pred}$ ,
- (1.4) —  $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)) != \text{false}$  for the overloads with both parameters  $\text{proj}$  and  $\text{pred}$ .

2 *Effects*: Returns the number of iterators  $i$  in the range  $[\text{first}, \text{last})$  for which  $E$  holds.

3 *Complexity*: Exactly  $\text{last} - \text{first}$  applications of the corresponding predicate and any projection.

#### 24.5.10 Mismatch

[mismatch]

```

template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
 class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2,
 class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 BinaryPredicate pred);

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 class Proj1 = identity, class Proj2 = identity,
 IndirectRelation<projected<I1, Proj1>,
 projected<I2, Proj2>> Pred = ranges::equal_to<>>
 constexpr mismatch_result<I1, I2>
 mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2,
 class Proj1 = identity, class Proj2 = identity,
 IndirectRelation<projected<iterator_t<R1>, Proj1>,
 projected<iterator_t<R2>, Proj2>> Pred = ranges::equal_to<>>
 constexpr mismatch_result<safe_iterator_t<R1>, safe_iterator_t<R2>>
 mismatch(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

1 Let `last2` be `first2 + (last1 - first1)` for the overloads with no parameter `last2` or `r2`.

2 Let  $E$  be:

- (2.1) —  $\neg (\ast(first1 + n) == \ast(first2 + n))$  for the overloads with no parameter `pred`,
- (2.2) —  $\neg pred(\ast(first1 + n), \ast(first2 + n)) == \text{false}$  for the overloads with a parameter `pred` and no parameter `proj1`,
- (2.3) —  $\neg \text{invoke}(pred, \text{invoke}(proj1, \ast(first1 + n)), \text{invoke}(proj2, \ast(first2 + n)))$  for the overloads with both parameters `pred` and `proj1`.

3 Returns:  $\{ first1 + n, first2 + n \}$ , where  $n$  is the smallest integer such that  $E$  holds, or  $\min(last1 - first1, last2 - first2)$  if no such integer exists.

4 Complexity: At most  $\min(last1 - first1, last2 - first2)$  applications of the corresponding predicate and any projections.

#### 24.5.11 Equal

[alg.equal]

```

template<class InputIterator1, class InputIterator2>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool equal(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
 class BinaryPredicate>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
bool equal(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2);

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool equal(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2,
 class BinaryPredicate>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
bool equal(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 class Pred = ranges::equal_to{}, class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
 constexpr bool equal(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, class Pred = ranges::equal_to{},
 class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyComparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
 constexpr bool equal(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

1 Let:

- (1.1) —  $\text{last2}$  be  $\text{first2} + (\text{last1} - \text{first1})$  for the overloads with no parameter  $\text{last2}$  or  $\text{r2}$ ,
- (1.2) —  $\text{pred}$  be  $\text{equal\_to}\{\}$  for the overloads with no parameter  $\text{pred}$ ,
- (1.3) —  $E$  be:
  - (1.3.1) —  $\text{pred}(*i, *(\text{first2} + (i - \text{first1})))$  for the overloads with no parameter  $\text{proj1}$ ,
  - (1.3.2) —  $\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *i), \text{invoke}(\text{proj2}, *(\text{first2} + (i - \text{first1}))))$  for the overloads with parameter  $\text{proj1}$ .

2 *Returns*: If  $\text{last1} - \text{first1} \neq \text{last2} - \text{first2}$ , return `false`. Otherwise return `true` if  $E$  holds for every iterator  $i$  in the range  $[\text{first1}, \text{last1}]$ . Otherwise, returns `false`.

3 *Complexity*: If the types of  $\text{first1}$ ,  $\text{last1}$ ,  $\text{first2}$ , and  $\text{last2}$ :

- (3.1) — meet the *Cpp17RandomAccessIterator* requirements (22.3.5.6) for the overloads in namespace `std`, or
- (3.2) — pairwise model *SizedSentinel* (22.3.4.8) for the overloads in namespace `ranges`, and  $\text{last1} - \text{first1} \neq \text{last2} - \text{first2}$ , then no applications of the corresponding predicate and each projection; otherwise,
- (3.3) — For the overloads with no `ExecutionPolicy`, at most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the corresponding predicate and any projections.
- (3.4) — For the overloads with an `ExecutionPolicy`,  $\mathcal{O}(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$  applications of the corresponding predicate.

## 24.5.12 Is permutation

[alg.is\_permutation]

```

template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);

```

```

template<class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, BinaryPredicate pred);
template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);
template<class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

```

1     *Requires:* ForwardIterator1 and ForwardIterator2 shall have the same value type. The comparison function shall be an equivalence relation.

2     *Remarks:* If last2 was not given in the argument list, it denotes first2 + (last1 - first1) below.

3     *Returns:* If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, first2 + (last1 - first1)), beginning with ForwardIterator2 begin, such that equal(first1, last1, begin) returns true or equal(first1, last1, begin, pred) returns true; otherwise, returns false.

4     *Complexity:* No applications of the corresponding predicate if ForwardIterator1 and ForwardIterator2 meet the requirements of random access iterators and last1 - first1 != last2 - first2. Otherwise, exactly last1 - first1 applications of the corresponding predicate if equal(first1, last1, first2, last2) would return true if pred was not given in the argument list or equal(first1, last1, first2, last2, pred) would return true if pred was given in the argument list; otherwise, at worst  $\mathcal{O}(N^2)$ , where N has the value last1 - first1.

```

namespace ranges {
 template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2,
 Sentinel<I2> S2, class Pred = ranges::equal_to<>, class Proj1 = identity,
 class Proj2 = identity>
 requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
 constexpr bool is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
 template<ForwardRange R1, ForwardRange R2, class Pred = ranges::equal_to<>,
 class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyComparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
 constexpr bool is_permutation(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

5     *Returns:* If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, last2), bounded by [pfirst, plast), such that ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2) returns true; otherwise, returns false.

6     *Complexity:* No applications of the corresponding predicate and projections if:

- (6.1) — S1 and I1 model SizedSentinel,
- (6.2) — S2 and I2 model SizedSentinel, and
- (6.3) — last1 - first1 != last2 - first2.

Otherwise, exactly last1 - first1 applications of the corresponding predicate and projections if ranges::equal(first1, last1, first2, last2, pred, proj1, proj2) would return true; otherwise, at worst  $\mathcal{O}(N^2)$ , where N has the value last1 - first1.

### 24.5.13 Search

[alg.search]

```

template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
search(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
 search(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
constexpr ForwardIterator1
 search(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
ForwardIterator1
 search(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

```

- 1     *Returns:* The first iterator  $i$  in the range  $[first1, last1 - (last2-first2))$  such that for every non-negative integer  $n$  less than  $last2 - first2$  the following corresponding conditions hold:  $*(i + n) == *(first2 + n)$ ,  $pred(*(i + n), *(first2 + n)) != \text{false}$ . Returns  $first1$  if  $[first2, last2)$  is empty, otherwise returns  $last1$  if no such iterator is found.
- 2     *Complexity:* At most  $(last1 - first1) * (last2 - first2)$  applications of the corresponding predicate.

```

namespace ranges {
 template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2,
 Sentinel<I2> S2, class Pred = ranges::equal_to<>,
 class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
 constexpr subrange<I1>
 search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
 template<ForwardRange R1, ForwardRange R2, class Pred = ranges::equal_to<>,
 class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyComparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
 constexpr safe_subrange_t<R1>
 search(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

- 3     *Returns:*
- (3.1)     —  $\{i, i + (last2 - first2)\}$ , where  $i$  is the first iterator in the range  $[first1, last1 - (last2 - first2))$  such that for every non-negative integer  $n$  less than  $last2 - first2$  the condition  
 $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *(i + n)), \text{invoke}(\text{proj2}, *(first2 + n))))$   
is true;
- (3.2)     — Returns  $\{last1, last1\}$  if no such iterator exists.
- 4     *Complexity:* At most  $(last1 - first1) * (last2 - first2)$  applications of the corresponding predicate and projections.

```

template<class ForwardIterator, class Size, class T>
constexpr ForwardIterator
 search_n(ForwardIterator first, ForwardIterator last,
 Size count, const T& value);

template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator
 search_n(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Size count, const T& value);

```

```

template<class ForwardIterator, class Size, class T,
 class BinaryPredicate>
constexpr ForwardIterator
search_n(ForwardIterator first, ForwardIterator last,
 Size count, const T& value,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T,
 class BinaryPredicate>
ForwardIterator
search_n(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Size count, const T& value,
 BinaryPredicate pred);

```

5     *Requires:* The type `Size` shall be convertible to integral type (7.3.8, 10.3.7).

6     *Returns:* The first iterator `i` in the range `[first, last - count]` such that for every non-negative integer `n` less than `count` the following corresponding conditions hold: `*(i + n) == value`, `pred(*(i + n), value) != false`. Returns `last` if no such iterator is found.

7     *Complexity:* At most `last - first` applications of the corresponding predicate.

```

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class T,
 class Pred = ranges::equal_to<>, class Proj = identity>
 requires IndirectlyComparable<I, const T*, Pred, Proj>
 constexpr subrange<I>
 search_n(I first, S last, iter_difference_t<I> count,
 const T& value, Pred pred = {}, Proj proj = {});
 template<ForwardRange R, class T, class Pred = ranges::equal_to<>,
 class Proj = identity>
 requires IndirectlyComparable<iterator_t<R>, const T*, Pred, Proj>
 constexpr safe_subrange_t<R>
 search_n(R&& r, iter_difference_t<iterator_t<R>> count,
 const T& value, Pred pred = {}, Proj proj = {});
}

```

8     *Returns:* `{i, i + count}` where `i` is the first iterator in the range `[first, last - count]` such that for every non-negative integer `n` less than `count`, the following condition holds: `invoke(pred, invoke(proj, *(i + n)), value)`. Returns `{last, last}` if no such iterator is found.

9     *Complexity:* At most `last - first` applications of the corresponding predicate and projection.

```

template<class ForwardIterator, class Searcher>
constexpr ForwardIterator
search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);

```

10    *Effects:* Equivalent to: `return searcher(first, last).first;`

11    *Remarks:* `Searcher` need not meet the `Cpp17CopyConstructible` requirements.

## 24.6 Mutating sequence operations

[alg.modifying.operations]

### 24.6.1 Copy

[alg.copy]

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator copy(InputIterator first, InputIterator last,
 OutputIterator result);

```

```

namespace ranges {
 template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O>
 requires IndirectlyCopyable<I, O>
 constexpr copy_result<I, O>
 copy(I first, S last, O result);
 template<InputRange R, WeaklyIncrementable O>
 requires IndirectlyCopyable<iterator_t<R>, O>
 constexpr copy_result<safe_iterator_t<R>, O>
 copy(R&& r, O result);
}

```

}

1 Let  $N$  be  $\text{last} - \text{first}$ .

2 *Requires:*  $\text{result}$  shall not be in the range  $[\text{first}, \text{last}]$ .

3 *Effects:* Copies elements in the range  $[\text{first}, \text{last}]$  into the range  $[\text{result}, \text{result} + N]$  starting from  $\text{first}$  and proceeding to  $\text{last}$ . For each non-negative integer  $n < N$ , performs  $*(\text{result} + n) = *(\text{first} + n)$ .

4 *Returns:*

(4.1) —  $\text{result} + N$  for the overload in namespace `std`, or

(4.2) —  $\{\text{last}, \text{result} + N\}$  for the overloads in namespace `ranges`.

5 *Complexity:* Exactly  $N$  assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 copy(ExecutionPolicy&& policy,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result);
```

6 *Requires:* The ranges  $[\text{first}, \text{last}]$  and  $[\text{result}, \text{result} + (\text{last} - \text{first})]$  shall not overlap.

7 *Effects:* Copies elements in the range  $[\text{first}, \text{last}]$  into the range  $[\text{result}, \text{result} + (\text{last} - \text{first})]$ . For each non-negative integer  $n < (\text{last} - \text{first})$ , performs  $*(\text{result} + n) = *(\text{first} + n)$ .

8 *Returns:*  $\text{result} + (\text{last} - \text{first})$ .

9 *Complexity:* Exactly  $\text{last} - \text{first}$  assignments.

```
template<class InputIterator, class Size, class OutputIterator>
constexpr OutputIterator copy_n(InputIterator first, Size n,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
ForwardIterator2 copy_n(ExecutionPolicy&& exec,
 ForwardIterator1 first, Size n,
 ForwardIterator2 result);
```

```
namespace ranges {
 template<InputIterator I, WeaklyIncrementable O>
 requires IndirectlyCopyable<I, O>
 constexpr copy_n_result<I, O>
 copy_n(I first, iter_difference_t<I> n, O result);
}
```

10 Let  $M$  be  $\max(n, 0)$ .

11 *Effects:* For each non-negative integer  $i < M$ , performs  $*(\text{result} + i) = *(\text{first} + i)$ .

12 *Returns:*

(12.1) —  $\text{result} + M$  for the overloads in namespace `std`, or

(12.2) —  $\{\text{first} + M, \text{result} + M\}$  for the overload in namespace `ranges`.

13 *Complexity:* Exactly  $M$  assignments.

```
template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator copy_if(InputIterator first, InputIterator last,
 OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class Predicate>
ForwardIterator2 copy_if(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, Predicate pred);
```

```
namespace ranges {
 template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 requires IndirectlyCopyable<I, O>
```

```

 constexpr copy_if_result<I, 0>
 copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<InputRange R, WeaklyIncrementable O, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 requires IndirectlyCopyable<iterator_t<R>, O>
 constexpr copy_if_result<safe_iterator_t<R>, O>
 copy_if(R&& r, O result, Pred pred, Proj proj = {});
}

```

14 Let  $E$  be:

- (14.1) — `bool(pred(*i))` for the overloads in namespace `std`, or
- (14.2) — `bool(invoker(pred, invoke(proj, *i)))` for the overloads in namespace `ranges`.

and  $N$  be the number of iterators  $i$  in the range  $[first, last)$  for which the condition  $E$  holds.

15 *Requires:* The ranges  $[first, last)$  and  $[result, result + (last - first))$  shall not overlap.  
*Note:* For the overload with an `ExecutionPolicy`, there may be a performance cost if `iterator_traits<ForwardIterator1>::value_type` is not *Cpp17MoveConstructible* (Table 26). — *end note*

16 *Effects:* Copies all of the elements referred to by the iterator  $i$  in the range  $[first, last)$  for which  $E$  is `true`.

17 *Returns:*

- (17.1) — `result + N` for the overloads in namespace `std`, or
- (17.2) — `{last, result + N}` for the overloads in namespace `ranges`.

18 *Complexity:* Exactly  $last - first$  applications of the corresponding predicate and any projection.

19 *Remarks:* Stable (15.5.5.7).

```

template<class BidirectionalIterator1, class BidirectionalIterator2>
constexpr BidirectionalIterator2
 copy_backward(BidirectionalIterator1 first,
 BidirectionalIterator1 last,
 BidirectionalIterator2 result);

namespace ranges {
 template<BidirectionalIterator I1, Sentinel<I1> S1, BidirectionalIterator I2>
 requires IndirectlyCopyable<I1, I2>
 constexpr copy_backward_result<I1, I2>
 copy_backward(I1 first, S1 last, I2 result);
 template<BidirectionalRange R, BidirectionalIterator I>
 requires IndirectlyCopyable<iterator_t<R>, I>
 constexpr copy_backward_result<safe_iterator_t<R>, I>
 copy_backward(R&& r, I result);
}

```

20 Let  $N$  be  $last - first$ .

21 *Requires:* `result` shall not be in the range  $(first, last]$ .

22 *Effects:* Copies elements in the range  $[first, last)$  into the range  $[result - N, result)$  starting from  $last - 1$  and proceeding to  $first$ .<sup>235</sup> For each positive integer  $n \leq N$ , performs  $*(result - n) = *(last - n)$ .

23 *Returns:*

- (23.1) — `result - N` for the overload in namespace `std`, or
- (23.2) — `{last, result - N}` for the overloads in namespace `ranges`.

24 *Complexity:* Exactly  $N$  assignments.

## 24.6.2 Move

[alg.move]

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator move(InputIterator first, InputIterator last,
 OutputIterator result);

```

<sup>235</sup>) `copy_backward` should be used instead of `copy` when `last` is in the range  $[result - N, result)$ .

```

namespace ranges {
 template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O>
 requires IndirectlyMovable<I, O>
 constexpr move_result<I, O>
 move(I first, S last, O result);
 template<InputRange R, WeaklyIncrementable O>
 requires IndirectlyMovable<iterator_t<R>, O>
 constexpr move_result<safe_iterator_t<R>, O>
 move(R&& r, O result);
}

```

1 Let  $E$  be

- (1.1) — `std::move(*(first + n))` for the overload in namespace `std`, or
- (1.2) — `ranges::iter_move(first + n)` for the overloads in namespace `ranges`.

Let  $N$  be  $last - first$ .

2 *Requires:* `result` shall not be in the range `[first, last)`.

3 *Effects:* Moves elements in the range `[first, last)` into the range `[result, result + N)` starting from `first` and proceeding to `last`. For each non-negative integer  $n < N$ , performs `*(result + n) = E`.

4 *Returns:*

- (4.1) — `result + N` for the overload in namespace `std`, or
- (4.2) — `{last, result + N}` for the overloads in namespace `ranges`.

5 *Complexity:* Exactly  $N$  assignments.

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 move(ExecutionPolicy&& policy,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result);

```

6 Let  $N$  be  $last - first$ .

7 *Requires:* The ranges `[first, last)` and `[result, result + N)` shall not overlap.

8 *Effects:* Moves elements in the range `[first, last)` into the range `[result, result + N)`. For each non-negative integer  $n < N$ , performs `*(result + n) = std::move(*(first + n))`.

9 *Returns:* `result + N`.

10 *Complexity:* Exactly  $N$  assignments.

```

template<class BidirectionalIterator1, class BidirectionalIterator2>
constexpr BidirectionalIterator2
move_backward(BidirectionalIterator1 first, BidirectionalIterator1 last,
 BidirectionalIterator2 result);

```

```

namespace ranges {
 template<BidirectionalIterator I1, Sentinel<I1> S1, BidirectionalIterator I2>
 requires IndirectlyMovable<I1, I2>
 constexpr move_backward_result<I1, I2>
 move_backward(I1 first, S1 last, I2 result);
 template<BidirectionalRange R, BidirectionalIterator I>
 requires IndirectlyMovable<iterator_t<R>, I>
 constexpr move_backward_result<safe_iterator_t<R>, I>
 move_backward(R&& r, I result);
}

```

11 Let  $E$  be

- (11.1) — `std::move(*(last - n))` for the overload in namespace `std`, or
- (11.2) — `ranges::iter_move(last - n)` for the overloads in namespace `ranges`.

Let  $N$  be  $last - first$ .

12 *Requires:* `result` shall not be in the range `(first, last]`.

13     *Effects:* Moves elements in the range  $[first, last)$  into the range  $[result - N, result)$  starting from  $last - 1$  and proceeding to  $first$ .<sup>236</sup> For each positive integer  $n \leq N$ , performs  $*(result - n) = E$ .

14     *Returns:*

(14.1)     —  $result - N$  for the overload in namespace **std**, or

(14.2)     —  $\{last, result - N\}$  for the overloads in namespace **ranges**.

15     *Complexity:* Exactly  $N$  assignments.

### 24.6.3 Swap

[alg.swap]

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator2
 swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
 swap_ranges(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2>
 requires IndirectlySwappable<I1, I2>
 constexpr swap_ranges_result<I1, I2>
 swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
 template<InputRange R1, InputRange R2>
 requires IndirectlySwappable<iterator_t<R1>, iterator_t<R2>>
 constexpr swap_ranges_result<safe_iterator_t<R1>, safe_iterator_t<R2>>
 swap_ranges(R1&& r1, R2&& r2);
}
```

1     Let:

- (1.1)     —  $last2$  be  $first2 + (last1 - first1)$  for the overloads with no parameter named  $last2$ , and
- (1.2)     —  $M$  be  $\min(last1 - first1, last2 - first2)$ .

2     *Requires:* The two ranges  $[first1, last1)$  and  $[first2, last2)$  shall not overlap. For the overloads in namespace **std**,  $*(first1 + n)$  shall be swappable with [\(15.5.3.2\)](#)  $*(first2 + n)$ .

3     *Effects:* For each non-negative integer  $n < M$  performs:

- (3.1)     —  $swap(*(first1 + n), *(first2 + n))$  for the overloads in namespace **std**, or
- (3.2)     — **ranges**::*iter\_swap*( $first1 + n$ ,  $first2 + n$ ) for the overloads in namespace **ranges**.

4     *Returns:*

- (4.1)     —  $last2$  for the overloads in namespace **std**, or
- (4.2)     —  $\{first1 + M, first2 + M\}$  for the overloads in namespace **ranges**.

5     *Complexity:* Exactly  $M$  swaps.

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

6     *Requires:*  $a$  and  $b$  shall be dereferenceable.  $*a$  shall be swappable with [\(15.5.3.2\)](#)  $*b$ .

7     *Effects:* As if by  $swap(*a, *b)$ .

### 24.6.4 Transform

[alg.transform]

```
template<class InputIterator, class OutputIterator,
 class UnaryOperation>
constexpr OutputIterator
 transform(InputIterator first1, InputIterator last1,
 OutputIterator result, UnaryOperation op);
```

<sup>236</sup> `move_backward` should be used instead of `move` when `last` is in the range  $[result - N, result)$ .

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class UnaryOperation>
ForwardIterator2
 transform(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 result, UnaryOperation op);

template<class InputIterator1, class InputIterator2,
 class OutputIterator, class BinaryOperation>
constexpr OutputIterator
 transform(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, OutputIterator result,
 BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator, class BinaryOperation>
ForwardIterator
 transform(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator result,
 BinaryOperation binary_op);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O,
 CopyConstructible F, class Proj = identity>
 requires Writable<O, indirect_result_t<F&, projected<I, Proj>>>
 constexpr unary_transform_result<I, O>
 transform(I first1, S last1, O result, F op, Proj proj = {});
 template<InputRange R, WeaklyIncrementable O, CopyConstructible F,
 class Proj = identity>
 requires Writable<O, indirect_result_t<F&, projected<iterator_t<R>, Proj>>>
 constexpr unary_transform_result<safe_iterator_t<R>, O>
 transform(R&& r, O result, F op, Proj proj = {});
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 WeaklyIncrementable O, CopyConstructible F, class Proj1 = identity,
 class Proj2 = identity>
 requires Writable<O, indirect_result_t<F&, projected<I1, Proj1>,
 projected<I2, Proj2>>>
 constexpr binary_transform_result<I1, I2, O>
 transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
 F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, WeaklyIncrementable O,
 CopyConstructible F, class Proj1 = identity, class Proj2 = identity>
 requires Writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>,
 projected<iterator_t<R2>, Proj2>>>
 constexpr binary_transform_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O>
 transform(R1&& r1, R2&& r2, O result,
 F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

1 Let:

- (1.1) —  $\text{last2}$  be  $\text{first2} + (\text{last1} - \text{first1})$  for the overloads with parameter  $\text{first2}$  but no parameter  $\text{last2}$ ,
- (1.2) —  $N$  be  $\text{last1} - \text{first1}$  for unary transforms, or  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  for binary transforms, and
- (1.3) —  $E$  be
  - (1.3.1) —  $\text{op}(*(\text{first1} + (\text{i} - \text{result})))$  for unary transforms defined in namespace `std`,
  - (1.3.2) —  $\text{binary\_op}(*(\text{first1} + (\text{i} - \text{result})), *(\text{first2} + (\text{i} - \text{result})))$  for binary transforms defined in namespace `std`,
  - (1.3.3) —  $\text{invoke}(\text{op}, \text{invoke}(\text{proj}, *(\text{first1} + (\text{i} - \text{result}))))$  for unary transforms defined in namespace `ranges`, or

(1.3.4) — invoke(binary\_op, invoke(proj1, \*(first1 + (i - result))), invoke(proj2, \*(first2 + (i - result)))) for binary transforms defined in namespace `ranges`.

2     *Requires:* `op` and `binary_op` shall not invalidate iterators or subranges, or modify elements in the ranges

(2.1)   — `[first1, first1 + N]`,

(2.2)   — `[first2, first2 + N]`, and

(2.3)   — `[result, result + N]`.<sup>237</sup>

3     *Effects:* Assigns through every iterator `i` in the range `[result, result + N]` a new corresponding value equal to `E`.

4     *Returns:*

(4.1)   — `result + N` for the overloads defined in namespace `std`,

(4.2)   — `{first1 + N, result + N}` for unary transforms defined in namespace `ranges`, or

(4.3)   — `{first1 + N, first2 + N, result + N}` for binary transforms defined in namespace `ranges`.

5     *Complexity:* Exactly  $N$  applications of `op` or `binary_op`, and any projections. This requirement also applies to the overload with an `ExecutionPolicy`.

6     *Remarks:* `result` may be equal to `first1` or `first2`.

## 24.6.5 Replace

[alg.replace]

```
template<class ForwardIterator, class T>
constexpr void replace(ForwardIterator first, ForwardIterator last,
 const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class T>
void replace(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
constexpr void replace_if(ForwardIterator first, ForwardIterator last,
 Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T>
void replace_if(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Predicate pred, const T& new_value);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, class T1, class T2, class Proj = identity>
 requires Writable<I, const T2&> &&
 IndirectRelation<ranges::equal_to<>, projected<I, Proj>, const T1*>
 constexpr I
 replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {});
 template<InputRange R, class T1, class T2, class Proj = identity>
 requires Writable<iterator_t<R>, const T2&> &&
 IndirectRelation<ranges::equal_to<>, projected<iterator_t<R>, Proj>, const T1*>
 constexpr safe_iterator_t<R>
 replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {});
 template<InputIterator I, Sentinel<I> S, class T, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 requires Writable<I, const T&>
 constexpr I replace_if(I first, S last, Pred pred, const T& new_value, Proj proj = {});
 template<InputRange R, class T, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 requires Writable<iterator_t<R>, const T&>
 constexpr safe_iterator_t<R>
 replace_if(R&& r, Pred pred, const T& new_value, Proj proj = {});
}
```

<sup>237)</sup> The use of fully closed ranges is intentional.

}

1 Let  $E$  be

- (1.1) —  $\text{bool}(*\text{i} == \text{old\_value})$  for `replace`,
- (1.2) —  $\text{bool}(\text{pred}(*\text{i}))$  for `replace_if`,
- (1.3) —  $\text{bool}(\text{invoke}(\text{proj}, *i) == \text{old\_value})$  for `ranges::replace`, or
- (1.4) —  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$  for `ranges::replace_if`.

2 *Requires:* The expression `*first = new_value` shall be valid.

3 *Effects:* Substitutes elements referred by the iterator  $i$  in the range  $[\text{first}, \text{last})$  with `new_value`, when  $E$  is true.

4 *Returns:* `last` for the overloads in namespace `ranges`.

5 *Complexity:* Exactly  $\text{last} - \text{first}$  applications of the corresponding predicate and any projection.

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
 replace_copy(InputIterator first, InputIterator last,
 OutputIterator result,
 const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
 replace_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result,
 const T& old_value, const T& new_value);

template<class InputIterator, class OutputIterator, class Predicate, class T>
constexpr OutputIterator
 replace_copy_if(InputIterator first, InputIterator last,
 OutputIterator result,
 Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class Predicate, class T>
ForwardIterator2
 replace_copy_if(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result,
 Predicate pred, const T& new_value);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, class T1, class T2, OutputIterator<const T2&> O,
 class Proj = identity>
 requires IndirectlyCopyable<I, O> &&
 IndirectRelation<ranges::equal_to<>, projected<I, Proj>, const T1*>
 constexpr replace_copy_result<I, O>
 replace_copy(I first, S last, O result, const T1& old_value, const T2& new_value,
 Proj proj = {});
 template<InputRange R, class T1, class T2, OutputIterator<const T2&> O,
 class Proj = identity>
 requires IndirectlyCopyable<iterator_t<R>, O> &&
 IndirectRelation<ranges::equal_to<>, projected<iterator_t<R>, Proj>, const T1*>
 constexpr replace_copy_result<safe_iterator_t<R>, O>
 replace_copy(R&& r, O result, const T1& old_value, const T2& new_value,
 Proj proj = {});

 template<InputIterator I, Sentinel<I> S, class T, OutputIterator<const T&> O,
 class Proj = identity, IndirectUnaryPredicate<projected<I, Proj>> Pred>
 requires IndirectlyCopyable<I, O>
 constexpr replace_copy_if_result<I, O>
 replace_copy_if(I first, S last, O result, Pred pred, const T& new_value,
 Proj proj = {});
}
```

```

template<InputRange R, class T, OutputIterator<const T&> O, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
requires IndirectlyCopyable<iterator_t<R>, O>
constexpr replace_copy_if_result<safe_iterator_t<R>, O>
 replace_copy_if(R&& r, O result, Pred pred, const T& new_value,
 Proj proj = {});
}

6 Let E be
(6.1) — bool(*(first + (i - result)) == old_value) for replace_copy,
(6.2) — bool(pred(*(first + (i - result)))) for replace_copy_if,
(6.3) — bool(invoker(proj, *(first + (i - result))) == old_value) for ranges::replace_copy,
(6.4) — bool(invoker(pred, invoker(proj, *(first + (i - result))))) for ranges::replace_copy_if.

```

7 *Requires:* The results of the expressions `*first` and `new_value` shall be writable (22.3.1) to the `result` output iterator. The ranges `[first, last]` and `[result, result + (last - first)]` shall not overlap.

8 *Effects:* Assigns to every iterator  $i$  in the range `[result, result + (last - first)]` either `new_value` or `*(first + (i - result))` depending on whether  $E$  holds.

9 *Returns:*

- (9.1) — `result + (last - first)` for the overloads in namespace `std`, or
- (9.2) — `{last, result + (last - first)}` for the overloads in namespace `ranges`.

10 *Complexity:* Exactly  $last - first$  applications of the corresponding predicate and any projection.

#### 24.6.6 Fill

[alg.fill]

```

template<class ForwardIterator, class T>
constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
void fill(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator fill_n(ExecutionPolicy&& exec,
 ForwardIterator first, Size n, const T& value);

namespace ranges {
 template<class T, OutputIterator<const T&> O, Sentinel<O> S>
 constexpr O fill(O first, S last, const T& value);
 template<class T, OutputRange<const T&> R>
 constexpr safe_iterator_t<R> fill(R&& r, const T& value);
 template<class T, OutputIterator<const T&> O>
 constexpr O fill_n(O first, iter_difference_t<O> n, const T& value);
}

```

1 Let  $N$  be  $\max(0, n)$  for the `fill_n` algorithms, and  $last - first$  for the `fill` algorithms.

2 *Requires:* The expression `value` shall be writable (22.3.1) to the output iterator. The type `Size` shall be convertible to an integral type (7.3.8, 10.3.7).

3 *Effects:* Assigns `value` through all the iterators in the range `[first, first + N]`.

4 *Returns:* `first + N`.

5 *Complexity:* Exactly  $N$  assignments.

### 24.6.7 Generate

[alg.generate]

```
template<class ForwardIterator, class Generator>
constexpr void generate(ForwardIterator first, ForwardIterator last,
 Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Generator>
void generate(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Generator gen);

template<class OutputIterator, class Size, class Generator>
constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
ForwardIterator generate_n(ExecutionPolicy&& exec,
 ForwardIterator first, Size n, Generator gen);

namespace ranges {
 template<Iterator O, Sentinel<O> S, CopyConstructible F>
 requires Invocable<F&> && Writable<O, invoke_result_t<F&>>
 constexpr O generate(O first, S last, F gen);
 template<class R, CopyConstructible F>
 requires Invocable<F&> && OutputRange<R, invoke_result_t<F&>>
 constexpr safe_iterator_t<R> generate(R&& r, F gen);
 template<Iterator O, CopyConstructible F>
 requires Invocable<F&> && Writable<O, invoke_result_t<F&>>
 constexpr O generate_n(O first, iter_difference_t<O> n, F gen);
}
```

- 1 Let  $N$  be  $\max(0, n)$  for the `generate_n` algorithms, and  $last - first$  for the `generate` algorithms.
- 2 *Requires:* `Size` shall be convertible to an integral type (7.3.8, 10.3.7).
- 3 *Effects:* Assigns the result of successive evaluations of `gen()` through each iterator in the range  $[first, first + N]$ .
- 4 *Returns:*  $first + N$ .
- 5 *Complexity:* Exactly  $N$  evaluations of `gen()` and assignments.

### 24.6.8 Remove

[alg.remove]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
 const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
ForwardIterator remove(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 const T& value);

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
 Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator remove_if(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Predicate pred);

namespace ranges {
 template<Permutable I, Sentinel<I> S, class T, class Proj = identity>
 requires IndirectRelation<ranges::equal_to<>, projected<I, Proj>, const T*>
 constexpr I remove(I first, S last, const T& value, Proj proj = {});
 template<ForwardRange R, class T, class Proj = identity>
 requires Permutable<iterator_t<R>> &&
 IndirectRelation<ranges::equal_to<>, projected<iterator_t<R>, Proj>, const T*>
 constexpr safe_iterator_t<R>
 remove(R&& r, const T& value, Proj proj = {});
```

```

template<Permutable I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
constexpr I remove_if(I first, S last, Pred pred, Proj proj = {});
template<ForwardRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
requires Permutable<iterator_t<R>>
constexpr safe_iterator_t<R>
remove_if(R&& r, Pred pred, Proj proj = {});
}

```

1 Let  $E$  be

- (1.1) — `bool(*i == value)` for `remove`,
- (1.2) — `bool(pred(*i))` for `remove_if`,
- (1.3) — `bool(invoker(proj, *i) == value)` for `ranges::remove`, or
- (1.4) — `bool(invoker(pred, invoker(proj, *i)))` for `ranges::remove_if`.

2 *Requires:* For the algorithms in namespace `std`, the type of `*first` shall meet the *Cpp17MoveAssignable* requirements (Table 28).

3 *Effects:* Eliminates all the elements referred to by iterator `i` in the range `[first, last)` for which  $E$  holds.

4 *Returns:* The end of the resulting range.

5 *Remarks:* Stable (15.5.5.7).

6 *Complexity:* Exactly  $last - first$  applications of the corresponding predicate and any projection.

7 [Note: Each element in the range `[ret, last)`, where `ret` is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — *end note*]

```

template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
remove_copy(InputIterator first, InputIterator last,
 OutputIterator result, const T& value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class T>
ForwardIterator2
remove_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, const T& value);

template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator
remove_copy_if(InputIterator first, InputIterator last,
 OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class Predicate>
ForwardIterator2
remove_copy_if(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, Predicate pred);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O, class T,
 class Proj = identity>
 requires IndirectlyCopyable<I, O> &&
 IndirectRelation<ranges::equal_to<>, projected<I, Proj>, const T*>
constexpr remove_copy_result<I, O>
remove_copy(I first, S last, O result, const T& value, Proj proj = {});
 template<InputRange R, WeaklyIncrementable O, class T, class Proj = identity>
 requires IndirectlyCopyable<iterator_t<R>, O> &&
 IndirectRelation<ranges::equal_to<>, projected<iterator_t<R>, Proj>, const T*>
constexpr remove_copy_result<safe_iterator_t<R>, O>

```

```

 remove_copy(R&& r, 0 result, const T& value, Proj proj = {});
template<InputIterator I, Sentinel<I> S, WeaklyIncrementable 0,
 class Proj = identity, IndirectUnaryPredicate<projected<I, Proj>> Pred>
requires IndirectlyCopyable<I, 0>
constexpr remove_copy_if_result<I, 0>
remove_copy_if(I first, S last, 0 result, Pred pred, Proj proj = {});
template<InputRange R, WeaklyIncrementable 0, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
requires IndirectlyCopyable<iterator_t<R>, 0>
constexpr remove_copy_if_result<safe_iterator_t<R>, 0>
remove_copy_if(R&& r, 0 result, Pred pred, Proj proj = {});
}

```

8 Let  $E$  be

- (8.1) —  $\text{bool}(*i == \text{value})$  for `remove_copy`,
- (8.2) —  $\text{bool}(\text{pred}(*i))$  for `remove_copy_if`,
- (8.3) —  $\text{bool}(\text{invoke}(\text{proj}, *i) == \text{value})$  for `ranges::remove_copy`, or
- (8.4) —  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$  for `ranges::remove_copy_if`.

9 Let  $N$  be the number of elements in  $[\text{first}, \text{last}]$  for which  $E$  is false.

10 *Requires:* The ranges  $[\text{first}, \text{last}]$  and  $[\text{result}, \text{result} + (\text{last} - \text{first})]$  shall not overlap. The expression  $*\text{result} = *\text{first}$  shall be valid. [Note: For the overloads with an `ExecutionPolicy`, there may be a performance cost if `iterator_traits<ForwardIterator1>::value_type` does not meet the *Cpp17MoveConstructible* (Table 26) requirements. — end note]

11 *Effects:* Copies all the elements referred to by the iterator  $i$  in the range  $[\text{first}, \text{last}]$  for which  $E$  is false.

12 *Returns:*

- (12.1) —  $\text{result} + N$ , for the algorithms in namespace `std`, or
- (12.2) —  $\{\text{last}, \text{result} + N\}$ , for the algorithms in namespace `ranges`.

13 *Complexity:* Exactly  $\text{last} - \text{first}$  applications of the corresponding predicate and any projection.

14 *Remarks:* Stable (15.5.5.7).

## 24.6.9 Unique

[alg.unique]

```

template<class ForwardIterator>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator unique(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator unique(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 BinaryPredicate pred);

namespace ranges {
 template<Permutable I, Sentinel<I> S, class Proj = identity,
 IndirectRelation<projected<I, Proj>> C = ranges::equal_to<>>
 constexpr I unique(I first, S last, C comp = {}, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectRelation<projected<iterator_t<R>, Proj>> C = ranges::equal_to<>>
 requires Permutable<iterator_t<R>>
 constexpr safe_iterator_t<R>
 unique(R&& r, C comp = {}, Proj proj = {});
}

```

1 Let  $\text{pred}$  be `equal_to{}` for the overloads with no parameter  $\text{pred}$ , and let  $E$  be

- (1.1) — `bool(pred(*(i - 1), *i))` for the overloads in namespace `std`, or  
 (1.2) — `bool(invoker(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace `ranges`.

2 *Requires:* For the overloads in namespace `std`, `pred` shall be an equivalence relation and the type of `*first` shall meet the *Cpp17MoveAssignable* requirements (Table 28).

3 *Effects:* For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator `i` in the range `[first + 1, last)` for which `E` is true.

4 *Returns:* The end of the resulting range.

5 *Complexity:* For nonempty ranges, exactly `(last - first) - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result);

template<class InputIterator, class OutputIterator,
 class BinaryPredicate>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last,
 OutputIterator result, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, BinaryPredicate pred);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O,
 class Proj = identity, IndirectRelation<projected<I, Proj>> C = ranges::equal_to<>>
 requires IndirectlyCopyable<I, O> &&
 (ForwardIterator<I> ||
 (InputIterator<O> && Same<iter_value_t<I>, iter_value_t<O>>) ||
 IndirectlyCopyableStorable<I, O>)
 constexpr unique_copy_result<I, O>
 unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});
 template<InputRange R, WeaklyIncrementable O, class Proj = identity,
 IndirectRelation<projected<iterator_t<R>, Proj>> C = ranges::equal_to<>>
 requires IndirectlyCopyable<iterator_t<R>, O> &&
 (ForwardIterator<iterator_t<R>> ||
 (InputIterator<O> && Same<iter_value_t<iterator_t<R>>, iter_value_t<O>>) ||
 IndirectlyCopyableStorable<iterator_t<R>, O>)
 constexpr unique_copy_result<safe_iterator_t<R>, O>
 unique_copy(R&& r, O result, C comp = {}, Proj proj = {});
}
```

6 Let `pred` be `equal_to{}` for the overloads in namespace `std` with no parameter `pred`, and let `E` be

- (6.1) — `bool(pred(*i, *(i - 1)))` for the overloads in namespace `std`, or  
 (6.2) — `bool(invoker(comp, invoke(proj, *i), invoke(proj, *(i - 1))))` for the overloads in namespace `ranges`.

7 *Requires:*

- (7.1) — The ranges `[first, last)` and `[result, result+(last-first))` shall not overlap.  
 (7.2) — For the overloads in namespace `std`:

- (7.2.1) — The comparison function shall be an equivalence relation.
- (7.2.2) — The expression `*result = *first` shall be valid.
- (7.2.3) — For the overloads with no `ExecutionPolicy`, let `T` be the value type of `InputIterator`. If `InputIterator` meets the `Cpp17ForwardIterator` requirements, then there are no additional requirements for `T`. Otherwise, if `OutputIterator` meets the `Cpp17ForwardIterator` requirements and its value type is the same as `T`, then `T` shall meet the `Cpp17CopyAssignable` (Table 29) requirements. Otherwise, `T` shall meet both the `Cpp17CopyConstructible` (Table 27) and `Cpp17CopyAssignable` requirements. [Note: For the overloads with an `ExecutionPolicy`, there may be a performance cost if the value type of `ForwardIterator1` does not meet both the `Cpp17CopyConstructible` and `Cpp17CopyAssignable` requirements. —end note]

8     *Effects:* Copies only the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first, last)` for which `E` holds.

9     *Returns:*

- (9.1) — `result + N` for the overloads in namespace `std`, or
- (9.2) — `{last, result + N}` for the overloads in namespace `ranges`

10    *Complexity:* Exactly `last - first - 1` applications of the corresponding predicate and no more than twice as many applications of any projectionh.

#### 24.6.10 Reverse

[alg.reverse]

```
template<class BidirectionalIterator>
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void reverse(ExecutionPolicy&& exec,
 BidirectionalIterator first, BidirectionalIterator last);

namespace ranges {
 template<BidirectionalIterator I, Sentinel<I> S>
 requires Permutable<I>
 constexpr I reverse(I first, S last);
 template<BidirectionalRange R>
 requires Permutable<iterator_t<R>>
 constexpr safe_iterator_t<R> reverse(R&& r);
}
```

1     *Requires:* For the overloads in namespace `std`, `BidirectionalIterator` shall meet the `Cpp17ValueSwappable` requirements (15.5.3.2).

2     *Effects:* For each non-negative integer `i < (last - first) / 2`, applies `std::iter_swap`, or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators `first + i`, `(last - i) - 1`.

3     *Returns:* `last` for the overloads in namespace `ranges`.

4     *Complexity:* Exactly `(last - first)/2` swaps.

```
template<class BidirectionalIterator, class OutputIterator>
constexpr OutputIterator
reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
 OutputIterator result);
template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
ForwardIterator
reverse_copy(ExecutionPolicy&& exec,
 BidirectionalIterator first, BidirectionalIterator last,
 ForwardIterator result);

namespace ranges {
 template<BidirectionalIterator I, Sentinel<I> S, WeaklyIncrementable O>
 requires IndirectlyCopyable<I, O>
 constexpr reverse_copy_result<I, O>
 reverse_copy(I first, S last, O result);
```

```

template<BidirectionalRange R, WeaklyIncrementable O>
 requires IndirectlyCopyable<iterator_t<R>, O>
 constexpr reverse_copy_result<safe_iterator_t<R>, O>
 reverse_copy(R&& r, O result);
}

5 Let N be $\text{last} - \text{first}$.
6 Requires: The ranges $[\text{first}, \text{last})$ and $[\text{result}, \text{result} + N)$ shall not overlap.
7 Effects: Copies the range $[\text{first}, \text{last})$ to the range $[\text{result}, \text{result} + N)$ such that for every non-negative integer $i < N$ the following assignment takes place: $*(\text{result} + N - 1 - i) = *(\text{first} + i)$.
8 Returns:
(8.1) — $\text{result} + N$ for the overloads in namespace std, or
(8.2) — $\{\text{last}, \text{result} + N\}$ for the overloads in namespace ranges.
9 Complexity: Exactly N assignments.

```

#### 24.6.11 Rotate

[alg.rotate]

```

template<class ForwardIterator>
constexpr ForwardIterator
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator middle, ForwardIterator last);

namespace ranges {
 template<Permutable I, Sentinel<I> S>
 constexpr subrange<I> rotate(I first, I middle, S last);
}

1 Requires: $[\text{first}, \text{middle})$ and $[\text{middle}, \text{last})$ shall be valid ranges. For the overloads in namespace std, ForwardIterator shall meet the Cpp17ValueSwappable requirements (15.5.3.2), and the type of *first shall meet the Cpp17MoveConstructible (Table 26) and Cpp17MoveAssignable (Table 28) requirements.
2 Effects: For each non-negative integer $i < (\text{last} - \text{first})$, places the element from the position $\text{first} + i$ into position $\text{first} + (i + (\text{last} - \text{middle})) \% (\text{last} - \text{first})$. [Note: This is a left rotate. — end note]
3 Returns:
(3.1) — $\text{first} + (\text{last} - \text{middle})$ for the overloads in namespace std, or
(3.2) — $\{\text{first} + (\text{last} - \text{middle}), \text{last}\}$ for the overload in namespace ranges.
4 Complexity: At most $\text{last} - \text{first}$ swaps.

namespace ranges {
 template<ForwardRange R>
 requires Permutable<iterator_t<R>>
 constexpr safe_subrange_t<R> rotate(R&& r, iterator_t<R> middle);
}
5 Effects: Equivalent to: return ranges::rotate(ranges::begin(r), middle, ranges::end(r));

template<class ForwardIterator, class OutputIterator>
constexpr OutputIterator
rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
rotate_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
 ForwardIterator2 result);

```

```

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, WeaklyIncrementable O>
 requires IndirectlyCopyable<I, O>
 constexpr rotate_copy_result<I, O>
 rotate_copy(I first, I middle, S last, O result);
}

6 Let N be $last - first$.
7 Requires: [$first, middle$] and [$middle, last$] shall be valid ranges. The ranges [$first, last$] and [$result, result + N$] shall not overlap.
8 Effects: Copies the range [$first, last$] to the range [$result, result + N$] such that for each non-negative integer $i < N$ the following assignment takes place: $*(result + i) = *(first + (i + (middle - first)) \% N)$.
9 Returns:
(9.1) — $result + N$ for the overloads in namespace std, or
(9.2) — $\{last, result + N\}$ for the overload in namespace ranges.
10 Complexity: Exactly N assignments.

```

```

namespace ranges {
 template<ForwardRange R, WeaklyIncrementable O>
 requires IndirectlyCopyable<iterator_t<R>, O>
 constexpr rotate_copy_result<safe_iterator_t<R>, O>
 rotate_copy(R&& r, iterator_t<R> middle, O result);
}

```

11 Effects: Equivalent to:

```
return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), result);
```

#### 24.6.12 Sample

[`alg.random.sample`]

```

template<class PopulationIterator, class SampleIterator,
 class Distance, class UniformRandomBitGenerator>
SampleIterator sample(PopulationIterator first, PopulationIterator last,
 SampleIterator out, Distance n,
 UniformRandomBitGenerator&& g);

```

1 Requires:

- (1.1) — `PopulationIterator` shall satisfy the `Cpp17InputIterator` requirements ([22.3.5.2](#)).
- (1.2) — `SampleIterator` shall satisfy the `Cpp17OutputIterator` requirements ([22.3.5.3](#)).
- (1.3) — `SampleIterator` shall satisfy the `Cpp17RandomAccessIterator` requirements ([22.3.5.6](#)) unless `PopulationIterator` satisfies the `Cpp17ForwardIterator` requirements ([22.3.5.4](#)).
- (1.4) — `PopulationIterator`'s value type shall be writable ([22.3.1](#)) to `out`.
- (1.5) — `Distance` shall be an integer type.
- (1.6) — `remove_reference_t<UniformRandomBitGenerator>` shall satisfy the requirements of a uniform random bit generator type ([25.6.2.3](#)) whose return type is convertible to `Distance`.
- (1.7) — `out` shall not be in the range [ $first, last$ ].

2 Effects: Copies  $\min(last - first, n)$  elements (the *sample*) from [ $first, last$ ] (the *population*) to `out` such that each possible sample has equal probability of appearance. [Note: Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*. — end note]

3 Returns: The end of the resulting sample range.

4 Complexity:  $\mathcal{O}(last - first)$ .

5 Remarks:

- (5.1) — Stable if and only if `PopulationIterator` satisfies the `Cpp17ForwardIterator` requirements.
- (5.2) — To the extent that the implementation of this function makes use of random numbers, the object `g` shall serve as the implementation's source of randomness.

### 24.6.13 Shuffle

[alg.random.shuffle]

```
template<class RandomAccessIterator, class UniformRandomBitGenerator>
void shuffle(RandomAccessIterator first,
 RandomAccessIterator last,
 UniformRandomBitGenerator&& g);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Gen>
 requires Permutable<I> &&
 UniformRandomBitGenerator<remove_reference_t<Gen>>
 I shuffle(I first, S last, Gen&& g);
 template<RandomAccessRange R, class Gen>
 requires Permutable<iterator_t<R>> &&
 UniformRandomBitGenerator<remove_reference_t<Gen>>
 safe_iterator_t<R> shuffle(R&& r, Gen&& g);
}
```

1     *Requires:* For the overload in namespace `std`:

- (1.1) — `RandomAccessIterator` shall meet the *Cpp17ValueSwappable* requirements (15.5.3.2).
- (1.2) — The type `remove_reference_t<UniformRandomBitGenerator>` shall meet the uniform random bit generator (25.6.2.3) requirements.

2     *Effects:* Permutes the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.

3     *Returns:* `last` for the overloads in namespace `ranges`.

4     *Complexity:* Exactly  $(last - first) - 1$  swaps.

5     *Remarks:* To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation's source of randomness.

### 24.6.14 Shift

[alg.shift]

```
template<class ForwardIterator>
constexpr ForwardIterator
shift_left(ForwardIterator first, ForwardIterator last,
 typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 typename iterator_traits<ForwardIterator>::difference_type n);
```

1     *Requires:* The type of `*first` shall satisfy the *Cpp17MoveAssignable* requirements.

2     *Effects:* If  $n \leq 0$  or  $n \geq last - first$ , does nothing. Otherwise, moves the element from position `first + n + i` into position `first + i` for each non-negative integer  $i < (last - first) - n$ . In the first overload case, does so in order starting from  $i = 0$  and proceeding to  $i = (last - first) - n - 1$ .

3     *Returns:* `first + (last - first - n)` if  $n$  is positive and  $n < last - first$ , otherwise `first` if  $n$  is positive, otherwise `last`.

4     *Complexity:* At most  $(last - first) - n$  assignments.

```
template<class ForwardIterator>
constexpr ForwardIterator
shift_right(ForwardIterator first, ForwardIterator last,
 typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 typename iterator_traits<ForwardIterator>::difference_type n);
```

5     *Requires:* The type of `*first` shall satisfy the *Cpp17MoveAssignable* requirements. `ForwardIterator` shall meet the *Cpp17BidirectionalIterator* requirements (22.3.5.5) or the *Cpp17ValueSwappable* requirements.

- 6     *Effects:* If  $n \leq 0$  or  $n \geq last - first$ , does nothing. Otherwise, moves the element from position  $first + i$  into position  $first + n + i$  for each non-negative integer  $i < (last - first) - n$ . In the first overload case, if `ForwardIterator` satisfies the `Cpp17BidirectionalIterator` requirements, does so in order starting from  $i = (last - first) - n - 1$  and proceeding to  $i = 0$ .
- 7     *Returns:*  $first + n$  if  $n$  is positive and  $n < last - first$ , otherwise  $last$  if  $n$  is positive, otherwise  $first$ .
- 8     *Complexity:* At most  $(last - first) - n$  assignments or swaps.

## 24.7 Sorting and related operations

[alg.sorting]

- 1 The operations in 24.7 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.
- 2 `Compare` is a function object type (19.14) that meets the requirements for a template parameter named `BinaryPredicate` (24.2). The return value of the function call operation applied to an object of type `Compare`, when contextually converted to `bool` (7.3), yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms assuming an ordering relation.
- 3 For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j) != false` defaults to `*i < *j != false`. For algorithms other than those described in 24.7.3, `comp` shall induce a strict weak ordering on the values.
- 4 The term *strict* refers to the requirement of an irreflexive relation (`!comp(x, x)` for all `x`), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

- (4.1) — `comp(a, b) && comp(b, c)` implies `comp(a, c)`
- (4.2) — `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

[Note: Under these conditions, it can be shown that

- (4.3) — `equiv` is an equivalence relation,
  - (4.4) — `comp` induces a well-defined relation on the equivalence classes determined by `equiv`, and
  - (4.5) — the induced relation is a strict total ordering.
- end note]

- 5 A sequence is *sorted with respect to a comp and proj* for a comparator and projection `comp` and `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence,

```
bool(invoker(comp, invoker(proj, *(i + n)), invoker(proj, *i)))
is false.
```

- 6 A sequence `[start, finish]` is *partitioned with respect to an expression f(e)* if there exists an integer `n` such that for all  $0 \leq i < (finish - start)$ , `f(*(start + i))` is true if and only if  $i < n$ .
- 7 In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an `operator==`, but an equivalence relation induced by the strict weak ordering. That is, two elements `a` and `b` are considered equivalent if and only if `!(a < b) && !(b < a)`.

### 24.7.1 Sorting

[alg.sort]

#### 24.7.1.1 sort

[sort]

```
template<class RandomAccessIterator>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void sort(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);
```

```

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void sort(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr I
 sort(I first, S last, Comp comp = {}, Proj proj = {});
 template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr safe_iterator_t<R>
 sort(R&& r, Comp comp = {}, Proj proj = {});
}

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* For the overloads in namespace `std`, `RandomAccessIterator` shall meet the *Cpp17Value-Swappable* requirements (15.5.3.2) and the type of `*first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements.
- 3 *Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last`, for the overloads in namespace `ranges`.
- 5 *Complexity:* Let  $N$  be `last - first`.  $\mathcal{O}(N \log N)$  comparisons and projections.

#### 24.7.1.2 `stable_sort`

[stable.sort]

```

template<class RandomAccessIterator>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void stable_sort(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void stable_sort(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 I stable_sort(I first, S last, Comp comp = {}, Proj proj = {});
 template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 safe_iterator_t<R>
 stable_sort(R&& r, Comp comp = {}, Proj proj = {});
}

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* For the overloads in namespace `std`, `RandomAccessIterator` shall meet the *Cpp17Value-Swappable* requirements (15.5.3.2) and the type of `*first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements.
- 3 *Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* Let  $N$  be `last - first`. If enough extra memory is available,  $N \log(N)$  comparisons. Otherwise, at most  $N \log^2(N)$  comparisons. In either case, twice as many projections as the number of comparisons.

6        *Remarks:* Stable (15.5.5.7).

#### 24.7.1.3 partial\_sort

[partial.sort]

```
template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
 RandomAccessIterator middle,
 RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
 RandomAccessIterator first,
 RandomAccessIterator middle,
 RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
 RandomAccessIterator middle,
 RandomAccessIterator last,
 Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
 RandomAccessIterator first,
 RandomAccessIterator middle,
 RandomAccessIterator last,
 Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr I
 partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
}
```

- 1        Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2        *Requires:* `[first, middle)` and `[middle, last)` shall be valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` shall meet the *Cpp17ValueSwappable* requirements (15.5.3.2) and the type of `*first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements.
- 3        *Effects:* Places the first  $\text{middle} - \text{first}$  elements from the range `[first, last)` as sorted with respect to `comp` and `proj` into the range `[first, middle)`. The rest of the elements in the range `[middle, last)` are placed in an unspecified order.
- 4        *Returns:* `last` for the overload in namespace `ranges`.
- 5        *Complexity:* Approximately  $(\text{last} - \text{first}) * \log(\text{middle} - \text{first})$  comparisons, and twice as many projections.

```
namespace ranges {
 template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr safe_iterator_t<R>
 partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
}
```

- 6        *Effects:* Equivalent to:

```
 return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

#### 24.7.1.4 partial\_sort\_copy

[partial.sort.copy]

```
template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
 partial_sort_copy(InputIterator first, InputIterator last,
 RandomAccessIterator result_first,
 RandomAccessIterator result_last);
```

```

template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 RandomAccessIterator result_first,
 RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
 class Compare>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
 RandomAccessIterator result_first,
 RandomAccessIterator result_last,
 Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
 class Compare>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 RandomAccessIterator result_first,
 RandomAccessIterator result_last,
 Compare comp);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, RandomAccessIterator I2, Sentinel<I2> S2,
 class Comp = ranges::less{}, class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyCopyable<I1, I2> && Sortable<I2, Comp, Proj2> &&
 IndirectStrictWeakOrder<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
 constexpr I2
 partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, RandomAccessRange R2, class Comp = ranges::less{},
 class Proj1 = identity, class Proj2 = identity>
 requires IndirectlyCopyable<iterator_t<R1>, iterator_t<R2>> &&
 Sortable<iterator_t<R2>, Comp, Proj2> &&
 IndirectStrictWeakOrder<Comp, projected<iterator_t<R1>, Proj1>,
 projected<iterator_t<R2>, Proj2>>
 constexpr safe_iterator_t<R2>
 partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

1 Let  $N$  be  $\min(\text{last} - \text{first}, \text{result\_last} - \text{result\_first})$ . Let  $\text{comp}$  be  $\text{less}\{\}$ , and  $\text{proj1}$  and  $\text{proj2}$  be  $\text{identity}\{\}$  for the overloads with no parameters by those names.

2 *Requires:* For the overloads in namespace `std`, `RandomAccessIterator` shall meet the *Cpp17ValueSwappable* requirements (15.5.3.2), the type of `*result_first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements, and the expression `*first` shall be writable (22.3.1) to `result_first`.

3 *Expects:* For iterators  $a1$  and  $b1$  in  $[\text{first}, \text{last})$ , and iterators  $x2$  and  $y2$  in  $[\text{result\_first}, \text{result\_last})$ , after evaluating the assignment  $*y2 = *b1$ , let  $E$  be the value of

```
bool(invoker(comp, invoke(proj1, *a1), invoke(proj2, *y2))).
```

Then, after evaluating the assignment  $*x2 = *a1$ ,  $E$  is equal to

```
bool(invoker(comp, invoke(proj2, *x2), invoke(proj2, *y2))).
```

[*Note:* Writing a value from the input range into the output range does not affect how it is ordered by `comp` and `proj1` or `proj2`. —end note]

4 *Effects:* Places the first  $N$  elements as sorted with respect to `comp` and `proj2` into the range  $[\text{result\_first}, \text{result\_first} + N)$ .

5 *Returns:* `result_first + N`.

6 *Complexity:* Approximately  $(\text{last} - \text{first}) * \log N$  comparisons, and twice as many projections.

**24.7.1.5 `is_sorted`** [is.sorted]

```

template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);

1 Effects: Equivalent to: return is_sorted_until(first, last) == last;

template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

2 Effects: Equivalent to:
 return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
 Compare comp);

3 Effects: Equivalent to: return is_sorted_until(first, last, comp) == last;

template<class ExecutionPolicy, class ForwardIterator, class Compare>
bool is_sorted(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Compare comp);

4 Effects: Equivalent to:
 is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
 IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
 constexpr bool is_sorted(I first, S last, Comp comp = {}, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 constexpr bool is_sorted(R&& r, Comp comp = {}, Proj proj = {});
}

5 Effects: Equivalent to: return ranges::is_sorted_until(first, last, comp, proj) == last;

template<class ForwardIterator>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last,
 Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Compare comp);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
 IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
 constexpr I is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 constexpr safe_iterator_t<R>
 is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});
}

6 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

```

- 7       >Returns: The last iterator *i* in [*first*, *last*] for which the range [*first*, *i*) is sorted with respect  
to *comp* and *proj*.  
8       >Complexity: Linear.

### 24.7.2 Nth element

[alg.nth.element]

```
template<class RandomAccessIterator>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
 RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void nth_element(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator nth,
 RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
 RandomAccessIterator last, Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void nth_element(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator nth,
 RandomAccessIterator last, Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr I
 nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});
}
```

- 1       Let *comp* be *less{}* and *proj* be *identity{}* for the overloads with no parameters by those names.  
2       Requires: [*first*, *nth*) and [*nth*, *last*) shall be valid ranges. For the overloads in namespace `std`,  
RandomAccessIterator shall meet the *Cpp17ValueSwappable* requirements (15.5.3.2), and the type  
of \**first* shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28)  
requirements.  
3       Effects: After *nth\_element* the element in the position pointed to by *nth* is the element that would be  
in that position if the whole range were sorted with respect to *comp* and *proj*, unless *nth == last*.  
Also for every iterator *i* in the range [*first*, *nth*) and every iterator *j* in the range [*nth*, *last*) it  
holds that: `bool(invoker(comp, invoke(proj, *j), invoke(proj, *i)))` is *false*.  
4       >Returns: *last* for the overload in namespace `ranges`.  
5       Complexity: For the overloads with no `ExecutionPolicy`, linear on average. For the overloads  
with an `ExecutionPolicy`,  $\mathcal{O}(N)$  applications of the predicate, and  $\mathcal{O}(N \log N)$  swaps, where  $N =$   
*last - first*.

```
namespace ranges {
 template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr safe_iterator_t<R>
 nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
}
```

- 6       Effects: Equivalent to:

```
 return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);
```

### 24.7.3 Binary search

[alg.binary.search]

- 1 All of the algorithms in this subclause are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

## 24.7.3.1 lower\_bound

[lower\_bound]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
 const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
 const T& value, Compare comp);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity,
 IndirectStrictWeakOrder<const T*, projected<I, Proj>> Comp = ranges::less<>>
 constexpr I lower_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
 template<ForwardRange R, class T, class Proj = identity,
 IndirectStrictWeakOrder<const T*, projected<iterator_t<R>, Proj>> Comp =
 ranges::less<>>
 constexpr safe_iterator_t<R>
 lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
}
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
- 2 *Requires:* The elements `e` of `[first, last)` shall be partitioned with respect to the expression `bool(invoker(comp, invoke(proj, e), value))`.
- 3 *Returns:* The furthermost iterator `i` in the range `[first, last]` such that for every iterator `j` in the range `[first, i)`, `bool(invoker(comp, invoke(proj, *j), value))` is true.
- 4 *Complexity:* At most  $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons and projections.

## 24.7.3.2 upper\_bound

[upper\_bound]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
 const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
 const T& value, Compare comp);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity,
 IndirectStrictWeakOrder<const T*, projected<I, Proj>> Comp = ranges::less<>>
 constexpr I upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
 template<ForwardRange R, class T, class Proj = identity,
 IndirectStrictWeakOrder<const T*, projected<iterator_t<R>, Proj>> Comp =
 ranges::less<>>
 constexpr safe_iterator_t<R>
 upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
}
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
- 2 *Requires:* The elements `e` of `[first, last)` shall be partitioned with respect to the expression `!bool(invoker(comp, value, invoke(proj, e)))`.
- 3 *Returns:* The furthermost iterator `i` in the range `[first, last]` such that for every iterator `j` in the range `[first, i)`, `!bool(invoker(comp, value, invoke(proj, *j)))` is true.
- 4 *Complexity:* At most  $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons and projections.

## 24.7.3.3 equal\_range

[equal.range]

```
template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
 ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
 ForwardIterator last, const T& value,
 Compare comp);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity,
 IndirectStrictWeakOrder<const T*, projected<I, Proj>> Comp = ranges::less<>>
 constexpr subrange<I>
 equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

 template<ForwardRange R, class T, class Proj = identity,
 IndirectStrictWeakOrder<const T*, projected<iterator_t<R>, Proj>> Comp =
 ranges::less<>>
 constexpr safe_subrange_t<R>
 equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});
}
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
- 2 *Requires:* The elements `e` of `[first, last)` shall be partitioned with respect to the expressions `bool(invoker(comp, invoker(proj, e), value))` and `!bool(invoker(comp, value, invoker(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` shall imply `!bool(comp(value, e))` for the overloads in namespace `std`.
- 3 *Returns:*
- (3.1) — For the overloads in namespace `std`:
 
$$\{\text{lower\_bound}(first, last, value, comp), \text{upper\_bound}(first, last, value, comp)\}$$
- (3.2) — For the overloads in namespace `ranges`:
 
$$\{\text{ranges::lower\_bound}(first, last, value, comp, proj), \text{ranges::upper\_bound}(first, last, value, comp, proj)\}$$
- 4 *Complexity:* At most  $2 * \log_2(last - first) + \mathcal{O}(1)$  comparisons and projections.

## 24.7.3.4 binary\_search

[binary.search]

```
template<class ForwardIterator, class T>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
 const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
 const T& value, Compare comp);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity,
 IndirectStrictWeakOrder<const T*, projected<I, Proj>> Comp = ranges::less<>>
 constexpr bool binary_search(I first, S last, const T& value, Comp comp = {},
 Proj proj = {});

 template<ForwardRange R, class T, class Proj = identity,
 IndirectStrictWeakOrder<const T*, projected<iterator_t<R>, Proj>> Comp =
 ranges::less<>>
 constexpr bool binary_search(R&& r, const T& value, Comp comp = {},
 Proj proj = {});
}
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

- 2     *Requires:* The elements  $e$  of  $[first, last)$  shall be partitioned with respect to the expressions  $\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, e), \text{value}))$  and  $\text{!bool}(\text{invoke}(\text{comp}, \text{value}, \text{invoke}(\text{proj}, e)))$ . Also, for all elements  $e$  of  $[first, last)$ ,  $\text{bool}(\text{comp}(e, \text{value}))$  shall imply  $\text{!bool}(\text{comp}(\text{value}, e))$  for the overloads in namespace `std`.
- 3     *Returns:* `true` if and only if for some iterator  $i$  in the range  $[first, last)$ ,  $\text{!bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, *i), \text{value})) \&& \text{!bool}(\text{invoke}(\text{comp}, \text{value}, \text{invoke}(\text{proj}, *i)))$  is `true`.
- 4     *Complexity:* At most  $\log_2(last - first) + \mathcal{O}(1)$  comparisons and projections.

#### 24.7.4 Partitions

[alg.partitions]

```
template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
namespace ranges {
 template<InputIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 constexpr bool is_partitioned(I first, S last, Pred pred, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr bool is_partitioned(R&& r, Pred pred, Proj proj = {});
}
```

- 1     Let `proj` be `identity{}` for the overloads with no parameter named `proj`.
- 2     *Returns:* `true` if and only if the elements  $e$  of  $[first, last)$  are partitioned with respect to the expression  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, e)))$ .
- 3     *Complexity:* Linear. At most  $last - first$  applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition(ForwardIterator first, ForwardIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator
partition(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
namespace ranges {
 template<Permutable I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 constexpr I
 partition(I first, S last, Pred pred, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 requires Permutable<iterator_t<R>>
 constexpr safe_iterator_t<R>
 partition(R&& r, Pred pred, Proj proj = {});
}
```

- 4     Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let  $E(x)$  be  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, x)))$ .
- 5     *Requires:* For the overloads in namespace `std`, `ForwardIterator` shall meet the *Cpp17ValueSwappable* requirements ([15.5.3.2](#)).
- 6     *Effects:* Places all the elements  $e$  in  $[first, last)$  that satisfy  $E(e)$  before all the elements that do not.
- 7     *Returns:* An iterator  $i$  such that  $E(*j)$  is `true` for every iterator  $j$  in  $[first, i)$  and `false` for every iterator  $j$  in  $[i, last)$ .
- 8     *Complexity:* Let  $N = last - first$ :

- (8.1) — For the overload with no `ExecutionPolicy`, exactly  $N$  applications of the predicate and projection. At most  $N/2$  swaps if the type of `first` meets the *Cpp17BidirectionalIterator* requirements for the overloads in namespace `std` or models `BidirectionalIterator` for the overloads in namespace `ranges`, and at most  $N$  swaps otherwise.
- (8.2) — For the overload with an `ExecutionPolicy`,  $\mathcal{O}(N \log N)$  swaps and  $\mathcal{O}(N)$  applications of the predicate.

```
template<class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(ExecutionPolicy&& exec,
 BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

namespace ranges {
 template<BidirectionalIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 requires Permutable<I>
 I stable_partition(I first, S last, Pred pred, Proj proj = {});
 template<BidirectionalRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 requires Permutable<iterator_t<R>>
 safe_iterator_t<R> stable_partition(R&& r, Pred pred, Proj proj = {});
}
}
```

10 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let `E(x)` be `bool(invoker(pred, invoke(proj, x)))`.

*Requires:* For the overloads in namespace `std`, `BidirectionalIterator` shall meet the *Cpp17ValueSwappable* requirements (15.5.3.2) and the type of `*first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements.

11 *Effects:* Places all the elements `e` in `[first, last]` that satisfy `E(e)` before all the elements that do not. The relative order of the elements in both groups is preserved.

12 *Returns:* An iterator `i` such that for every iterator `j` in `[first, i]`, `E(*j)` is `true`, and for every iterator `j` in the range `[i, last]`, `E(*j)` is `false`,

13 *Complexity:* Let  $N = \text{last} - \text{first}$ :

- (13.1) — For the overloads with no `ExecutionPolicy`, at most  $N \log N$  swaps, but only  $\mathcal{O}(N)$  swaps if there is enough extra memory. Exactly  $N$  applications of the predicate and projection.
- (13.2) — For the overload with an `ExecutionPolicy`,  $\mathcal{O}(N \log N)$  swaps and  $\mathcal{O}(N)$  applications of the predicate.

```
template<class InputIterator, class OutputIterator1,
 class OutputIterator2, class Predicate>
constexpr pair<OutputIterator1, OutputIterator2>
partition_copy(InputIterator first, InputIterator last,
 OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1,
 class ForwardIterator2, class Predicate>
pair<ForwardIterator1, ForwardIterator2>
partition_copy(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

namespace ranges {
 template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O1, WeaklyIncrementable O2,
 class Proj = identity, IndirectUnaryPredicate<projected<I, Proj>> Pred>
 requires IndirectlyCopyable<I, O1> && IndirectlyCopyable<I, O2>
 constexpr partition_copy_result<I, O1, O2>
 partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
 Proj proj = {});
}
```

```

template<InputRange R, WeaklyIncrementable O1, WeaklyIncrementable O2,
 class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 requires IndirectlyCopyable<iterator_t<R>, O1 &&
 IndirectlyCopyable<iterator_t<R>, O2>
 constexpr partition_copy_result<safe_iterator_t<R>, O1, O2>
 partition_copy(R&& r, O1 out_true, O2 out_false, Pred pred, Proj proj = {});
}

```

14 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let  $E(x)$  be `bool(invoker(pred, invoke(proj, x)))`.

15 *Requires:* The input range and output ranges shall not overlap. For the overloads in namespace `std`, the expression `*first` shall be writable (22.3.1) to `out_true` and `out_false`. [Note: For the overload with an `ExecutionPolicy`, there may be a performance cost if `first`'s value type does not meet the `Cpp17CopyConstructible` requirements. — end note]

16 *Effects:* For each iterator `i` in `[first, last)`, copies `*i` to the output range beginning with `out_true` if  $E(*i)$  is `true`, or to the output range beginning with `out_false` otherwise.

17 *Returns:* Let `o1` be the end of the output range beginning at `out_true`, and `o2` the end of the output range beginning at `out_false`. Returns

(17.1) — `{o1, o2}` for the overloads in namespace `std`, or

(17.2) — `{last, o1, o2}` for the overloads in namespace `ranges`.

18 *Complexity:* Exactly  $last - first$  applications of `pred` and `proj`.

```

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
 partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

```

```

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
 IndirectUnaryPredicate<projected<I, Proj>> Pred>
 constexpr I partition_point(I first, S last, Pred pred, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr safe_iterator_t<R>
 partition_point(R&& r, Pred pred, Proj proj = {});
}

```

19 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let  $E(x)$  be `bool(invoker(pred, invoke(proj, x)))`.

20 *Requires:* The elements `e` of `[first, last)` shall be partitioned with respect to  $E(e)$ .

21 *Returns:* An iterator `mid` such that  $E(*i)$  is `true` for all iterators `i` in `[first, mid)`, and `false` for all iterators `i` in `[mid, last)`

22 *Complexity:*  $\mathcal{O}(\log(last - first))$  applications of `pred` and `proj`.

## 24.7.5 Merge

[alg.merge]

```

template<class InputIterator1, class InputIterator2,
 class OutputIterator>
constexpr OutputIterator
 merge(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator>
ForwardIterator
 merge(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result);

```

```

template<class InputIterator1, class InputIterator2,
 class OutputIterator, class Compare>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result, Compare comp);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 WeaklyIncrementable O, class Comp = ranges::less<>, class Proj1 = identity,
 class Proj2 = identity>
 requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
 constexpr merge_result<I1, I2, O>
 merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, WeaklyIncrementable O, class Comp = ranges::less<>,
 class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
 constexpr merge_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O>
 merge(R1&& r1, R2&& r2, O result,
 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

1 Let  $N$  be  $(last1 - first1) + (last2 - first2)$ . Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

2 *Requires:* The ranges  $[first1, last1]$  and  $[first2, last2]$  shall be sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range shall not overlap with either of the original ranges.

3 *Effects:* Copies all the elements of the two ranges  $[first1, last1]$  and  $[first2, last2]$  into the range  $[result, result\_last]$ , where `result_last` is  $result + N$ . If an element `a` precedes `b` in an input range, `a` is copied into the output range before `b`. If `e1` is an element of  $[first1, last1]$  and `e2` of  $[first2, last2]$ , `e2` is copied into the output range before `e1` if and only if `bool(invoker(comp, invoke(proj2, e2), invoke(proj1, e1)))` is true.

4 *Returns:*

- (4.1) — `result_last` for the overloads in namespace `std`, or
- (4.2) —  $\{last1, last2, result\_last\}$  for the overloads in namespace `ranges`.

5 *Complexity:*

- (5.1) — For the overloads with no `ExecutionPolicy`, at most  $N - 1$  comparisons and applications of each projection.
- (5.2) — For the overloads with an `ExecutionPolicy`,  $\mathcal{O}(N)$  comparisons.

6 *Remarks:* Stable (15.5.5.7).

```

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,
 BidirectionalIterator middle,
 BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec,
 BidirectionalIterator first,
 BidirectionalIterator middle,
 BidirectionalIterator last);

```

```

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first,
 BidirectionalIterator middle,
 BidirectionalIterator last, Compare comp);
template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec,
 BidirectionalIterator first,
 BidirectionalIterator middle,
 BidirectionalIterator last, Compare comp);

namespace ranges {
 template<BidirectionalIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 I inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});
}

```

7 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

8 *Requires:* `[first, middle)` and `[middle, last)` shall be valid ranges sorted with respect to `comp` and `proj`. For the overloads in namespace `std`, `BidirectionalIterator` shall meet the *Cpp17ValueSwappable* requirements (15.5.3.2) and the type of `*first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements.

9 *Effects:* Merges two sorted consecutive ranges `[first, middle)` and `[middle, last)`, putting the result of the merge into the range `[first, last)`. The resulting range is sorted with respect to `comp` and `proj`.

10 *Returns:* `last` for the overload in namespace `ranges`.

11 *Complexity:* Let  $N = \text{last} - \text{first}$ :

(11.1) — For the overloads with no `ExecutionPolicy`, and if enough additional memory is available, exactly  $N - 1$  comparisons.

(11.2) — Otherwise,  $\mathcal{O}(N \log N)$  comparisons.

In either case, twice as many projections as comparisons.

12 *Remarks:* Stable (15.5.5.7).

```

namespace ranges {
 template<BidirectionalRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 safe_iterator_t<R>
 inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
}

```

13 *Effects:* Equivalent to:

```
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

## 24.7.6 Set operations on sorted structures

[alg.set.operations]

- <sup>1</sup> This subclause defines all the basic set operations on sorted structures. They also work with `multisets` (21.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to `multisets` in a standard way by defining `set_union()` to contain the maximum number of occurrences of every element, `set_intersection()` to contain the minimum, and so on.

### 24.7.6.1 includes

[includes]

```

template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

```

```

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool includes(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 Compare comp);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 class Proj1 = identity, class Proj2 = identity,
 IndirectStrictWeakOrder<projected<I1, Proj1>,
 projected<I2, Proj2>> Comp = ranges::less<>>
 constexpr bool includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, class Proj1 = identity,
 class Proj2 = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R1>, Proj1>,
 projected<iterator_t<R2>, Proj2>> Comp = ranges::less<>>
 constexpr bool includes(R1&& r1, R2&& r2, Comp comp = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

- 1 Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.
- 2 *Requires:* The ranges `[first1, last1]` and `[first2, last2]` shall be sorted with respect to `comp` and `proj1` or `proj2`, respectively.
- 3 *Returns:* `true` if and only if `[first2, last2]` is a subsequence of `[first1, last1]`. [Note: A sequence  $S$  is a subsequence of another sequence  $T$  if  $S$  can be obtained from  $T$  by removing some, all, or none of  $T$ 's elements and keeping the remaining elements in the same order. — end note]
- 4 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.

#### 24.7.6.2 set\_union

[set.union]

```

template<class InputIterator1, class InputIterator2,
 class OutputIterator>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator>
ForwardIterator
set_union(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result);

template<class InputIterator1, class InputIterator2,
 class OutputIterator, class Compare>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator, class Compare>
ForwardIterator
set_union(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 Compare comp);

```

```

 ForwardIterator result, Compare comp);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 WeaklyIncrementable O, class Comp = ranges::less<>,
 class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
 constexpr set_union_result<I1, I2, O>
 set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, WeaklyIncrementable O,
 class Comp = ranges::less<>, class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
 constexpr set_union_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O>
 set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* The ranges `[first1, last1)` and `[first2, last2)` shall be sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range shall not overlap with either of the original ranges.
- 3 *Effects:* Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.
- 4 *Returns:* Let `result_last` be the end of the constructed range. Returns
  - (4.1) — `result_last` for the overloads in namespace `std`, or
  - (4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.
- 6 *Remarks:* Stable (15.5.5.7). If `[first1, last1)` contains  $m$  elements that are equivalent to each other and `[first2, last2)` contains  $n$  elements that are equivalent to them, then all  $m$  elements from the first range are copied to the output range, in order, and then the final  $\max(n - m, 0)$  elements from the second range are copied to the output range, in order.

#### 24.7.6.3 set\_intersection

[set.intersection]

```

template<class InputIterator1, class InputIterator2,
 class OutputIterator>
constexpr OutputIterator
 set_intersection(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator>
ForwardIterator
 set_intersection(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result);

template<class InputIterator1, class InputIterator2,
 class OutputIterator, class Compare>
constexpr OutputIterator
 set_intersection(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator, class Compare>
ForwardIterator
 set_intersection(ExecutionPolicy&& exec,

```

```

 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result, Compare comp);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 WeaklyIncrementable O, class Comp = ranges::less<>,
 class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
 constexpr set_intersection_result<I1, I2, O>
 set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, WeaklyIncrementable O,
 class Comp = ranges::less<>, class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
 constexpr set_intersection_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O>
 set_intersection(R1&& r1, R2&& r2, O result,
 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* The ranges `[first1, last1]` and `[first2, last2]` shall be sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range shall not overlap with either of the original ranges.
- 3 *Effects:* Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.
- 4 *Returns:* Let `result_last` be the end of the constructed range. Returns
  - (4.1) — `result_last` for the overloads in namespace `std`, or
  - (4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.
- 6 *Remarks:* Stable (15.5.5.7). If `[first1, last1]` contains  $m$  elements that are equivalent to each other and `[first2, last2]` contains  $n$  elements that are equivalent to them, the first  $\min(m, n)$  elements are copied from the first range to the output range, in order.

#### 24.7.6.4 set\_difference

[set.difference]

```

template<class InputIterator1, class InputIterator2,
 class OutputIterator>
constexpr OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator>
ForwardIterator
set_difference(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result);

template<class InputIterator1, class InputIterator2,
 class OutputIterator, class Compare>
constexpr OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result, Compare comp);

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator, class Compare>
ForwardIterator
set_difference(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result, Compare comp);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 WeaklyIncrementable O, class Comp = ranges::less<>,
 class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
 constexpr set_difference_result<I1, O>
 set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, WeaklyIncrementable O,
 class Comp = ranges::less<>, class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
 constexpr set_difference_result<safe_iterator_t<R1>, O>
 set_difference(R1&& r1, R2&& r2, O result,
 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* The ranges `[first1, last1]` and `[first2, last2]` shall be sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range shall not overlap with either of the original ranges.
- 3 *Effects:* Copies the elements of the range `[first1, last1]` which are not present in the range `[first2, last2]` to the range beginning at `result`. The elements in the constructed range are sorted.
- 4 *Returns:* Let `result_last` be the end of the constructed range. Returns
  - (4.1) — `result_last` for the overloads in namespace `std`, or
  - (4.2) — `{last1, result_last}` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.
- 6 *Remarks:* If `[first1, last1]` contains  $m$  elements that are equivalent to each other and `[first2, last2]` contains  $n$  elements that are equivalent to them, the last  $\max(m - n, 0)$  elements from `[first1, last1]` is copied to the output range, in order.

#### 24.7.6.5 set\_symmetric\_difference

[set.symmetric.difference]

```

template<class InputIterator1, class InputIterator2,
 class OutputIterator>
constexpr OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result);

template<class InputIterator1, class InputIterator2,
 class OutputIterator, class Compare>
constexpr OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 Compare comp);

```

```

 OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator, class Compare>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 ForwardIterator result, Compare comp);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 WeaklyIncrementable O, class Comp = ranges::less<>,
 class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
 constexpr set_symmetric_difference_result<I1, I2, O>
 set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
 Comp comp = {}, Proj1 proj1 = {},
 Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, WeaklyIncrementable O,
 class Comp = ranges::less<>, class Proj1 = identity, class Proj2 = identity>
 requires Mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
 constexpr set_symmetric_difference_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O>
 set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

- <sup>1</sup> Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.
- <sup>2</sup> *Requires:* The resulting range shall not overlap with either of the original ranges. The ranges `[first1, last1]` and `[first2, last2]` shall be sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range shall not overlap with either of the original ranges.
- <sup>3</sup> *Effects:* Copies the elements of the range `[first1, last1]` that are not present in the range `[first2, last2]`, and the elements of the range `[first2, last2]` that are not present in the range `[first1, last1]` to the range beginning at `result`. The elements in the constructed range are sorted.
- <sup>4</sup> *Returns:* Let `result_last` be the end of the constructed range. Returns
  - (4.1) — `result_last` for the overloads in namespace `std`, or
  - (4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.
- <sup>5</sup> *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.
- <sup>6</sup> *Remarks:* Stable (15.5.5.7). If `[first1, last1]` contains  $m$  elements that are equivalent to each other and `[first2, last2]` contains  $n$  elements that are equivalent to them, then  $|m - n|$  of those elements shall be copied to the output range: the last  $m - n$  of these elements from `[first1, last1]` if  $m > n$ , and the last  $n - m$  of these elements from `[first2, last2]` if  $m < n$ . In either case, the elements are copied in order.

## 24.7.7 Heap operations

[alg.heap.operations]

- <sup>1</sup> A random access range `[a, b)` is a *heap with respect to comp and proj* for a comparator and projection `comp` and `proj` if its elements are organized such that:
  - (1.1) — With  $N = b - a$ , for all  $i$ ,  $0 < i < N$ , `bool(invoker(comp, invoke(proj, a[ $\lfloor \frac{i-1}{2} \rfloor$ ]), invoke(proj, a[i])))` is `false`.
  - (1.2) — `*a` may be removed by `pop_heap`, or a new element added by `push_heap`, in  $\mathcal{O}(\log N)$  time.
- <sup>2</sup> These properties make heaps useful as priority queues.
- <sup>3</sup> `make_heap` converts a range into a heap and `sort_heap` turns a heap into a sorted sequence.

### 24.7.7.1 push\_heap

[push.heap]

```

template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

```

```

template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr I
 push_heap(I first, S last, Comp comp = {}, Proj proj = {});
 template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr safe_iterator_t<R>
 push_heap(R&& r, Comp comp = {}, Proj proj = {});
}

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* The range `[first, last - 1]` shall be a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, the type of `*first` shall meet the *Cpp17MoveConstructible* requirements (Table 26) and the *Cpp17MoveAssignable* requirements (Table 28).
- 3 *Effects:* Places the value in the location `last - 1` into the resulting heap `[first, last]`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most  $\log(last - first)$  comparisons and twice as many projections.

#### 24.7.7.2 pop\_heap

[pop.heap]

```

template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr I
 pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
 template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr safe_iterator_t<R>
 pop_heap(R&& r, Comp comp = {}, Proj proj = {});
}

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* The range `[first, last)` shall be a valid non-empty heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` shall meet the *Cpp17ValueSwappable* requirements (15.5.3.2) and the type of `*first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements.
- 3 *Effects:* Swaps the value in the location `first` with the value in the location `last - 1` and makes `[first, last - 1]` into a heap with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most  $2 \log(last - first)$  comparisons and twice as many projections.

#### 24.7.7.3 make\_heap

[make.heap]

```

template<class RandomAccessIterator>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

```

```

template<class RandomAccessIterator, class Compare>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr I
 make_heap(I first, S last, Comp comp = {}, Proj proj = {});
 template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr safe_iterator_t<R>
 make_heap(R&& r, Comp comp = {}, Proj proj = {});
}

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* For the overloads in namespace `std`, the type of `*first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements.
- 3 *Effects:* Constructs a heap with respect to `comp` and `proj` out of the range `[first, last)`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most  $3(\text{last} - \text{first})$  comparisons and twice as many projections.

#### 24.7.7.4 sort\_heap

[sort.heap]

```

template<class RandomAccessIterator>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr I
 sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
 template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr safe_iterator_t<R>
 sort_heap(R&& r, Comp comp = {}, Proj proj = {});
}

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Requires:* The range `[first, last)` shall be a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` shall meet the *Cpp17ValueSwappable* requirements (15.5.3.2) and the type of `*first` shall meet the *Cpp17MoveConstructible* (Table 26) and *Cpp17MoveAssignable* (Table 28) requirements.
- 3 *Effects:* Sorts elements in the heap `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most  $2N \log N$  comparisons, where  $N = \text{last} - \text{first}$ , and twice as many projections.

#### 24.7.7.5 is\_heap

[is.heap]

```

template<class RandomAccessIterator>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);

```

- 1 *Effects:* Equivalent to: `return is_heap_until(first, last) == last;`

```

template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator last);
2 Effects: Equivalent to:
 return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

3 Effects: Equivalent to: return is_heap_until(first, last, comp) == last;

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
bool is_heap(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

4 Effects: Equivalent to:
 return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Proj = identity,
 IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
 constexpr bool is_heap(I first, S last, Comp comp = {}, Proj proj = {});
 template<RandomAccessRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 constexpr bool is_heap(R&& r, Comp comp = {}, Proj proj = {});

5 Effects: Equivalent to: return ranges::is_heap_until(first, last, comp, proj) == last;

template<class RandomAccessIterator>
constexpr RandomAccessIterator
 is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
RandomAccessIterator
 is_heap_until(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
 is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
 is_heap_until(ExecutionPolicy&& exec,
 RandomAccessIterator first, RandomAccessIterator last,
 Compare comp);

namespace ranges {
 template<RandomAccessIterator I, Sentinel<I> S, class Proj = identity,
 IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
 constexpr I is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
 template<RandomAccessRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 constexpr safe_iterator_t<R>
 is_heap_until(R&& r, Comp comp = {}, Proj proj = {});
}

6 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
7 Returns: The last iterator i in [first, last] for which the range [first, i) is a heap with respect
 to comp and proj.
8 Complexity: Linear.

```

## 24.7.8 Minimum and maximum

[alg.min.max]

```
template<class T> constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

namespace ranges {
 template<class T, class Proj = identity,
 IndirectStrictWeakOrder<projected<const T*, Proj>> Comp = ranges::less<>>
 constexpr const T& min(const T& a, const T& b, Comp comp = {}, Proj proj = {});
}
```

1     *Requires:* For the first form, type T shall be *Cpp17LessThanComparable* (Table 24).

2     *Returns:* The smaller value.

3     *Remarks:* Returns the first argument when the arguments are equivalent. An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

4     *Complexity:* Exactly one comparison and two applications of the projection, if any.

```
template<class T>
constexpr T min(initializer_list<T> r);
template<class T, class Compare>
constexpr T min(initializer_list<T> r, Compare comp);

namespace ranges {
 template<Copyable T, class Proj = identity,
 IndirectStrictWeakOrder<projected<const T*, Proj>> Comp = ranges::less<>>
 constexpr T min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 requires IndirectlyCopyableStorable<iterator_t<R>, iter_value_t<iterator_t<R>>>
 constexpr iter_value_t<iterator_t<R>>
 min(R&& r, Comp comp = {}, Proj proj = {});
}
```

5     *Requires:* ranges::distance(r) > 0. For the overloads in namespace std, T shall be *Cpp17CopyConstructible*. For the first form, type T shall be *Cpp17LessThanComparable*.

6     *Returns:* The smallest value in the input range.

7     *Remarks:* Returns a copy of the leftmost element when several elements are equivalent to the smallest. An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

8     *Complexity:* Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the projection, if any.

```
template<class T> constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& max(const T& a, const T& b, Compare comp);

namespace ranges {
 template<class T, class Proj = identity,
 IndirectStrictWeakOrder<projected<const T*, Proj>> Comp = ranges::less<>>
 constexpr const T& max(const T& a, const T& b, Comp comp = {}, Proj proj = {});
}
```

9     *Requires:* For the first form, type T shall be *Cpp17LessThanComparable* (Table 24).

10    *Returns:* The larger value.

11    *Remarks:* Returns the first argument when the arguments are equivalent. An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

12    *Complexity:* Exactly one comparison and two applications of the projection, if any.

```
template<class T>
constexpr T max(initializer_list<T> r);
```

```

template<class T, class Compare>
constexpr T max(initializer_list<T> r, Compare comp);

namespace ranges {
 template<Copyable T, class Proj = identity,
 IndirectStrictWeakOrder<projected<const T*, Proj>> Comp = ranges::less<>>
 constexpr T max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 requires IndirectlyCopyableStorable<iterator_t<R>, iter_value_t<iterator_t<R>>>
 constexpr iter_value_t<iterator_t<R>>
 max(R&& r, Comp comp = {}, Proj proj = {});
}

```

13     *Requires:* `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` shall be *Cpp17CopyConstructible*. For the first form, type `T` shall be *Cpp17LessThanComparable*.

14     *Returns:* The largest value in the input range.

15     *Remarks:* Returns a copy of the leftmost element when several elements are equivalent to the largest. An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

16     *Complexity:* Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

```

template<class T> constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

namespace ranges {
 template<class T, class Proj = identity,
 IndirectStrictWeakOrder<projected<const T*, Proj>> Comp = ranges::less<>>
 constexpr minmax_result<const T&>
 minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});
}

```

17     *Requires:* For the first form, type `T` shall be *Cpp17LessThanComparable* (Table 24).

18     *Returns:* `{(b, a)}` if `b` is smaller than `a`, and `{a, b}` otherwise.

19     *Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

20     *Complexity:* Exactly one comparison and two applications of the projection, if any.

```

template<class T>
constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);

namespace ranges {
 template<Copyable T, class Proj = identity,
 IndirectStrictWeakOrder<projected<const T*, Proj>> Comp = ranges::less<>>
 constexpr minmax_result<T>
 minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
 template<InputRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 requires IndirectlyCopyableStorable<iterator_t<R>, iter_value_t<iterator_t<R>>>
 constexpr minmax_result<iter_value_t<iterator_t<R>>>
 minmax(R&& r, Comp comp = {}, Proj proj = {});
}

```

21     *Requires:* `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` shall be *Cpp17CopyConstructible*. For the first form, type `T` shall be *Cpp17LessThanComparable*.

22     *Returns:* Let `X` be the return type. Returns `Xx, y`, where `x` is a copy of the leftmost element with the smallest and `y` a copy of the rightmost element with the largest value in the input range.

23     *Remarks:* An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

24     *Complexity:* At most  $(3/2)\text{ranges}::\text{distance}(r)$  applications of the corresponding predicate and twice as many applications of the projection, if any.

```
template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
 Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator min_element(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Compare comp);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
 IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
 constexpr I min_element(I first, S last, Comp comp = {}, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 constexpr safe_iterator_t<R>
 min_element(R&& r, Comp comp = {}, Proj proj = {});
}
```

25     Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

26     *Returns:* The first iterator i in the range [first, last) such that for every iterator j in the range [first, last),

```
bool(invoker(comp, invoker(proj, *j), invoker(proj, *i)))
is false. Returns last if first == last.
```

27     *Complexity:* Exactly max(last - first - 1, 0) comparisons and twice as many projections.

```
template<class ForwardIterator>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator max_element(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
 Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator max_element(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Compare comp);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
 IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
 constexpr I max_element(I first, S last, Comp comp = {}, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 constexpr safe_iterator_t<R>
 max_element(R&& r, Comp comp = {}, Proj proj = {});
}
```

28     Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

29     *Returns:* The first iterator *i* in the range [*first*, *last*) such that for every iterator *j* in the range [*first*, *last*),  
     bool(invoker(comp, invoke(proj, \*i), invoke(proj, \*j)))  
     is false. Returns *last* if *first* == *last*.

30     *Complexity:* Exactly max(*last* - *first* - 1, 0) comparisons and twice as many projections.

```

template<class ForwardIterator>
constexpr pair<ForwardIterator, ForwardIterator>
 minmax_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
pair<ForwardIterator, ForwardIterator>
 minmax_element(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
 minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
pair<ForwardIterator, ForwardIterator>
 minmax_element(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, Compare comp);

namespace ranges {
 template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
 IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
 constexpr minmax_result<I>
 minmax_element(I first, S last, Comp comp = {}, Proj proj = {});
 template<ForwardRange R, class Proj = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
 constexpr minmax_result<safe_iterator_t<R>>
 minmax_element(R&& r, Comp comp = {}, Proj proj = {});
}

```

31     *Returns:* {*first*, *first*} if [*first*, *last*) is empty, otherwise {*m*, *M*}, where *m* is the first iterator in [*first*, *last*) such that no iterator in the range refers to a smaller element, and where *M* is the last iterator<sup>238</sup> in [*first*, *last*) such that no iterator in the range refers to a larger element.

32     *Complexity:* Let *N* be *last* - *first*. At most  $\max(\lfloor \frac{3}{2}(N-1) \rfloor, 0)$  comparisons and twice as many applications of the projection, if any.

#### 24.7.9 Bounded value

[alg.clamp]

```

template<class T>
constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);

```

1     *Requires:* The value of *lo* shall be no greater than *hi*. For the first form, type *T* shall be *Cpp17LessThanComparable* (Table 24).

2     *Returns:* *lo* if *v* is less than *lo*, *hi* if *hi* is less than *v*, otherwise *v*.

3     *[Note:* If NaN is avoided, *T* can be a floating-point type. — end note]

4     *Complexity:* At most two comparisons.

#### 24.7.10 Lexicographical comparison

[alg.lex.comparison]

```

template<class InputIterator1, class InputIterator2>
constexpr bool
 lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2);

```

<sup>238</sup>) This behavior intentionally differs from *max\_element()*.

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool
lexicographical_compare(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class Compare>
bool
lexicographical_compare(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 Compare comp);

namespace ranges {
 template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
 class Proj1 = identity, class Proj2 = identity,
 IndirectStrictWeakOrder<projected<I1, Proj1>,
 projected<I2, Proj2>> Comp = ranges::less<>>
 constexpr bool
 lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
 template<InputRange R1, InputRange R2, class Proj1 = identity,
 class Proj2 = identity,
 IndirectStrictWeakOrder<projected<iterator_t<R1>, Proj1>,
 projected<iterator_t<R2>, Proj2>> Comp = ranges::less<>>
 constexpr bool
 lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
}

```

<sup>1</sup> *Returns:* true if and only if the sequence of elements defined by the range [first1, last1) is lexicographically less than the sequence of elements defined by the range [first2, last2).

<sup>2</sup> *Complexity:* At most  $2\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the corresponding comparison and each projection, if any.

<sup>3</sup> *Remarks:* If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

<sup>4</sup> [Example: `ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2)` could be implemented as:

```

for (; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
 if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
 if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;
— end example]

```

<sup>5</sup> [Note: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — end note]

## 24.7.11 Three-way comparison algorithms

[alg.3way]

```
template<class T, class U> constexpr auto compare_3way(const T& a, const U& b);
```

<sup>1</sup> *Effects:* Compares two values and produces a result of the strongest applicable comparison category type:

- (1.1) — Returns `a <= b` if that expression is well-formed.
- (1.2) — Otherwise, if the expressions `a == b` and `a < b` are each well-formed and convertible to `bool`, returns `strong_ordering::equal` when `a == b` is `true`, otherwise returns `strong_ordering::less` when `a < b` is `true`, and otherwise returns `strong_ordering::greater`.
- (1.3) — Otherwise, if the expression `a == b` is well-formed and convertible to `bool`, returns `strong_equality::equal` when `a == b` is `true`, and otherwise returns `strong_equality::nonequal`.
- (1.4) — Otherwise, the function is defined as deleted.

```
template<class InputIterator1, class InputIterator2, class Cmp>
constexpr auto
lexicographical_compare_3way(InputIterator1 b1, InputIterator1 e1,
 InputIterator2 b2, InputIterator2 e2,
 Cmp comp)
 -> common_comparison_category_t<decltype(comp(*b1, *b2)), strong_ordering>;
```

2     *Requires:* `Cmp` shall be a function object type whose return type is a comparison category type.

3     *Effects:* Lexicographically compares two ranges and produces a result of the strongest applicable comparison category type. Equivalent to:

```
for (; b1 != e1 && b2 != e2; void(++b1), void(++b2))
 if (auto cmp = comp(*b1,*b2); cmp != 0)
 return cmp;
 return b1 != e1 ? strong_ordering::greater :
 b2 != e2 ? strong_ordering::less :
 strong_ordering::equal;
```

```
template<class InputIterator1, class InputIterator2>
constexpr auto
lexicographical_compare_3way(InputIterator1 b1, InputIterator1 e1,
 InputIterator2 b2, InputIterator2 e2);
```

4     *Effects:* Equivalent to:

```
return lexicographical_compare_3way(b1, e1, b2, e2,
 [](const auto& t, const auto& u) {
 return compare_3way(t, u);
 });
```

#### 24.7.12 Permutation generators

[[alg.permutation.generators](#)]

```
template<class BidirectionalIterator>
constexpr bool next_permutation(BidirectionalIterator first,
 BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool next_permutation(BidirectionalIterator first,
 BidirectionalIterator last, Compare comp);

namespace ranges {
 template<BidirectionalIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr bool
 next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
 template<BidirectionalRange R, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr bool
 next_permutation(R&& r, Comp comp = {}, Proj proj = {});
}
```

1     Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2     *Requires:* For the overloads in namespace `std`, `BidirectionalIterator` shall meet the `Cpp17ValueSwappable` requirements ([15.5.3.2](#)).

3     *Effects:* Takes a sequence defined by the range [first, last) and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

4     *Returns:* `true` if and only if a next permutation was found.

5     *Complexity:* At most  $(last - first) / 2$  swaps.

```
template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
 BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
 BidirectionalIterator last, Compare comp);

namespace ranges {
 template<BidirectionalIterator I, Sentinel<I> S, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<I, Comp, Proj>
 constexpr bool
 prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});
 template<BidirectionalRange R, class Comp = ranges::less<>,
 class Proj = identity>
 requires Sortable<iterator_t<R>, Comp, Proj>
 constexpr bool
 prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
}
```

6     Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

7     *Requires:* For the overloads in namespace `std`, `BidirectionalIterator` shall meet the *Cpp17Value-Swappable* requirements ([15.5.3.2](#)).

8     *Effects:* Takes a sequence defined by the range [first, last) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

9     *Returns:* `true` if and only if a previous permutation was found.

10    *Complexity:* At most  $(last - first) / 2$  swaps.

## 24.8 Header <numeric> synopsis

[[numeric.ops.overview](#)]

// 24.9.14, least common multiple
template<class M, class N>
 constexpr common_type_t<M,N> lcm(M m, N n);
}
```

## 24.9 Generalized numeric operations

[numeric.ops]

- <sup>1</sup> [Note: The use of closed ranges as well as semi-open ranges to specify requirements throughout this subclause is intentional. — *end note*]

### 24.9.1 Definitions

[numerics.defns]

- <sup>1</sup> Define *GENERALIZED\_NONCOMMUTATIVE\_SUM*(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) as follows:
  - (1.1) — *a*<sub>1</sub> when *N* is 1, otherwise
  - (1.2) — *op*(*GENERALIZED\_NONCOMMUTATIVE\_SUM*(*op*, *a*<sub>1</sub>, ..., *a*<sub>K</sub>),  
*GENERALIZED\_NONCOMMUTATIVE\_SUM*(*op*, *a*<sub>M</sub>, ..., *a*<sub>N</sub>)) for any *K* where  $1 < K + 1 = M \leq N$ .
- <sup>2</sup> Define *GENERALIZED\_SUM*(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) as *GENERALIZED\_NONCOMMUTATIVE\_SUM*(*op*, *b*<sub>1</sub>, ..., *b*<sub>N</sub>), where *b*<sub>1</sub>, ..., *b*<sub>N</sub> may be any permutation of *a*<sub>1</sub>, ..., *a*<sub>N</sub>.

### 24.9.2 Accumulate

[accumulate]

```
template<class InputIterator, class T>
 T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
 T accumulate(InputIterator first, InputIterator last, T init,
 BinaryOperation binary_op);
```

- <sup>1</sup> *Requires:* *T* shall satisfy the *Cpp17CopyConstructible* (Table 27) and *Cpp17CopyAssignable* (Table 29) requirements. In the range [*first*, *last*], *binary\_op* shall neither modify elements nor invalidate iterators or subranges.<sup>239</sup>
- <sup>2</sup> *Effects:* Computes its result by initializing the accumulator *acc* with the initial value *init* and then modifies it with *acc* = *std::move*(*acc*) + \**i* or *acc* = *binary\_op*(*std::move*(*acc*), \**i*) for every iterator *i* in the range [*first*, *last*] in order.<sup>240</sup>

### 24.9.3 Reduce

[reduce]

```
template<class InputIterator>
 typename iterator_traits<InputIterator>::value_type
 reduce(InputIterator first, InputIterator last);

1 Effects: Equivalent to:
 return reduce(first, last,
 typename iterator_traits<InputIterator>::value_type{});

template<class ExecutionPolicy, class ForwardIterator>
 typename iterator_traits<ForwardIterator>::value_type
 reduce(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

2 Effects: Equivalent to:
 return reduce(std::forward<ExecutionPolicy>(exec), first, last,
 typename iterator_traits<ForwardIterator>::value_type{});
```

<sup>239</sup>) The use of fully closed ranges is intentional.

<sup>240</sup>) *accumulate* is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

```

template<class InputIterator, class T>
T reduce(InputIterator first, InputIterator last, T init);
3 Effects: Equivalent to:
 return reduce(first, last, init, plus<>());
template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, T init);
4 Effects: Equivalent to:
 return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());

```

```

template<class InputIterator, class T, class BinaryOperation>
T reduce(InputIterator first, InputIterator last, T init,
 BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, T init,
 BinaryOperation binary_op);
5 Requires:

```

- (5.1) — *T* shall be *Cpp17MoveConstructible* (Table 26).
- (5.2) — All of *binary\_op*(*init*, *\*first*), *binary\_op*(\**first*, *init*), *binary\_op*(*init*, *init*), and *binary\_op*(\**first*, \**first*) shall be convertible to *T*.
- (5.3) — *binary\_op* shall neither invalidate iterators or subranges, nor modify elements in the range [*first*, *last*].

6 Returns: *GENERALIZED\_SUM*(*binary\_op*, *init*, *\*i*, ...) for every *i* in [*first*, *last*]).

7 Complexity:  $\mathcal{O}(\text{last} - \text{first})$  applications of *binary\_op*.

8 [Note: The difference between *reduce* and *accumulate* is that *reduce* applies *binary\_op* in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative *binary\_op* such as floating-point addition. — end note]

#### 24.9.4 Inner product

[inner.product]

```

template<class InputIterator1, class InputIterator2, class T>
T inner_product(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, T init);
template<class InputIterator1, class InputIterator2, class T,
 class BinaryOperation1, class BinaryOperation2>
T inner_product(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, T init,
 BinaryOperation1 binary_op1,
 BinaryOperation2 binary_op2);

```

1 Requires: *T* shall satisfy the *Cpp17CopyConstructible* (Table 27) and *Cpp17CopyAssignable* (Table 29) requirements. In the ranges [*first1*, *last1*] and [*first2*, *first2* + (*last1* - *first1*)] *binary\_op1* and *binary\_op2* shall neither modify elements nor invalidate iterators or subranges.<sup>241</sup>

2 Effects: Computes its result by initializing the accumulator *acc* with the initial value *init* and then modifying it with *acc* = *std::move*(*acc*) + (*\*i1*) \* (*\*i2*) or *acc* = *binary\_op1*(*std::move*(*acc*), *binary\_op2*(\**i1*, \**i2*)) for every iterator *i1* in the range [*first1*, *last1*] and iterator *i2* in the range [*first2*, *first2* + (*last1* - *first1*))] in order.

#### 24.9.5 Transform reduce

[transform.reduce]

```

template<class InputIterator1, class InputIterator2, class T>
T transform_reduce(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2,
 T init);

```

1 Effects: Equivalent to:

<sup>241</sup> The use of fully closed ranges is intentional.

```

 return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());

template<class ExecutionPolicy,
 class ForwardIterator1, class ForwardIterator2, class T>
T transform_reduce(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2,
 T init);

```

2     *Effects:* Equivalent to:

```

 return transform_reduce(std::forward<ExecutionPolicy>(exec),
 first1, last1, first2, init, plus<>(), multiplies<>());

template<class InputIterator1, class InputIterator2, class T,
 class BinaryOperation1, class BinaryOperation2>
T transform_reduce(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2,
 T init,
 BinaryOperation1 binary_op1,
 BinaryOperation2 binary_op2);

template<class ExecutionPolicy,
 class ForwardIterator1, class ForwardIterator2, class T,
 class BinaryOperation1, class BinaryOperation2>
T transform_reduce(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2,
 T init,
 BinaryOperation1 binary_op1,
 BinaryOperation2 binary_op2);

```

3     *Requires:*

- (3.1) —  $T$  shall be *Cpp17MoveConstructible* (Table 26).
- (3.2) — All of
  - (3.2.1) —  $\text{binary\_op1}(init, init)$ ,
  - (3.2.2) —  $\text{binary\_op1}(init, \text{binary\_op2}(*\text{first1}, *\text{first2}))$ ,
  - (3.2.3) —  $\text{binary\_op1}(\text{binary\_op2}(*\text{first1}, *\text{first2}), init)$ , and
  - (3.2.4) —  $\text{binary\_op1}(\text{binary\_op2}(*\text{first1}, *\text{first2}), \text{binary\_op2}(*\text{first1}, *\text{first2}))$   
shall be convertible to  $T$ .
- (3.3) — Neither  $\text{binary\_op1}$  nor  $\text{binary\_op2}$  shall invalidate subranges, or modify elements in the ranges  $[\text{first1}, \text{last1}]$  and  $[\text{first2}, \text{first2} + (\text{last1} - \text{first1})]$ .

4     *Returns:*

*GENERALIZED\_SUM*( $\text{binary\_op1}$ ,  $\text{init}$ ,  $\text{binary\_op2}(*i, *(\text{first2} + (i - \text{first1})))$ , ...)

for every iterator  $i$  in  $[\text{first1}, \text{last1}]$ .

5     *Complexity:*  $\mathcal{O}(\text{last1} - \text{first1})$  applications each of  $\text{binary\_op1}$  and  $\text{binary\_op2}$ .

```

template<class InputIterator, class T,
 class BinaryOperation, class UnaryOperation>
T transform_reduce(InputIterator first, InputIterator last, T init,
 BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
 class ForwardIterator, class T,
 class BinaryOperation, class UnaryOperation>
T transform_reduce(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 T init, BinaryOperation binary_op, UnaryOperation unary_op);

```

6     *Requires:*

- (6.1) —  $T$  shall be *Cpp17MoveConstructible* (Table 26).
- (6.2) — All of

- (6.2.1) — `binary_op(init, init)`,
- (6.2.2) — `binary_op(init, unary_op(*first))`,
- (6.2.3) — `binary_op(unary_op(*first), init)`, and
- (6.2.4) — `binary_op(unary_op(*first), unary_op(*first))`
- shall be convertible to `T`.
- (6.3) — Neither `unary_op` nor `binary_op` shall invalidate subranges, or modify elements in the range `[first, last]`.

7     *Returns:*

`GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)`

for every iterator `i` in `[first, last]`.

8     *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.

9     *[Note: `transform_reduce` does not apply `unary_op` to `init`. —end note]*

## 24.9.6 Partial sum

[partial.sum]

```
template<class InputIterator, class OutputIterator>
OutputIterator partial_sum(
 InputIterator first, InputIterator last,
 OutputIterator result);
template<class InputIterator, class OutputIterator, class BinaryOperation>
OutputIterator partial_sum(
 InputIterator first, InputIterator last,
 OutputIterator result, BinaryOperation binary_op);
```

1     *Requires:* `InputIterator`'s value type shall be constructible from the type of `*first`. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` shall be implicitly convertible to `InputIterator`'s value type. `acc` shall be writable (22.3.1) to the `result` output iterator. In the ranges `[first, last]` and `[result, result + (last - first)]` `binary_op` shall neither modify elements nor invalidate iterators or subranges.<sup>242</sup>

2     *Effects:* For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last]` in order, `acc` is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.

3     *Returns:* `result + (last - first)`.

4     *Complexity:* Exactly  $(\text{last} - \text{first}) - 1$  applications of the binary operation.

5     *Remarks:* `result` may be equal to `first`.

## 24.9.7 Exclusive scan

[exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T>
OutputIterator exclusive_scan(InputIterator first, InputIterator last,
 OutputIterator result, T init);
```

1     *Effects:* Equivalent to:

```
return exclusive_scan(first, last, result, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2 exclusive_scan(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, T init);
```

2     *Effects:* Equivalent to:

```
return exclusive_scan(std::forward<ExecutionPolicy>(exec),
 first, last, result, init, plus<>());
```

---

<sup>242</sup>) The use of fully closed ranges is intentional.

```

template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
OutputIterator exclusive_scan(InputIterator first, InputIterator last,
 OutputIterator result, T init, BinaryOperation binary_op);
template<class ExecutionPolicy,
 class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
ForwardIterator2 exclusive_scan(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, T init, BinaryOperation binary_op);

3 Requires:
(3.1) — T shall be Cpp17MoveConstructible (Table 26).
(3.2) — All of binary_op(init, init), binary_op(init, *first), and binary_op(*first, *first)
 shall be convertible to T.
(3.3) — binary_op shall neither invalidate iterators or subranges, nor modify elements in the ranges
 [first, last] or [result, result + (last - first)].
4 Effects: For each integer K in [0, last - first) assigns through result + K the value of:
 GENERALIZED_NONCOMMUTATIVE_SUM(
 binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))
5 Returns: The end of the resulting range beginning at result.
6 Complexity: $\mathcal{O}(\text{last} - \text{first})$ applications of binary_op.
7 Remarks: result may be equal to first.
8 [Note: The difference between exclusive_scan and inclusive_scan is that exclusive_scan excludes
 the ith input element from the ith sum. If binary_op is not mathematically associative, the behavior
 of exclusive_scan may be nondeterministic. —end note]

```

#### 24.9.8 Inclusive scan

[inclusive.scan]

```

template<class InputIterator, class OutputIterator>
OutputIterator inclusive_scan(InputIterator first, InputIterator last, OutputIterator result);
1 Effects: Equivalent to:
 return inclusive_scan(first, last, result, plus<>());
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 inclusive_scan(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result);
2 Effects: Equivalent to:
 return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());
template<class InputIterator, class OutputIterator, class BinaryOperation>
OutputIterator inclusive_scan(InputIterator first, InputIterator last,
 OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryOperation>
ForwardIterator2 inclusive_scan(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, BinaryOperation binary_op);

template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
OutputIterator inclusive_scan(InputIterator first, InputIterator last,
 OutputIterator result, BinaryOperation binary_op, T init);
template<class ExecutionPolicy,
 class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2 inclusive_scan(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, BinaryOperation binary_op, T init);

3 Requires:

```

- (3.1) — If `init` is provided, `T` shall be *Cpp17MoveConstructible* (Table 26); otherwise, `ForwardIterator1`'s value type shall be *Cpp17MoveConstructible*.
- (3.2) — If `init` is provided, all of `binary_op(init, init)`, `binary_op(init, *first)`, and `binary_op(*first, *first)` shall be convertible to `T`; otherwise, `binary_op(*first, *first)` shall be convertible to `ForwardIterator1`'s value type.
- (3.3) — `binary_op` shall neither invalidate iterators or subranges, nor modify elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

4     *Effects:* For each integer `K` in `[0, last - first]` assigns through `result + K` the value of

- (4.1) — *GENERALIZED\_NONCOMMUTATIVE\_SUM*  

$$\text{binary\_op, init, } \*(\text{first} + 0), \*(\text{first} + 1), \dots, \*(\text{first} + K)$$
 if `init` is provided, or
- (4.2) — *GENERALIZED\_NONCOMMUTATIVE\_SUM*  

$$\text{binary\_op, } \*(\text{first} + 0), \*(\text{first} + 1), \dots, \*(\text{first} + K)$$
 otherwise.

5     *Returns:* The end of the resulting range beginning at `result`.

6     *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications of `binary_op`.

7     *Remarks:* `result` may be equal to `first`.

8     *[Note:* The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the  $i^{\text{th}}$  input element in the  $i^{\text{th}}$  sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` may be nondeterministic. — *end note*]

#### 24.9.9 Transform exclusive scan

[`transform.exclusive.scan`]

```
template<class InputIterator, class OutputIterator, class T,
 class BinaryOperation, class UnaryOperation>
OutputIterator transform_exclusive_scan(InputIterator first, InputIterator last,
 OutputIterator result, T init,
 BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
 class ForwardIterator1, class ForwardIterator2, class T,
 class BinaryOperation, class UnaryOperation>
ForwardIterator2 transform_exclusive_scan(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, T init,
 BinaryOperation binary_op, UnaryOperation unary_op);
```

1     *Requires:*

- (1.1) — `T` shall be *Cpp17MoveConstructible* (Table 26).
- (1.2) — All of
  - (1.2.1) — `binary_op(init, init)`,
  - (1.2.2) — `binary_op(init, unary_op(*first))`, and
  - (1.2.3) — `binary_op(unary_op(*first), unary_op(*first))`
 shall be convertible to `T`.
- (1.3) — Neither `unary_op` nor `binary_op` shall invalidate iterators or subranges, or modify elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

2     *Effects:* For each integer `K` in `[0, last - first]` assigns through `result + K` the value of:

*GENERALIZED\_NONCOMMUTATIVE\_SUM*  

$$\text{binary\_op, init, } \text{unary\_op}(\*(\text{first} + 0)), \text{unary\_op}(\*(\text{first} + 1)), \dots, \text{unary\_op}(\*(\text{first} + K - 1))$$

3     *Returns:* The end of the resulting range beginning at `result`.

4     *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.

5     *Remarks:* `result` may be equal to `first`.

6 [Note: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the  $i^{\text{th}}$  input element from the  $i^{\text{th}}$  sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` may be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`. — end note]

#### 24.9.10 Transform inclusive scan

[`transform.inclusive.scan`]

```
template<class InputIterator, class OutputIterator,
 class BinaryOperation, class UnaryOperation>
OutputIterator transform_inclusive_scan(InputIterator first, InputIterator last,
 OutputIterator result,
 BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
 class ForwardIterator1, class ForwardIterator2,
 class BinaryOperation, class UnaryOperation>
ForwardIterator2 transform_inclusive_scan(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result,
 BinaryOperation binary_op, UnaryOperation unary_op);

template<class InputIterator, class OutputIterator,
 class BinaryOperation, class UnaryOperation, class T>
OutputIterator transform_inclusive_scan(InputIterator first, InputIterator last,
 OutputIterator result,
 BinaryOperation binary_op, UnaryOperation unary_op,
 T init);

template<class ExecutionPolicy,
 class ForwardIterator1, class ForwardIterator2,
 class BinaryOperation, class UnaryOperation, class T>
ForwardIterator2 transform_inclusive_scan(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result,
 BinaryOperation binary_op, UnaryOperation unary_op,
 T init);
```

1 *Requires:*

- (1.1) — If `init` is provided, `T` shall be *Cpp17MoveConstructible* (Table 26); otherwise, `ForwardIterator1`'s value type shall be *Cpp17MoveConstructible*.
- (1.2) — If `init` is provided, all of
  - (1.2.1) — `binary_op(init, init)`,
  - (1.2.2) — `binary_op(init, unary_op(*first))`, and
  - (1.2.3) — `binary_op(unary_op(*first), unary_op(*first))`
 shall be convertible to `T`; otherwise, `binary_op(unary_op(*first), unary_op(*first))` shall be convertible to `ForwardIterator1`'s value type.
- (1.3) — Neither `unary_op` nor `binary_op` shall invalidate iterators or subranges, nor modify elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

2 *Effects:* For each integer `K` in  $[0, \text{last} - \text{first}]$  assigns through `result + K` the value of

- (2.1) — *GENERALIZED\_NONCOMMUTATIVE\_SUM*  
`binary_op, init,`  
`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))`  
 if `init` is provided, or
- (2.2) — *GENERALIZED\_NONCOMMUTATIVE\_SUM*  
`binary_op,`  
`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))`  
 otherwise.

3 *Returns:* The end of the resulting range beginning at `result`.

4 *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.

5 *Remarks:* `result` may be equal to `first`.

6 [Note: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_inclusive_scan` includes the  $i^{\text{th}}$  input element in the  $i^{\text{th}}$  sum. If `binary_op` is not mathematically associative, the behavior of `transform_inclusive_scan` may be nondeterministic. `transform_inclusive_scan` does not apply `unary_op` to `init`. — end note]

### 24.9.11 Adjacent difference

[`adjacent_difference`]

```
template<class InputIterator, class OutputIterator>
OutputIterator
adjacent_difference(InputIterator first, InputIterator last, OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
 OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryOperation>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, BinaryOperation binary_op);
```

1 Let  $T$  be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`, let `binary_op` be an lvalue that denotes an object of type `minus<>`.

2 *Requires:*

- (2.1) — For the overloads with no `ExecutionPolicy`,  $T$  shall be *Cpp17MoveAssignable* (Table 28) and shall be constructible from the type of `*first`. `acc` (defined below) shall be writable (22.3.1) to the `result` output iterator. The result of the expression `binary_op(val, std::move(acc))` shall be writable to the `result` output iterator.
- (2.2) — For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first, *first)` and `*first` shall be writable to `result`.
- (2.3) — For all overloads, in the ranges `[first, last]` and `[result, result + (last - first)]`, `binary_op` shall neither modify elements nor invalidate iterators or subranges.<sup>243</sup>

3 *Effects:* For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type  $T$ , initializes it with `*first`, and assigns the result to `*result`. For every iterator  $i$  in `[first + 1, last]` in order, creates an object `val` whose type is  $T$ , initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.

4 For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every  $d$  in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

5 *Returns:* `result + (last - first)`.

6 *Complexity:* Exactly  $(last - first) - 1$  applications of the binary operation.

7 *Remarks:* For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges `[first, last]` and `[result, result + (last - first)]` shall not overlap.

### 24.9.12 Iota

[`numeric.iota`]

```
template<class ForwardIterator, class T>
void iota(ForwardIterator first, ForwardIterator last, T value);
```

- 1 *Requires:*  $T$  shall be convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type  $T$ , shall be well-formed.

<sup>243</sup>) The use of fully closed ranges is intentional.

- 2     *Effects:* For each element referred to by the iterator *i* in the range [*first*, *last*), assigns *\*i = value* and increments *value* as if by *++value*.
- 3     *Complexity:* Exactly *last - first* increments and assignments.

#### 24.9.13 Greatest common divisor

[**numeric.ops.gcd**]

```
template<class M, class N>
constexpr common_type_t<M,N> gcd(M m, N n);
```

- 1     *Requires:*  $|m|$  and  $|n|$  shall be representable as a value of `common_type_t<M, N>`. [Note: These requirements ensure, for example, that  $\gcd(m, m) = |m|$  is representable as a value of type *M*. — *end note*]

- 2     *Remarks:* If either *M* or *N* is not an integer type, or if either is *cv bool*, the program is ill-formed.

- 3     *Returns:* Zero when *m* and *n* are both zero. Otherwise, returns the greatest common divisor of  $|m|$  and  $|n|$ .

- 4     *Throws:* Nothing.

#### 24.9.14 Least common multiple

[**numeric.ops.lcm**]

```
template<class M, class N>
constexpr common_type_t<M,N> lcm(M m, N n);
```

- 1     *Requires:*  $|m|$  and  $|n|$  shall be representable as a value of `common_type_t<M, N>`. The least common multiple of  $|m|$  and  $|n|$  shall be representable as a value of type `common_type_t<M, N>`.

- 2     *Remarks:* If either *M* or *N* is not an integer type, or if either is *cv bool* the program is ill-formed.

- 3     *Returns:* Zero when either *m* or *n* is zero. Otherwise, returns the least common multiple of  $|m|$  and  $|n|$ .

- 4     *Throws:* Nothing.

### 24.10 C library algorithms

[**alg.c.library**]

- 1     [Note: The header `<cstdlib>` (16.2.2) declares the functions described in this subclause. — *end note*]

```
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
 c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
 compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);
```

- 2     *Effects:* These functions have the semantics specified in the C standard library.

- 3     *Remarks:* The behavior is undefined unless the objects in the array pointed to by *base* are of trivial type.

- 4     *Throws:* Any exception thrown by *compar()* (15.5.5.12).

SEE ALSO: ISO C 7.22.5.

# 25 Numerics library [numerics]

## 25.1 General

[numerics.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform seminumerical operations.
- <sup>2</sup> The following subclauses describe components for complex number types, random number generation, numeric (*n*-at-a-time) arrays, generalized numeric algorithms, and mathematical functions for floating-point types, as summarized in Table 81.

Table 81 — Numerics library summary

| Subclause                                            | Header(s)            |
|------------------------------------------------------|----------------------|
| 25.2 Requirements                                    |                      |
| 25.3 Floating-point environment                      | <cfenv>              |
| 25.4 Complex numbers                                 | <complex>            |
| 25.5 Bit manipulation                                | <bit>                |
| 25.6 Random number generation                        | <random>             |
| 25.7 Numeric arrays                                  | <valarray>           |
| 25.8 Mathematical functions for floating-point types | <cmath><br><cstdlib> |

## 25.2 Numeric type requirements

[numeric.requirements]

- 1 The `complex` and `valarray` components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a type `T` that satisfies the following requirements:<sup>244</sup>
  - (1.1) — `T` is not an abstract class (it has no pure virtual member functions);
  - (1.2) — `T` is not a reference type;
  - (1.3) — `T` is not cv-qualified;
  - (1.4) — If `T` is a class, it has a public default constructor;
  - (1.5) — If `T` is a class, it has a public copy constructor with the signature `T::T(const T&)`
  - (1.6) — If `T` is a class, it has a public destructor;
  - (1.7) — If `T` is a class, it has a public assignment operator whose signature is either `T& T::operator=(const T&)` or `T& T::operator=(T)`
  - (1.8) — If `T` is a class, its assignment operator, copy and default constructors, and destructor shall correspond to each other in the following sense:
    - (1.8.1) — Initialization of raw storage using the copy constructor on the value of `T()`, however obtained, is semantically equivalent to value-initialization of the same raw storage.
    - (1.8.2) — Initialization of raw storage using the default constructor, followed by assignment, is semantically equivalent to initialization of raw storage using the copy constructor.
    - (1.8.3) — Destruction of an object, followed by initialization of its raw storage using the copy constructor, is semantically equivalent to assignment to the original object.

[Note: This rule states, in part, that there shall not be any subtle differences in the semantics of initialization versus assignment. This gives an implementation considerable flexibility in how arrays are initialized.]

[Example: An implementation is allowed to initialize a `valarray` by allocating storage using the `new` operator (which implies a call to the default constructor for each element) and then assigning each

<sup>244</sup>) In other words, value types. These include arithmetic types, pointers, the library class `complex`, and instantiations of `valarray` for value types.

element its value. Or the implementation can allocate raw storage and use the copy constructor to initialize each element. — *end example*]

If the distinction between initialization and assignment is important for a class, or if it fails to satisfy any of the other conditions listed above, the programmer should use `vector` (21.3.11) instead of `valarray` for that class. — *end note*]

- (1.9) — If T is a class, it does not overload unary `operator&`.
- 2 If any operation on T throws an exception the effects are undefined.
- 3 In addition, many member and related functions of `valarray<T>` can be successfully instantiated and will exhibit well-defined behavior if and only if T satisfies additional requirements specified for each such member or related function.
- 4 [Example: It is valid to instantiate `valarray<complex>`, but `operator>()` will not be successfully instantiated for `valarray<complex>` operands, since `complex` does not have any ordering operators. — *end example*]

## 25.3 The floating-point environment

[cfenv]

### 25.3.1 Header <cfenv> synopsis

[cfenv.syn]

```
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below // optional
#define FE_INEXACT see below // optional
#define FE_INVALID see below // optional
#define FE_OVERFLOW see below // optional
#define FE_UNDERFLOW see below // optional

#define FE_DOWNWARD see below // optional
#define FE_TONEAREST see below // optional
#define FE_TOWARDZERO see below // optional
#define FE_UPWARD see below // optional

#define FE_DFL_ENV see below

namespace std {
 // types
 using fenv_t = object type;
 using fexcept_t = integer type;

 // functions
 int feclareexcept(int except);
 int fegetexceptflag(fexcept_t* pflag, int except);
 int feraiseexcept(int except);
 int fesetexceptflag(const fexcept_t* pflag, int except);
 int fetestexcept(int except);

 int fegetround();
 int fesetround(int mode);

 int fegetenv(fenv_t* penv);
 int feholdexcept(fenv_t* penv);
 int fesetenv(const fenv_t* penv);
 int feupdateenv(const fenv_t* penv);
}
```

<sup>1</sup> The contents and meaning of the header <cfenv> are the same as the C standard library header <fenv.h>. [Note: This document does not require an implementation to support the FENV\_ACCESS pragma; it is implementation-defined (14.6) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — *end note*]

<sup>2</sup> The floating-point environment has thread storage duration (6.6.4.2). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the

corresponding thread object (31.3.2) at the time it constructed the object. [Note: That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation. — end note]

- 3 A separate floating-point environment shall be maintained for each thread. Each function accesses the environment corresponding to its calling thread.

SEE ALSO: ISO C 7.6

## 25.4 Complex numbers

[complex.numbers]

- 1 The header <complex> defines a class template, and numerous functions for representing and manipulating complex numbers.
- 2 The effect of instantiating the template `complex` for any type other than `float`, `double`, or `long double` is unspecified. The specializations `complex<float>`, `complex<double>`, and `complex<long double>` are literal types (6.7).
- 3 If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.
- 4 If `z` is an lvalue of type `cv complex<T>` then:

- (4.1) — the expression `reinterpret_cast<cv T(&)[2]>(z)` shall be well-formed,
- (4.2) — `reinterpret_cast<cv T(&)[2]>(z)[0]` shall designate the real part of `z`, and
- (4.3) — `reinterpret_cast<cv T(&)[2]>(z)[1]` shall designate the imaginary part of `z`.

Moreover, if `a` is an expression of type `cv complex<T>*` and the expression `a[i]` is well-defined for an integer expression `i`, then:

- (4.4) — `reinterpret_cast<cv T*>(a)[2*i]` shall designate the real part of `a[i]`, and
- (4.5) — `reinterpret_cast<cv T*>(a)[2*i + 1]` shall designate the imaginary part of `a[i]`.

### 25.4.1 Header <complex> synopsis

[complex.syn]

```
namespace std {
 // 25.4.2, class template complex
 template<class T> class complex;

 // 25.4.3, specializations
 template<> class complex<float>;
 template<> class complex<double>;
 template<> class complex<long double>;

 // 25.4.6, operators
 template<class T> constexpr complex<T> operator+(const complex<T>&, const complex<T>&);
 template<class T> constexpr complex<T> operator+(const complex<T>&, const T&);
 template<class T> constexpr complex<T> operator+(const T&, const complex<T>&);

template<class T> complex<T> sin (const complex<T>&);
template<class T> complex<T> sinh (const complex<T>&);
template<class T> complex<T> sqrt (const complex<T>&);
template<class T> complex<T> tan (const complex<T>&);
template<class T> complex<T> tanh (const complex<T>&);

// 25.4.10, complex literals
inline namespace literals {
 inline namespace complex_literals {
 constexpr complex<long double> operator""il(long double);
 constexpr complex<long double> operator""il(unsigned long long);
 constexpr complex<double> operator""i(double);
 constexpr complex<double> operator""i(unsigned long long);
 constexpr complex<float> operator""if(float);
 constexpr complex<float> operator""if(unsigned long long);
 }
}
}
```

## 25.4.2 Class template complex

[complex]

```

namespace std {
 template<class T> class complex {
```

```

public:
 using value_type = T;

 constexpr complex(const T& re = T(), const T& im = T());
 constexpr complex(const complex&);
 template<class X> constexpr complex(const complex<X>&);

 constexpr T real() const;
 constexpr void real(T);
 constexpr T imag() const;
 constexpr void imag(T);

 constexpr complex& operator= (const T&);
 constexpr complex& operator+=(const T&);
 constexpr complex& operator-=(const T&);
 constexpr complex& operator*=(const T&);
 constexpr complex& operator/=(const T&);

 constexpr complex& operator=(const complex&);
 template<class X> constexpr complex& operator= (const complex<X>&);
 template<class X> constexpr complex& operator+=(const complex<X>&);
 template<class X> constexpr complex& operator-=(const complex<X>&);
 template<class X> constexpr complex& operator*=(const complex<X>&);
 template<class X> constexpr complex& operator/=(const complex<X>&);

};

}

```

- <sup>1</sup> The class `complex` describes an object that can store the Cartesian components, `real()` and `imag()`, of a complex number.

### 25.4.3 Specializations

[`complex.special`]

```

namespace std {
 template<> class complex<float> {
public:
 using value_type = float;

 constexpr complex(float re = 0.0f, float im = 0.0f);
 constexpr complex(const complex<float>&) = default;
 constexpr explicit complex(const complex<double>&);
 constexpr explicit complex(const complex<long double>&);

 constexpr float real() const;
 constexpr void real(float);
 constexpr float imag() const;
 constexpr void imag(float);

 constexpr complex& operator= (float);
 constexpr complex& operator+=(float);
 constexpr complex& operator-=(float);
 constexpr complex& operator*=(float);
 constexpr complex& operator/=(float);

 constexpr complex& operator=(const complex&);
 template<class X> constexpr complex& operator= (const complex<X>&);
 template<class X> constexpr complex& operator+=(const complex<X>&);
 template<class X> constexpr complex& operator-=(const complex<X>&);
 template<class X> constexpr complex& operator*=(const complex<X>&);
 template<class X> constexpr complex& operator/=(const complex<X>&);

};

template<> class complex<double> {
public:
 using value_type = double;

```

```

constexpr complex(double re = 0.0, double im = 0.0);
constexpr complex(const complex<float>&);
constexpr complex(const complex<double>&) = default;
constexpr explicit complex(const complex<long double>&);

constexpr double real() const;
constexpr void real(double);
constexpr double imag() const;
constexpr void imag(double);

constexpr complex& operator= (double);
constexpr complex& operator+=(double);
constexpr complex& operator-=(double);
constexpr complex& operator*=(double);
constexpr complex& operator/=(double);

constexpr complex& operator=(const complex&);
template<class X> constexpr complex& operator= (const complex<X>&);
template<class X> constexpr complex& operator+=(const complex<X>&);
template<class X> constexpr complex& operator-=(const complex<X>&);
template<class X> constexpr complex& operator*=(const complex<X>&);
template<class X> constexpr complex& operator/=(const complex<X>&);
};

template<> class complex<long double> {
public:
 using value_type = long double;

 constexpr complex(long double re = 0.0L, long double im = 0.0L);
 constexpr complex(const complex<float>&);
 constexpr complex(const complex<double>&);
 constexpr complex(const complex<long double>&) = default;

 constexpr long double real() const;
 constexpr void real(long double);
 constexpr long double imag() const;
 constexpr void imag(long double);

 constexpr complex& operator= (long double);
 constexpr complex& operator+=(long double);
 constexpr complex& operator-=(long double);
 constexpr complex& operator*=(long double);
 constexpr complex& operator/=(long double);

 constexpr complex& operator=(const complex&);
 template<class X> constexpr complex& operator= (const complex<X>&);
 template<class X> constexpr complex& operator+=(const complex<X>&);
 template<class X> constexpr complex& operator-=(const complex<X>&);
 template<class X> constexpr complex& operator*=(const complex<X>&);
 template<class X> constexpr complex& operator/=(const complex<X>&);
};

}

```

#### 25.4.4 Member functions

[complex.members]

```
template<class T> constexpr complex(const T& re = T(), const T& im = T());
```

<sup>1</sup> *Effects:* Constructs an object of class complex.

<sup>2</sup> *Ensures:* `real() == re && imag() == im.`

`constexpr T real() const;`

<sup>3</sup> *Returns:* The value of the real component.

```
constexpr void real(T val);
4 Effects: Assigns val to the real component.

constexpr T imag() const;
5 Returns: The value of the imaginary component.

constexpr void imag(T val);
6 Effects: Assigns val to the imaginary component.
```

#### 25.4.5 Member operators

[complex.member.ops]

```
constexpr complex& operator+=(const T& rhs);
1 Effects: Adds the scalar value rhs to the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

2 Returns: *this.

constexpr complex& operator-=(const T& rhs);
3 Effects: Subtracts the scalar value rhs from the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

4 Returns: *this.

constexpr complex& operator*=(const T& rhs);
5 Effects: Multiplies the scalar value rhs by the complex value *this and stores the result in *this.

6 Returns: *this.

constexpr complex& operator/=(const T& rhs);
7 Effects: Divides the scalar value rhs into the complex value *this and stores the result in *this.

8 Returns: *this.

template<class X> constexpr complex& operator+=(const complex<X>& rhs);
9 Effects: Adds the complex value rhs to the complex value *this and stores the sum in *this.

10 Returns: *this.

template<class X> constexpr complex& operator-=(const complex<X>& rhs);
11 Effects: Subtracts the complex value rhs from the complex value *this and stores the difference in *this.

12 Returns: *this.

template<class X> constexpr complex& operator*=(const complex<X>& rhs);
13 Effects: Multiplies the complex value rhs by the complex value *this and stores the product in *this.

14 Returns: *this.

template<class X> constexpr complex& operator/=(const complex<X>& rhs);
15 Effects: Divides the complex value rhs into the complex value *this and stores the quotient in *this.

16 Returns: *this.
```

#### 25.4.6 Non-member operations

[complex.ops]

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
1 Returns: complex<T>(lhs).

2 Remarks: unary operator.

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);

3 Returns: complex<T>(lhs) += rhs.
```

```

template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
4 Returns: complex<T>(-lhs.real(), -lhs.imag());
5 Remarks: unary operator.

template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);
6 Returns: complex<T>(lhs) -= rhs.

template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);
7 Returns: complex<T>(lhs) *= rhs.

template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);
8 Returns: complex<T>(lhs) /= rhs.

template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
template<class T> constexpr bool operator==(const T& lhs, const complex<T>& rhs);
9 Returns: lhs.real() == rhs.real() && lhs.imag() == rhs.imag().

10 Remarks: The imaginary part is assumed to be T(), or 0.0, for the T arguments.

template<class T> constexpr bool operator!=(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator!=(const complex<T>& lhs, const T& rhs);
template<class T> constexpr bool operator!=(const T& lhs, const complex<T>& rhs);
11 Returns: rhs.real() != lhs.real() || rhs.imag() != lhs.imag().

template<class T, class charT, class traits>
 basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);

12 Requires: The input values shall be convertible to T.

13 Effects: Extracts a complex number x of the form: u, (u), or (u,v), where u is the real part and v is the imaginary part (28.7.4.2).

14 If bad input is encountered, calls is.setstate(ios_base::failbit) (which may throw ios::failure (28.5.5.4)).

15 Returns: is.

16 Remarks: This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

template<class T, class charT, class traits>
 basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);

17 Effects: Inserts the complex number x onto the stream o as if it were implemented as follows:
 basic_ostringstream<charT, traits> s;
 s.flags(o.flags());
 s.imbue(o.getloc());
 s.precision(o.precision());
 s << '(' << x.real() << "," << x.imag() << ')';
 return o << s.str();

18 [Note: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting showpoint into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. —end note]

```

### 25.4.7 Value operations

[complex.value.ops]

```
template<class T> constexpr T real(const complex<T>& x);
1 Returns: x.real().

template<class T> constexpr T imag(const complex<T>& x);
2 Returns: x.imag().

template<class T> T abs(const complex<T>& x);
3 Returns: The magnitude of x.

template<class T> T arg(const complex<T>& x);
4 Returns: The phase angle of x, or atan2(imag(x), real(x)).

template<class T> constexpr T norm(const complex<T>& x);
5 Returns: The squared magnitude of x.

template<class T> constexpr complex<T> conj(const complex<T>& x);
6 Returns: The complex conjugate of x.

template<class T> complex<T> proj(const complex<T>& x);
7 Returns: The projection of x onto the Riemann sphere.

8 Remarks: Behaves the same as the C function cproj. SEE ALSO: ISO C 7.3.9.5

template<class T> complex<T> polar(const T& rho, const T& theta = T());
9 Requires: rho shall be non-negative and non-NaN. theta shall be finite.

10 Returns: The complex value corresponding to a complex number whose magnitude is rho and whose
 phase angle is theta.
```

### 25.4.8 Transcendentals

[complex.transcendentals]

```
template<class T> complex<T> acos(const complex<T>& x);
1 Returns: The complex arc cosine of x.

2 Remarks: Behaves the same as the C function cacos. SEE ALSO: ISO C 7.3.5.1

template<class T> complex<T> asin(const complex<T>& x);
3 Returns: The complex arc sine of x.

4 Remarks: Behaves the same as the C function casin. SEE ALSO: ISO C 7.3.5.2

template<class T> complex<T> atan(const complex<T>& x);
5 Returns: The complex arc tangent of x.

6 Remarks: Behaves the same as the C function catan. SEE ALSO: ISO C 7.3.5.3

template<class T> complex<T> acosh(const complex<T>& x);
7 Returns: The complex arc hyperbolic cosine of x.

8 Remarks: Behaves the same as the C function cacosh. SEE ALSO: ISO C 7.3.6.1

template<class T> complex<T> asinh(const complex<T>& x);
9 Returns: The complex arc hyperbolic sine of x.

10 Remarks: Behaves the same as the C function casinh. SEE ALSO: ISO C 7.3.6.2

template<class T> complex<T> atanh(const complex<T>& x);
11 Returns: The complex arc hyperbolic tangent of x.

12 Remarks: Behaves the same as the C function catanh. SEE ALSO: ISO C 7.3.6.3
```

```

template<class T> complex<T> cos(const complex<T>& x);
13 Returns: The complex cosine of x.

template<class T> complex<T> cosh(const complex<T>& x);
14 Returns: The complex hyperbolic cosine of x.

template<class T> complex<T> exp(const complex<T>& x);
15 Returns: The complex base-e exponential of x.

template<class T> complex<T> log(const complex<T>& x);
16 Returns: The complex natural (base-e) logarithm of x. For all x, imag(log(x)) lies in the interval
 [- π , π]. [Note: The semantics of this function are intended to be the same in C++ as they are for
 clog in C. — end note]
17 Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> log10(const complex<T>& x);
18 Returns: The complex common (base-10) logarithm of x, defined as log(x) / log(10).
19 Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
template<class T> complex<T> pow(const complex<T>& x, const T& y);
template<class T> complex<T> pow(const T& x, const complex<T>& y);
20 Returns: The complex power of base x raised to the yth power, defined as exp(y * log(x)). The
 value returned for pow(0, 0) is implementation-defined.
21 Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> sin(const complex<T>& x);
22 Returns: The complex sine of x.

template<class T> complex<T> sinh(const complex<T>& x);
23 Returns: The complex hyperbolic sine of x.

template<class T> complex<T> sqrt(const complex<T>& x);
24 Returns: The complex square root of x, in the range of the right half-plane. [Note: The semantics of
 this function are intended to be the same in C++ as they are for csqrt in C. — end note]
25 Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> tan(const complex<T>& x);
26 Returns: The complex tangent of x.

template<class T> complex<T> tanh(const complex<T>& x);
27 Returns: The complex hyperbolic tangent of x.

```

### 25.4.9 Additional overloads

[cmplx.over]

- <sup>1</sup> The following function templates shall have additional overloads:

|      |      |
|------|------|
| arg  | norm |
| conj | proj |
| imag | real |

where `norm`, `conj`, `imag`, and `real` are `constexpr` overloads.

- <sup>2</sup> The additional overloads shall be sufficient to ensure:

- (2.1) — If the argument has type `long double`, then it is effectively cast to `complex<long double>`.
- (2.2) — Otherwise, if the argument has type `double` or an integer type, then it is effectively cast to `complex<double>`.
- (2.3) — Otherwise, if the argument has type `float`, then it is effectively cast to `complex<float>`.

<sup>3</sup> Function template `pow` shall have additional overloads sufficient to ensure, for a call with at least one argument of type `complex<T>`:

- (3.1) — If either argument has type `complex<long double>` or type `long double`, then both arguments are effectively cast to `complex<long double>`.
- (3.2) — Otherwise, if either argument has type `complex<double>`, `double`, or an integer type, then both arguments are effectively cast to `complex<double>`.
- (3.3) — Otherwise, if either argument has type `complex<float>` or `float`, then both arguments are effectively cast to `complex<float>`.

#### 25.4.10 Suffixes for complex number literals

[complex.literals]

<sup>1</sup> This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);
```

<sup>2</sup> *Returns:* `complex<long double>{0.0L, static_cast<long double>(d)}`.

```
constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);
```

<sup>3</sup> *Returns:* `complex<double>{0.0, static_cast<double>(d)}`.

```
constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);
```

<sup>4</sup> *Returns:* `complex<float>{0.0f, static_cast<float>(d)}`.

#### 25.5 Bit manipulation

[bit]

##### 25.5.1 General

[bit.general]

<sup>1</sup> The header `<bit>` provides components to access, manipulate and process both individual bits and bit sequences.

##### 25.5.2 Header `<bit>` synopsis

[bit.syn]

```
namespace std {
 // 25.5.3, bit_cast
 template<typename To, typename From>
 constexpr To bit_cast(const From& from) noexcept;

 // 25.5.4, integral powers of 2
 template<class T>
 constexpr bool ispow2(T x) noexcept;
 template<class T>
 constexpr T ceil2(T x) noexcept;
 template<class T>
 constexpr T floor2(T x) noexcept;
 template<class T>
 constexpr T log2p1(T x) noexcept;
}
```

##### 25.5.3 Function template `bit_cast`

[bit.cast]

```
template<typename To, typename From>
 constexpr To bit_cast(const From& from) noexcept;
```

<sup>1</sup> *Returns:* An object of type `To`. Each bit of the value representation of the result is equal to the corresponding bit in the object representation of `from`. Padding bits of the `To` object are unspecified. If there is no value of type `To` corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified.

<sup>2</sup> *Remarks:* This function shall not participate in overload resolution unless:

- (2.1) — `sizeof(To) == sizeof(From)` is true;

- (2.2) — `is_trivially_copyable_v<To>` is `true`; and
- (2.3) — `is_trivially_copyable_v<From>` is `true`.

This function shall be `constexpr` if and only if `To`, `From`, and the types of all subobjects of `To` and `From` are types `T` such that:

- (2.4) — `is_union_v<T>` is `false`;
- (2.5) — `is_pointer_v<T>` is `false`;
- (2.6) — `is_member_pointer_v<T>` is `false`;
- (2.7) — `is_VOLATILE_v<T>` is `false`; and
- (2.8) — `T` has no non-static data members of reference type.

## 25.5.4 Integral powers of 2

[bit.pow.two]

```
template<class T>
constexpr bool ispow2(T x) noexcept;
```

<sup>1</sup> *Returns*: `true` if `x` is an integral power of two; `false` otherwise.

<sup>2</sup> *Remarks*: This function shall not participate in overload resolution unless `T` is an unsigned integer type (6.7.1).

```
template<class T>
constexpr T ceil2(T x) noexcept;
```

<sup>3</sup> *Returns*: The minimal value `y` such that `ispow2(y)` is `true` and `y >= x`; if `y` is not representable as a value of type `T`, the result is an unspecified value.

<sup>4</sup> *Remarks*: This function shall not participate in overload resolution unless `T` is an unsigned integer type (6.7.1).

```
template<class T>
constexpr T floor2(T x) noexcept;
```

<sup>5</sup> *Returns*: If `x == 0, 0`; otherwise the maximal value `y` such that `ispow2(y)` is `true` and `y <= x`.

<sup>6</sup> *Remarks*: This function shall not participate in overload resolution unless `T` is an unsigned integer type (6.7.1).

```
template<class T>
constexpr T log2p1(T x) noexcept;
```

<sup>7</sup> *Returns*: If `x == 0, 0`; otherwise one plus the base-2 logarithm of `x`, with any fractional part discarded.

<sup>8</sup> *Remarks*: This function shall not participate in overload resolution unless `T` is an unsigned integer type (6.7.1).

## 25.6 Random number generation

[rand]

<sup>1</sup> This subclause defines a facility for generating (pseudo-)random numbers.

<sup>2</sup> In addition to a few utilities, four categories of entities are described: *uniform random bit generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that satisfy the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated. [Note: These entities are specified in such a way as to permit the binding of any uniform random bit generator object `e` as the argument to any random number distribution object `d`, thus producing a zero-argument function object such as given by `bind(d, e)`. — end note]

<sup>3</sup> Each of the entities specified via this subclause has an associated arithmetic type (6.7.1) identified as `result_type`. With `T` as the `result_type` thus associated with such an entity, that entity is characterized:

- a) as *boolean* or equivalently as *boolean-valued*, if `T` is `bool`;
- b) otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is `true`;
- c) otherwise as *floating* or equivalently as *real-valued*.

If integer-valued, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

- <sup>4</sup> Unless otherwise specified, all descriptions of calculations in this subclause use mathematical real numbers.
- <sup>5</sup> Throughout this subclause, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:

- a) the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and
- b) the operator `lshiftw` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo  $2^w$ .

### 25.6.1 Header <random> synopsis

[rand.synopsis]

```

## 25.6.2 Requirements

[rand.req]

### 25.6.2.1 General requirements

[rand.req.genl]

- 1 Throughout this subclause 25.6, the effect of instantiating a template:
  - a) that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of seed sequence (25.6.2.2).
  - b) that has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of uniform random bit generator (25.6.2.3).
  - c) that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of random number engine (25.6.2.4).
  - d) that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.
  - e) that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
  - f) that has a template type parameter named `UIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
- 2 Throughout this subclause 25.6, phrases of the form “`x` is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “`x` is a value of a type satisfying the requirements of the specified iterator type”.
- 3 Throughout this subclause 25.6, any constructor that can be called with a single argument and that satisfies a requirement specified in this subclause shall be declared `explicit`.

### 25.6.2.2 Seed sequence requirements

[rand.req.seedseq]

- 1 A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values  $i$ ,  $0 \leq i < 2^{32}$ , based on the consumed data. [Note: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. —end note]
- 2 A class `S` satisfies the requirements of a seed sequence if the expressions shown in Table 82 are valid and have the indicated semantics, and if `S` also satisfies all other requirements of this subclause 25.6.2.2. In that Table and throughout this subclause:
  - a) `T` is the type named by `S`'s associated `result_type`;
  - b) `q` is a value of `S` and `r` is a possibly const value of `S`;
  - c) `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;

- d) `rb` and `re` are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;
- e) `ob` is an output iterator; and
- f) `il` is a value of `initializer_list<T>`.

Table 82 — Seed sequence requirements

| Expression                      | Return type         | Pre/post-condition                                                                                                                                                                                                                                                            | Complexity                                   |
|---------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <code>S::result_type</code>     | <code>T</code>      | <code>T</code> is an unsigned integer type (6.7.1) of at least 32 bits.                                                                                                                                                                                                       | compile-time                                 |
| <code>S()</code>                |                     | Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type <code>S</code> .                                                                                                                                                  | constant                                     |
| <code>S(ib, ie)</code>          |                     | Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence <code>[ib, ie]</code> .                                                                                                                                        | $\mathcal{O}(ie - ib)$                       |
| <code>S(il)</code>              |                     | Same as <code>S(il.begin(), il.end())</code> .                                                                                                                                                                                                                                | same as <code>S(il.begin(), il.end())</code> |
| <code>q.generate(rb, re)</code> | <code>void</code>   | Does nothing if <code>rb == re</code> . Otherwise, fills the supplied sequence <code>[rb, re)</code> with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of <code>generate</code> 's previous invocations. | $\mathcal{O}(re - rb)$                       |
| <code>r.size()</code>           | <code>size_t</code> | The number of 32-bit units that would be copied by a call to <code>r.param</code> .                                                                                                                                                                                           | constant                                     |
| <code>r.param(ob)</code>        | <code>void</code>   | Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type <code>S</code> , and that would reproduce in that second object a state indistinguishable from the state of the first object.                   | $\mathcal{O}(r.size())$                      |

### 25.6.2.3 Uniform random bit generator requirements

[rand.req.urng]

- <sup>1</sup> A *uniform random bit generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned. [Note: The degree to which `g`'s results approximate the ideal is often determined statistically. — *end note*]

```
template<class G>
concept UniformRandomBitGenerator =
 Invocable<G&> && UnsignedIntegral<invoke_result_t<G>> &&
 requires {
 { G::min() } -> Same<invoke_result_t<G>>;
 { G::max() } -> Same<invoke_result_t<G>>;
 };
```

- <sup>2</sup> Let `g` be an object of type `G`. `G` models `UniformRandomBitGenerator` only if

- (2.1) — both `G::min()` and `G::max()` are constant expressions (7.7),
- (2.2) — `G::min() < G::max()`,

- (2.3) —  $G::min() \leq g()$ ,
- (2.4) —  $g() \leq G::max()$ , and
- (2.5) —  $g()$  has amortized constant complexity.

3 A class  $G$  meets the *uniform random bit generator* requirements if  $G$  models `UniformRandomBitGenerator`, `invoke_result_t<G&>` is an unsigned integer type (6.7.1), and  $G$  provides a nested *typedef-name result\_type* that denotes the same type as `invoke_result_t<G&>`.

#### 25.6.2.4 Random number engine requirements

[rand.req.eng]

- 1 A *random number engine* (commonly shortened to *engine*)  $e$  of type  $E$  is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.
  - 2 At any given time,  $e$  has a state  $e_i$  for some integer  $i \geq 0$ . Upon construction,  $e$  has an initial state  $e_0$ . An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.
  - 3  $E$ 's specification shall define:
    - a) the size of  $E$ 's state in multiples of the size of `result_type`, given as an integral constant expression;
    - b) the *transition algorithm*  $TA$  by which  $e$ 's state  $e_i$  is advanced to its *successor state*  $e_{i+1}$ ; and
    - c) the *generation algorithm*  $GA$  by which an engine's state is mapped to a value of type `result_type`.
  - 4 A class  $E$  that satisfies the requirements of a uniform random bit generator (25.6.2.3) also satisfies the requirements of a *random number engine* if the expressions shown in Table 83 are valid and have the indicated semantics, and if  $E$  also satisfies all other requirements of this subclause 25.6.2.4. In that Table and throughout this subclause:
    - a)  $T$  is the type named by  $E$ 's associated `result_type`;
    - b)  $e$  is a value of  $E$ ,  $v$  is an lvalue of  $E$ ,  $x$  and  $y$  are (possibly `const`) values of  $E$ ;
    - c)  $s$  is a value of  $T$ ;
    - d)  $q$  is an lvalue satisfying the requirements of a seed sequence (25.6.2.2);
    - e)  $z$  is a value of type `unsigned long long`;
    - f)  $os$  is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
    - g)  $is$  is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;
- where `charT` and `traits` are constrained according to Clause 20 and Clause 28.

Table 83 — Random number engine requirements

| Expression            | Return type       | Pre/post-condition                                                                                                   | Complexity                                                                                       |
|-----------------------|-------------------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| $E()$                 |                   | Creates an engine with the same initial state as all other default-constructed engines of type $E$ .                 | $\mathcal{O}(\text{size of state})$                                                              |
| $E(x)$                |                   | Creates an engine that compares equal to $x$ .                                                                       | $\mathcal{O}(\text{size of state})$                                                              |
| $E(s)$                |                   | Creates an engine with initial state determined by $s$ .                                                             | $\mathcal{O}(\text{size of state})$                                                              |
| $E(q)$ <sup>245</sup> |                   | Creates an engine with an initial state that depends on a sequence produced by one call to <code>q.generate</code> . | same as complexity of <code>q.generate</code> called on a sequence whose length is size of state |
| $e.seed()$            | <code>void</code> | <i>Ensures:</i> $e == E()$ .                                                                                         | same as $E()$                                                                                    |

| <code>os &lt;&lt; x</code>               | reference to the type of <code>os</code> | With <code>os.flags</code> set to <code>ios_base::dec ios_base::left</code> and the fill character set to the space character, writes to <code>os</code> the textual representation of <code>x</code> 's current state. In the output, adjacent numbers are separated by one or more space characters.<br><i>Ensures:</i> The <code>os.flags</code> and fill character are unchanged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | $\mathcal{O}(\text{size of state})$                                               |
| <code>is &gt;&gt; v</code>               | reference to the type of <code>is</code> | With <code>is.flags</code> set to <code>ios_base::dec</code> , sets <code>v</code> 's state as determined by reading its textual representation from <code>is</code> . If bad input is encountered, ensures that <code>v</code> 's state is unchanged by the operation and calls <code>is.setstate(ios::failbit)</code> (which may throw <code>ios::failure</code> (28.5.5.4)). If a textual representation written via <code>os &lt;&lt; x</code> was subsequently read via <code>is &gt;&gt; v</code> , then <code>x == v</code> provided that there have been no intervening invocations of <code>x</code> or of <code>v</code> .<br><i>Requires:</i> <code>is</code> provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of <code>is</code> , and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were respectively the same as those of <code>is</code> .<br><i>Ensures:</i> The <code>is.flags</code> are unchanged. | $\mathcal{O}(\text{size of state})$                                               |

<sup>5</sup> `E` shall satisfy the *Cpp17CopyConstructible* (Table 27) and *Cpp17CopyAssignable* (Table 29) requirements. These operations shall each be of complexity no worse than  $\mathcal{O}(\text{size of state})$ .

<sup>246</sup>) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes `z` consecutive calls `e()`.

### 25.6.2.5 Random number engine adaptor requirements

[rand.req.adapt]

- 1 A *random number engine adaptor* (commonly shortened to *adaptor*) **a** of type **A** is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine **b** of type **B** adapted in this way is termed a *base engine* in this context. The expression **a.base()** shall be valid and shall return a *const* reference to **a**'s base engine.
- 2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

**A::A();**

- 3 *Effects:* The base engine is initialized as if by its default constructor.

**bool operator==(const A& a1, const A& a2);**

- 4 *Returns:* **true** if **a1**'s base engine is equal to **a2**'s base engine. Otherwise returns **false**.

**A::A(result\_type s);**

- 5 *Effects:* The base engine is initialized with **s**.

**template<class Sseq> A::A(Sseq& q);**

- 6 *Effects:* The base engine is initialized with **q**.

**void seed();**

- 7 *Effects:* With **b** as the base engine, invokes **b.seed()**.

**void seed(result\_type s);**

- 8 *Effects:* With **b** as the base engine, invokes **b.seed(s)**.

**template<class Sseq> void seed(Sseq& q);**

- 9 *Effects:* With **b** as the base engine, invokes **b.seed(q)**.

- 10 **A** shall also satisfy the following additional requirements:

- a) The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.
- b) The state of **A** shall include the state of its base engine. The size of **A**'s state shall be no less than the size of the base engine.
- c) Copying **A**'s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of **A**.
- d) The textual representation of **A** shall include the textual representation of its base engine.

### 25.6.2.6 Random number distribution requirements

[rand.req.dist]

- 1 A *random number distribution* (commonly shortened to *distribution*) **d** of type **D** is a function object returning values that are distributed according to an associated mathematical *probability density function*  $p(z)$  or according to an associated *discrete probability function*  $P(z_i)$ . A distribution's specification identifies its associated probability function  $p(z)$  or  $P(z_i)$ .
- 2 An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example,  $p(z | a, b)$  or  $P(z_i | a, b)$ , to name specific parameters, or by writing, for example,  $p(z | \{p\})$  or  $P(z_i | \{p\})$ , to denote a distribution's parameters **p** taken as a whole.
- 3 A class **D** satisfies the requirements of a *random number distribution* if the expressions shown in Table 84 are valid and have the indicated semantics, and if **D** and its associated types also satisfy all other requirements of this subclause 25.6.2.6. In that Table and throughout this subclause,
  - a) **T** is the type named by **D**'s associated **result\_type**;
  - b) **P** is the type named by **D**'s associated **param\_type**;
  - c) **d** is a value of **D**, and **x** and **y** are (possibly *const*) values of **D**;

- d) `glb` and `lub` are values of `T` respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by `d`'s `operator()`, as determined by the current values of `d`'s parameters;
- e) `p` is a (possibly `const`) value of `P`;
- f) `g`, `g1`, and `g2` are lvalues of a type satisfying the requirements of a uniform random bit generator (25.6.2.3);
- g) `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
- h) `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;
- where `charT` and `traits` are constrained according to Clause 20 and Clause 28.

Table 84 — Random number distribution requirements

| Expression                  | Return type       | Pre/post-condition                                                                                                                                                                                                                | Complexity                                                 |
|-----------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <code>D::result_type</code> | <code>T</code>    | <code>T</code> is an arithmetic type (6.7.1).                                                                                                                                                                                     | compile-time                                               |
| <code>D::param_type</code>  | <code>P</code>    |                                                                                                                                                                                                                                   | compile-time                                               |
| <code>D()</code>            |                   | Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type <code>D</code> .                                                                                 | constant                                                   |
| <code>D(p)</code>           |                   | Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct <code>p</code> .                                                              | same as <code>p</code> 's construction                     |
| <code>d.reset()</code>      | <code>void</code> | Subsequent uses of <code>d</code> do not depend on values produced by any engine prior to invoking <code>reset</code> .                                                                                                           | constant                                                   |
| <code>x.param()</code>      | <code>P</code>    | Returns a value <code>p</code> such that <code>D(p).param() == p</code> .                                                                                                                                                         | no worse than the complexity of <code>D(p)</code>          |
| <code>d.param(p)</code>     | <code>void</code> | <i>Ensures:</i> <code>d.param() == p</code> .                                                                                                                                                                                     | no worse than the complexity of <code>D(p)</code>          |
| <code>d(g)</code>           | <code>T</code>    | With <code>p = d.param()</code> , the sequence of numbers returned by successive invocations with the same object <code>g</code> is randomly distributed according to the associated $p(z   \{p\})$ or $P(z_i   \{p\})$ function. | amortized constant number of invocations of <code>g</code> |
| <code>d(g,p)</code>         | <code>T</code>    | The sequence of numbers returned by successive invocations with the same objects <code>g</code> and <code>p</code> is randomly distributed according to the associated $p(z   \{p\})$ or $P(z_i   \{p\})$ function.               | amortized constant number of invocations of <code>g</code> |
| <code>x.min()</code>        | <code>T</code>    | Returns <code>glb</code> .                                                                                                                                                                                                        | constant                                                   |
| <code>x.max()</code>        | <code>T</code>    | Returns <code>lub</code> .                                                                                                                                                                                                        | constant                                                   |

| Expression                 | Return type                              | Pre/post-condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Complexity                    |
|----------------------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <code>x == y</code>        | <code>bool</code>                        | This operator is an equivalence relation. Returns <code>true</code> if <code>x.param() == y.param()</code> and $S_1 = S_2$ , where $S_1$ and $S_2$ are the infinite sequences of values that would be generated, respectively, by repeated future calls to <code>x(g1)</code> and <code>y(g2)</code> whenever <code>g1 == g2</code> . Otherwise returns <code>false</code> .                                                                                                                                                                                                                                                                                              | constant                      |
| <code>x != y</code>        | <code>bool</code>                        | <code>!(x == y).</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | same as <code>x == y</code> . |
| <code>os &lt;&lt; x</code> | reference to the type of <code>os</code> | Writes to <code>os</code> a textual representation for the parameters and the additional internal data of <code>x</code> .<br><i>Ensures:</i> The <code>os(fmtflags</code> and fill character are unchanged.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                               |
| <code>is &gt;&gt; d</code> | reference to the type of <code>is</code> | Restores from <code>is</code> the parameters and additional internal data of the lvalue <code>d</code> . If bad input is encountered, ensures that <code>d</code> is unchanged by the operation and calls<br><code>is.setstate(ios::failbit)</code><br>(which may throw<br><code>ios::failure</code> (28.5.5.4)).<br><i>Requires:</i> <code>is</code> provides a textual representation that was previously written using an <code>os</code> whose imbued locale and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were the same as those of <code>is</code> .<br><i>Ensures:</i> The <code>is(fmtflags</code> are unchanged. |                               |

- <sup>4</sup> D shall satisfy the *Cpp17CopyConstructible* (Table 27) and *Cpp17CopyAssignable* (Table 29) requirements.
- <sup>5</sup> The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of D between any of the invocations `d(g)`.
- <sup>6</sup> If a textual representation is written using `os << x` and that representation is restored into the same or a different object y of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.
- <sup>7</sup> It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 25.6, declarations of `D::param_type` are in the form of `typedefs` for convenience of exposition only.
- <sup>8</sup> P shall satisfy the *Cpp17CopyConstructible* (Table 27), *Cpp17CopyAssignable* (Table 29), and *Cpp17EqualityComparable* (Table 23) requirements.
- <sup>9</sup> For each of the constructors of D taking arguments corresponding to parameters of the distribution, P shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of D that return values corresponding to parameters of the distribution, P shall have a corresponding member function with the identical name, type, and semantics.
- <sup>10</sup> P shall have a declaration of the form
- ```
using distribution_type = D;
```

25.6.3 Random number engine class templates

[rand.eng]

- ¹ Each type instantiated from a class template specified in this subclause 25.6.3 satisfies the requirements of a random number engine (25.6.2.4) type.
- ² Except where specified otherwise, the complexity of each function specified in this subclause 25.6.3 is constant.
- ³ Except where specified otherwise, no function described in this subclause 25.6.3 throws an exception.
- ⁴ Every function described in this subclause 25.6.3 that has a function parameter *q* of type *Sseq&* for a template type parameter named *Sseq* that is different from type *seed_seq* throws what and when the invocation of *q.generate* throws.
- ⁵ Descriptions are provided in this subclause 25.6.3 only for engine operations that are not described in 25.6.2.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- ⁶ Each template specified in this subclause 25.6.3 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.
- ⁷ For every random number engine and for every random number engine adaptor *X* defined in this subclause (25.6.3) and in subclause 25.6.4:

(7.1) — if the constructor

```
template<class Sseq> explicit X(Sseq& q);
```

is called with a type *Sseq* that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function

```
template<class Sseq> void seed(Sseq& q);
```

is called with a type *Sseq* that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to *X::result_type*.

25.6.3.1 Class template linear_congruential_engine

[rand.eng.lcong]

- ¹ A *linear_congruential_engine* random number engine produces unsigned integer random numbers. The state *x_i* of a *linear_congruential_engine* object *x* is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form $TA(x_i) = (a \cdot x_i + c) \bmod m$; the generation algorithm is $GA(x_i) = x_{i+1}$.

```
template<class UIntType, UIntType a, UIntType c, UIntType m>
class linear_congruential_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type multiplier = a;
    static constexpr result_type increment = c;
    static constexpr result_type modulus = m;
    static constexpr result_type min() { return c == 0u ? 1u : 0u; }
    static constexpr result_type max() { return m - 1u; }
    static constexpr result_type default_seed = 1u;

    // constructors and seeding functions
    linear_congruential_engine() : linear_congruential_engine(default_seed) {}
    explicit linear_congruential_engine(result_type s);
    template<class Sseq> explicit linear_congruential_engine(Sseq& q);
    void seed(result_type s = default_seed);
    template<class Sseq> void seed(Sseq& q);
```

```
// generating functions
result_type operator()();
void discard(unsigned long long z);
};
```

- 2 If the template parameter m is 0, the modulus m used throughout this subclause 25.6.3.1 is `numeric_limits<result_type>::max()` plus 1. [Note: m need not be representable as a value of type `result_type`. — end note]
- 3 If the template parameter m is not 0, the following relations shall hold: $a < m$ and $c < m$.
- 4 The textual representation consists of the value of x_i .

```
explicit linear_congruential_engine(result_type s);
```

- 5 *Effects:* Constructs a `linear_congruential_engine` object. If $c \bmod m$ is 0 and $s \bmod m$ is 0, sets the engine's state to 1, otherwise sets the engine's state to $s \bmod m$.

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

- 6 *Effects:* Constructs a `linear_congruential_engine` object. With $k = \lceil \frac{\log_2 m}{32} \rceil$ and a an array (or equivalent) of length $k + 3$, invokes `q.generate(a + 0, a + k + 3)` and then computes $S = \left(\sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j} \right) \bmod m$. If $c \bmod m$ is 0 and S is 0, sets the engine's state to 1, else sets the engine's state to S .

25.6.3.2 Class template `mersenne_twister_engine`

[rand.eng.mers]

- 1 A `mersenne_twister_engine` random number engine²⁴⁷ produces unsigned integer random numbers in the closed interval $[0, 2^w - 1]$. The state x_i of a `mersenne_twister_engine` object x is of size n and consists of a sequence X of n values of the type delivered by x ; all subscripts applied to X are to be taken modulo n .
- 2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values n and m , a twist value r , and a conditional xor-mask a . To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values u, d, s, b, t, c , and ℓ .

The state transition is performed as follows:

- a) Concatenate the upper $w - r$ bits of X_{i-n} with the lower r bits of X_{i+1-n} to obtain an unsigned integer value Y .
- b) With $\alpha = a \cdot (Y \text{ bitand } 1)$, set X_i to $X_{i+m-n} \text{ xor } (Y \text{ rshift } 1) \text{ xor } \alpha$.

The sequence X is initialized with the help of an initialization multiplier f .

- 3 The generation algorithm determines the unsigned integer values z_1, z_2, z_3, z_4 as follows, then delivers z_4 as its result:

- a) Let $z_1 = X_i \text{ xor } ((X_i \text{ rshift } u) \text{ bitand } d)$.
- b) Let $z_2 = z_1 \text{ xor } ((z_1 \text{ lshift}_w s) \text{ bitand } b)$.
- c) Let $z_3 = z_2 \text{ xor } ((z_2 \text{ lshift}_w t) \text{ bitand } c)$.
- d) Let $z_4 = z_3 \text{ xor } (z_3 \text{ rshift } \ell)$.

```
template<class UIntType, size_t w, size_t n, size_t m, size_t r,
         UIntType a, size_t u, UIntType d, size_t s,
         UIntType b, size_t t,
         UIntType c, size_t l, UIntType f>
class mersenne_twister_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t state_size = n;
```

²⁴⁷) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```

static constexpr size_t shift_size = m;
static constexpr size_t mask_bits = r;
static constexpr UIntType xor_mask = a;
static constexpr size_t tempering_u = u;
static constexpr UIntType tempering_d = d;
static constexpr size_t tempering_s = s;
static constexpr UIntType tempering_b = b;
static constexpr size_t tempering_t = t;
static constexpr UIntType tempering_c = c;
static constexpr size_t tempering_l = l;
static constexpr UIntType initialization_multiplier = f;
static constexpr result_type min() { return 0; }
static constexpr result_type max() { return 2w - 1; }
static constexpr result_type default_seed = 5489u;

// constructors and seeding functions
mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
explicit mersenne_twister_engine(result_type value);
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// generating functions
result_type operator()();
void discard(unsigned long long z);
};

```

- ⁴ The following relations shall hold: $0 < m, m \leq n, 2u < w, r \leq w, u \leq w, s \leq w, t \leq w, l \leq w, w \leq \text{numeric_limits<} \text{UIntType} \text{>}::\text{digits}, a \leq (1u \ll w) - 1u, b \leq (1u \ll w) - 1u, c \leq (1u \ll w) - 1u, d \leq (1u \ll w) - 1u$, and $f \leq (1u \ll w) - 1u$.
- ⁵ The textual representation of x_i consists of the values of X_{i-n}, \dots, X_{i-1} , in that order.

```
explicit mersenne_twister_engine(result_type value);
```

- ⁶ *Effects:* Constructs a `mersenne_twister_engine` object. Sets X_{-n} to `value` mod 2^w . Then, iteratively for $i = 1 - n, \dots, -1$, sets X_i to

$$[f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w-2))) + i \text{ mod } n] \text{ mod } 2^w.$$

- ⁷ *Complexity:* $\mathcal{O}(n)$.

```
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
```

- ⁸ *Effects:* Constructs a `mersenne_twister_engine` object. With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $n \cdot k$, invokes `q.generate(a+0, a+n \cdot k)` and then, iteratively for $i = -n, \dots, -1$, sets X_i to $(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j})$ mod 2^w . Finally, if the most significant $w - r$ bits of X_{-n} are zero, and if each of the other resulting X_i is 0, changes X_{-n} to 2^{w-1} .

25.6.3.3 Class template `subtract_with_carry_engine`

[rand.eng.sub]

- ¹ A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.
- ² The state x_i of a `subtract_with_carry_engine` object x is of size $\mathcal{O}(r)$, and consists of a sequence X of r integer values $0 \leq X_i < m = 2^w$; all subscripts applied to X are to be taken modulo r . The state x_i additionally consists of an integer c (known as the *carry*) whose value is either 0 or 1.
- ³ The state transition is performed as follows:

- Let $Y = X_{i-s} - X_{i-r} - c$.
- Set X_i to $y = Y \text{ mod } m$. Set c to 1 if $Y < 0$, otherwise set c to 0.

[*Note:* This algorithm corresponds to a modular linear function of the form $\text{TA}(x_i) = (a \cdot x_i) \text{ mod } b$, where b is of the form $m^r - m^s + 1$ and $a = b - (b-1)/m$. — *end note*]

- ⁴ The generation algorithm is given by $\text{GA}(x_i) = y$, where y is the value produced as a result of advancing the engine's state as described above.

```

template<class UIntType, size_t w, size_t s, size_t r>
class subtract_with_carry_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t short_lag = s;
    static constexpr size_t long_lag = r;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return m - 1; }
    static constexpr result_type default_seed = 19780503u;

    // constructors and seeding functions
    subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
    explicit subtract_with_carry_engine(result_type value);
    template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
};

```

- 5 The following relations shall hold: $0u < s, s < r, 0 < w$, and $w \leq \text{numeric_limits<} \text{UIntType}\text{>}::\text{digits}$.
 6 The textual representation consists of the values of X_{i-r}, \dots, X_{i-1} , in that order, followed by c .

```
explicit subtract_with_carry_engine(result_type value);
```

- 7 *Effects:* Constructs a `subtract_with_carry_engine` object. Sets the values of X_{-r}, \dots, X_{-1} , in that order, as specified below. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

To set the values X_k , first construct `e`, a `linear_congruential_engine` object, as if by the following definition:

```
linear_congruential_engine<result_type,
    40014u, 0u, 2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each X_k , obtain new values z_0, \dots, z_{n-1} from $n = \lceil w/32 \rceil$ successive invocations of `e` taken modulo 2^{32} . Set X_k to $\left(\sum_{j=0}^{n-1} z_j \cdot 2^{32j} \right) \bmod m$.

- 8 *Complexity:* Exactly $n \cdot r$ invocations of `e`.

```
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

- 9 *Effects:* Constructs a `subtract_with_carry_engine` object. With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $r \cdot k$, invokes `q.generate(a+0, a+r \cdot k)` and then, iteratively for $i = -r, \dots, -1$, sets X_i to $\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j} \right) \bmod m$. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

25.6.4 Random number engine adaptor class templates

[rand.adapt]

25.6.4.1 In general

[rand.adapt.general]

- 1 Each type instantiated from a class template specified in this subclause 25.6.4 satisfies the requirements of a random number engine adaptor (25.6.2.5) type.
 2 Except where specified otherwise, the complexity of each function specified in this subclause 25.6.4 is constant.
 3 Except where specified otherwise, no function described in this subclause 25.6.4 throws an exception.
 4 Every function described in this subclause 25.6.4 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.
 5 Descriptions are provided in this subclause 25.6.4 only for adaptor operations that are not described in subclause 25.6.2.5 or for operations where there is additional semantic information. In particular, declarations

for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

- 6 Each template specified in this subclause 25.6.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

25.6.4.2 Class template `discard_block_engine`

[rand.adapt.disc]

- ¹ A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine e . The state x_i of a `discard_block_engine` engine adaptor object x consists of the state e_i of its base engine e and an additional integer n . The size of the state is the size of e 's state plus 1.
- ² The transition algorithm discards all but $r > 0$ values from each block of $p \geq r$ values delivered by e . The state transition is performed as follows: If $n \geq r$, advance the state of e from e_i to e_{i+p-r} and set n to 0. In any case, then increment n and advance e 's then-current state e_j to e_{j+1} .
- ³ The generation algorithm yields the value returned by the last invocation of $e()$ while advancing e 's state as described above.

```
template<class Engine, size_t p, size_t r>
class discard_block_engine {
public:
    // types
    using result_type = typename Engine::result_type;

    // engine characteristics
    static constexpr size_t block_size = p;
    static constexpr size_t used_block = r;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    discard_block_engine();
    explicit discard_block_engine(const Engine& e);
    explicit discard_block_engine(Engine&& e);
    explicit discard_block_engine(result_type s);
    template<class Sseq> explicit discard_block_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; }

private:
    Engine e;    // exposition only
    int n;       // exposition only
};
```

- ⁴ The following relations shall hold: $0 < r$ and $r \leq p$.
- ⁵ The textual representation consists of the textual representation of e followed by the value of n .
- ⁶ In addition to its behavior pursuant to subclause 25.6.2.5, each constructor that is not a copy constructor sets n to 0.

25.6.4.3 Class template `independent_bits_engine`

[rand.adapt.ibits]

- ¹ An `independent_bits_engine` random number engine adaptor combines random numbers that are produced by some base engine e , so as to produce random numbers with a specified number of bits w . The state x_i of an `independent_bits_engine` engine adaptor object x consists of the state e_i of its base engine e ; the size of the state is the size of e 's state.

- ² The transition and generation algorithms are described in terms of the following integral constants:
- Let $R = e.\max() - e.\min() + 1$ and $m = \lfloor \log_2 R \rfloor$.
 - With n as determined below, let $w_0 = \lfloor w/n \rfloor$, $n_0 = n - w \bmod n$, $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$, and $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$.
 - Let $n = \lceil w/m \rceil$ if and only if the relation $R - y_0 \leq \lfloor y_0/n \rfloor$ holds as a result. Otherwise let $n = 1 + \lceil w/m \rceil$.
[Note: The relation $w = n_0 w_0 + (n - n_0)(w_0 + 1)$ always holds. — end note]
- ³ The transition algorithm is carried out by invoking $e()$ as often as needed to obtain n_0 values less than $y_0 + e.\min()$ and $n - n_0$ values less than $y_1 + e.\min()$.
- ⁴ The generation algorithm uses the values produced while advancing the state as described above to yield a quantity S obtained as if by the following algorithm:

```

S = 0;
for (k = 0; k ≠ n_0; k += 1) {
    do u = e() - e.\min(); while (u ≥ y_0);
    S = 2^{w_0} · S + u mod 2^{w_0};
}
for (k = n_0; k ≠ n; k += 1) {
    do u = e() - e.\min(); while (u ≥ y_1);
    S = 2^{w_0+1} · S + u mod 2^{w_0+1};
}

template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return 2^w - 1; }

    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<class Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; };

private:
    Engine e;    // exposition only
};

```

- ⁵ The following relations shall hold: $0 < w$ and $w \leq \text{numeric_limits}<\text{result_type}>::\text{digits}$.
- ⁶ The textual representation consists of the textual representation of e .

25.6.4.4 Class template `shuffle_order_engine`

[rand.adapt.shuf]

- ¹ A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine e , but delivers them in a different sequence. The state x_i of a `shuffle_order_engine` engine adaptor x consists of the state e_i of its base engine e , an additional value Y of the type delivered by e , and an additional sequence V of k values also of the type delivered by e . The size of the state is the size of e 's state plus $k + 1$.

² The transition algorithm permutes the values produced by e . The state transition is performed as follows:

a) Calculate an integer $j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor$.

b) Set Y to V_j and then set V_j to $e()$.

³ The generation algorithm yields the last value of Y produced while advancing e 's state as described above.

```
template<class Engine, size_t k>
class shuffle_order_engine {
public:
    // types
    using result_type = typename Engine::result_type;

    // engine characteristics
    static constexpr size_t table_size = k;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    shuffle_order_engine();
    explicit shuffle_order_engine(const Engine& e);
    explicit shuffle_order_engine(Engine&& e);
    explicit shuffle_order_engine(result_type s);
    template<class Sseq> explicit shuffle_order_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; };

private:
    Engine e;           // exposition only
    result_type V[k];  // exposition only
    result_type Y;     // exposition only
};
```

⁴ The following relation shall hold: $0 < k$.

⁵ The textual representation consists of the textual representation of e , followed by the k values of V , followed by the value of Y .

⁶ In addition to its behavior pursuant to subclause 25.6.2.5, each constructor that is not a copy constructor initializes $V[0], \dots, V[k-1]$ and Y , in that order, with values returned by successive invocations of $e()$.

25.6.5 Engines and engine adaptors with predefined parameters [rand.predef]

```
using minstd_rand0 =
    linear_congruential_engine<uint_fast32_t, 16807, 0, 2147483647>;
```

¹ *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `minstd_rand0` shall produce the value 1043618065.

```
using minstd_rand =
    linear_congruential_engine<uint_fast32_t, 48271, 0, 2147483647>;
```

² *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `minstd_rand` shall produce the value 399268537.

```
using mt19937 =
    mersenne_twister_engine<uint_fast32_t,
```

32,624,397,31,0x9908b0df,11,0xffffffff,7,0x9d2c5680,15,0xefc60000,18,1812433253>;

3 *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `mt19937` shall produce the value 4123659995.

```
using mt19937_64 =
    mersenne_twister_engine<uint_fast64_t,
        64,312,156,31,0xb5026f5aa96619e9,29,
        0x5555555555555555,17,
        0x71d67ffeda60000,37,
        0xffff7eee00000000,43,
        6364136223846793005>;
```

4 *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `mt19937_64` shall produce the value 9981545732273789042.

```
using ranlux24_base =
    subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;
```

5 *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `ranlux24_base` shall produce the value 7937952.

```
using ranlux48_base =
    subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;
```

6 *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `ranlux48_base` shall produce the value 61839128582725.

```
using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;
```

7 *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `ranlux24` shall produce the value 9901578.

```
using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
```

8 *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `ranlux48` shall produce the value 249142670248501.

```
using knuth_b = shuffle_order_engine<minstd_rand0,256>;
```

9 *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `knuth_b` shall produce the value 1112339016.

```
using default_random_engine = implementation-defined;
```

10 *Remarks:* The choice of engine type named by this `typedef` is implementation-defined. [Note: The implementation may select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations may select different underlying engine types, code that uses this `typedef` need not generate identical sequences across implementations. —end note]

25.6.6 Class `random_device`

[`rand.device`]

- 1 A `random_device` uniform random bit generator produces nondeterministic random numbers.
- 2 If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```
class random_device {
public:
    // types
    using result_type = unsigned int;

    // generator characteristics
    static constexpr result_type min() { return numeric_limits<result_type>::min(); }
    static constexpr result_type max() { return numeric_limits<result_type>::max(); }

    // constructors
    random_device() : random_device(implementation-defined) {}
    explicit random_device(const string& token);
```

```

// generating functions
result_type operator()();

// property functions
double entropy() const noexcept;

// no copy functions
random_device(const random_device& ) = delete;
void operator=(const random_device& ) = delete;
};

explicit random_device(const string& token);

```

- 3 *Effects:* Constructs a `random_device` nondeterministic uniform random bit generator object. The semantics of the `token` parameter and the token value used by the default constructor are implementation-defined.²⁴⁸
- 4 *Throws:* A value of an implementation-defined type derived from `exception` if the `random_device` could not be initialized.

```
double entropy() const noexcept;
```

- 5 *Returns:* If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate²⁴⁹ for the random numbers returned by `operator()`, in the range `min()` to $\log_2(\max() + 1)$.
- ```
result_type operator()();
```
- 6     *Returns:* A nondeterministic random value, uniformly distributed between `min()` and `max()`, inclusive. It is implementation-defined how these values are generated.
- 7     *Throws:* A value of an implementation-defined type derived from `exception` if a random number could not be obtained.

## 25.6.7 Utilities

[rand.util]

### 25.6.7.1 Class `seed_seq`

[rand.util.seedseq]

```

class seed_seq {
public:
// types
using result_type = uint_least32_t;

// constructors
seed_seq();
template<class T>
seed_seq(initializer_list<T> il);
template<class InputIterator>
seed_seq(InputIterator begin, InputIterator end);

// generating functions
template<class RandomAccessIterator>
void generate(RandomAccessIterator begin, RandomAccessIterator end);

// property functions
size_t size() const noexcept;
template<class OutputIterator>
void param(OutputIterator dest) const;

// no copy functions
seed_seq(const seed_seq&) = delete;
void operator=(const seed_seq&) = delete;

```

<sup>248</sup>) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

<sup>249</sup>) If a device has  $n$  states whose respective probabilities are  $P_0, \dots, P_{n-1}$ , the device entropy  $S$  is defined as  $S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i$ .

```
private:
 vector<result_type> v; // exposition only
};
```

**seed\_seq();**

1      *Effects:* Constructs a **seed\_seq** object as if by default-constructing its member **v**.

2      *Throws:* Nothing.

```
template<class T>
seed_seq(initializer_list<T> il);
```

3      *Requires:* **T** shall be an integer type.

4      *Effects:* Same as **seed\_seq(il.begin(), il.end())**.

```
template<class InputIterator>
 seed_seq(InputIterator begin, InputIterator end);
```

5      *Requires:* **InputIterator** shall satisfy the *Cpp17InputIterator* requirements (22.3.5.2). Moreover, **iterator\_traits<InputIterator>::value\_type** shall denote an integer type.

6      *Effects:* Constructs a **seed\_seq** object by the following algorithm:

```
for (InputIterator s = begin; s != end; ++s)
 v.push_back((*s) mod 232);
```

```
template<class RandomAccessIterator>
void generate(RandomAccessIterator begin, RandomAccessIterator end);
```

7      *Requires:* **RandomAccessIterator** shall satisfy the *Cpp17RandomAccessIterator* requirements (22.3.5.6) and the requirements of a mutable iterator. Moreover, **iterator\_traits<RandomAccessIterator>::value\_type** shall denote an unsigned integer type capable of accommodating 32-bit quantities.

8      *Effects:* Does nothing if **begin == end**. Otherwise, with **s = v.size()** and **n = end - begin**, fills the supplied range [**begin, end**] according to the following algorithm in which each operation is to be carried out modulo 2<sup>32</sup>, each indexing operator applied to **begin** is to be taken modulo **n**, and **T(x)** is defined as **x xor (x rshift 27)**:

- a) By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let **p = (n - t)/2** and let **q = p + t**, where

$$t = (n \geq 623) ? 11 : (n \geq 68) ? 7 : (n \geq 39) ? 5 : (n \geq 7) ? 3 : (n - 1)/2;$$

- b) With **m** as the larger of **s + 1** and **n**, transform the elements of the range: iteratively for **k = 0, ..., m - 1**, calculate values

$$\begin{aligned} r_1 &= 1664525 \cdot T(\text{begin}[k] \text{ xor } \text{begin}[k + p] \text{ xor } \text{begin}[k - 1]) \\ r_2 &= r_1 + \begin{cases} s & , k = 0 \\ k \bmod n + v[k - 1] & , 0 < k \leq s \\ k \bmod n & , s < k \end{cases} \end{aligned}$$

and, in order, increment **begin[k + p]** by **r<sub>1</sub>**, increment **begin[k + q]** by **r<sub>2</sub>**, and set **begin[k]** to **r<sub>2</sub>**.

- c) Transform the elements of the range again, beginning where the previous step ended: iteratively for **k = m, ..., m + n - 1**, calculate values

$$\begin{aligned} r_3 &= 1566083941 \cdot T(\text{begin}[k] + \text{begin}[k + p] + \text{begin}[k - 1]) \\ r_4 &= r_3 - (k \bmod n) \end{aligned}$$

and, in order, update **begin[k + p]** by xorring it with **r<sub>3</sub>**, update **begin[k + q]** by xorring it with **r<sub>4</sub>**, and set **begin[k]** to **r<sub>4</sub>**.

9      *Throws:* What and when **RandomAccessIterator** operations of **begin** and **end** throw.

```
size_t size() const noexcept;
```

10     *Returns:* The number of 32-bit units that would be returned by a call to **param()**.

11     *Complexity:* Constant time.

```

template<class OutputIterator>
void param(OutputIterator dest) const;
12 Requires: OutputIterator shall satisfy the Cpp17OutputIterator requirements (22.3.5.3). Moreover,
 the expression *dest = rt shall be valid for a value rt of type result_type.
13 Effects: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the
 following statement:
14 copy(v.begin(), v.end(), dest);
 Throws: What and when OutputIterator operations of dest throw.

```

### 25.6.7.2 Function template generate\_canonical

[rand.util.canonical]

- 1 Each function instantiated from the template described in this subclause 25.6.7.2 maps the result of one or more invocations of a supplied uniform random bit generator g to one member of the specified RealType such that, if the values  $g_i$  produced by g are uniformly distributed, the instantiation's results  $t_j$ ,  $0 \leq t_j < 1$ , are distributed as uniformly as possible as specified below.
- 2 [Note: Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. —end note]

```

template<class RealType, size_t bits, class URBG>
RealType generate_canonical(URBG& g);

```

- 3 Complexity: Exactly  $k = \max(1, \lceil b / \log_2 R \rceil)$  invocations of g, where  $b^{250}$  is the lesser of numeric\_limits<RealType>::digits and bits, and R is the value of g.max() - g.min() + 1.
- 4 Effects: Invokes g() k times to obtain values  $g_0, \dots, g_{k-1}$ , respectively. Calculates a quantity

$$S = \sum_{i=0}^{k-1} (g_i - g.\min()) \cdot R^i$$

using arithmetic of type RealType.

- 5 Returns:  $S/R^k$ .

- 6 Throws: What and when g throws.

## 25.6.8 Random number distribution class templates

[rand.dist]

### 25.6.8.1 In general

[rand.dist.general]

- 1 Each type instantiated from a class template specified in this subclause 25.6.8 satisfies the requirements of a random number distribution (25.6.2.6) type.
- 2 Descriptions are provided in this subclause 25.6.8 only for distribution operations that are not described in 25.6.2.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- 3 The algorithms for producing each of the specified distributions are implementation-defined.
- 4 The value of each probability density function  $p(z)$  and of each discrete probability function  $P(z_i)$  specified in this subclause is 0 everywhere outside its stated domain.

### 25.6.8.2 Uniform distributions

[rand.dist.uni]

#### 25.6.8.2.1 Class template uniform\_int\_distribution

[rand.dist.uni.int]

- 1 A uniform\_int\_distribution random number distribution produces random integers  $i$ ,  $a \leq i \leq b$ , distributed according to the constant discrete probability function

$$P(i | a, b) = 1/(b - a + 1).$$

---

<sup>250</sup> b is introduced to avoid any attempt to produce more bits of randomness than can be held in RealType.

```

template<class IntType = int>
class uniform_int_distribution {
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 uniform_int_distribution() : uniform_int_distribution(0) {}
 explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
 explicit uniform_int_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 result_type a() const;
 result_type b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());

```

2      *Requires:*  $a \leq b$ .

3      *Effects:* Constructs a `uniform_int_distribution` object; `a` and `b` correspond to the respective parameters of the distribution.

`result_type a() const;`

4      *Returns:* The value of the `a` parameter with which the object was constructed.

`result_type b() const;`

5      *Returns:* The value of the `b` parameter with which the object was constructed.

#### 25.6.8.2.2 Class template `uniform_real_distribution`

[`rand.dist.uni.real`]

1 A `uniform_real_distribution` random number distribution produces random numbers  $x$ ,  $a \leq x < b$ , distributed according to the constant probability density function

$$p(x | a, b) = 1/(b - a)$$

[*Note:* This implies that  $p(x | a, b)$  is undefined when `a == b`. — *end note*]

```

template<class RealType = double>
class uniform_real_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 uniform_real_distribution() : uniform_real_distribution(0.0) {}
 explicit uniform_real_distribution(RealType a, RealType b = 1.0);
 explicit uniform_real_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);

```

```

template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit uniform_real_distribution(RealType a, RealType b = 1.0);

```

2       *Requires:*  $a \leq b$  and  $b - a \leq \text{numeric\_limits}<\text{RealType}>::\text{max}()$ .

3       *Effects:* Constructs a `uniform_real_distribution` object; `a` and `b` correspond to the respective parameters of the distribution.

`result_type a() const;`

4       *Returns:* The value of the `a` parameter with which the object was constructed.

`result_type b() const;`

5       *Returns:* The value of the `b` parameter with which the object was constructed.

### 25.6.8.3 Bernoulli distributions

[rand.dist.bern]

#### 25.6.8.3.1 Class bernoulli\_distribution

[rand.dist.bern.bernoulli]

1 A `bernoulli_distribution` random number distribution produces `bool` values `b` distributed according to the discrete probability function

$$P(b|p) = \begin{cases} p & \text{if } b = \text{true}, \text{ or} \\ 1-p & \text{if } b = \text{false}. \end{cases}$$

```

class bernoulli_distribution {
public:
 // types
 using result_type = bool;
 using param_type = unspecified;

 // constructors and reset functions
 bernoulli_distribution() : bernoulli_distribution(0.5) {}
 explicit bernoulli_distribution(double p);
 explicit bernoulli_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit bernoulli_distribution(double p);

```

2       *Requires:*  $0 \leq p \leq 1$ .

3       *Effects:* Constructs a `bernoulli_distribution` object; `p` corresponds to the parameter of the distribution.

```
double p() const;
```

4     *Returns:* The value of the `p` parameter with which the object was constructed.

#### 25.6.8.3.2 Class template `binomial_distribution`

[`rand.dist.bern.bin`]

1 A `binomial_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i | t, p) = \binom{t}{i} \cdot p^i \cdot (1 - p)^{t-i} .$$

```
template<class IntType = int>
class binomial_distribution {
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 binomial_distribution() : binomial_distribution(1) {}
 explicit binomial_distribution(IntType t, double p = 0.5);
 explicit binomial_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 IntType t() const;
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit binomial_distribution(IntType t, double p = 0.5);
```

2     *Requires:*  $0 \leq p \leq 1$  and  $0 \leq t$ .

3     *Effects:* Constructs a `binomial_distribution` object; `t` and `p` correspond to the respective parameters of the distribution.

```
IntType t() const;
```

4     *Returns:* The value of the `t` parameter with which the object was constructed.

```
double p() const;
```

5     *Returns:* The value of the `p` parameter with which the object was constructed.

#### 25.6.8.3.3 Class template `geometric_distribution`

[`rand.dist.bern.geo`]

1 A `geometric_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i | p) = p \cdot (1 - p)^i .$$

```
template<class IntType = int>
class geometric_distribution {
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;
```

```

// constructors and reset functions
geometric_distribution() : geometric_distribution(0.5) {}
explicit geometric_distribution(double p);
explicit geometric_distribution(const param_type& parm);
void reset();

// generating functions
template<class URNG>
result_type operator()(URNG& g);
template<class URNG>
result_type operator()(URNG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit geometric_distribution(double p);

```

2      *Requires:*  $0 < p < 1$ .

3      *Effects:* Constructs a `geometric_distribution` object;  $p$  corresponds to the parameter of the distribution.

4      *Returns:* The value of the  $p$  parameter with which the object was constructed.

#### 25.6.8.3.4 Class template `negative_binomial_distribution` [rand.dist.bern.negbin]

1    A `negative_binomial_distribution` random number distribution produces random integers  $i \geq 0$  distributed according to the discrete probability function

$$P(i | k, p) = \binom{k + i - 1}{i} \cdot p^k \cdot (1 - p)^i .$$

[*Note:* This implies that  $P(i | k, p)$  is undefined when  $p == 1$ . — *end note*]

```

template<class IntType = int>
class negative_binomial_distribution {
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructor and reset functions
 negative_binomial_distribution() : negative_binomial_distribution(1) {}
 explicit negative_binomial_distribution(IntType k, double p = 0.5);
 explicit negative_binomial_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 IntType k() const;
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

```

```
explicit negative_binomial_distribution(IntType k, double p = 0.5);
2 Requires: $0 < p \leq 1$ and $0 < k$.
3 Effects: Constructs a negative_binomial_distribution object; k and p correspond to the respective parameters of the distribution.
```

```
IntType k() const;
4 Returns: The value of the k parameter with which the object was constructed.

double p() const;
5 Returns: The value of the p parameter with which the object was constructed.
```

#### 25.6.8.4 Poisson distributions

[rand.dist.pois]

##### 25.6.8.4.1 Class template poisson\_distribution

[rand.dist.pois.poisson]

- 1 A **poisson\_distribution** random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i | \mu) = \frac{e^{-\mu} \mu^i}{i!}.$$

The distribution parameter  $\mu$  is also known as this distribution's *mean*.

```
template<class IntType = int>
class poisson_distribution
{
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 poisson_distribution() : poisson_distribution(1.0) {}
 explicit poisson_distribution(double mean);
 explicit poisson_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 double mean() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit poisson_distribution(double mean);
```

- 2 Requires:  $0 < \text{mean}$ .
- 3 Effects: Constructs a **poisson\_distribution** object; **mean** corresponds to the parameter of the distribution.

```
double mean() const;
4 Returns: The value of the mean parameter with which the object was constructed.
```

##### 25.6.8.4.2 Class template exponential\_distribution

[rand.dist.pois.exp]

- 1 An **exponential\_distribution** random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | \lambda) = \lambda e^{-\lambda x}.$$

```

template<class RealType = double>
class exponential_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 exponential_distribution() : exponential_distribution(1.0) {}
 explicit exponential_distribution(RealType lambda);
 explicit exponential_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType lambda() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit exponential_distribution(RealType lambda);

```

2      *Requires:*  $0 < \lambda$ .

3      *Effects:* Constructs an `exponential_distribution` object; `lambda` corresponds to the parameter of the distribution.

RealType lambda() const;

4      *Returns:* The value of the `lambda` parameter with which the object was constructed.

#### 25.6.8.4.3 Class template `gamma_distribution`

[rand.dist.pois.gamma]

1 A `gamma_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.$$

```

template<class RealType = double>
class gamma_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 gamma_distribution() : gamma_distribution(1.0) {}
 explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
 explicit gamma_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

```

```

// property functions
RealType alpha() const;
RealType beta() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit gamma_distribution(RealType alpha, RealType beta = 1.0);

```

2     *Requires:*  $0 < \alpha$  and  $0 < \beta$ .

3     *Effects:* Constructs a `gamma_distribution` object; `alpha` and `beta` correspond to the parameters of the distribution.

RealType alpha() const;

4     *Returns:* The value of the `alpha` parameter with which the object was constructed.

RealType beta() const;

5     *Returns:* The value of the `beta` parameter with which the object was constructed.

#### 25.6.8.4.4 Class template `weibull_distribution`

[`rand.dist.pois.weibull`]

1 A `weibull_distribution` random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function

$$p(x | a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right).$$

```

template<class RealType = double>
class weibull_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 weibull_distribution() : weibull_distribution(1.0) {}
 explicit weibull_distribution(RealType a, RealType b = 1.0);
 explicit weibull_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType a() const;
 RealType b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit weibull_distribution(RealType a, RealType b = 1.0);

```

2     *Requires:*  $0 < a$  and  $0 < b$ .

3     *Effects:* Constructs a `weibull_distribution` object; `a` and `b` correspond to the respective parameters of the distribution.

RealType a() const;

4     *Returns:* The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5       >Returns: The value of the **b** parameter with which the object was constructed.

#### 25.6.8.4.5 Class template **extreme\_value\_distribution** [rand.dist.pois.extreme]

1 An **extreme\_value\_distribution** random number distribution produces random numbers  $x$  distributed according to the probability density function<sup>251</sup>

$$p(x | a, b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right).$$

```
template<class RealType = double>
class extreme_value_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 extreme_value_distribution() : extreme_value_distribution(0.0) {}
 explicit extreme_value_distribution(RealType a, RealType b = 1.0);
 explicit extreme_value_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 RealType a() const;
 RealType b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

2       >Requires:  $0 < b$ .

3       >Effects: Constructs an **extreme\_value\_distribution** object; **a** and **b** correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4       >Returns: The value of the **a** parameter with which the object was constructed.

```
RealType b() const;
```

5       >Returns: The value of the **b** parameter with which the object was constructed.

#### 25.6.8.5 Normal distributions [rand.dist.norm]

##### 25.6.8.5.1 Class template **normal\_distribution** [rand.dist.norm.normal]

1 A **normal\_distribution** random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right).$$

The distribution parameters  $\mu$  and  $\sigma$  are also known as this distribution's *mean* and *standard deviation*.

---

<sup>251)</sup> The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

```

template<class RealType = double>
class normal_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 normal_distribution() : normal_distribution(0.0) {}
 explicit normal_distribution(RealType mean, RealType stddev = 1.0);
 explicit normal_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType mean() const;
 RealType stddev() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit normal_distribution(RealType mean, RealType stddev = 1.0);

```

2      *Requires:*  $0 < \text{stddev}$ .

3      *Effects:* Constructs a `normal_distribution` object; `mean` and `stddev` correspond to the respective parameters of the distribution.

`RealType mean() const;`

4      *Returns:* The value of the `mean` parameter with which the object was constructed.

`RealType stddev() const;`

5      *Returns:* The value of the `stddev` parameter with which the object was constructed.

#### 25.6.8.5.2 Class template `lognormal_distribution`

[`rand.dist.norm.lognormal`]

1 A `lognormal_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right).$$

```

template<class RealType = double>
class lognormal_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 lognormal_distribution() : lognormal_distribution(0.0) {}
 explicit lognormal_distribution(RealType m, RealType s = 1.0);
 explicit lognormal_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);

```

```

template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType m() const;
RealType s() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit lognormal_distribution(RealType m, RealType s = 1.0);

```

2       *Requires:*  $0 < s$ .

3       *Effects:* Constructs a `lognormal_distribution` object; `m` and `s` correspond to the respective parameters of the distribution.

RealType m() const;

4       *Returns:* The value of the `m` parameter with which the object was constructed.

RealType s() const;

5       *Returns:* The value of the `s` parameter with which the object was constructed.

#### 25.6.8.5.3 Class template `chi_squared_distribution`

[`rand.dist.norm.chisq`]

1 A `chi_squared_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}} .$$

```

template<class RealType = double>
 class chi_squared_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 chi_squared_distribution() : chi_squared_distribution(1) {}
 explicit chi_squared_distribution(RealType n);
 explicit chi_squared_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 RealType n() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit chi_squared_distribution(RealType n);

```

2       *Requires:*  $0 < n$ .

3       *Effects:* Constructs a `chi_squared_distribution` object; `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

4     *Returns:* The value of the **n** parameter with which the object was constructed.

#### 25.6.8.5.4 Class template **cauchy\_distribution** [rand.dist.norm.cauchy]

1 A **cauchy\_distribution** random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | a, b) = \left( \pi b \left( 1 + \left( \frac{x - a}{b} \right)^2 \right) \right)^{-1}.$$

```
template<class RealType = double>
class cauchy_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 cauchy_distribution() : cauchy_distribution(0.0) {}
 explicit cauchy_distribution(RealType a, RealType b = 1.0);
 explicit cauchy_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 RealType a() const;
 RealType b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

explicit cauchy_distribution(RealType a, RealType b = 1.0);
```

2     *Requires:*  $0 < b$ .

3     *Effects:* Constructs a **cauchy\_distribution** object; **a** and **b** correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4     *Returns:* The value of the **a** parameter with which the object was constructed.

```
RealType b() const;
```

5     *Returns:* The value of the **b** parameter with which the object was constructed.

#### 25.6.8.5.5 Class template **fisher\_f\_distribution** [rand.dist.norm.f]

1 A **fisher\_f\_distribution** random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function

$$p(x | m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2) \Gamma(n/2)} \cdot \left( \frac{m}{n} \right)^{m/2} \cdot x^{(m/2)-1} \cdot \left( 1 + \frac{mx}{n} \right)^{-(m+n)/2}.$$

```
template<class RealType = double>
class fisher_f_distribution {
public:
 // types
 using result_type = RealType;
```

```

using param_type = unspecified;

// constructor and reset functions
fisher_f_distribution() : fisher_f_distribution(1) {}
explicit fisher_f_distribution(RealType m, RealType n = 1);
explicit fisher_f_distribution(const param_type& parm);
void reset();

// generating functions
template<class URNG>
result_type operator()(URNG& g);
template<class URNG>
result_type operator()(URNG& g, const param_type& parm);

// property functions
RealType m() const;
RealType n() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit fisher_f_distribution(RealType m, RealType n = 1);

```

2      *Requires:*  $0 < m$  and  $0 < n$ .

3      *Effects:* Constructs a `fisher_f_distribution` object;  $m$  and  $n$  correspond to the respective parameters of the distribution.

`RealType m() const;`

4      *Returns:* The value of the  $m$  parameter with which the object was constructed.

`RealType n() const;`

5      *Returns:* The value of the  $n$  parameter with which the object was constructed.

#### 25.6.8.5.6 Class template `student_t_distribution`

[`rand.dist.norm.t`]

1 A `student_t_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}.$$

```

template<class RealType = double>
class student_t_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 student_t_distribution() : student_t_distribution(1) {}
 explicit student_t_distribution(RealType n);
 explicit student_t_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

```

```

// property functions
RealType n() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit student_t_distribution(RealType n);

2 Requires: $0 < n$.
3 Effects: Constructs a student_t_distribution object; n corresponds to the parameter of the distribution.

RealType n() const;
4 Returns: The value of the n parameter with which the object was constructed.

```

### 25.6.8.6 Sampling distributions [rand.dist.samp]

#### 25.6.8.6.1 Class template `discrete_distribution` [rand.dist.samp.discrete]

- 1 A `discrete_distribution` random number distribution produces random integers  $i$ ,  $0 \leq i < n$ , distributed according to the discrete probability function

$$P(i | p_0, \dots, p_{n-1}) = p_i .$$

- 2 Unless specified otherwise, the distribution parameters are calculated as:  $p_k = w_k / S$  for  $k = 0, \dots, n - 1$ , in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```

template<class IntType = int>
class discrete_distribution {
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructor and reset functions
 discrete_distribution();
 template<class InputIterator>
 discrete_distribution(InputIterator firstW, InputIterator lastW);
 discrete_distribution(initializer_list<double> wl);
 template<class UnaryOperation>
 discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
 explicit discrete_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 vector<double> probabilities() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

discrete_distribution();

```

- 3 Effects: Constructs a `discrete_distribution` object with  $n = 1$  and  $p_0 = 1$ . [Note: Such an object will always deliver the value 0. — end note]

```

template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);

4 Requires: InputIterator shall satisfy the Cpp17InputIterator requirements (22.3.5.2). Moreover,
 iterator_traits<InputIterator>::value_type shall denote a type that is convertible to double.
 If firstW == lastW, let n = 1 and w0 = 1. Otherwise, [firstW, lastW) shall form a sequence w of
 length n > 0.

5 Effects: Constructs a discrete_distribution object with probabilities given by the formula above.

 discrete_distribution(initializer_list<double> wl);

6 Effects: Same as discrete_distribution(wl.begin(), wl.end()).

template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);

7 Requires: Each instance of type UnaryOperation shall be a function object (19.14) whose return type
 shall be convertible to double. Moreover, double shall be convertible to the type of UnaryOperation's
 sole parameter. If nw = 0, let n = 1, otherwise let n = nw. The relation 0 < δ = (xmax - xmin)/n shall
 hold.

8 Effects: Constructs a discrete_distribution object with probabilities given by the formula above,
 using the following values: If nw = 0, let w0 = 1. Otherwise, let wk = fw(xmin + k · δ + δ/2) for
 k = 0, ..., n - 1.

9 Complexity: The number of invocations of fw shall not exceed n.

vector<double> probabilities() const;

10 Returns: A vector<double> whose size member returns n and whose operator[] member returns
 pk when invoked with argument k for k = 0, ..., n - 1.

```

#### 25.6.8.6.2 Class template piecewise\_constant\_distribution [rand.dist.samp.pconst]

- <sup>1</sup> A piecewise\_constant\_distribution random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , uniformly distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1}.$$

- <sup>2</sup> The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n - 1$ . Unless specified otherwise, the remaining  $n$  distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \dots, n - 1,$$

in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```

template<class RealType = double>
class piecewise_constant_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 piecewise_constant_distribution();
 template<class InputIteratorB, class InputIteratorW>
 piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);
 template<class UnaryOperation>
 piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
 template<class UnaryOperation>
 piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
 UnaryOperation fw);
 explicit piecewise_constant_distribution(const param_type& parm);
 void reset();

```

```
// generating functions
template<class URBG>
 result_type operator()(URBG& g);
template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
vector<result_type> intervals() const;
vector<result_type> densities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};
```

`piecewise_constant_distribution();`

- 3     *Effects:* Constructs a `piecewise_constant_distribution` object with  $n = 1$ ,  $\rho_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```
template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);
```

- 4     *Requires:* `InputIteratorB` and `InputIteratorW` shall each satisfy the *Cpp17InputIterator* requirements (22.3.5.2). Moreover, the *id-expressions* `iterator_traits<InputIteratorB>::value_type` and `iterator_traits<InputIteratorW>::value_type` shall each denote a type that is convertible to `double`. If `firstB == lastB` or `++firstB == lastB`, let  $n = 1$ ,  $w_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise,  $[firstB, lastB)$  shall form a sequence  $b$  of length  $n + 1$ , the length of the sequence  $w$  starting from `firstW` shall be at least  $n$ , and any  $w_k$  for  $k \geq n$  shall be ignored by the distribution.

- 5     *Effects:* Constructs a `piecewise_constant_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

- 6     *Requires:* Each instance of type `UnaryOperation` shall be a function object (19.14) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter.

- 7     *Effects:* Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let  $n = 1$ ,  $w_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let  $[bl.begin(), bl.end())$  form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw((b_{k+1} + b_k)/2)$  for  $k = 0, \dots, n - 1$ .

- 8     *Complexity:* The number of invocations of `fw` shall not exceed  $n$ .

```
template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

- 9     *Requires:* Each instance of type `UnaryOperation` shall be a function object (19.14) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter. If `nw = 0`, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  shall hold.

- 10    *Effects:* Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: Let  $b_k = xmin + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = fw(b_k + \delta/2)$  for  $k = 0, \dots, n - 1$ .

- 11    *Complexity:* The number of invocations of `fw` shall not exceed  $n$ .

`vector<result_type> intervals() const;`

- 12    *Returns:* A `vector<result_type>` whose `size` member returns  $n + 1$  and whose `operator[]` member returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

`vector<result_type> densities() const;`

- 13    *Returns:* A `vector<result_type>` whose `size` member returns  $n$  and whose `operator[]` member returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n - 1$ .

### 25.6.8.6.3 Class template `piecewise_linear_distribution` [rand.dist.samp.plinear]

- <sup>1</sup> A `piecewise_linear_distribution` random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.$$

- <sup>2</sup> The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n - 1$ . Unless specified otherwise, the remaining  $n + 1$  distribution parameters are calculated as  $\rho_k = w_k / S$  for  $k = 0, \dots, n$ , in which the values  $w_k$ , commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k).$$

```
template<class RealType = double>
class piecewise_linear_distribution {
public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 piecewise_linear_distribution();
 template<class InputIteratorB, class InputIteratorW>
 piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);
 template<class UnaryOperation>
 piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
 template<class UnaryOperation>
 piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
 explicit piecewise_linear_distribution(const param_type& parm);
 void reset();

 // generating functions
 template<class URNG>
 result_type operator()(URNG& g);
 template<class URNG>
 result_type operator()(URNG& g, const param_type& parm);

 // property functions
 vector<result_type> intervals() const;
 vector<result_type> densities() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
};

piecewise_linear_distribution();
```

- <sup>3</sup> *Effects:* Constructs a `piecewise_linear_distribution` object with  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```
template<class InputIteratorB, class InputIteratorW>
piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);
```

- <sup>4</sup> *Requires:* `InputIteratorB` and `InputIteratorW` shall each satisfy the `Cpp17InputIterator` requirements (22.3.5.2). Moreover, the *id-expressions* `iterator_traits<InputIteratorB>::value_type` and `iterator_traits<InputIteratorW>::value_type` shall each denote a type that is convertible to `double`. If `firstB == lastB` or `++firstB == lastB`, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

Otherwise, `[firstB, lastB)` shall form a sequence  $b$  of length  $n+1$ , the length of the sequence  $w$  starting from `firstW` shall be at least  $n+1$ , and any  $w_k$  for  $k \geq n+1$  shall be ignored by the distribution.

5     *Effects:* Constructs a `piecewise_linear_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

6     *Requires:* Each instance of type `UnaryOperation` shall be a function object (19.14) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter.

7     *Effects:* Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let `[bl.begin(), bl.end())` form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .

8     *Complexity:* The number of invocations of `fw` shall not exceed  $n+1$ .

```
template<class UnaryOperation>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

9     *Requires:* Each instance of type `UnaryOperation` shall be a function object (19.14) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter. If `nw = 0`, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  shall hold.

10    *Effects:* Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: Let  $b_k = xmin + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .

11    *Complexity:* The number of invocations of `fw` shall not exceed  $n+1$ .

```
vector<result_type> intervals() const;
```

12    *Returns:* A `vector<result_type>` whose `size` member returns  $n+1$  and whose `operator[]` member returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

```
vector<result_type> densities() const;
```

13    *Returns:* A `vector<result_type>` whose `size` member returns  $n$  and whose `operator[]` member returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

## 25.6.9 Low-quality random number generation

[c.math.rand]

1    *[Note:* The header `<cstdlib>` (16.2.2) declares the functions described in this subclause. — end note]

```
int rand();
void srand(unsigned int seed);
```

2     *Effects:* The `rand` and `srand` functions have the semantics specified in the C standard library.

3     *Remarks:* The implementation may specify that particular library functions may call `rand`. It is implementation-defined whether the `rand` function may introduce data races (15.5.9). [Note: The other random number generation facilities in this document (25.6) are often preferable to `rand`, because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance. — end note]

SEE ALSO: ISO C 7.22.2

## 25.7 Numeric arrays

[numarray]

### 25.7.1 Header `<valarray>` synopsis

[valarray.syn]

```
#include <initializer_list>

namespace std {
 template<class T> class valarray; // An array of type T
 class slice; // a BLAS-like slice out of an array
 template<class T> class slice_array; // a generalized slice out of an array
 class gslice; // a masked array
 template<class T> class gslice_array;
 template<class T> class mask_array;
 template<class T> class indirect_array; // an indirected array
```

```

template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);

template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
}

```

- <sup>1</sup> The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.
- <sup>2</sup> The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.
- <sup>3</sup> Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the `const` member functions of `valarray<T>` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.<sup>252</sup>
- <sup>4</sup> Implementations introducing such replacement types shall provide additional functions and operators as follows:
  - (4.1) — for every function taking a `const valarray<T>&` other than `begin` and `end` (25.7.10), identical functions taking the replacement types shall be added;
  - (4.2) — for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.
- <sup>5</sup> In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.
- <sup>6</sup> These library functions are permitted to throw a `bad_alloc` (16.6.3.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

## 25.7.2 Class template `valarray`

[template.valarray]

### 25.7.2.1 Overview

[template.valarray.overview]

```

namespace std {
 template<class T> class valarray {
 public:
 using value_type = T;

 // 25.7.2.2, construct/destroy
 valarray();
 explicit valarray(size_t);
 valarray(const T&, size_t);
 valarray(const T*, size_t);
 valarray(const valarray&);
 valarray(valarray&&) noexcept;
 valarray(const slice_array<T>&);
 valarray(const gslice_array<T>&);
 valarray(const mask_array<T>&);
 valarray(const indirect_array<T>&);
 valarray(initializer_list<T>);
 ~valarray();

 // 25.7.2.3, assignment
 valarray& operator=(const valarray&);
 valarray& operator=(valarray&&) noexcept;
 valarray& operator=(initializer_list<T>);
 };
}

```

<sup>252</sup>) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for `valarray` expressions.

```

valarray& operator=(const T&);
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

// 25.7.2.4, element access
const T& operator[](size_t) const;
T& operator[](size_t);

// 25.7.2.5, subset operations
valarray operator[](slice) const;
slice_array<T> operator[](slice);
valarray operator[](const gslice&) const;
gslice_array<T> operator[](const gslice&);
valarray operator[](const valarray<bool>&) const;
mask_array<T> operator[](const valarray<bool>&);
valarray operator[](const valarray<size_t>&) const;
indirect_array<T> operator[](const valarray<size_t>&);

// 25.7.2.6, unary operators
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

// 25.7.2.7, compound assignment
valarray& operator*=(const T&);
valarray& operator/=(const T&);
valarray& operator%=(const T&);
valarray& operator+==(const T&);
valarray& operator-=(const T&);
valarray& operator^=(const T&);
valarray& operator&=(const T&);
valarray& operator|==(const T&);
valarray& operator<=(const T&);
valarray& operator>=(const T&);

valarray& operator*=(const valarray&);
valarray& operator/=(const valarray&);
valarray& operator%=(const valarray&);
valarray& operator+=(const valarray&);
valarray& operator-=(const valarray&);
valarray& operator^=(const valarray&);
valarray& operator|=(const valarray&);
valarray& operator&=(const valarray&);
valarray& operator<=(const valarray&);
valarray& operator>=(const valarray&);

// 25.7.2.8, member functions
void swap(valarray&) noexcept;

size_t size() const;

T sum() const;
T min() const;
T max() const;

valarray shift (int) const;
valarray cshift(int) const;
valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;
void resize(size_t sz, T c = T());
};

}

```

```
template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;
}
```

- 1 The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 25.7. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.<sup>253</sup>

### 25.7.2.2 Constructors

[`valarray.cons`]

```
valarray();
```

- 1 *Effects:* Constructs a `valarray` that has zero length.<sup>254</sup>

```
explicit valarray(size_t n);
```

- 2 *Effects:* Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.3).

```
valarray(const T& v, size_t n);
```

- 3 *Effects:* Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

```
valarray(const T* p, size_t n);
```

- 4 *Requires:* `p` points to an array (9.2.3.4) of at least `n` elements.

*Effects:* Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.<sup>255</sup>

```
valarray(const valarray& v);
```

- 5 *Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.<sup>256</sup>

```
valarray(valarray&& v) noexcept;
```

- 6 *Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

- 7 *Complexity:* Constant.

```
valarray(initializer_list<T> il);
```

- 8 *Effects:* Equivalent to `valarray(il.begin(), il.size())`.

```
valarray(const slice_array<T>&);
valarray(const gslice_array<T>&);
valarray(const mask_array<T>&);
valarray(const indirect_array<T>&);
```

- 9 These conversion constructors convert one of the four reference templates to a `valarray`.

```
~valarray();
```

- 10 *Effects:* The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

### 25.7.2.3 Assignment

[`valarray.assign`]

```
valarray& operator=(const valarray& v);
```

- 1 *Effects:* Each element of the `*this` array is assigned the value of the corresponding element of `v`. If the length of `v` is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

253) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

254) This default constructor is essential, since arrays of `valarray` may be useful. After initialization, the length of an empty array can be increased with the `resize` member function.

255) This constructor is the preferred method for converting a C array to a `valarray` object.

256) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

2       *Ensures:* `size() == v.size()`.  
 3       *Returns:* `*this`.

valarray& operator=(valarray&& v) noexcept;  
 4       *Effects:* `*this` obtains the value of `v`. The value of `v` after the assignment is not specified.  
 5       *Returns:* `*this`.  
 6       *Complexity:* Linear.

valarray& operator=(initializer\_list<T> il);  
 7       *Effects:* Equivalent to: `return *this = valarray(il);`

valarray& operator=(const T& v);  
 8       *Effects:* Assigns `v` to each element of `*this`.  
 9       *Returns:* `*this`.

valarray& operator=(const slice\_array<T>&);  
 valarray& operator=(const gslice\_array<T>&);  
 valarray& operator=(const mask\_array<T>&);  
 valarray& operator=(const indirect\_array<T>&);

10      *Requires:* The length of the array to which the argument refers equals `size()`. The value of an element in the left-hand side of a `valarray` assignment operator does not depend on the value of another element in that left-hand side.  
 11      These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

**25.7.2.4 Element access**

[valarray.access]

const T& operator[](size\_t n) const;  
 T& operator[](size\_t n);

1       *Requires:* `n < size()`.  
 2       *Returns:* A reference to the corresponding element of the array. [Note: The expression `(a[i] = q, a[i]) == q` evaluates to `true` for any non-constant `valarray<T>` `a`, any `T` `q`, and for any `size_t` `i` such that the value of `i` is less than the length of `a`. —end note]  
 3       *Remarks:* The expression `&a[i+j] == &a[i] + j` evaluates to `true` for all `size_t` `i` and `size_t` `j` such that `i+j < a.size()`.  
 4       The expression `&a[i] != &b[j]` evaluates to `true` for any two arrays `a` and `b` and for any `size_t` `i` and `size_t` `j` such that `i < a.size()` and `j < b.size()`. [Note: This property indicates an absence of aliasing and may be used to advantage by optimizing compilers. Compilers may take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarrays`. —end note]  
 5       The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (25.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

**25.7.2.5 Subset operations**

[valarray.sub]

1       The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The `const`-qualified versions return this subset as a new `valarray` object. The non-`const` versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=` and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

valarray operator[](slice slicearr) const;  
 2       *Returns:* A `valarray` containing those elements of the controlled sequence designated by `slicearr`.  
 [Example:  
`const valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);`

```
// v0[slice(2, 5, 3)] returns valarray<char>("cfileo", 5)
— end example]
```

```
slice_array<T> operator[](slice slicearr);
```

- 3     >Returns: An object that holds references to elements of the controlled sequence selected by `slicearr`.  
 [Example:

```
valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
— end example]
```

```
valarray operator[](const gslice& gslicearr) const;
```

- 4     >Returns: A `valarray` containing those elements of the controlled sequence designated by `gslicearr`.  
 [Example:

```
const valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
— end example]
```

```
gslice_array<T> operator[](const gslice& gslicearr);
```

- 5     >Returns: An object that holds references to elements of the controlled sequence selected by `gslicearr`.  
 [Example:

```
valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
valarray<char> v1("ABCDEF", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
— end example]
```

```
valarray operator[](const valarray<bool>& boolarr) const;
```

- 6     >Returns: A `valarray` containing those elements of the controlled sequence designated by `boolarr`.  
 [Example:

```
const valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
— end example]
```

```
mask_array<T> operator[](const valarray<bool>& boolarr);
```

- 7     >Returns: An object that holds references to elements of the controlled sequence selected by `boolarr`.  
 [Example:

```
valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
— end example]
```

```
valarray operator[](const valarray<size_t>& indarr) const;
```

- 8     >Returns: A `valarray` containing those elements of the controlled sequence designated by `indarr`.  
 [Example:

```

const valarray<char> v0("abcdefghijklmnp", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
— end example]

```

```
indirect_array<T> operator[](const valarray<size_t>& indarr);
```

- 9     *Returns:* An object that holds references to elements of the controlled sequence selected by `indarr`.  
   [*Example:*

```

valarray<char> v0("abcdefghijklmnp", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnop", 16)
— end example]

```

### 25.7.2.6 Unary operators

[**valarray.unary**]

```

valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

```

- 1     *Requires:* Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type T (`bool` for `operator!`) or which may be unambiguously implicitly converted to type T (`bool` for `operator!`).  
   2     *Returns:* A `valarray` whose length is `size()`. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

### 25.7.2.7 Compound assignment

[**valarray.cassign**]

```

valarray& operator*=(const valarray& v);
valarray& operator/=(const valarray& v);
valarray& operator%=(const valarray& v);
valarray& operator+==(const valarray& v);
valarray& operator-=(const valarray& v);
valarray& operator^=(const valarray& v);
valarray& operator&=(const valarray& v);
valarray& operator|==(const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);

```

- 1     *Requires:* `size() == v.size()`. Each of these operators may only be instantiated for a type T if the indicated operator can be applied to two operands of type T. The value of an element in the left-hand side of a `valarray` compound assignment operator does not depend on the value of another element in that left hand side.  
   2     *Effects:* Each of these operators performs the indicated operation on each of the elements of `*this` and the corresponding element of v.  
   3     *Returns:* `*this`.  
   4     *Remarks:* The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```

valarray& operator*=(const T& v);
valarray& operator/=(const T& v);
valarray& operator%=(const T& v);
valarray& operator+==(const T& v);
valarray& operator-=(const T& v);
valarray& operator^=(const T& v);
valarray& operator&=(const T& v);
valarray& operator|==(const T& v);
valarray& operator<<=(const T& v);

```

```
valarray& operator>>=(const T& v);
```

5     *Requires:* Each of these operators may only be instantiated for a type T if the indicated operator can be applied to two operands of type T.

6     *Effects:* Each of these operators applies the indicated operation to each element of *\*this* and v.

7     *Returns:* *\*this*

8     *Remarks:* The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

### 25.7.2.8 Member functions

[valarray.members]

```
void swap(valarray& v) noexcept;
```

1     *Effects:* *\*this* obtains the value of v. v obtains the value of *\*this*.

2     *Complexity:* Constant.

```
size_t size() const;
```

3     *Returns:* The number of elements in the array.

4     *Complexity:* Constant time.

```
T sum() const;
```

5     *Requires:* *size()* > 0. This function may only be instantiated for a type T to which *operator+=* can be applied.

6     *Returns:* The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying *operator+=* to a copy of an element of the array and all other elements of the array in an unspecified order.

```
T min() const;
```

7     *Requires:* *size()* > 0

8     *Returns:* The minimum value contained in *\*this*. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using *operator<*.

```
T max() const;
```

9     *Requires:* *size()* > 0.

10    *Returns:* The maximum value contained in *\*this*. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using *operator<*.

```
valarray shift(int n) const;
```

11    *Returns:* A valarray of length *size()*, each of whose elements I is *(\*this)[I + n]* if *I + n* is non-negative and less than *size()*, otherwise T(). [Note: If element zero is taken as the leftmost element, a positive value of n shifts the elements left n places, with zero fill. — end note]

12    *[Example:* If the argument has the value -2, the first two elements of the result will be value-initialized (9.3); the third element of the result will be assigned the value of the first element of the argument; etc. — end example]

```
valarray cshift(int n) const;
```

13    *Returns:* A valarray of length *size()* that is a circular shift of *\*this*. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right -n places.

```
valarray apply(T func(T)) const;
```

```
valarray apply(T func(const T&)) const;
```

14    *Returns:* A valarray whose length is *size()*. Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of *\*this*.

```
void resize(size_t sz, T c = T());
```

- 15     *Effects:* Changes the length of the `*this` array to `sz` and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

### 25.7.3 valarray non-member operations

[`valarray.nonmembers`]

#### 25.7.3.1 Binary operators

[`valarray.binary`]

```
template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);
```

- 1     *Requires:* Each of these operators may only be instantiated for a type `T` to which the indicated operator can be applied and for which the indicated operator returns a value which is of type `T` or which can be unambiguously implicitly converted to type `T`. The argument arrays have the same length.

- 2     *Returns:* A `valarray` whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<T> operator* (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator* (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&,
 const typename valarray<T>::value_type&);
```

```
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&,
 const valarray<T>&);
```

- 3     *Requires:* Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type T or which can be unambiguously implicitly converted to type T.
- 4     *Returns:* A `valarray` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

### 25.7.3.2 Logical operators

[`valarray.comparison`]

```
template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator|||(const valarray<T>&, const valarray<T>&);
```

- 1     *Requires:* Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type `bool` or which can be unambiguously implicitly converted to type `bool`. The two array arguments have the same length.
- 2     *Returns:* A `valarray<bool>` whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<bool> operator==(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator< (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator> (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator|||(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator|||(const typename valarray<T>::value_type&,
 const valarray<T>&);
```

- 3     *Requires:* Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type `bool` or which can be unambiguously implicitly converted to type `bool`.

- <sup>4</sup> *Returns:* A `valarray<bool>` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

### 25.7.3.3 Transcendentals

[`valarray.transcend`]

```
template<class T> valarray<T> abs (const valarray<T>&);
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp (const valarray<T>&);
template<class T> valarray<T> log (const valarray<T>&);
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);
```

- <sup>1</sup> *Requires:* Each of these functions may only be instantiated for a type T to which a unique function with the indicated name can be applied (unqualified). This function shall return a value which is of type T or which can be unambiguously implicitly converted to type T.

### 25.7.3.4 Specialized algorithms

[`valarray.special`]

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

- <sup>1</sup> *Effects:* Equivalent to `x.swap(y)`.

## 25.7.4 Class slice

[`class.slice`]

### 25.7.4.1 Overview

[`class.slice.overview`]

```
namespace std {
 class slice {
 public:
 slice();
 slice(size_t, size_t, size_t);

 size_t start() const;
 size_t size() const;
 size_t stride() const;
 };
 }
}
```

- <sup>1</sup> The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.<sup>257</sup>

### 25.7.4.2 Constructors

[`cons.slice`]

```
slice();
slice(size_t start, size_t length, size_t stride);
slice(const slice&);
```

- <sup>1</sup> The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

<sup>257</sup>) BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs may instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

<sup>2</sup> [Example: `slice(3, 8, 2)` constructs a slice which selects elements 3, 5, 7, ... 17 from an array.  
— end example]

### 25.7.4.3 Access functions

[slice.access]

```
size_t start() const;
size_t size() const;
size_t stride() const;
```

<sup>1</sup> Returns: The start, length, or stride specified by a `slice` object.

<sup>2</sup> Complexity: Constant time.

### 25.7.5 Class template `slice_array`

[template.slice.array]

#### 25.7.5.1 Overview

[template.slice.array.overview]

```
namespace std {
 template<class T> class slice_array {
 public:
 using value_type = T;

 void operator= (const valarray<T>&) const;
 void operator*= (const valarray<T>&) const;
 void operator/= (const valarray<T>&) const;
 void operator%= (const valarray<T>&) const;
 void operator+= (const valarray<T>&) const;
 void operator-= (const valarray<T>&) const;
 void operator^= (const valarray<T>&) const;
 void operator&= (const valarray<T>&) const;
 void operator|= (const valarray<T>&) const;
 void operator<<=(const valarray<T>&) const;
 void operator>>=(const valarray<T>&) const;

 slice_array(const slice_array&);
 ~slice_array();
 const slice_array& operator=(const slice_array&) const;
 void operator=(const T&) const;

 slice_array() = delete; // as implied by declaring copy constructor above
 };
}
```

<sup>1</sup> This template is a helper template used by the `slice` subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```

<sup>2</sup> It has reference semantics to a subset of an array specified by a `slice` object. [Example: The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are 1, 4, ..., 13. — end example]

#### 25.7.5.2 Assignment

[slice.arr.assign]

```
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

<sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

#### 25.7.5.3 Compound assignment

[slice.arr.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
```

```
void operator<=(const valarray<T>&) const;
void operator>=(const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

#### 25.7.5.4 Fill function

[`slice.arr.fill`]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

#### 25.7.6 The `gslice` class

[`class.gslice`]

##### 25.7.6.1 Overview

[`class.gslice.overview`]

```
namespace std {
 class gslice {
 public:
 gslice();
 gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

 size_t start() const;
 valarray<size_t> size() const;
 valarray<size_t> stride() const;
 };
 }
}
```

- <sup>1</sup> This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset ( $s$ ), a set of lengths ( $l_j$ ), and a set of strides ( $d_j$ ). The number of lengths shall equal the number of strides.
- <sup>2</sup> A `gslice` represents a mapping from a set of indices ( $i_j$ ), equal in number to the number of strides, to a single index  $k$ . It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices  $i_j$  range in value from 0 to  $l_{ij} - 1$ .

- <sup>3</sup> [Example: The `gslice` specification

```
start = 3
length = {2, 4, 3}
stride = {19, 4, 1}
```

yields the sequence of one-dimensional indices

$$k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1$$

which are ordered as shown in the following table:

|                                        |     |
|----------------------------------------|-----|
| $(i_0, \quad i_1, \quad i_2, \quad k)$ | $=$ |
| $(0, \quad 0, \quad 0, \quad 3),$      |     |
| $(0, \quad 0, \quad 1, \quad 4),$      |     |
| $(0, \quad 0, \quad 2, \quad 5),$      |     |
| $(0, \quad 1, \quad 0, \quad 7),$      |     |
| $(0, \quad 1, \quad 1, \quad 8),$      |     |
| $(0, \quad 1, \quad 2, \quad 9),$      |     |
| $(0, \quad 2, \quad 0, \quad 11),$     |     |
| $(0, \quad 2, \quad 1, \quad 12),$     |     |
| $(0, \quad 2, \quad 2, \quad 13),$     |     |
| $(0, \quad 3, \quad 0, \quad 15),$     |     |
| $(0, \quad 3, \quad 1, \quad 16),$     |     |
| $(0, \quad 3, \quad 2, \quad 17),$     |     |
| $(1, \quad 0, \quad 0, \quad 22),$     |     |

```
(1, 0, 1, 23),
...
(1, 3, 2, 36)
```

That is, the highest-ordered index turns fastest. — *end example*]

- <sup>4</sup> It is possible to have degenerate generalized slices in which an address is repeated.
- <sup>5</sup> [Example: If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

```
(0, 0, 0, 3),
(0, 0, 1, 4),
(0, 0, 2, 5),
(0, 1, 0, 4),
(0, 1, 1, 5),
(0, 1, 2, 6),
...

```

— *end example*]

- <sup>6</sup> If a degenerate slice is used as the argument to the non-const version of operator [] (const `gslice&`), the behavior is undefined.

### 25.7.6.2 Constructors

[`gslice.cons`]

```
gslice();
gslice(size_t start, const valarray<size_t>& lengths,
 const valarray<size_t>& strides);
gslice(const gslice&);
```

- <sup>1</sup> The default constructor is equivalent to `gslice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gslice` based on a specification of start, lengths, and strides, as explained in the previous subclause.

### 25.7.6.3 Access functions

[`gslice.access`]

```
size_t start() const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
```

- <sup>1</sup> Returns: The representation of the start, lengths, or strides specified for the `gslice`.
- <sup>2</sup> Complexity: `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

### 25.7.7 Class template `gslice_array`

[`template.gslice.array`]

#### 25.7.7.1 Overview

[`template.gslice.array.overview`]

```
namespace std {
 template<class T> class gslice_array {
 public:
 using value_type = T;

 void operator= (const valarray<T>&) const;
 void operator*= (const valarray<T>&) const;
 void operator/= (const valarray<T>&) const;
 void operator%=(const valarray<T>&) const;
 void operator+= (const valarray<T>&) const;
 void operator-= (const valarray<T>&) const;
 void operator^=(const valarray<T>&) const;
 void operator&=(const valarray<T>&) const;
 void operator|= (const valarray<T>&) const;
 void operator<=(const valarray<T>&) const;
 void operator>=(const valarray<T>&) const;
```

```

gslice_array(const gslice_array&);
~gslice_array();
const gslice_array& operator=(const gslice_array&) const;
void operator=(const T&) const;

 gslice_array() = delete; // as implied by declaring copy constructor above
};

}

```

- <sup>1</sup> This template is a helper template used by the `gslice` subscript operator

```
gslice_array<T> valarray<T>::operator[](const gslice&);
```

- <sup>2</sup> It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

### 25.7.7.2 Assignment

[`gslice.array.assign`]

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

### 25.7.7.3 Compound assignment

[`gslice.array.comp.assign`]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|==(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

### 25.7.7.4 Fill function

[`gslice.array.fill`]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

## 25.7.8 Class template `mask_array`

[`template.mask.array`]

### 25.7.8.1 Overview

[`template.mask.array.overview`]

```

namespace std {
 template<class T> class mask_array {
 public:
 using value_type = T;

 void operator= (const valarray<T>&) const;
 void operator*=(const valarray<T>&) const;
 void operator/=(const valarray<T>&) const;
 void operator%=(const valarray<T>&) const;
 void operator+=(const valarray<T>&) const;
 void operator-=(const valarray<T>&) const;
 void operator^=(const valarray<T>&) const;
 void operator&=(const valarray<T>&) const;
 void operator|==(const valarray<T>&) const;
 void operator<<=(const valarray<T>&) const;
 void operator>>=(const valarray<T>&) const;

```

```

mask_array(const mask_array&);
~mask_array();
const mask_array& operator=(const mask_array&) const;
void operator=(const T&) const;

 mask_array() = delete; // as implied by declaring copy constructor above
};

}

```

- <sup>1</sup> This template is a helper template used by the mask subscript operator:

```
mask_array<T> valarray<T>::operator[](const valarray<bool>&).
```

- <sup>2</sup> It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`.)

### 25.7.8.2 Assignment

[mask.array.assign]

```
void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

### 25.7.8.3 Compound assignment

[mask.array.comp.assign]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+==(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the mask object refers.

### 25.7.8.4 Fill function

[mask.array.fill]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

## 25.7.9 Class template indirect\_array

[template.indirect.array]

### 25.7.9.1 Overview

[template.indirect.array.overview]

```

namespace std {
 template<class T> class indirect_array {
 public:
 using value_type = T;

 void operator= (const valarray<T>&) const;
 void operator*=(const valarray<T>&) const;
 void operator/=(const valarray<T>&) const;
 void operator%=(const valarray<T>&) const;
 void operator+==(const valarray<T>&) const;
 void operator-=(const valarray<T>&) const;
 void operator^=(const valarray<T>&) const;
 void operator&=(const valarray<T>&) const;
 void operator|=(const valarray<T>&) const;
 void operator<<=(const valarray<T>&) const;
 void operator>>=(const valarray<T>&) const;
 };
}
```

```

 indirect_array(const indirect_array&);
 ~indirect_array();
 const indirect_array& operator=(const indirect_array&) const;
 void operator=(const T&) const;

 indirect_array() = delete; // as implied by declaring copy constructor above
};

}

```

- <sup>1</sup> This template is a helper template used by the indirect subscript operator

```
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&).
```

- <sup>2</sup> It has reference semantics to a subset of an array specified by an `indirect_array`. Thus, the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

### 25.7.9.2 Assignment

[`indirect.array.assign`]

```
void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.
- <sup>2</sup> If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.
- <sup>3</sup> [Example:

```
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
```

results in undefined behavior since element 4 is specified twice in the indirection. — end example]

### 25.7.9.3 Compound assignment

[`indirect.array.comp.assign`]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+==(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|==(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.
- <sup>2</sup> If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

### 25.7.9.4 Fill function

[`indirect.array.fill`]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

### 25.7.10 valarray range access

[`valarray.range`]

- <sup>1</sup> In the `begin` and `end` function templates that follow, `unspecified1` is a type that meets the requirements of a mutable `Cpp17RandomAccessIterator` (22.3.5.6) and models `ContiguousIterator` (22.3.4.14), whose `value_type` is the template parameter `T` and whose `reference` type is `T&`. `unspecified2` is a type that

meets the requirements of a constant *Cpp17RandomAccessIterator* and models *ContiguousIterator*, whose *value\_type* is the template parameter T and whose *reference type* is *const T&*.

- 2 The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (25.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
```

- 3 *Returns:* An iterator referencing the first value in the array.

```
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
```

- 4 *Returns:* An iterator referencing one past the last value in the array.

long double sph_neumannl(unsigned n, long double x);
}

```

- <sup>1</sup> The contents and meaning of the header <cmath> are the same as the C standard library header <math.h>, with the addition of a three-dimensional hypotenuse function (25.8.3) and the mathematical special functions described in 25.8.5. [Note: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (15.2). —end note]
- <sup>2</sup> For each set of overloaded functions within <cmath>, with the exception of `abs`, there shall be additional overloads sufficient to ensure:
  1. If any argument of arithmetic type corresponding to a `double` parameter has type `long double`, then all arguments of arithmetic type (6.7.1) corresponding to `double` parameters are effectively cast to `long double`.
  2. Otherwise, if any argument of arithmetic type corresponding to a `double` parameter has type `double` or an integer type, then all arguments of arithmetic type corresponding to `double` parameters are effectively cast to `double`.
  3. Otherwise, all arguments of arithmetic type corresponding to `double` parameters have type `float`.

[Note: `abs` is exempted from these rules in order to stay compatible with C. —end note]

SEE ALSO: ISO C 7.12

### 25.8.2 Absolute values

[c.math.abs]

- <sup>1</sup> [Note: The headers <cstdlib> (16.2.2) and <cmath> (25.8.1) declare the functions described in this subclause.  
— end note]

```
int abs(int j);
long int abs(long int j);
long long int abs(long long int j);
float abs(float j);
double abs(double j);
long double abs(long double j);
```

- <sup>2</sup> Effects: The `abs` functions have the semantics specified in the C standard library for the functions `abs`, `labs`, `llabs`, `fabsf`, `fabs`, and `fabsl`.

- <sup>3</sup> Remarks: If `abs()` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X` cannot be converted to `int` by integral promotion (7.3.6), the program is ill-formed. [Note: Arguments that can be promoted to `int` are permitted for compatibility with C. — end note]

SEE ALSO: ISO C 7.12.7.2, 7.22.6.1

### 25.8.3 Three-dimensional hypotenuse

[c.math.hypot3]

```
float hypot(float x, float y, float z);
double hypot(double x, double y, double z);
long double hypot(long double x, long double y, long double z);
```

- <sup>1</sup> Returns:  $\sqrt{x^2 + y^2 + z^2}$ .

### 25.8.4 Classification / comparison functions

[c.math.fpclass]

- <sup>1</sup> The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library. Each function is overloaded for the three floating-point types.

SEE ALSO: ISO C 7.12.3, 7.12.4

### 25.8.5 Mathematical special functions

[sf.cmath]

- <sup>1</sup> If any argument value to any of the functions specified in this subclause is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

- (1.1) — the function description's *Returns*: clause explicitly specifies a domain and those argument values fall outside the specified domain, or
  - (1.2) — the corresponding mathematical function value has a nonzero imaginary component, or
  - (1.3) — the corresponding mathematical function is not mathematically defined.<sup>258</sup>
- <sup>2</sup> Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

#### 25.8.5.1 Associated Laguerre polynomials

[sf.cmath.assoc\_laguerre]

```
double assoc_laguerre(unsigned n, unsigned m, double x);
float assoc_laguerref(unsigned n, unsigned m, float x);
long double assoc_laguerrel(unsigned n, unsigned m, long double x);
```

- <sup>1</sup> Effects: These functions compute the associated Laguerre polynomials of their respective arguments `n`, `m`, and `x`.

- <sup>2</sup> Returns:

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0,$$

where `n` is `n`, `m` is `m`, and `x` is `x`.

- <sup>3</sup> Remarks: The effect of calling each of these functions is implementation-defined if `n >= 128` or if `m >= 128`.

<sup>258</sup>) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.

### 25.8.5.2 Associated Legendre functions

[sf.cmath.assoc\_legendre]

```
double assoc_legendre(unsigned l, unsigned m, double x);
float assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
```

1     *Effects:* These functions compute the associated Legendre functions of their respective arguments  $l$ ,  $m$ , and  $x$ .

2     *Returns:*

$$P_\ell^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_\ell(x), \quad \text{for } |x| \leq 1,$$

where  $l$  is  $l$ ,  $m$  is  $m$ , and  $x$  is  $x$ .

3     *Remarks:* The effect of calling each of these functions is implementation-defined if  $l \geq 128$ .

### 25.8.5.3 Beta function

[sf.cmath.beta]

```
double beta(double x, double y);
float betaf(float x, float y);
long double betal(long double x, long double y);
```

1     *Effects:* These functions compute the beta function of their respective arguments  $x$  and  $y$ .

2     *Returns:*

$$\Beta(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)}, \quad \text{for } x > 0, y > 0,$$

where  $x$  is  $x$  and  $y$  is  $y$ .

### 25.8.5.4 Complete elliptic integral of the first kind

[sf.cmath.comp\_ellint\_1]

```
double comp_ellint_1(double k);
float comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
```

1     *Effects:* These functions compute the complete elliptic integral of the first kind of their respective arguments  $k$ .

2     *Returns:*

$$K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1,$$

where  $k$  is  $k$ .

3     See also [25.8.5.11](#).

### 25.8.5.5 Complete elliptic integral of the second kind

[sf.cmath.comp\_ellint\_2]

```
double comp_ellint_2(double k);
float comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

1     *Effects:* These functions compute the complete elliptic integral of the second kind of their respective arguments  $k$ .

2     *Returns:*

$$E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1,$$

where  $k$  is  $k$ .

3     See also [25.8.5.12](#).

### 25.8.5.6 Complete elliptic integral of the third kind

[sf.cmath.comp\_ellint\_3]

```
double comp_ellint_3(double k, double nu);
float comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);
```

1     *Effects:* These functions compute the complete elliptic integral of the third kind of their respective arguments  $k$  and  $\nu$ .

2     *Returns:*

$$\Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for } |k| \leq 1,$$

where  $k$  is `nu` and  $\nu$  is `nu`.

3 See also 25.8.5.13.

### 25.8.5.7 Regular modified cylindrical Bessel functions

[sf.cmath.cyl\_bessel\_i]

```
double cyl_bessel_i(double nu, double x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

1 *Effects:* These functions compute the regular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns:*

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where  $\nu$  is `nu` and  $x$  is `x`.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 25.8.5.8.

### 25.8.5.8 Cylindrical Bessel functions of the first kind

[sf.cmath.cyl\_bessel\_j]

```
double cyl_bessel_j(double nu, double x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Bessel functions of the first kind of their respective arguments `nu` and `x`.

2 *Returns:*

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where  $\nu$  is `nu` and  $x$  is `x`.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if `nu >= 128`.

### 25.8.5.9 Irregular modified cylindrical Bessel functions

[sf.cmath.cyl\_bessel\_k]

```
double cyl_bessel_k(double nu, double x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

1 *Effects:* These functions compute the irregular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns:*

$$K_\nu(x) = (\pi/2)i^{\nu+1}(J_\nu(ix) + iN_\nu(ix)) = \begin{cases} \frac{\pi}{2} \frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \frac{\pi}{2} \lim_{\mu \rightarrow \nu} \frac{I_{-\mu}(x) - I_\mu(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where  $\nu$  is `nu` and  $x$  is `x`.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 25.8.5.7, 25.8.5.8, 25.8.5.10.

### 25.8.5.10 Cylindrical Neumann functions

[sf.cmath.cyl\_neumann]

```
double cyl_neumann(double nu, double x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments `nu` and `x`.

2       >Returns:

$$N_\nu(x) = \begin{cases} \frac{J_\nu(x) \cos \nu\pi - J_{-\nu}(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim_{\mu \rightarrow \nu} \frac{J_\mu(x) \cos \mu\pi - J_{-\mu}(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where  $\nu$  is nu and  $x$  is x.

3       >Remarks: The effect of calling each of these functions is implementation-defined if nu >= 128.

4       >See also 25.8.5.8.

#### 25.8.5.11 Incomplete elliptic integral of the first kind

[sf.cmath.ellint\_1]

```
double ellint_1(double k, double phi);
float ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

1       >Effects: These functions compute the incomplete elliptic integral of the first kind of their respective arguments k and phi (phi measured in radians).

2       >Returns:

$$F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1,$$

where k is k and  $\phi$  is phi.

#### 25.8.5.12 Incomplete elliptic integral of the second kind

[sf.cmath.ellint\_2]

```
double ellint_2(double k, double phi);
float ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

1       >Effects: These functions compute the incomplete elliptic integral of the second kind of their respective arguments k and phi (phi measured in radians).

2       >Returns:

$$E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta} d\theta, \quad \text{for } |k| \leq 1,$$

where k is k and  $\phi$  is phi.

#### 25.8.5.13 Incomplete elliptic integral of the third kind

[sf.cmath.ellint\_3]

```
double ellint_3(double k, double nu, double phi);
float ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

1       >Effects: These functions compute the incomplete elliptic integral of the third kind of their respective arguments k, nu, and phi (phi measured in radians).

2       >Returns:

$$\Pi(\nu, k, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1,$$

where  $\nu$  is nu, k is k, and  $\phi$  is phi.

#### 25.8.5.14 Exponential integral

[sf.cmath.expint]

```
double expint(double x);
float expintf(float x);
long double expintl(long double x);
```

1       >Effects: These functions compute the exponential integral of their respective arguments x.

2       >Returns:

$$Ei(x) = - \int_{-x}^{\infty} \frac{e^{-t}}{t} dt$$

where x is x.

### 25.8.5.15 Hermite polynomials

[sf.cmath.hermite]

```
double hermite(unsigned n, double x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

1     *Effects:* These functions compute the Hermite polynomials of their respective arguments **n** and **x**.

2     *Returns:*

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

where *n* is **n** and *x* is **x**.

3     *Remarks:* The effect of calling each of these functions is implementation-defined if **n** >= 128.

### 25.8.5.16 Laguerre polynomials

[sf.cmath.laguerre]

```
double laguerre(unsigned n, double x);
float laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1     *Effects:* These functions compute the Laguerre polynomials of their respective arguments **n** and **x**.

2     *Returns:*

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}), \quad \text{for } x \geq 0,$$

where *n* is **n** and *x* is **x**.

3     *Remarks:* The effect of calling each of these functions is implementation-defined if **n** >= 128.

### 25.8.5.17 Legendre polynomials

[sf.cmath.legendre]

```
double legendre(unsigned l, double x);
float legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1     *Effects:* These functions compute the Legendre polynomials of their respective arguments **l** and **x**.

2     *Returns:*

$$P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l, \quad \text{for } |x| \leq 1,$$

where *l* is **l** and *x* is **x**.

3     *Remarks:* The effect of calling each of these functions is implementation-defined if **l** >= 128.

### 25.8.5.18 Riemann zeta function

[sf.cmath.riemann\_zeta]

```
double riemann_zeta(double x);
float riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

1     *Effects:* These functions compute the Riemann zeta function of their respective arguments **x**.

2     *Returns:*

$$\zeta(x) = \begin{cases} \sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \frac{1}{1 - 2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\ 2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0 \end{cases}$$

where *x* is **x**.

**25.8.5.19 Spherical Bessel functions of the first kind**

[sf.cmath.sph\_bessel]

```
double sph_bessel(unsigned n, double x);
float sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

1     *Effects:* These functions compute the spherical Bessel functions of the first kind of their respective arguments **n** and **x**.

2     *Returns:*

$$j_n(x) = (\pi/2x)^{1/2} J_{n+1/2}(x), \quad \text{for } x \geq 0,$$

where *n* is **n** and *x* is **x**.

3     *Remarks:* The effect of calling each of these functions is implementation-defined if **n** >= 128.

4     See also [25.8.5.8](#).

**25.8.5.20 Spherical associated Legendre functions**

[sf.cmath.sph\_legendre]

```
double sph_legendre(unsigned l, unsigned m, double theta);
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

1     *Effects:* These functions compute the spherical associated Legendre functions of their respective arguments **l**, **m**, and **theta** (**theta** measured in radians).

2     *Returns:*

$$Y_\ell^m(\theta, 0)$$

where

$$Y_\ell^m(\theta, \phi) = (-1)^m \left[ \frac{(2\ell+1)}{4\pi} \frac{(\ell-m)!}{(\ell+m)!} \right]^{1/2} P_\ell^m(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq \ell,$$

and *l* is **l**, *m* is **m**, and *theta* is **theta**.

3     *Remarks:* The effect of calling each of these functions is implementation-defined if **l** >= 128.

4     See also [25.8.5.2](#).

**25.8.5.21 Spherical Neumann functions**

[sf.cmath.sph\_neumann]

```
double sph_neumann(unsigned n, double x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

1     *Effects:* These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments **n** and **x**.

2     *Returns:*

$$n_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x), \quad \text{for } x \geq 0,$$

where *n* is **n** and *x* is **x**.

3     *Remarks:* The effect of calling each of these functions is implementation-defined if **n** >= 128.

4     See also [25.8.5.10](#).

# 26 Time library [time]

## 26.1 General

[time.general]

- <sup>1</sup> This Clause describes the chrono library (26.2) and various C functions (26.13) that provide generally useful time utilities, as summarized in Table 85.

Table 85 — Time library summary

|       | Subclause                         | Header(s) |
|-------|-----------------------------------|-----------|
| 26.3  | <i>Cpp17Clock</i> requirements    |           |
| 26.4  | Time-related traits               | <chrono>  |
| 26.5  | Class template <i>duration</i>    |           |
| 26.6  | Class template <i>time_point</i>  |           |
| 26.7  | Clocks                            |           |
| 26.8  | Civil calendar                    |           |
| 26.9  | Class template <i>time_of_day</i> |           |
| 26.10 | Time zones                        |           |
| 26.11 | Formatting                        |           |
| 26.12 | Parsing                           |           |
| 26.13 | C library time utilities          | <ctime>   |

## 26.2 Header <chrono> synopsis

### 26.3 Cpp17Clock requirements

[time.clock.req]

- <sup>1</sup> A clock is a bundle consisting of a `duration`, a `time_point`, and a function `now()` to get the current `time_point`. The origin of the clock's `time_point` is referred to as the clock's *epoch*. A clock shall satisfy the requirements in Table 86.
- <sup>2</sup> In Table 86 C1 and C2 denote clock types. t1 and t2 are values returned by `C1::now()` where the call returning t1 happens before (6.8.2) the call returning t2 and both of these calls occur before `C1::time_point::max()`. [Note: This means C1 did not wrap around between t1 and t2. — end note]

Table 86 — Cpp17Clock requirements

| Expression                  | Return type                                                                                          | Operational semantics                                                                                                                                  |
|-----------------------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>C1::rep</code>        | An arithmetic type or a class emulating an arithmetic type                                           | The representation type of <code>C1::duration</code> .                                                                                                 |
| <code>C1::period</code>     | a specialization of <code>ratio</code>                                                               | The tick period of the clock in seconds.                                                                                                               |
| <code>C1::duration</code>   | <code>chrono::duration&lt;C1::rep, C1::period&gt;</code>                                             | The <code>duration</code> type of the clock.                                                                                                           |
| <code>C1::time_point</code> | <code>chrono::time_point&lt;C1&gt;</code> or <code>chrono::time_point&lt;C2, C1::duration&gt;</code> | The <code>time_point</code> type of the clock. C1 and C2 shall refer to the same epoch.                                                                |
| <code>C1::is_steady</code>  | <code>const bool</code>                                                                              | <code>true</code> if <code>t1 &lt;= t2</code> is always <code>true</code> and the time between clock ticks is constant, otherwise <code>false</code> . |

Table 86 — *Cpp17Clock* requirements (continued)

| Expression | Return type    | Operational semantics                                               |
|------------|----------------|---------------------------------------------------------------------|
| C1::now()  | C1::time_point | Returns a time_point object representing the current point in time. |

<sup>3</sup> [Note: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. — end note]

<sup>4</sup> A type TC meets the *Cpp17TrivialClock* requirements if:

- (4.1) — TC satisfies the *Cpp17Clock* requirements (26.3),
- (4.2) — the types TC::rep, TC::duration, and TC::time\_point satisfy the *Cpp17EqualityComparable* (Table 23), *Cpp17LessThanComparable* (Table 24), *Cpp17DefaultConstructible* (Table 25), *Cpp17CopyConstructible* (Table 27), *Cpp17CopyAssignable* (Table 29), and *Cpp17Destructible* (Table 30) requirements and the requirements of numeric types (25.2). [Note: This means, in particular, that operations on these types will not throw exceptions. — end note]
- (4.3) — lvalues of the types TC::rep, TC::duration, and TC::time\_point are swappable (15.5.3.2),
- (4.4) — the function TC::now() does not throw exceptions, and
- (4.5) — the type TC::time\_point::clock meets the *Cpp17TrivialClock* requirements, recursively.

## 26.4 Time-related traits

[time.traits]

### 26.4.1 treat\_as\_floating\_point

[time.traits.is\_fp]

```
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

<sup>1</sup> The duration template uses the *treat\_as\_floating\_point* trait to help determine if a *duration* object can be converted to another *duration* with a different tick period. If *treat\_as\_floating\_point\_v<Rep>* is *true*, then implicit conversions are allowed among *durations*. Otherwise, the implicit convertibility depends on the tick periods of the *durations*. [Note: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If *treat\_as\_floating\_point\_v<Rep>* is *false*, Rep will be treated as if it behaved like an integral type for the purpose of these conversions. — end note]

### 26.4.2 duration\_values

[time.traits.duration\_values]

```
template<class Rep>
struct duration_values {
public:
 static constexpr Rep zero() noexcept;
 static constexpr Rep min() noexcept;
 static constexpr Rep max() noexcept;
};
```

<sup>1</sup> The duration template uses the *duration\_values* trait to construct special values of the duration's representation (Rep). This is done because the representation might be a class type with behavior which requires some other implementation to return these special values. In that case, the author of that class type should specialize *duration\_values* to return the indicated values.

*static constexpr Rep zero() noexcept;*

<sup>2</sup> Returns: Rep(0). [Note: Rep(0) is specified instead of Rep() because Rep() may have some other meaning, such as an uninitialized value. — end note]

<sup>3</sup> Remarks: The value returned shall be the additive identity.

*static constexpr Rep min() noexcept;*

<sup>4</sup> Returns: numeric\_limits<Rep>::lowest().

<sup>5</sup> Remarks: The value returned shall compare less than or equal to zero().

```
static constexpr Rep max() noexcept;
6 Returns: numeric_limits<Rep>::max().
7 Remarks: The value returned shall compare greater than zero().
```

### 26.4.3 Specializations of common\_type

[time.traits.specializations]

```
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
 using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

- <sup>1</sup> The period of the duration indicated by this specialization of common\_type shall be the greatest common divisor of Period1 and Period2. [Note: This can be computed by forming a ratio of the greatest common divisor of Period1::num and Period2::num and the least common multiple of Period1::den and Period2::den. —end note]
- <sup>2</sup> [Note: The typedef name type is a synonym for the duration with the largest tick period possible where both duration arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations may have round-off errors. —end note]

```
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
 using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```

- <sup>3</sup> The common type of two time\_point types is a time\_point with the same clock as the two types and the common type of their two durations.

### 26.4.4 Class template is\_clock

[time.traits.is\_clock]

```
template<class T> struct is_clock;
```

- <sup>1</sup> is\_clock is a Cpp17UnaryTypeTrait (19.15.1) with a base characteristic of true\_type if T meets the Cpp17Clock requirements (26.3), otherwise false\_type. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the Cpp17Clock requirements is unspecified, except that as a minimum a type T shall not qualify as a Cpp17Clock unless it satisfies all of the following conditions:

- (1.1) — the qualified-ids T::rep, T::period, T::duration, and T::time\_point are valid and each denotes a type (12.9.2),
- (1.2) — the expression T::is\_steady is well-formed when treated as an unevaluated operand,
- (1.3) — the expression T::now() is well-formed when treated as an unevaluated operand.
- 2 The behavior of a program that adds specializations for is\_clock is undefined.

### 26.5 Class template duration

[time.duration]

- <sup>1</sup> A duration type measures time between two points in time (time\_points). A duration has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template ratio.

```
namespace std::chrono {
 template<class Rep, class Period = ratio<1>>
 class duration {
 public:
 using rep = Rep;
 using period = typename Period::type;

 private:
 rep rep_; // exposition only

 public:
 // 26.5.1, construct/copy/destroy
 constexpr duration() = default;
```

```

template<class Rep2>
 constexpr explicit duration(const Rep2& r);
template<class Rep2, class Period2>
 constexpr duration(const duration<Rep2, Period2>& d);
~duration() = default;
duration(const duration&) = default;
duration& operator=(const duration&) = default;

// 26.5.2, observer
constexpr rep count() const;

// 26.5.3, arithmetic
constexpr common_type_t<duration> operator+() const;
constexpr common_type_t<duration> operator-() const;
constexpr duration& operator++();
constexpr duration& operator++(int);
constexpr duration& operator--();
constexpr duration& operator--(int);

constexpr duration& operator+=(const duration& d);
constexpr duration& operator-=(const duration& d);

constexpr duration& operator*=(const rep& rhs);
constexpr duration& operator/=(const rep& rhs);
constexpr duration& operator%=(const rep& rhs);
constexpr duration& operator%=(const duration& rhs);

// 26.5.4, special values
static constexpr duration zero() noexcept;
static constexpr duration min() noexcept;
static constexpr duration max() noexcept;
};

}

```

- 2 `Rep` shall be an arithmetic type or a class emulating an arithmetic type. If `duration` is instantiated with a `duration` type as the argument for the template parameter `Rep`, the program is ill-formed.
- 3 If `Period` is not a specialization of `ratio`, the program is ill-formed. If `Period::num` is not positive, the program is ill-formed.
- 4 Members of `duration` shall not throw exceptions other than those thrown by the indicated operations on their representations.
- 5 The defaulted copy constructor of `duration` shall be a `constexpr` function if and only if the required initialization of the member `rep_` for copy and move, respectively, would satisfy the requirements for a `constexpr` function.
- 6 [Example:

```

duration<long, ratio<60>> d0; // holds a count of minutes using a long
duration<long long, milli> d1; // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2; // holds a count with a tick period of $\frac{1}{30}$ of a second
 // (30 Hz) using a double

```

— end example]

## 26.5.1 Constructors

[time.duration.cons]

```

template<class Rep2>
 constexpr explicit duration(const Rep2& r);

```

- 1 *Remarks:* This constructor shall not participate in overload resolution unless `Rep2` is implicitly convertible to `rep` and
  - (1.1) — `treat_as_floating_point_v<rep>` is true or
  - (1.2) — `treat_as_floating_point_v<Rep2>` is false.

[Example:

```

duration<int, milli> d(3); // OK

```

```

 duration<int, milli> d(3.5); // error
 — end example]
2 Effects: Constructs an object of type duration.
3 Ensures: count() == static_cast<rep>(r).

template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);
4 Remarks: This constructor shall not participate in overload resolution unless no overflow is induced
 in the conversion and treat_as_floating_point_v<rep> is true or both ratio_divide<Period2,
 period>::den is 1 and treat_as_floating_point_v<Rep2> is false. [Note: This requirement pre-
 vents implicit truncation error when converting between integral-based duration types. Such a
 construction could easily lead to confusion about the value of the duration. — end note] [Example:
 duration<int, milli> ms(3);
 duration<int, micro> us = ms; // OK
 duration<int, milli> ms2 = us; // error
 — end example]
5 Effects: Constructs an object of type duration, constructing rep_ from
 duration_cast<duration>(d).count().

```

## 26.5.2 Observer

[time.duration.observer]

```

constexpr rep count() const;
1 Returns: rep_.

```

## 26.5.3 Arithmetic

[time.duration.arithmetic]

```

constexpr common_type_t<duration> operator+() const;
1 Returns: common_type_t<duration>(*this).

constexpr common_type_t<duration> operator-() const;
2 Returns: common_type_t<duration>(-rep_).

constexpr duration& operator++();
3 Effects: As if by ++rep_.
4 Returns: *this.

constexpr duration operator++(int);
5 Returns: duration(rep_++).

constexpr duration& operator--();
6 Effects: As if by --rep_.
7 Returns: *this.

constexpr duration operator--(int);
8 Returns: duration(rep_--).

constexpr duration& operator+=(const duration& d);
9 Effects: As if by: rep_ += d.count();
10 Returns: *this.

constexpr duration& operator-=(const duration& d);
11 Effects: As if by: rep_ -= d.count();
12 Returns: *this.

```

```

constexpr duration& operator*=(const rep& rhs);
13 Effects: As if by: rep_ *= rhs;
14 Returns: *this.

constexpr duration& operator/=(const rep& rhs);
15 Effects: As if by: rep_ /= rhs;
16 Returns: *this.

constexpr duration& operator%=(const rep& rhs);
17 Effects: As if by: rep_ %= rhs;
18 Returns: *this.

constexpr duration& operator%=(const duration& rhs);
19 Effects: As if by: rep_ %= rhs.count();
20 Returns: *this.

```

#### 26.5.4 Special values

[time.duration.special]

```

static constexpr duration zero() noexcept;
1 Returns: duration(duration_values<rep>::zero());

static constexpr duration min() noexcept;
2 Returns: duration(duration_values<rep>::min());

static constexpr duration max() noexcept;
3 Returns: duration(duration_values<rep>::max());

```

#### 26.5.5 Non-member arithmetic

[time.duration.nonmember]

- <sup>1</sup> In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
2 Returns: CD(CD(lhs).count() + CD(rhs).count());

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
3 Returns: CD(CD(lhs).count() - CD(rhs).count());

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& d, const Rep2& s);
4 Remarks: This operator shall not participate in overload resolution unless Rep2 is implicitly convertible
 to common_type_t<Rep1, Rep2>.

5 Returns: CD(CD(d).count() * s).

template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const Rep1& s, const duration<Rep2, Period>& d);
6 Remarks: This operator shall not participate in overload resolution unless Rep1 is implicitly convertible
 to common_type_t<Rep1, Rep2>.

7 Returns: d * s.

```

```

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator/(const duration<Rep1, Period>& d, const Rep2& s);
8 Remarks: This operator shall not participate in overload resolution unless Rep2 is implicitly convertible
 to common_type_t<Rep1, Rep2> and Rep2 is not a specialization of duration.
9 Returns: CD(CD(d).count() / s).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<Rep1, Rep2>
operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
10 Let CD be common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.
11 Returns: CD(lhs).count() / CD(rhs).count().

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator%(const duration<Rep1, Period>& d, const Rep2& s);
12 Remarks: This operator shall not participate in overload resolution unless Rep2 is implicitly convertible
 to common_type_t<Rep1, Rep2> and Rep2 is not a specialization of duration.
13 Returns: CD(CD(d).count() % s).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
14 Returns: CD(CD(lhs).count() % CD(rhs).count()).

```

## 26.5.6 Comparisons

[time.duration.comparisons]

- 1 In the function descriptions that follow, CT represents common\_type\_t<A, B>, where A and B are the types of the two arguments to the function.

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

```

- 2 Returns: CT(lhs).count() == CT(rhs).count().

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator!=(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

```

- 3 Returns: !(lhs == rhs).

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

```

- 4 Returns: CT(lhs).count() < CT(rhs).count().

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

```

- 5 Returns: rhs < lhs.

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

```

- 6 Returns: !(rhs < lhs).

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
 const duration<Rep2, Period2>& rhs);

```

- 7 Returns: !(lhs < rhs).

### 26.5.7 duration\_cast

[time.duration.cast]

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
```

- 1 *Remarks:* This function shall not participate in overload resolution unless ToDuration is a specialization of duration.
- 2 *Returns:* Let CF be ratio\_divide<Period, typename ToDuration::period>, and CR be common\_type<typename ToDuration::rep, Rep, intmax\_t>::type.
  - (2.1) — If CF::num == 1 and CF::den == 1, returns  

$$\text{ToDuration}(\text{static\_cast<} \text{typename ToDuration::rep} \text{>}(d.\text{count}()))$$
  - (2.2) — otherwise, if CF::num != 1 and CF::den == 1, returns  

$$\text{ToDuration}(\text{static\_cast<} \text{typename ToDuration::rep} \text{>}(\text{static\_cast<} \text{CR} \text{>}(d.\text{count}()) * \text{static\_cast<} \text{CR} \text{>}(CF.\text{:num})))$$
  - (2.3) — otherwise, if CF::num == 1 and CF::den != 1, returns  

$$\text{ToDuration}(\text{static\_cast<} \text{typename ToDuration::rep} \text{>}(\text{static\_cast<} \text{CR} \text{>}(d.\text{count}()) / \text{static\_cast<} \text{CR} \text{>}(CF.\text{:den})))$$
  - (2.4) — otherwise, returns  

$$\text{ToDuration}(\text{static\_cast<} \text{typename ToDuration::rep} \text{>}(\text{static\_cast<} \text{CR} \text{>}(d.\text{count}()) * \text{static\_cast<} \text{CR} \text{>}(CF.\text{:num}) / \text{static\_cast<} \text{CR} \text{>}(CF.\text{:den})))$$

- 3 [Note: This function does not use any implicit conversions; all conversions are done with static\_cast. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. —end note]

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);
```

- 4 *Remarks:* This function shall not participate in overload resolution unless ToDuration is a specialization of duration.
- 5 *Returns:* The greatest result t representable in ToDuration for which t <= d.

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);
```

- 6 *Remarks:* This function shall not participate in overload resolution unless ToDuration is a specialization of duration.
- 7 *Returns:* The least result t representable in ToDuration for which t >= d.

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);
```

- 8 *Remarks:* This function shall not participate in overload resolution unless ToDuration is a specialization of duration, and treat\_as\_floating\_point\_v<typename ToDuration::rep> is false.
- 9 *Returns:* The value of ToDuration that is closest to d. If there are two closest values, then return the value t for which t % 2 == 0.

### 26.5.8 Suffixes for duration literals

[time.duration.literals]

- 1 This subclause describes literal suffixes for constructing duration literals. The suffixes h, min, s, ms, us, ns denote duration values of the corresponding types hours, minutes, seconds, milliseconds, microseconds, and nanoseconds respectively if they are applied to integral literals.
- 2 If any of these suffixes are applied to a floating-point literal the result is a chrono::duration literal with an unspecified floating-point representation.
- 3 If any of these suffixes are applied to an integer literal and the resulting chrono::duration value cannot be represented in the result type because of overflow, the program is ill-formed.
- 4 [Example: The following code shows some duration literals.

```
using namespace std::chrono_literals;
```

```

auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
— end example]

constexpr chrono::hours operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);

5 Returns: A duration literal representing hours hours.

constexpr chrono::minutes operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator""min(long double minutes);

6 Returns: A duration literal representing minutes minutes.

constexpr chrono::seconds operator""s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator""s(long double sec);

7 Returns: A duration literal representing sec seconds.

8 [Note: The same suffix s is used for basic_string but there is no conflict, since duration suffixes apply
 to numbers and string literal suffixes apply to character array literals. — end note]

constexpr chrono::milliseconds operator""ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);

9 Returns: A duration literal representing msec milliseconds.

constexpr chrono::microseconds operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);

10 Returns: A duration literal representing usec microseconds.

constexpr chrono::nanoseconds operator""ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);

11 Returns: A duration literal representing nsec nanoseconds.

```

### 26.5.9 Algorithms

[time.duration.alg]

```

template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);

1 Remarks: This function shall not participate in overload resolution unless numeric_limits<Rep>::is_
 signed is true.

2 Returns: If d >= d.zero(), return d, otherwise return -d.

```

### 26.5.10 I/O

[time.duration.io]

```

template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);

1 Requires: Rep is an integral type whose integer conversion rank (6.7.4) is greater than or equal to that
 of short, or a floating point type. charT is char or wchar_t.

2 Effects: Forms a basic_string<charT, traits> from d.count() using to_string if charT is char,
 or to_wstring if charT is wchar_t. Appends the units suffix described below to the basic_string.
 Inserts the resulting basic_string into os. [Note: This specification ensures that the result of this
 streaming operation will obey the width and alignment properties of the stream. — end note]

3 The units suffix depends on the type Period::type as follows:
 (3.1) — If Period::type is atto, the suffix is "as".
 (3.2) — Otherwise, if Period::type is femto, the suffix is "fs".
 (3.3) — Otherwise, if Period::type is pico, the suffix is "ps".
 (3.4) — Otherwise, if Period::type is nano, the suffix is "ns".
 (3.5) — Otherwise, if Period::type is micro, the suffix is "μs" ("\\u00b5\\u0073").

```

- (3.6) — Otherwise, if `Period::type` is `milli`, the suffix is "ms".
- (3.7) — Otherwise, if `Period::type` is `centi`, the suffix is "cs".
- (3.8) — Otherwise, if `Period::type` is `deci`, the suffix is "ds".
- (3.9) — Otherwise, if `Period::type` is `ratio<1>`, the suffix is "s".
- (3.10) — Otherwise, if `Period::type` is `deca`, the suffix is "das".
- (3.11) — Otherwise, if `Period::type` is `hecto`, the suffix is "hs".
- (3.12) — Otherwise, if `Period::type` is `kilo`, the suffix is "ks".
- (3.13) — Otherwise, if `Period::type` is `mega`, the suffix is "Ms".
- (3.14) — Otherwise, if `Period::type` is `giga`, the suffix is "Gs".
- (3.15) — Otherwise, if `Period::type` is `tera`, the suffix is "Ts".
- (3.16) — Otherwise, if `Period::type` is `peta`, the suffix is "Ps".
- (3.17) — Otherwise, if `Period::type` is `exa`, the suffix is "Es".
- (3.18) — Otherwise, if `Period::type` is `ratio<60>`, the suffix is "min".
- (3.19) — Otherwise, if `Period::type` is `ratio<3600>`, the suffix is "h".
- (3.20) — Otherwise, if `Period::type::den == 1`, the suffix is "[*num*]s".
- (3.21) — Otherwise, the suffix is "[*num/den*]s".

In the list above the use of *num* and *den* refer to the static data members of `Period::type`, which are converted to arrays of `charT` using a decimal conversion with no leading zeroes.

4 If `Period::type` is `micro`, but the character U+00B5 cannot be represented in the encoding used for `charT`, the unit suffix "us" is used instead of "μs".

5 *Returns:* os.

```
template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
 to_stream(basic_ostream<charT, traits>& os, const charT* fmt,
 const duration<Rep, Period>& d);
```

6 *Effects:* Streams d into os using the format specified by the NTCTS `fmt`. `fmt` encoding follows the rules specified in [26.11](#).

7 *Returns:* os.

```
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
 from_stream(basic_istream<charT, traits>& is, const charT* fmt,
 duration<Rep, Period>& d,
 basic_string<charT, traits, Alloc>* abbrev = nullptr,
 minutes* offset = nullptr);
```

8 *Effects:* Attempts to parse the input stream is into the duration d using the format flags given in the NTCTS `fmt` as specified in [26.12](#). If the parse parses everything specified by the parsing format flags without error, and yet none of the flags impacts a duration, d will be assigned a zero value. If %Z is used and successfully parsed, that value will be assigned to \*abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to \*offset if offset is non-null.

9 *Returns:* is.

## 26.6 Class template time\_point

[time.point]

```
namespace std::chrono {
 template<class Clock, class Duration = typename Clock::duration>
 class time_point {
 public:
 using clock = Clock;
 using duration = Duration;
 using rep = typename duration::rep;
 using period = typename duration::period;
```

```

private:
 duration d_; // exposition only

public:
 // 26.6.1, construct
 constexpr time_point(); // has value epoch
 constexpr explicit time_point(const duration& d); // same as time_point() + d
 template<class Duration2>
 constexpr time_point(const time_point<clock, Duration2>& t);

 // 26.6.2, observer
 constexpr duration time_since_epoch() const;

 // 26.6.3, arithmetic
 constexpr time_point& operator++();
 constexpr time_point operator++(int);
 constexpr time_point& operator--();
 constexpr time_point operator--(int);
 constexpr time_point& operator+=(const duration& d);
 constexpr time_point& operator-=(const duration& d);

 // 26.6.4, special values
 static constexpr time_point min() noexcept;
 static constexpr time_point max() noexcept;
};

}

```

<sup>1</sup> Clock shall either satisfy the *Cpp17Clock* requirements (26.3) or be the type `local_t`.

<sup>2</sup> If Duration is not an instance of `duration`, the program is ill-formed.

### 26.6.1 Constructors

[time.point.cons]

```
constexpr time_point();
```

<sup>1</sup> *Effects:* Constructs an object of type `time_point`, initializing `d_` with `duration::zero()`. Such a `time_point` object represents the epoch.

```
constexpr explicit time_point(const duration& d);
```

<sup>2</sup> *Effects:* Constructs an object of type `time_point`, initializing `d_` with `d`. Such a `time_point` object represents the epoch + `d`.

```
template<class Duration2>
 constexpr time_point(const time_point<clock, Duration2>& t);
```

<sup>3</sup> *Remarks:* This constructor shall not participate in overload resolution unless `Duration2` is implicitly convertible to `duration`.

<sup>4</sup> *Effects:* Constructs an object of type `time_point`, initializing `d_` with `t.time_since_epoch()`.

### 26.6.2 Observer

[time.point.observer]

```
constexpr duration time_since_epoch() const;
```

<sup>1</sup> *Returns:* `d_`.

### 26.6.3 Arithmetic

[time.point.arithmetic]

```
constexpr time_point& operator++();
```

<sup>1</sup> *Effects:* `++d_`.

<sup>2</sup> *Returns:* `*this`.

```
constexpr time_point operator++(int);
```

<sup>3</sup> *Returns:* `time_point{d_++}`.

```

constexpr time_point& operator--();
4 Effects: --d_.
5 Returns: *this.

constexpr time_point operator--(int);
6 Returns: time_point{d_--}.

constexpr time_point& operator+=(const duration& d);
7 Effects: As if by: d_ += d;
8 Returns: *this.

constexpr time_point& operator-=(const duration& d);
9 Effects: As if by: d_ -= d;
10 Returns: *this.

```

**26.6.4 Special values**

[time.point.special]

```

static constexpr time_point min() noexcept;
1 Returns: time_point(duration::min()).

static constexpr time_point max() noexcept;
2 Returns: time_point(duration::max()).

```

**26.6.5 Non-member arithmetic**

[time.point.nonmember]

```

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);

1 Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>>
operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);

2 Returns: rhs + lhs.

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);

3 Returns: CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.

template<class Clock, class Duration1, class Duration2>
constexpr common_type_t<Duration1, Duration2>
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

4 Returns: lhs.time_since_epoch() - rhs.time_since_epoch().

```

**26.6.6 Comparisons**

[time.point.comparisons]

```

template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);

1 Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator!=(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);

2 Returns: !(lhs == rhs).

```

```

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
3 Returns: lhs.time_since_epoch() < rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
4 Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
5 Returns: !(rhs < lhs).

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
 const time_point<Clock, Duration2>& rhs);
6 Returns: !(lhs < rhs).

```

**26.6.7 time\_point\_cast**

[time.point.cast]

```

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);

1 Remarks: This function shall not participate in overload resolution unless ToDuration is a specialization
 of duration.

2 Returns:
 time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);

3 Remarks: This function shall not participate in overload resolution unless ToDuration is a specialization
 of duration.

4 Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()));

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);

5 Remarks: This function shall not participate in overload resolution unless ToDuration is a specialization
 of duration.

6 Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()));

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

7 Remarks: This function shall not participate in overload resolution unless ToDuration is a specialization
 of duration, and treat_as_floating_point_v<typename ToDuration::rep> is false.

8 Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch())).

```

**26.7 Clocks**

[time.clock]

- 1 The types defined in this subclause shall satisfy the *Cpp17TrivialClock* requirements (26.3) unless otherwise specified.

**26.7.1 Class system\_clock**

[time.clock.system]

**26.7.1.1 Overview**

[time.clock.system.overview]

```

namespace std::chrono {
 class system_clock {
 public:
 using rep = see below;
 using period = ratio<unspecified, unspecified>;

```

```

using duration = chrono::duration<rep, period>;
using time_point = chrono::time_point<system_clock>;
static constexpr bool is_steady = unspecified;

static time_point now() noexcept;

// mapping to/from C type time_t
static time_t to_time_t (const time_point& t) noexcept;
static time_point from_time_t(time_t t) noexcept;
};

}

```

- <sup>1</sup> Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since (and before) 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as *Unix time*. This measure facilitates an efficient mapping between `sys_time` and calendar types (26.8). [Example:  
`sys_seconds{sys_days{1970y/January/1}}.time_since_epoch()` is 0s.  
`sys_seconds{sys_days{2000y/January/1}}.time_since_epoch()` is 946'684'800s, which is 10'957 \* 86'400s.  
— end example]

### 26.7.1.2 Members

[`time.clock.system.members`]

- ```

using system_clock::rep = unspecified;

1   Requires: system_clock::duration::min() < system_clock::duration::zero() shall be true.  

    [Note: This implies that rep is a signed type. — end note]

static time_t to_time_t(const time_point& t) noexcept;

2   Returns: A time_t object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

static time_point from_time_t(time_t t) noexcept;

3   Returns: A time_point object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

```

26.7.1.3 Non-member functions

[`time.clock.system.nonmembers`]

- ```

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);

1 Remarks: This operator shall not participate in overload resolution if treat_as_floating_point_v<typename Duration::rep> is true, or if Duration{1} >= days{1}.

2 Effects:
 auto const dp = floor<days>(tp);
 os << year_month_day{dp} << ' ' << time_of_day{tp-dp};

3 Returns: os.

4 Example:
 cout << sys_seconds{0s} << '\n'; // 1970-01-01 00:00:00
 cout << sys_seconds{946'684'800s} << '\n'; // 2000-01-01 00:00:00
 cout << sys_seconds{946'688'523s} << '\n'; // 2000-01-01 01:02:03
— end example]

```

- ```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);

5   Effects: os << year_month_day{dp}.

6   Returns: os.

```

```

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
    to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const sys_time<Duration>& tp);
7   Effects: Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the
   rules specified in 26.11. If %Z is used, it will be replaced with "UTC" widened to charT. If %z is used
   (or a modified variant of %z), an offset of 0min will be formatted.
8   Returns: os.

```

```

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                 sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                 minutes* offset = nullptr);
9   Effects: Attempts to parse the input stream is into the sys_time tp using the format flags given in
   the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid date, is.setstate(ios_
   base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed,
   that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used
   and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally,
   the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that
   difference to tp.
10  Returns: is.

```

26.7.2 Class `utc_clock`

[time.clock.utc]

26.7.2.1 Overview

[time.clock.utc.overview]

```

namespace std::chrono {
    class utc_clock {
        public:
            using rep           = a signed arithmetic type;
            using period        = ratio<unspecified, unspecified>;
            using duration      = chrono::duration<rep, period>;
            using time_point    = chrono::time_point<utc_clock>;
            static constexpr bool is_steady = unspecified;

            static time_point now();

            template<class Duration>
            static sys_time<common_type_t<Duration, seconds>>
                to_sys(const utc_time<Duration>& t);
            template<class Duration>
            static utc_time<common_type_t<Duration, seconds>>
                from_sys(const sys_time<Duration>& t);
    };
}

```

¹ In contrast to `sys_time`, which does not take leap seconds into account, `utc_clock` and its associated `time_point`, `utc_time`, count time, including leap seconds, since 1970-01-01 00:00:00 UTC. [Example: `clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch()` is 0s. `clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch()` is 946'684'822s, which is 10'957 * 86'400s + 22s.
— end example]

² `utc_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `utc_clock::now()` does not propagate an exception. [Note: `noexcept(from_sys(system_clock::now()))` is false. — end note]

26.7.2.2 Member functions

[time.clock.utc.members]

```
static time_point now();
```

¹ Returns: `from_sys(system_clock::now())`, or a more accurate value of `utc_time`.

```
template<typename Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& u);
```

2 *Returns:* A `sys_time` `t`, such that `from_sys(t) == u` if such a mapping exists. Otherwise `u` represents a `time_point` during a leap second insertion and the last representable value of `sys_time` prior to the insertion of the leap second is returned.

```
template<typename Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);
```

3 *Returns:* A `utc_time` `u`, such that `u.time_since_epoch() - t.time_since_epoch()` is equal to the number of leap seconds that were inserted between `t` and 1970-01-01. If `t` is exactly the date of leap second insertion, then the conversion counts that leap second as inserted.

[*Example:*

```
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
— end example]
```

26.7.2.3 Non-member functions

[`time.clock.utc.nonmembers`]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);
```

1 *Effects:* Calls `to_stream(os, fmt, t)`, where `fmt` is a string containing "%F %T" widened to `charT`.

2 *Returns:* `os`.

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const utc_time<Duration>& tp);
```

3 *Effects:* Streams `tp` into `os` using the format specified by the NTCTS `fmt`. `fmt` encoding follows the rules specified in 26.11. If `%Z` is used, it will be replaced with "UTC" widened to `charT`. If `%z` is used (or a modified variant of `%z`), an offset of 0min will be formatted. If `tp` represents a time during a leap second insertion, and if a seconds field is formatted, the integral portion of that format shall be "60" widened to `charT`.

4 *Returns:* `os`.

5 [i]Example:

```
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
    cout << u << " UTC\n";
```

Produces this output:

```
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
```

2015-07-01 00:00:00.250 UTC

— end example]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

6 *Effects:* Attempts to parse the input stream `is` into the `utc_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 26.12. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` shall be called and `tp` shall not be modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

7 *Returns:* `is`.

26.7.3 Class `tai_clock`

[time.clock.tai]

26.7.3.1 Overview

[time.clock.tai.overview]

```
namespace std::chrono {
    class tai_clock {
        public:
            using rep = a signed arithmetic type;
            using period = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<tai_clock>;
            static constexpr bool is_steady = unspecified;

            static time_point now();

            template<class Duration>
            static utc_time<common_type_t<Duration, seconds>>
            to_utc(const tai_time<Duration>&) noexcept;
            template<class Duration>
            static tai_time<common_type_t<Duration, seconds>>
            from_utc(const utc_time<Duration>&) noexcept;
    };
}
```

1 The clock `tai_clock` measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC falls another second behind TAI. For example by 2000-01-01 there had been 22 leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

2 `tai_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `tai_clock::now()` does not propagate an exception. [Note: `noexcept(from_utc(utc_clock::now()))` is false. — end note]

26.7.3.2 Member functions

[time.clock.tai.members]

`static time_point now();`

1 *Returns:* `from_utc(utc_clock::now())`, or a more accurate value of `tai_time`.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const tai_time<Duration>& t) noexcept;
```

2 *Returns:*

`utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s`

[Note:

`378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s`

— end note]

```
template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;
```

3 >Returns:

```
tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s
```

[Note:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— end note]

26.7.3.3 Non-member functions

[time.clock.tai.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);
```

1 >Effects: Calls `to_stream(os, fmt, t)`, where `fmt` is a string containing "%F %T" widened to `charT`.

2 >Returns: `os`.

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const tai_time<Duration>& tp);
```

3 >Effects: Streams `tp` into `os` using the format specified by the NTCTS `fmt`. `fmt` encoding follows the rules specified in 26.11. If %Z is used, it will be replaced with "TAI". If %z is used (or a modified variant of %z), an offset of 0min will be formatted. The date and time formatted shall be equivalent to that formatted by a `sys_time` initialized with:

```
sys_time<Duration>{tp.time_since_epoch()} -
(sys_days{1970y/January/1} - sys_days{1958y/January/1})
```

4 >Returns: `os`.

5 >[Example:

```
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("%F %T %Z == ", st) << format("%F %T %Z\n", tt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
```

— end example]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

6 >Effects: Attempts to parse the input stream `is` into the `tai_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 26.12. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` shall be called and `tp` shall not be modified. If %Z is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

7 >Returns: `is`.

26.7.4 Class `gps_clock`

[time.clock.gps]

26.7.4.1 Overview

[time.clock.gps.overview]

```
namespace std::chrono {
    class gps_clock {
```

```

public:
    using rep           = a signed arithmetic type;
    using period        = ratio<unspecified, unspecified>;
    using duration      = chrono::duration<rep, period>;
    using time_point    = chrono::time_point<gps_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;
    template<class Duration>
    static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
};

}

```

- ¹ The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC falls another second behind GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.
- ² `gps_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception. [Note: `noexcept(from_utc(utc_clock::now()))` is false. — end note]

26.7.4.2 Member functions

[time.clock.gps.members]

```

static time_point now();

1   Returns: from_utc(utc_clock::now()), or a more accurate value of gps_time.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
    to_utc(const gps_time<Duration>& t) noexcept;

2   Returns:
    gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
    [Note:
        315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
    — end note]

template<class Duration>
static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;

3   Returns:
    gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
    [Note:
        315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
    — end note]

```

26.7.4.3 Non-member functions

[time.clock.gps.nonmembers]

```

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);

1   Effects: Calls to_stream(os, fmt, t), where fmt is a string containing "%F %T" widened to charT.
2   Returns: os.

```

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
    to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const gps_time<Duration>& tp);
```

- 3 *Effects:* Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11. If %Z is used, it will be replaced with "GPS". If %z is used (or a modified variant of %z), an offset of 0min will be formatted. The date and time formatted shall be equivalent to that formatted by a sys_time initialized with:

```
sys_time<Duration>{tp.time_since_epoch()} +
    (sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})
```

- 4 *Returns:* os.

- 5 *[Example:*

```
auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("%F %T %Z == ", st) << format("%F %T %Z\n", gt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

— end example]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

- 6 *Effects:* Attempts to parse the input stream is into the gps_time tp using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

- 7 *Returns:* is.

26.7.5 Type file_clock

[time.clock.file]

26.7.5.1 Overview

[time.clock.file.overview]

```
namespace std::chrono {
    using file_clock = see below;
}
```

- 1 file_clock is an alias for a type meeting the Cpp17TrivialClock requirements (26.3), and using a signed arithmetic type for file_clock::rep. file_clock is used to create the time_point system used for file_time_type (28.11). Its epoch is unspecified, and noexcept(file_clock::now()) is true. [Note: The type that file_clock denotes may be in a different namespace than std::chrono, such as std::filesystem. — end note]

26.7.5.2 Member functions

[time.clock.file.members]

- 1 The type denoted by file_clock provides precisely one of the following two sets of static member functions:

```
template<class Duration>
static sys_time<see below>
    to_sys(const file_time<Duration>&);

template<class Duration>
static file_time<see below>
    from_sys(const sys_time<Duration>&);
```

or:

```
template<class Duration>
static utc_time<see below>
    to_utc(const file_time<Duration>&);
```

```
template<class Duration>
static file_time<see below>
from_utc(const utc_time<Duration>&);
```

These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`.

26.7.5.3 Non-member functions

[`time.clock.file.nonmembers`]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
1 Effects: Calls to_stream(os, fmt, t), where fmt is a string containing "%F %T" widened to charT.
2 Returns: os.
```

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const file_time<Duration>& tp);
3 Effects: Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11. If %Z is used, it will be replaced with "UTC" widened to charT. If %z is used (or a modified variant of %z), an offset of 0min will be formatted. The date and time formatted shall be equivalent to that formatted by a sys_time initialized with clock_cast<system_clock>(tp), or by a utc_time initialized with clock_cast<utc_clock>(tp).
4 Returns: os.
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
5 Effects: Attempts to parse the input stream is into the file_time tp using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.
6 Returns: is.
```

26.7.6 Class `steady_clock`

[`time.clock.steady`]

```
namespace std::chrono {
    class steady_clock {
        public:
            using rep      = unspecified;
            using period   = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<unspecified, duration>;
            static constexpr bool is_steady = true;

            static time_point now() noexcept;
        };
    }
}
```

¹ Objects of class `steady_clock` represent clocks for which values of `time_point` never decrease as physical time advances and for which values of `time_point` advance at a steady rate relative to real time. That is, the clock may not be adjusted.

26.7.7 Class `high_resolution_clock`

[time.clock.hires]

```
namespace std::chrono {
    class high_resolution_clock {
    public:
        using rep      = unspecified;
        using period   = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<unspecified, duration>;
        static constexpr bool is_steady = unspecified;

        static time_point now() noexcept;
    };
}
```

- ¹ Objects of class `high_resolution_clock` represent clocks with the shortest tick period. `high_resolution_clock` may be a synonym for `system_clock` or `steady_clock`.

26.7.8 Local time

[time.clock.local]

- ¹ The family of time points denoted by `local_time<Duration>` are based on the pseudo clock `local_t`. `local_t` has no member `now()` and thus does not meet the clock requirements. Nevertheless `local_time<Duration>` serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete `time_point` algebra is available for `local_time<Duration>` (just as for `sys_time<Duration>`).

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);
```

- ² *Effects:*

```
os << sys_time<Duration>{lt.time_since_epoch()};
```

- ³ *Returns:* os.

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const local_time<Duration>& tp,
          const string* abbrev = nullptr, const seconds* offset_sec = nullptr);
```

- ⁴ *Effects:* Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in [26.11](#). If %Z is used, it will be replaced with *abbrev if abbrev is not equal to nullptr. If abbrev is equal to nullptr (and %Z is used), os.setstate(ios_base::failbit) shall be called. If %z is used (or a modified variant of %z), it will be formatted with the value of *offset_sec if offset_sec is not equal to nullptr. If %z (or a modified variant of %z) is used, and offset_sec is equal to nullptr, then os.setstate(ios_base::failbit) shall be called.

- ⁵ *Returns:* os.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            local_time<Duration>& tp, basic_string<charT, traits, Alloc*>* abbrev = nullptr,
            minutes* offset = nullptr);
```

- ⁶ *Effects:* Attempts to parse the input stream is into the local_time tp using the format flags given in the NTCTS fmt as specified in [26.12](#). If the parse fails to decode a valid date, is.setstate(ios_base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

- ⁷ *Returns:* is.

26.7.9 `time_point` conversions

[time.clock.cast]

26.7.9.1 Class template `clock_time_conversion`

[time.clock.conv]

```
namespace std::chrono {
    template<class DestClock, class SourceClock>
```

```
    struct clock_time_conversion {};
}
```

- ¹ `clock_time_conversion` serves as a trait which can be used to specify how to convert a source `time_point` of type `time_point<SourceClock, Duration>` to a destination `time_point` of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified `operator()` that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock, OtherDuration>` representing an equivalent point in time. `OtherDuration` is a `chrono::duration` whose specialization is computed from the input `Duration` in a manner which can vary for each `clock_time_conversion` specialization. A program may specialize `clock_time_conversion` if at least one of the template parameters is a user-defined clock type.
- ² Several specializations are provided by the implementation, as described in [26.7.9.2](#), [26.7.9.3](#), [26.7.9.4](#), and [26.7.9.5](#).

26.7.9.2 Identity conversions

[time.clock.cast.id]

```
template<typename Clock>
struct clock_time_conversion<Clock, Clock> {
    template<class Duration>
    time_point<Clock, Duration>
        operator()(const time_point<Clock, Duration>& t) const;
};

template<class Duration>
time_point<Clock, Duration>
operator()(const time_point<Clock, Duration>& t) const;

1   Returns: t.

template<>
struct clock_time_conversion<system_clock, system_clock> {
    template<class Duration>
    sys_time<Duration>
        operator()(const sys_time<Duration>& t) const;
};

template<class Duration>
sys_time<Duration>
operator()(const sys_time<Duration>& t) const;

2   Returns: t.

template<>
struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
    utc_time<Duration>
        operator()(const utc_time<Duration>& t) const;
};

template<class Duration>
utc_time<Duration>
operator()(const utc_time<Duration>& t) const;

3   Returns: t.
```

26.7.9.3 Conversions between `system_clock` and `utc_clock`

[time.clock.cast.sys.utc]

```
template<>
struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
    utc_time<common_type_t<Duration, seconds>>
        operator()(const sys_time<Duration>& t) const;
};
```

```

template<class Duration>
utc_time<common_type_t<Duration, seconds>>
operator()(const sys_time<Duration>& t) const;

1   Returns: utc_clock::from_sys(t).

template<>
struct clock_time_conversion<system_clock, utc_clock> {
    template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
    operator()(const utc_time<Duration>& t) const;
};

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
operator()(const utc_time<Duration>& t) const;

2   Returns: utc_clock::to_sys(t).

```

26.7.9.4 Conversions between system_clock and other clocks

[time.clock.cast.sys]

```

template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_sys(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));

1   Remarks: This function does not participate in overload resolution unless SourceClock::to_sys(t) is well-formed. If SourceClock::to_sys(t) does not return sys_time<Duration>, where Duration is a valid chrono::duration specialization, the program is ill-formed.

2   Returns: SourceClock::to_sys(t).

template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
    auto operator()(const sys_time<Duration>& t) const
        -> decltype(DestClock::from_sys(t));
};

template<class Duration>
auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));

3   Remarks: This function does not participate in overload resolution unless DestClock::from_sys(t) is well-formed. If DestClock::from_sys(t) does not return time_point<DestClock, Duration>, where Duration is a valid chrono::duration specialization, the program is ill-formed.

4   Returns: DestClock::from_sys(t).

```

26.7.9.5 Conversions between utc_clock and other clocks

[time.clock.cast.utc]

```

template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_utc(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));

1   Remarks: This function does not participate in overload resolution unless SourceClock::to_utc(t) is well-formed. If SourceClock::to_utc(t) does not return utc_time<Duration>, where Duration is a valid chrono::duration specialization, the program is ill-formed.

```

2 *Returns:* `SourceClock::to_utc(t)`.

```
template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
        -> decltype(DestClock::from_utc(t));
};

template<class Duration>
auto operator()(const utc_time<Duration>& t) const
    -> decltype(DestClock::from_utc(t));
```

3 *Remarks:* This function does not participate in overload resolution unless `DestClock::from_utc(t)` is well-formed. If `DestClock::from_utc(t)` does not return `time_point<DestClock, Duration>`, where `Duration` is a valid `chrono::duration` specialization, the program is ill-formed.

4 *Returns:* `DestClock::from_utc(t)`.

26.7.9.6 Function `template clock_cast`

[time.clock.cast.fn]

```
template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);
```

1 *Remarks:* This function does not participate in overload resolution unless at least one of the following clock time conversion expressions is well-formed:

- (1.1) — `clock_time_conversion<DestClock, SourceClock>{}(t)`
- (1.2) — `clock_time_conversion<DestClock, system_clock>{}(`
 `clock_time_conversion<system_clock, SourceClock>{}(t))`
- (1.3) — `clock_time_conversion<DestClock, utc_clock>{}(`
 `clock_time_conversion<utc_clock, SourceClock>{}(t))`
- (1.4) — `clock_time_conversion<DestClock, utc_clock>{}(`
 `clock_time_conversion<utc_clock, system_clock>{}(`
 `clock_time_conversion<system_clock, SourceClock>{}(t)))`
- (1.5) — `clock_time_conversion<DestClock, system_clock>{}(`
 `clock_time_conversion<system_clock, utc_clock>{}(`
 `clock_time_conversion<utc_clock, SourceClock>{}(t)))`

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations. If, among the well-formed clock time conversion expressions from the above list, there is not a unique best expression, the `clock_cast` is ambiguous and the program is ill-formed.

2 *Returns:* The best well-formed clock time conversion expression in the above list.

26.8 The civil calendar

[time.cal]

26.8.1 In general

[time.cal.general]

1 The types in [26.8](#) describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.

26.8.2 Class `last_spec`

[time.cal.last]

```
namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}
```

1 The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

26.8.3 Class day

[time.cal.day]

26.8.3.1 Overview

```
namespace std::chrono {
    class day {
        unsigned char d_;           // exposition only
    public:
        day() = default;
        constexpr explicit day(unsigned d) noexcept;

        constexpr day& operator++()    noexcept;
        constexpr day operator++(int) noexcept;
        constexpr day& operator--()    noexcept;
        constexpr day operator--(int) noexcept;

        constexpr day& operator+=(const days& d) noexcept;
        constexpr day& operator-=(const days& d) noexcept;

        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

¹ day represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into day's unspecified internal storage. day is *Cpp17EqualityComparable* (Table 23) and *Cpp17LessThanComparable* (Table 24), and participates in basic arithmetic with `days` objects, which represent a difference between two day objects.

² day is a trivially copyable and standard-layout class type.

26.8.3.2 Member functions

[time.cal.day.members]

```
constexpr explicit day(unsigned d) noexcept;
```

¹ *Effects:* Constructs an object of type day by initializing `d_` with `d`. The value held is unspecified if `d` is not in the range [0, 255].

```
constexpr day& operator++() noexcept;
```

² *Effects:* `++d_`.

³ *Returns:* `*this`.

```
constexpr day operator++(int) noexcept;
```

⁴ *Effects:* `++(*this)`.

⁵ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator--() noexcept;
```

⁶ *Effects:* `--d_`.

⁷ *Returns:* `*this`.

```
constexpr day operator--(int) noexcept;
```

⁸ *Effects:* `--(*this)`.

⁹ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator+=(const days& d) noexcept;
```

¹⁰ *Effects:* `*this = *this + d`.

¹¹ *Returns:* `*this`.

```
constexpr day& operator-=(const days& d) noexcept;
```

¹² *Effects:* `*this = *this - d`.

¹³ *Returns:* `*this`.

```
constexpr explicit operator unsigned() const noexcept;
14   Returns: d_.

constexpr bool ok() const noexcept;
15   Returns: 1 <= d_ && d_ <= 31.
```

26.8.3.3 Non-member functions

[time.cal.day.nonmembers]

```
constexpr bool operator==(const day& x, const day& y) noexcept;
1   Returns: unsigned{x} == unsigned{y}.
```

```
constexpr bool operator<(const day& x, const day& y) noexcept;
2   Returns: unsigned{x} < unsigned{y}.
```

```
constexpr day operator+(const day& x, const days& y) noexcept;
3   Returns: day(unsigned{x} + y.count()).
```

```
constexpr day operator+(const days& x, const day& y) noexcept;
4   Returns: y + x.
```

```
constexpr day operator-(const day& x, const days& y) noexcept;
5   Returns: x + -y.

constexpr days operator-(const day& x, const day& y) noexcept;
6   Returns: days{int(unsigned{x}) - int(unsigned{y})}.
```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const day& d);
7   Effects: Inserts format(fmt, d) where fmt is "%d" widened to charT. If !d.ok(), appends with " is
not a valid day".
8   Returns: os.
```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const day& d);
9   Effects: Streams d into os using the format specified by the NTCTS fmt. fmt encoding follows the
rules specified in 26.11.
10  Returns: os.
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
11  Effects: Attempts to parse the input stream is into the day d using the format flags given in the NTCTS
fmt as specified in 26.12. If the parse fails to decode a valid day, is.setstate(ios_base::failbit)
shall be called and d shall not be modified. If %Z is used and successfully parsed, that value will be
assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed,
that value will be assigned to *offset if offset is non-null.
12  Returns: is.
```

```
constexpr day operator""d(unsigned long long d) noexcept;
13  Returns: day{static_cast<unsigned>(d)}.
```

26.8.4 Class month

[time.cal.month]

26.8.4.1 Overview

[time.cal.month.overview]

```
namespace std::chrono {
```

```

class month {
    unsigned char m_;           // exposition only
public:
    month() = default;
    constexpr explicit month(unsigned m) noexcept;

    constexpr month& operator++()    noexcept;
    constexpr month operator++(int) noexcept;
    constexpr month& operator--()    noexcept;
    constexpr month operator--(int) noexcept;

    constexpr month& operator+=(const months& m) noexcept;
    constexpr month& operator-=(const months& m) noexcept;

    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

¹ `month` represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `month`'s unspecified internal storage. `month` is *Cpp17EqualityComparable* (Table 23) and *Cpp17LessThanComparable* (Table 24), and participates in basic arithmetic with `months` objects, which represent a difference between two `month` objects.

² `month` is a trivially copyable and standard-layout class type.

26.8.4.2 Member functions

[time.cal.month.members]

```
constexpr explicit month(unsigned m) noexcept;
```

¹ *Effects:* Constructs an object of type `month` by initializing `m_` with `m`. The value held is unspecified if `m` is not in the range [0, 255].

```
constexpr month& month::operator++() noexcept;
```

² *Effects:* `*this += months{1}`.

³ *Returns:* `*this`.

```
constexpr month operator++(int) noexcept;
```

⁴ *Effects:* `++(*this)`.

⁵ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator--() noexcept;
```

⁶ *Effects:* `*this -= months{1}`.

⁷ *Returns:* `*this`.

```
constexpr month operator--(int) noexcept;
```

⁸ *Effects:* `--(*this)`.

⁹ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator+=(const months& m) noexcept;
```

¹⁰ *Effects:* `*this = *this + m`.

¹¹ *Returns:* `*this`.

```
constexpr month& operator-=(const months& m) noexcept;
```

¹² *Effects:* `*this = *this - m`.

¹³ *Returns:* `*this`.

```
constexpr explicit month::operator unsigned() const noexcept;
```

¹⁴ *Returns:* `m_`.

```

constexpr bool month::ok() const noexcept;
15   Returns:  $1 \leq m_ \&& m_ \leq 12$ .

```

26.8.4.3 Non-member functions [time.cal.month.nonmembers]

```

constexpr bool operator==(const month& x, const month& y) noexcept;
1   Returns:  $unsigned\{x\} == unsigned\{y\}$ .

```

```

constexpr bool operator<(const month& x, const month& y) noexcept;
2   Returns:  $unsigned\{x\} < unsigned\{y\}$ .

```

```

constexpr month operator+(const month& x, const months& y) noexcept;
3   Returns:
    month{modulo(static_cast<long long>(unsigned\{x\}) + (y.count() - 1), 12) + 1}
where modulo(n, 12) computes the remainder of n divided by 12 using Euclidean division. [Note: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 11]. Assuming no overflow in the signed summation, this operation results in a month holding a value in the range [1, 12] even if !x.ok(). —end note] [Example: February + months{11} == January. —end example]

```

```

constexpr month operator+(const months& x, const month& y) noexcept;
4   Returns:  $y + x$ .

```

```

constexpr month operator-(const month& x, const months& y) noexcept;
5   Returns:  $x + -y$ .

```

```

constexpr months operator-(const month& x, const month& y) noexcept;
6   Returns: If x.ok() == true and y.ok() == true, returns a value m in the range [months{0}, months{11}] satisfying  $y + m == x$ . Otherwise the value returned is unspecified. [Example: January - February == months{11}. —end example]

```

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month& m);
7   Effects: If m.ok() == true inserts format(os.getloc(), fmt, m) where fmt is "%b" widened to charT. Otherwise inserts  $unsigned\{m\} << "$  is not a valid month".

```

```

8   Returns: os.

```

```

template<class charT, class traits>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const month& m);
9   Effects: Streams m into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11.

```

```

10  Returns: os.

```

```

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);

```

```

11  Effects: Attempts to parse the input stream is into the month m using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid month, is.setstate(ios_base::failbit) shall be called and m shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

```

```

12  Returns: is.

```

26.8.5 Class year

[time.cal.year]

26.8.5.1 Overview

```
namespace std::chrono {
    class year {
        short y_;                                // exposition only
    public:
        year() = default;
        constexpr explicit year(int y) noexcept;

        constexpr year& operator++()    noexcept;
        constexpr year operator++(int) noexcept;
        constexpr year& operator--()    noexcept;
        constexpr year operator--(int) noexcept;

        constexpr year operator+=(const years& y) noexcept;
        constexpr year& operator=(const years& y) noexcept;

        constexpr year operator+() const noexcept;
        constexpr year operator-() const noexcept;

        constexpr bool is_leap() const noexcept;

        constexpr explicit operator int() const noexcept;
        constexpr bool ok() const noexcept;

        static constexpr year min() noexcept;
        static constexpr year max() noexcept;
    };
}
```

¹ **year** represents a year in the civil calendar. It can represent values in the range [`min()`, `max()`]. It can be constructed with any `int` value, which will be subsequently truncated to fit into `year`'s unspecified internal storage. `year` is *Cpp17EqualityComparable* (Table 23) and *Cpp17LessThanComparable* (Table 24), and participates in basic arithmetic with `years` objects, which represent a difference between two `year` objects.

² `year` is a trivially copyable and standard-layout class type.

26.8.5.2 Member functions

[time.cal.year.members]

`constexpr explicit year(int y) noexcept;`

¹ *Effects:* Constructs an object of type `year` by initializing `y_` with `y`. The value held is unspecified if `y` is not in the range [-32767, 32767].

`constexpr year& operator++() noexcept;`

² *Effects:* `++y_`.

³ *Returns:* `*this`.

`constexpr year operator++(int) noexcept;`

⁴ *Effects:* `++(*this)`.

⁵ *Returns:* A copy of `*this` as it existed on entry to this member function.

`constexpr year& operator--() noexcept;`

⁶ *Effects:* `--y_`.

⁷ *Returns:* `*this`.

`constexpr year operator--(int) noexcept;`

⁸ *Effects:* `--(*this)`.

⁹ *Returns:* A copy of `*this` as it existed on entry to this member function.

```

constexpr year& operator+=(const years& y) noexcept;
10   Effects: *this = *this + y.
11   Returns: *this.

constexpr year& operator-=(const years& y) noexcept;
12   Effects: *this = *this - y.
13   Returns: *this.

constexpr year operator+() const noexcept;
14   Returns: *this.

constexpr year year::operator-() const noexcept;
15   Returns: year{-y}.

constexpr bool is_leap() const noexcept;
16   Returns: y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0).

constexpr explicit operator int() const noexcept;
17   Returns: y_.

constexpr bool ok() const noexcept;
18   Returns: min() <= y_ && y_ <= max().

static constexpr year min() noexcept;
19   Returns: year{-32767}.

static constexpr year max() noexcept;
20   Returns: year{32767}.

```

26.8.5.3 Non-member functions

[time.cal.year.nonmembers]

```

constexpr bool operator==(const year& x, const year& y) noexcept;
1   Returns: int{x} == int{y}.

constexpr bool operator<(const year& x, const year& y) noexcept;
2   Returns: int{x} < int{y}.

constexpr year operator+(const year& x, const years& y) noexcept;
3   Returns: year{int{x} + y.count()}.

constexpr year operator+(const years& x, const year& y) noexcept;
4   Returns: y + x.

constexpr year operator-(const year& x, const years& y) noexcept;
5   Returns: x + -y.

constexpr years operator-(const year& x, const year& y) noexcept;
6   Returns: years{int{x} - int{y}}.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year& y);
7   Effects: Inserts format(fmt, y) where fmt is "%Y" widened to charT. If !y.ok(), appends with " is
not a valid year".
8   Returns: os.

```

```

template<class charT, class traits>
basic_ostream<charT, traits>&
    to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const year& y);
9   Effects: Streams y into os using the format specified by the NTCTS fmt. fmt encoding follows the
   rules specified in 26.11.
10  Returns: os.

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                 year& y, basic_string<charT, traits, Alloc>*& abbrev = nullptr,
                 minutes*& offset = nullptr);

11  Effects: Attempts to parse the input stream is into the year y using the format flags given in the NTCTS
   fmt as specified in 26.12. If the parse fails to decode a valid year, is.setstate(ios_base::failbit)
   shall be called and y shall not be modified. If %Z is used and successfully parsed, that value will be
   assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed,
   that value will be assigned to *offset if offset is non-null.
12  Returns: is.

constexpr year operator""y(unsigned long long y) noexcept;
13  Returns: year{static_cast<int>(y)}.

```

26.8.6 Class weekday

[time.cal.wd]

26.8.6.1 Overview

[time.cal.wd.overview]

```

namespace std::chrono {
    class weekday {
        unsigned char wd_;           // exposition only
    public:
        weekday() = default;
        constexpr explicit weekday(unsigned wd) noexcept;
        constexpr weekday(const sys_days& dp) noexcept;
        constexpr explicit weekday(const local_days& dp) noexcept;

        constexpr weekday& operator++()    noexcept;
        constexpr weekday& operator++(int) noexcept;
        constexpr weekday& operator--()    noexcept;
        constexpr weekday& operator--(int) noexcept;

        constexpr weekday& operator+=(const days& d) noexcept;
        constexpr weekday& operator-=(const days& d) noexcept;

        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;

        constexpr weekday_indexed operator[](unsigned index) const noexcept;
        constexpr weekday_last operator[](last_spec) const noexcept;
    };
}

```

¹ weekday represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `weekday`'s unspecified internal storage. `weekday` is *Cpp17EqualityComparable* (Table 23). [Note: `weekday` is not *Cpp17LessThanComparable* because there is no universal consensus on which day is the first day of the week. `weekday`'s arithmetic operations treat the days of the week as a circular range, with no beginning and no end. — *end note*]

² `weekday` is a trivially copyable and standard-layout class type.

26.8.6.2 Member functions

[time.cal.wd.members]

```
constexpr explicit weekday(unsigned wd) noexcept;
```

1 *Effects:* Constructs an object of type `weekday` by initializing `wd_` with `wd`. The value held is unspecified if `wd` is not in the range [0, 255].

```
constexpr weekday(const sys_days& dp) noexcept;
```

2 *Effects:* Constructs an object of type `weekday` by computing what day of the week corresponds to the `sys_days` `dp`, and representing that day of the week in `wd_`.

3 *[Example:* If `dp` represents 1970-01-01, the constructed `weekday` represents Thursday by storing 4 in `wd_`. — *end example*]

```
constexpr explicit weekday(const local_days& dp) noexcept;
```

4 *Effects:* Constructs an object of type `weekday` by computing what day of the week corresponds to the `local_days` `dp`, and representing that day of the week in `wd_`.

5 *Remarks:* The value after construction is identical to that constructed from `sys_days{dp.time_since_epoch()}`.

```
constexpr weekday& operator++() noexcept;
```

6 *Effects:* `*this += days{1}`.

7 *Returns:* `*this`.

```
constexpr weekday operator++(int) noexcept;
```

8 *Effects:* `++(*this)`.

9 *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator--() noexcept;
```

10 *Effects:* `*this -= days{1}`.

11 *Returns:* `*this`.

```
constexpr weekday operator--(int) noexcept;
```

12 *Effects:* `--(*this)`.

13 *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator+=(const days& d) noexcept;
```

14 *Effects:* `*this = *this + d`.

15 *Returns:* `*this`.

```
constexpr weekday& operator-=(const days& d) noexcept;
```

16 *Effects:* `*this = *this - d`.

17 *Returns:* `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

18 *Returns:* `wd_`.

```
constexpr bool ok() const noexcept;
```

19 *Returns:* `wd_ <= 6`.

```
constexpr weekday_indexed operator[](unsigned index) const noexcept;
```

20 *Returns:* `{*this, index}`.

```
constexpr weekday_last operator[](last_spec) const noexcept;
```

21 *Returns:* `weekday_last{*this}`.

26.8.6.3 Non-member functions

[time.cal.wd.nonmembers]

```
constexpr bool operator==(const weekday& x, const weekday& y) noexcept;
```

1 >Returns: `unsigned{x} == unsigned{y}`.

```
constexpr weekday operator+(const weekday& x, const days& y) noexcept;
```

2 >Returns:

```
weekday{modulo(static_cast<long long>(unsigned{x}) + y.count(), 7)}
```

where `modulo(n, 7)` computes the remainder of `n` divided by 7 using Euclidean division. [Note: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 6]. Assuming no overflow in the signed summation, this operation results in a `weekday` holding a value in the range [0, 6] even if `!x.ok()`. —end note] [Example: `Monday + days{6} == Sunday`. —end example]

```
constexpr weekday operator+(const days& x, const weekday& y) noexcept;
```

3 >Returns: `y + x`.

```
constexpr weekday operator-(const weekday& x, const days& y) noexcept;
```

4 >Returns: `x + -y`.

```
constexpr days operator-(const weekday& x, const weekday& y) noexcept;
```

5 >Returns: If `x.ok() == true` and `y.ok() == true`, returns a value `d` in the range [`days{0}`, `days{6}`] satisfying `y + d == x`. Otherwise the value returned is unspecified. [Example: `Sunday - Monday == days{6}`. —end example]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<((basic_ostream<charT, traits>& os, const weekday& wd);
```

6 >Effects: If `wd.ok() == true` inserts `format(os.getloc(), fmt, wd)` where `fmt` is "%a" widened to `charT`. Otherwise inserts `unsigned{wd} << " is not a valid weekday"`.

7 >Returns: `os`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const weekday& wd);
```

8 >Effects: Streams `wd` into `os` using the format specified by the NTCTS `fmt`. `fmt` encoding follows the rules specified in [26.11](#).

9 >Returns: `os`.

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

10 >Effects: Attempts to parse the input stream `is` into the `weekday wd` using the format flags given in the NTCTS `fmt` as specified in [26.12](#). If the parse fails to decode a valid weekday, `is.setstate(ios_base::failbit)` shall be called and `wd` shall not be modified. If %Z is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

11 >Returns: `is`.

26.8.7 Class `weekday_indexed`

[time.cal.wdidx]

26.8.7.1 Overview

[time.cal.wdidx.overview]

```
namespace std::chrono {
class weekday_indexed {
    chrono::weekday wd_; // exposition only
    unsigned char index_; // exposition only
```

```

public:
    weekday_indexed() = default;
    constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned index() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

¹ `weekday_indexed` represents a `weekday` and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

² [Note: A `weekday_indexed` object can be constructed by indexing a `weekday` with an `unsigned`. — end note] [Example:

```

constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);

— end example]

```

³ `weekday_indexed` is a trivially copyable and standard-layout class type.

26.8.7.2 Member functions

[time.cal.wdidx.members]

```
constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
```

¹ Effects: Constructs an object of type `weekday_indexed` by initializing `wd_` with `wd` and `index_` with `index`. The values held are unspecified if `!wd_.ok()` or `index` is not in the range [1, 5].

```
constexpr chrono::weekday weekday() const noexcept;
```

² Returns: `wd_`.

```
constexpr unsigned index() const noexcept;
```

³ Returns: `index_`.

```
constexpr bool ok() const noexcept;
```

⁴ Returns: `wd_.ok() && 1 <= index_ && index_ <= 5`.

26.8.7.3 Non-member functions

[time.cal.wdidx.nonmembers]

```
constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
```

¹ Returns: `x.weekday() == y.weekday() && x.index() == y.index()`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
```

² Effects: `os << wdi.weekday() << '[' << wdi.index(). If wdi.index() is in the range [1, 5], appends with ']', otherwise appends with " is not a valid index]".`

³ Returns: `os`.

26.8.8 Class `weekday_last`

[time.cal.wdlast]

26.8.8.1 Overview

[time.cal.wdlast.overview]

```

namespace std::chrono {
    class weekday_last {
        chrono::weekday wd_; // exposition only

    public:
        constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

        constexpr chrono::weekday weekday() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

```

- ¹ `weekday_last` represents the last weekday of a month.
- ² [Note: A `weekday_last` object can be constructed by indexing a `weekday` with `last`. — end note] [Example:
`constexpr auto wdl = Sunday[last]; // wdl is the last Sunday of an as yet unspecified month`
`static_assert(wdl.weekday() == Sunday);`
— end example]
- ³ `weekday_last` is a trivially copyable and standard-layout class type.

26.8.8.2 Member functions

[time.cal.wdlast.members]

```
constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

- ¹ *Effects:* Constructs an object of type `weekday_last` by initializing `wd_` with `wd`.

```
constexpr chrono::weekday weekday() const noexcept;
```

- ² *Returns:* `wd_`.

```
constexpr bool ok() const noexcept;
```

- ³ *Returns:* `wd_.ok()`.

26.8.8.3 Non-member functions

[time.cal.wdlast.nonmembers]

```
constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

- ¹ *Returns:* `x.weekday() == y.weekday()`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);
```

- ² *Returns:* `os << wdl.weekday() << "[last]"`.

26.8.9 Class month_day

[time.cal.md]

26.8.9.1 Overview

[time.cal.md.overview]

```
namespace std::chrono {
    class month_day {
        chrono::month m_; // exposition only
        chrono::day d_; // exposition only

    public:
        month_day() = default;
        constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

- ¹ `month_day` represents a specific day of a specific month, but with an unspecified year. `month_day` is *Cpp17EqualityComparable* (Table 23) and *Cpp17LessThanComparable* (Table 24).

- ² `month_day` is a trivially copyable and standard-layout class type.

26.8.9.2 Member functions

[time.cal.md.members]

```
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

- ¹ *Effects:* Constructs an object of type `month_day` by initializing `m_` with `m`, and `d_` with `d`.

```
constexpr chrono::month month() const noexcept;
```

- ² *Returns:* `m_`.

```
constexpr chrono::day day() const noexcept;
```

- ³ *Returns:* `d_`.

```
constexpr bool ok() const noexcept;
```

⁴ *Returns:* true if `m_.ok()` is true, `1d <= d_`, and `d_` is less than or equal to the number of days in month `m_`; otherwise returns false. When `m_ == February`, the number of days is considered to be 29.

26.8.9.3 Non-member functions [time.cal.md.nonmembers]

```
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
```

¹ *Returns:* `x.month() == y.month() && x.day() == y.day()`.

```
constexpr bool operator<(const month_day& x, const month_day& y) noexcept;
```

² *Returns:* If `x.month() < y.month()` returns true. Otherwise, if `x.month() > y.month()` returns false. Otherwise, returns `x.day() < y.day()`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day& md);
```

³ *Returns:* `os << md.month() << '/' << md.day()`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const month_day& md);
```

⁴ *Effects:* Streams `md` into `os` using the format specified by the NTCTS `fmt`. `fmt` encoding follows the rules specified in [26.11](#).

⁵ *Returns:* `os`.

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

⁶ *Effects:* Attempts to parse the input stream `is` into the `month_day` `md` using the format flags given in the NTCTS `fmt` as specified in [26.12](#). If the parse fails to decode a valid `month_day`, `is.setstate(ios_base::failbit)` shall be called and `md` shall not be modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

⁷ *Returns:* `is`.

26.8.10 Class month_day_last [time.cal.mdlst]

```
namespace std::chrono {
class month_day_last {
    chrono::month m_; // exposition only

public:
    constexpr explicit month_day_last(const chrono::month& m) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr bool ok() const noexcept;
};}
```

¹ `month_day_last` represents the last day of a month.

² [Note: A `month_day_last` object can be constructed using the expression `m/last` or `last/m`, where `m` is an expression of type `month`. — end note] [Example:

```
constexpr auto mdl = February/last; // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
— end example]
```

³ `month_day_last` is a trivially copyable and standard-layout class type.

```

constexpr explicit month_day_last(const chrono::month& m) noexcept;
4   Effects: Constructs an object of type month_day_last by initializing m_ with m.

constexpr month month() const noexcept;
5   Returns: m_.

constexpr bool ok() const noexcept;
6   Returns: m_.ok().

constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;
7   Returns: x.month() == y.month().

constexpr bool operator<(const month_day_last& x, const month_day_last& y) noexcept;
8   Returns: x.month() < y.month().

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);
9   Returns: os << mdl.month() << "/last".

```

26.8.11 Class month_weekday

[time.cal.mwd]

26.8.11.1 Overview

[time.cal.mwd.overview]

```

namespace std::chrono {
class month_weekday {
    chrono::month          m_;           // exposition only
    chrono::weekday_indexed wdi_;        // exposition only
public:
    constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

    constexpr chrono::month          month()          const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
    constexpr bool ok() const noexcept;
};
}

```

¹ month_weekday represents the n^{th} weekday of a month, of an as yet unspecified year. To do this the month_weekday stores a month and a weekday_indexed.

² [Example:

```

constexpr auto mwd
    = February/Tuesday[3];           // mwd is the third Tuesday of February of an as yet unspecified
year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
— end example]

```

³ month_weekday is a trivially copyable and standard-layout class type.

26.8.11.2 Member functions

[time.cal.mwd.members]

```

constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
1   Effects: Constructs an object of type month_weekday by initializing m_ with m, and wdi_ with wdi.

constexpr chrono::month month() const noexcept;
2   Returns: m_.

constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
3   Returns: wdi_.

constexpr bool ok() const noexcept;
4   Returns: m_.ok() && wdi_.ok().

```

26.8.11.3 Non-member functions

[time.cal.mwd.nonmembers]

```
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
1   Returns: x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed().

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
2   Returns: os << mwd.month() << '/' << mwd.weekday_indexed().
```

26.8.12 Class month_weekday_last

[time.cal.mwdlast]

26.8.12.1 Overview

[time.cal.mwdlast.overview]

```
namespace std::chrono {
    class month_weekday_last {
        chrono::month      m_;      // exposition only
        chrono::weekday_last wdl_;  // exposition only
    public:
        constexpr month_weekday_last(const chrono::month& m,
                                      const chrono::weekday_last& wdl) noexcept;

        constexpr chrono::month      month()      const noexcept;
        constexpr chrono::weekday_last weekday_last() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

¹ month_weekday_last represents the last weekday of a month, of an as yet unspecified year. To do this the month_weekday_last stores a month and a weekday_last.

² [Example:

```
constexpr auto mwd
    = February/Tuesday[last];    // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_last() == Tuesday[last]);
— end example]
```

³ month_weekday_last is a trivially copyable and standard-layout class type.

26.8.12.2 Member functions

[time.cal.mwdlast.members]

```
constexpr month_weekday_last(const chrono::month& m,
                           const chrono::weekday_last& wdl) noexcept;
```

¹ Effects: Constructs an object of type month_weekday_last by initializing m_ with m, and wdl_ with wdl.

```
constexpr chrono::month month() const noexcept;
```

² Returns: m_.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

³ Returns: wdl_.

```
constexpr bool ok() const noexcept;
```

⁴ Returns: m_.ok() && wdl_.ok().

26.8.12.3 Non-member functions

[time.cal.mwdlast.nonmembers]

```
constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;
```

¹ Returns: x.month() == y.month() && x.weekday_last() == y.weekday_last().

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);
2   Returns: os << mwdl.month() << '/' << mwdl.weekday_last().

```

26.8.13 Class year_month

[time.cal.ym]

26.8.13.1 Overview

[time.cal.ym.overview]

```

namespace std::chrono {
    class year_month {
        chrono::year y_;           // exposition only
        chrono::month m_;          // exposition only

    public:
        year_month() = default;
        constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;

        constexpr year_month& operator+=(const months& dm) noexcept;
        constexpr year_month& operator-=(const months& dm) noexcept;
        constexpr year_month& operator+=(const years& dy) noexcept;
        constexpr year_month& operator-=(const years& dy) noexcept;

        constexpr bool ok() const noexcept;
    };
}

```

¹ `year_month` represents a specific month of a specific year, but with an unspecified day. `year_month` is a field-based time point with a resolution of `months`. `year_month` is *Cpp17EqualityComparable* (Table 23) and *Cpp17LessThanComparable* (Table 24).

² `year_month` is a trivially copyable and standard-layout class type.

26.8.13.2 Member functions

[time.cal.ym.members]

```
constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
```

¹ *Effects:* Constructs an object of type `year_month` by initializing `y_` with `y`, and `m_` with `m`.

```
constexpr chrono::year year() const noexcept;
```

² *Returns:* `y_`.

```
constexpr chrono::month month() const noexcept;
```

³ *Returns:* `m_`.

```
constexpr year_month& operator+=(const months& dm) noexcept;
```

⁴ *Effects:* `*this = *this + dm`.

⁵ *Returns:* `*this`.

```
constexpr year_month& operator-=(const months& dm) noexcept;
```

⁶ *Effects:* `*this = *this - dm`.

⁷ *Returns:* `*this`.

```
constexpr year_month& operator+=(const years& dy) noexcept;
```

⁸ *Effects:* `*this = *this + dy`.

⁹ *Returns:* `*this`.

```
constexpr year_month& operator-=(const years& dy) noexcept;
```

¹⁰ *Effects:* `*this = *this - dy`.

¹¹ *Returns:* `*this`.

```

constexpr bool ok() const noexcept;
12   Returns: y_.ok() && m_.ok().

26.8.13.3 Non-member functions [time.cal.ym.nonmembers]

constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
1   Returns: x.year() == y.year() && x.month() == y.month().

constexpr bool operator<(const year_month& x, const year_month& y) noexcept;
2   Returns: If x.year() < y.year() returns true. Otherwise, if x.year() > y.year() returns false.
   Otherwise, returns x.month() < y.month().

constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;
3   Returns: A year_month value z such that z - ym == dm.
   Complexity:  $\mathcal{O}(1)$  with respect to the value of dm.

constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;
4   Returns: ym + dm.

constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;
5   Returns: ym + -dm.

constexpr months operator-(const year_month& x, const year_month& y) noexcept;
6   Returns:
      x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
      static_cast<int>(unsigned{y.month()})}

constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;
7   Returns: (ym.year() + dy) / ym.month().

constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;
8   Returns: ym + dy.

constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;
9   Returns: ym + -dy.

template<class charT, class traits>
  basic_ostream<charT, traits>&
  operator<<((basic_ostream<charT, traits>& os, const year_month& ym);
10  Returns: os << ym.year() << '/' << ym.month().

template<class charT, class traits>
  basic_ostream<charT, traits>&
  to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const year_month& ym);
11  Effects: Streams ym into os using the format specified by the NTCTS fmt. fmt encoding follows the
   rules specified in 26.11.
12  Returns: os.

template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
  from_stream(basic_istream<charT, traits>& is, const charT* fmt,
              year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
              minutes* offset = nullptr);
13  Effects: Attempts to parse the input stream is into the year_month ym using the format flags given in the
   NTCTS fmt as specified in 26.12. If the parse fails to decode a valid year_month, is.setstate(ios-
   base::failbit) shall be called and ym shall not be modified. If %Z is used and successfully parsed,
   that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and
   successfully parsed, that value will be assigned to *offset if offset is non-null.

```

14 >Returns: is.

26.8.14 Class year_month_day [time.cal.ymd]
26.8.14.1 Overview [time.cal.ymd.overview]

```
namespace std::chrono {
    class year_month_day {
        chrono::year y_;           // exposition only
        chrono::month m_;          // exposition only
        chrono::day d_;            // exposition only

    public:
        year_month_day() = default;
        constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                               const chrono::day& d) noexcept;
        constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
        constexpr year_month_day(const sys_days& dp) noexcept;
        constexpr explicit year_month_day(const local_days& dp) noexcept;

        constexpr year_month_day& operator+=(const months& m) noexcept;
        constexpr year_month_day& operator-=(const months& m) noexcept;
        constexpr year_month_day& operator+=(const years& y) noexcept;
        constexpr year_month_day& operator-=(const years& y) noexcept;

        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;

        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

¹ *year_month_day* represents a specific year, month, and day. *year_month_day* is a field-based time point with a resolution of days. [Note: *year_month_day* supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to *sys_days*, which efficiently supports days-oriented arithmetic. —end note] *year_month_day* is *Cpp17EqualityComparable* (Table 23) and *Cpp17LessThanComparable* (Table 24),

² *year_month_day* is a trivially copyable and standard-layout class type.

26.8.14.2 Member functions [time.cal.ymd.members]

```
constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                         const chrono::day& d) noexcept;
```

¹ *Effects:* Constructs an object of type *year_month_day* by initializing *y_* with *y*, *m_* with *m*, and *d_* with *d*.

```
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
```

² *Effects:* Constructs an object of type *year_month_day* by initializing *y_* with *ymdl.year()*, *m_* with *ymdl.month()*, and *d_* with *ymdl.day()*. [Note: This conversion from *year_month_day_last* to *year_month_day* may be more efficient than converting a *year_month_day_last* to a *sys_days*, and then converting that *sys_days* to a *year_month_day*. —end note]

```
constexpr year_month_day(const sys_days& dp) noexcept;
```

³ *Effects:* Constructs an object of type *year_month_day* that corresponds to the date represented by *dp*.

⁴ *Remarks:* For any value *ymd* of type *year_month_day* for which *ymd.ok()* is true, *ymd == year_month_day{sys_days{ymd}}* is true.

```
constexpr explicit year_month_day(const local_days& dp) noexcept;
```

⁵ *Effects:* Constructs an object of type *year_month_day* that corresponds to the date represented by *dp*.

⁶ *Remarks:* Equivalent to constructing with *sys_days{dp.time_since_epoch()}*.

```

constexpr year_month_day& operator+=(const months& m) noexcept;
7   Effects: *this = *this + m.
8   Returns: *this.

constexpr year_month_day& operator-=(const months& m) noexcept;
9   Effects: *this = *this - m.
10  Returns: *this.

constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
11  Effects: *this = *this + y.
12  Returns: *this.

constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
13  Effects: *this = *this - y.
14  Returns: *this.

constexpr chrono::year year() const noexcept;
15  Returns: y_.

constexpr chrono::month month() const noexcept;
16  Returns: m_.

constexpr chrono::day day() const noexcept;
17  Returns: d_.

constexpr operator sys_days() const noexcept;
18  Returns: If ok(), returns a sys_days holding a count of days from the sys_days epoch to *this (a
    negative value if *this represents a date prior to the sys_days epoch). Otherwise, if y_.ok() &&
    m_.ok() is true, returns a sys_days which is offset from sys_days{y_/m_/last} by the number of
    days d_ is offset from sys_days{y_/m_/last}.day(). Otherwise the value returned is unspecified.

19  Remarks: A sys_days in the range [days{-12687428}, days{11248737}] which is converted to a
    year_month_day shall have the same value when converted back to a sys_days.

20  [Example:
    static_assert(year_month_day{sys_days{2017y/January/0}} == 2016y/December/31);
    static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
    static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
  — end example]

constexpr explicit operator local_days() const noexcept;
21  Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
22  Returns: If y_.ok() is true, and m_.ok() is true, and d_ is in the range [1d, (y_/m_/last).day()], then
    returns true; otherwise returns false.

```

26.8.14.3 Non-member functions

[time.cal.ymd.nonmembers]

```

constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
1  Returns: x.year() == y.year() && x.month() == y.month() && x.day() == y.day().

constexpr bool operator<(const year_month_day& x, const year_month_day& y) noexcept;
2  Returns: If x.year() < y.year(), returns true. Otherwise, if x.year() > y.year(), returns false.
    Otherwise, if x.month() < y.month(), returns true. Otherwise, if x.month() > y.month(), returns
    false. Otherwise, returns x.day() < y.day().

```

```

constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;
3   Returns: (ymd.year() / ymd.month() + dm) / ymd.day().
4   [Note: If ymd.day() is in the range [1d, 28d], ok() will return true for the resultant year_month_day.
— end note]

constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;
5   Returns: ymd + dm.

constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;
6   Returns: ymd + (-dm).

constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;
7   Returns: (ymd.year() + dy) / ymd.month() / ymd.day().
8   [Note: If ymd.month() is February and ymd.day() is not in the range [1d, 28d], ok() may return
false for the resultant year_month_day. — end note]

constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;
9   Returns: ymd + dy.

constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;
10  Returns: ymd + (-dy).

template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);
11  Effects: Inserts format(fmt, ymd) where fmt is "%F" widened to charT. If !ymd.ok(), appends with
" is not a valid date".
12  Returns: os.

template<class charT, class traits>
  basic_ostream<charT, traits>&
    to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const year_month_day& ymd);
13  Effects: Streams ymd into os using the format specified by the NTCTS fmt. fmt encoding follows the
rules specified in 26.11.
14  Returns: os.

template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
15  Effects: Attempts to parse the input stream is into the year_month_day ymd using the format flags
given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid year_month_day,
is.setstate(ios_base::failbit) shall be called and ymd shall not be modified. If %Z is used and
successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified
variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.
16  Returns: is.

```

26.8.15 Class year_month_day_last

[time.cal.ymdlast]

26.8.15.1 Overview

[time.cal.ymdlast.overview]

```

namespace std::chrono {
  class year_month_day_last {
    chrono::year          y_;           // exposition only
    chrono::month_day_last mdl_;        // exposition only

```

```

public:
    constexpr year_month_day_last(const chrono::year& y,
                                  const chrono::month_day_last& mdl) noexcept;

    constexpr year_month_day_last& operator+=(const months& m) noexcept;
    constexpr year_month_day_last& operator-=(const months& m) noexcept;
    constexpr year_month_day_last& operator+=(const years& y) noexcept;
    constexpr year_month_day_last& operator-=(const years& y) noexcept;

    constexpr chrono::year           year()           const noexcept;
    constexpr chrono::month          month()          const noexcept;
    constexpr chrono::month_day_last month_day_last() const noexcept;
    constexpr chrono::day            day()            const noexcept;

    constexpr      operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

¹ `year_month_day_last` represents the last day of a specific year and month. `year_month_day_last` is a field-based time point with a resolution of days, except that it is restricted to pointing to the last day of a year and month. [Note: `year_month_day_last` supports `years`- and `months`-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports days-oriented arithmetic. — end note] `year_month_day_last` is *Cpp17EqualityComparable* (Table 23) and *Cpp17LessThanComparable* (Table 24),

² `year_month_day_last` is a trivially copyable and standard-layout class type.

26.8.15.2 Member functions

[time.cal.ymdlast.members]

```
constexpr year_month_day_last(const chrono::year& y,
                             const chrono::month_day_last& mdl) noexcept;
```

¹ *Effects:* Constructs an object of type `year_month_day_last` by initializing `y_` with `y` and `mdl_` with `mdl`.

```
constexpr year_month_day_last& operator+=(const months& m) noexcept;
```

² *Effects:* `*this = *this + m`.

Returns: `*this`.

```

⁴ *Effects:* `*this = *this - m`.

Returns: `*this`.

```
constexpr year_month_day_last& operator+=(const years& y) noexcept;
```

⁶ *Effects:* `*this = *this + y`.

Returns: `*this`.

```
constexpr year_month_day_last& operator-=(const years& y) noexcept;
```

⁸ *Effects:* `*this = *this - y`.

Returns: `*this`.

```
constexpr chrono::year year() const noexcept;
```

¹⁰ *Returns:* `y_`.

```
constexpr chrono::month month() const noexcept;
```

¹¹ *Returns:* `mdl_.month()`.

```
constexpr chrono::month_day_last month_day_last() const noexcept;
```

¹² *Returns:* `mdl_`.

```

constexpr chrono::day day() const noexcept;
13   Returns: A day representing the last day of the (year, month) pair represented by *this.
14   [Note: This value may be computed on demand. —end note]

constexpr operator sys_days() const noexcept;
15   Returns: sys_days{year()/month()/day()}.

constexpr explicit operator local_days() const noexcept;
16   Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
17   Returns: y_.ok() && mdl_.ok().

```

26.8.15.3 Non-member functions [time.cal.ymdlast.nonmembers]

```

constexpr bool operator==(const year_month_day_last& x, const year_month_day_last& y) noexcept;
1   Returns: x.year() == y.year() && x.month_day_last() == y.month_day_last().

constexpr bool operator<(const year_month_day_last& x, const year_month_day_last& y) noexcept;
2   Returns: If x.year() < y.year(), returns true. Otherwise, if x.year() > y.year(), returns false.
   Otherwise, returns x.month_day_last() < y.month_day_last().

constexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const months& dm) noexcept;
3   Returns: (ymdl.year() / ymdl.month() + dm) / last.

constexpr year_month_day_last
operator+(const months& dm, const year_month_day_last& ymdl) noexcept;
4   Returns: ymdl + dm.

constexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const months& dm) noexcept;
5   Returns: ymdl + (-dm).

constexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const years& dy) noexcept;
6   Returns: {ymdl.year() + dy, ymdl.month_day_last()}.

constexpr year_month_day_last
operator+(const years& dy, const year_month_day_last& ymdl) noexcept;
7   Returns: ymdl + dy.

constexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const years& dy) noexcept;
8   Returns: ymdl + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<((basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);
9   Returns: os << ymdl.year() << '/' << ymdl.month_day_last().

```

26.8.16 Class year_month_weekday

[time.cal.ymwd]

26.8.16.1 Overview

[time.cal.ymwd.overview]

```

namespace std::chrono {
class year_month_weekday {
    chrono::year      y_;           // exposition only
    chrono::month     m_;           // exposition only
    chrono::weekday_indexed wdi_;   // exposition only
}

```

```

public:
    year_month_weekday() = default;
    constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                                const chrono::weekday_indexed& wdi) noexcept;
    constexpr year_month_weekday(const sys_days& dp) noexcept;
    constexpr explicit year_month_weekday(const local_days& dp) noexcept;

    constexpr year_month_weekday& operator+=(const months& m) noexcept;
    constexpr year_month_weekday& operator-=(const months& m) noexcept;
    constexpr year_month_weekday& operator+=(const years& y) noexcept;
    constexpr year_month_weekday& operator-=(const years& y) noexcept;

    constexpr chrono::year           year()           const noexcept;
    constexpr chrono::month          month()          const noexcept;
    constexpr chrono::weekday        weekday()        const noexcept;
    constexpr unsigned               index()          const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

    constexpr      operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

¹ `year_month_weekday` represents a specific year, month, and n^{th} weekday of the month. `year_month_weekday` is a field-based time point with a resolution of `days`. [Note: `year_month_weekday` supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports days-oriented arithmetic. — end note] `year_month_weekday` is *Cpp17EqualityComparable* (Table 23).

² `year_month_weekday` is a trivially copyable and standard-layout class type.

26.8.16.2 Member functions

[time.cal.ymwd.members]

```
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                            const chrono::weekday_indexed& wdi) noexcept;
```

¹ *Effects:* Constructs an object of type `year_month_weekday` by initializing `y_` with `y`, `m_` with `m`, and `wdi_` with `wdi`.

```
constexpr year_month_weekday(const sys_days& dp) noexcept;
```

² *Effects:* Constructs an object of type `year_month_weekday` which corresponds to the date represented by `dp`.

³ *Remarks:* For any value `ymdl` of type `year_month_weekday` for which `ymdl.ok()` is `true`, `ymdl == year_month_weekday{sys_days{ymdl}}` is `true`.

```
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

⁴ *Effects:* Constructs an object of type `year_month_weekday` that corresponds to the date represented by `dp`.

⁵ *Remarks:* Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_weekday& operator+=(const months& m) noexcept;
```

⁶ *Effects:* `*this = *this + m`.

⁷ *Returns:* `*this`.

```
constexpr year_month_weekday& operator-=(const months& m) noexcept;
```

⁸ *Effects:* `*this = *this - m`.

⁹ *Returns:* `*this`.

```
constexpr year_month_weekday& operator+=(const years& y) noexcept;
```

¹⁰ *Effects:* `*this = *this + y`.

```

11     Returns: *this.

12     constexpr year_month_weekday& operator=(const years& y) noexcept;
13     Effects: *this = *this - y.
14     Returns: *this.

15     constexpr chrono::year year() const noexcept;
16     Returns: y_.

17     constexpr chrono::month month() const noexcept;
18     Returns: m_.

19     constexpr chrono::weekday weekday() const noexcept;
20     Returns: wdi_.weekday().

21     constexpr unsigned index() const noexcept;
22     Returns: wdi_.index().

23     constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
24     Returns: wdi_.

25     constexpr operator sys_days() const noexcept;
26     Returns: If y_.ok() && m_.ok() && wdi_.weekday().ok(), returns a sys_days that represents
27     the date (index() - 1) * 7 days after the first weekday() of year()/month(). If index() is 0
28     the returned sys_days represents the date 7 days prior to the first weekday() of year()/month().
29     Otherwise the returned value is unspecified.

30     constexpr explicit operator local_days() const noexcept;
31     Returns: local_days{sys_days{*this}.time_since_epoch()}.

32     constexpr bool ok() const noexcept;
33     Returns: If any of y_.ok(), m_.ok(), or wdi_.ok() is false, returns false. Otherwise, if *this
34     represents a valid date, returns true. Otherwise, returns false.

```

26.8.16.3 Non-member functions

[time.cal.ymwd.nonmembers]

```

constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;
1     Returns:
2         x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()

constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;
2     Returns: (ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed().

constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;
3     Returns: ymwd + dm.

constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;
4     Returns: ymwd + (-dm).

constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const years& dy) noexcept;
5     Returns: {ymwd.year() + dy, ymwd.month(), ymwd.weekday_indexed()}.

constexpr year_month_weekday operator+(const years& dy, const year_month_weekday& ymwd) noexcept;
6     Returns: ymwd + dm.

constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const years& dy) noexcept;
7     Returns: ymwd + (-dm).

```

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);
8   Returns: os << ymwdi.year() << '/' << ymwdi.month() << '/' << ymwdi.weekday_indexed().

```

26.8.17 Class `year_month_weekday_last`

[time.cal.ymwdlast]

26.8.17.1 Overview

```

namespace std::chrono {
    class year_month_weekday_last {
        chrono::year      y_;      // exposition only
        chrono::month     m_;      // exposition only
        chrono::weekday_last wdl_; // exposition only

    public:
        constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                         const chrono::weekday_last& wdl) noexcept;

        constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
        constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
        constexpr year_month_weekday_last& operator+=(const years& y)    noexcept;
        constexpr year_month_weekday_last& operator-=(const years& y)    noexcept;

        constexpr chrono::year      year()      const noexcept;
        constexpr chrono::month     month()     const noexcept;
        constexpr chrono::weekday   weekday()   const noexcept;
        constexpr chrono::weekday_last weekday_last() const noexcept;

        constexpr          operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

```

¹ `year_month_weekday_last` represents a specific year, month, and last weekday of the month. `year_month_weekday_last` is a field-based time point with a resolution of days, except that it is restricted to pointing to the last weekday of a year and month. [Note: `year_month_weekday_last` supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports days-oriented arithmetic. —end note] `year_month_weekday_last` is *Cpp17EqualityComparable* (Table 23).

26.8.17.2 Member functions

[time.cal.ymwdlast.members]

¹ `year_month_weekday_last` is a trivially copyable and standard-layout class type.

```
constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                 const chrono::weekday_last& wdl) noexcept;
```

² *Effects:* Constructs an object of type `year_month_weekday_last` by initializing `y_` with `y`, `m_` with `m`, and `wdl_` with `wdl`.

```
constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
```

³ *Effects:* `*this = *this + m`.

⁴ *Returns:* `*this`.

```
constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
```

⁵ *Effects:* `*this = *this - m`.

⁶ *Returns:* `*this`.

```
constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
```

⁷ *Effects:* `*this = *this + y`.

⁸ *Returns:* `*this`.

```

constexpr year_month_weekday_last& operator==(const years& y) noexcept;
9   Effects: *this = *this - y.
10  Returns: *this.

constexpr chrono::year year() const noexcept;
11  Returns: y_.

constexpr chrono::month month() const noexcept;
12  Returns: m_.

constexpr chrono::weekday weekday() const noexcept;
13  Returns: wdl_.weekday();

constexpr chrono::weekday_last weekday_last() const noexcept;
14  Returns: wdl_.

constexpr operator sys_days() const noexcept;
15  Returns: If ok() == true, returns a sys_days that represents the last weekday() of year()/month(). Otherwise the returned value is unspecified.

constexpr explicit operator local_days() const noexcept;
16  Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
17  Returns: y_.ok() && m_.ok() && wdl_.ok().

```

26.8.17.3 Non-member functions

[time.cal.ymwdl.last.nonmembers]

```

constexpr bool operator==(const year_month_weekday_last& x,
                           const year_month_weekday_last& y) noexcept;
1   Returns:
     x.year() == y.year() && x.month() == y.month() && x.weekday_last() == y.weekday_last()

constexpr year_month_weekday_last
operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
2   Returns: (ymwdl.year() / ymwdl.month() + dm) / ymwdl.weekday_last().

constexpr year_month_weekday_last
operator+(const months& dm, const year_month_weekday_last& ymwdl) noexcept;
3   Returns: ymwdl + dm.

constexpr year_month_weekday_last
operator-(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
4   Returns: ymwdl + (-dm).

constexpr year_month_weekday_last
operator+(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
5   Returns: {ymwdl.year() + dy, ymwdl.month(), ymwdl.weekday_last()}.

constexpr year_month_weekday_last
operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;
6   Returns: ymwdl + dy.

constexpr year_month_weekday_last
operator-(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
7   Returns: ymwdl + (-dy).

```

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);
8   Returns: os << ymwdl.year() << '/' << ymwdl.month() << '/' << ymwdl.weekday_last().

```

26.8.18 Conventional syntax operators

[time.cal.operators]

- 1 A set of overloaded `operator/` functions provides a conventional syntax for the creation of civil calendar dates.
- 2 [Note: The year, month, and day are accepted in any of the following 3 orders:

```

year/month/day
month/day/year
day/month/year

```

Anywhere a `day` is required, any of the following can also be specified:

```

last
weekday[i]
weekday[last]

```

— end note]

- 3 [Note: Partial-date types such as `year_month` and `month_day` can be created by not applying the second division operator for any of the three orders. For example:

```

year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;

```

— end note]

- 4 [Example:

```

auto a = 2015/4/4;           // a == int(125)
auto b = 2015y/4/4;          // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;    // error: no viable operator/ for first /
auto d = 2015/April/4;      // error: no viable operator/ for first /

```

— end example]

```

constexpr year_month
operator/(const year& y, const month& m) noexcept;

```

- 5 Returns: {y, m}.

```

constexpr year_month
operator/(const year& y, int m) noexcept;

```

- 6 Returns: y / month(m).

```

constexpr month_day
operator/(const month& m, const day& d) noexcept;

```

- 7 Returns: {m, d}.

```

constexpr month_day
operator/(const month& m, int d) noexcept;

```

- 8 Returns: m / day(d).

```

constexpr month_day
operator/(int m, const day& d) noexcept;

```

- 9 Returns: month(m) / d.

```

constexpr month_day
operator/(const day& d, const month& m) noexcept;

```

- 10 Returns: m / d.

```

constexpr month_day
operator/(const day& d, int m) noexcept;
11   Returns: month(m) / d.

constexpr month_day_last
operator/(const month& m, last_spec) noexcept;
12   Returns: month_day_last{m}.

constexpr month_day_last
operator/(int m, last_spec) noexcept;
13   Returns: month(m) / last.

constexpr month_day_last
operator/(last_spec, const month& m) noexcept;
14   Returns: m / last.

constexpr month_day_last
operator/(last_spec, int m) noexcept;
15   Returns: month(m) / last.

constexpr month_weekday
operator/(const month& m, const weekday_indexed& wdi) noexcept;
16   Returns: {m, wdi}.

constexpr month_weekday
operator/(int m, const weekday_indexed& wdi) noexcept;
17   Returns: month(m) / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, const month& m) noexcept;
18   Returns: m / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, int m) noexcept;
19   Returns: month(m) / wdi.

constexpr month_weekday_last
operator/(const month& m, const weekday_last& wdl) noexcept;
20   Returns: {m, wdl}.

constexpr month_weekday_last
operator/(int m, const weekday_last& wdl) noexcept;
21   Returns: month(m) / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, const month& m) noexcept;
22   Returns: m / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;
23   Returns: month(m) / wdl.

constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;
24   Returns: {ym.year(), ym.month(), d}.

constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;
25   Returns: ym / day(d).

```

```

constexpr year_month_day
operator/(const year& y, const month_day& md) noexcept;
26   Returns: y / md.month() / md.day().

constexpr year_month_day
operator/(int y, const month_day& md) noexcept;
27   Returns: year(y) / md.

constexpr year_month_day
operator/(const month_day& md, const year& y) noexcept;
28   Returns: y / md.

constexpr year_month_day
operator/(const month_day& md, int y) noexcept;
29   Returns: year(y) / md.

constexpr year_month_day_last
operator/(const year_month& ym, last_spec) noexcept;
30   Returns: {ym.year(), month_day_last{ym.month()}};

constexpr year_month_day_last
operator/(const year& y, const month_day_last& mdl) noexcept;
31   Returns: {y, mdl}.

constexpr year_month_day_last
operator/(int y, const month_day_last& mdl) noexcept;
32   Returns: year(y) / mdl.

constexpr year_month_day_last
operator/(const month_day_last& mdl, const year& y) noexcept;
33   Returns: y / mdl.

constexpr year_month_day_last
operator/(const month_day_last& mdl, int y) noexcept;
34   Returns: year(y) / mdl.

constexpr year_month_weekday
operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
35   Returns: {ym.year(), ym.month(), wdi}.

constexpr year_month_weekday
operator/(const year& y, const month_weekday& mwd) noexcept;
36   Returns: {y, mwd.month(), mwd.weekday_indexed()}.

constexpr year_month_weekday
operator/(int y, const month_weekday& mwd) noexcept;
37   Returns: year(y) / mwd.

constexpr year_month_weekday
operator/(const month_weekday& mwd, const year& y) noexcept;
38   Returns: y / mwd.

constexpr year_month_weekday
operator/(const month_weekday& mwd, int y) noexcept;
39   Returns: year(y) / mwd.

constexpr year_month_weekday_last
operator/(const year_month& ym, const weekday_last& wdl) noexcept;
40   Returns: {ym.year(), ym.month(), wdl}.

```

```

constexpr year_month_weekday_last
operator/(const year& y, const month_weekday_last& mwdl) noexcept;
41   Returns: {y, mwdl.month(), mwdl.weekday_last()}.

constexpr year_month_weekday_last
operator/(int y, const month_weekday_last& mwdl) noexcept;
42   Returns: year(y) / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, const year& y) noexcept;
43   Returns: y / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, int y) noexcept;
44   Returns: year(y) / mwdl.

```

26.9 Class template `time_of_day`

[time.tod]

26.9.1 Overview

[time.tod.overview]

```

namespace std::chrono {
    template<class Duration> class time_of_day;

    template<> class time_of_day<hours>;
    template<> class time_of_day<minutes>;
    template<> class time_of_day<seconds>;
    template<class Rep, class Period> class time_of_day<duration<Rep, Period>>;
}

```

- ¹ The `time_of_day` class template splits a duration representing the time elapsed since midnight into a “broken down” time of day such as *hours:minutes:seconds*. The `Duration` template parameter dictates the precision to which the time is broken down. [Note: This can vary from a coarse precision of hours to a very fine precision of nanoseconds. — *end note*] A `time_of_day` object also tracks whether it should be output as a 12-hour time format or a 24-hour time format.
- ² The primary `time_of_day` template is not defined. Four specializations are provided to handle four different levels of precision.
- ³ Each specialization of `time_of_day` is a trivially copyable and standard-layout class type.

26.9.2 Hours precision

[time.tod.hours]

```

namespace std::chrono {
    template<>
    class time_of_day<hours> {
        public:
            using precision = chrono::hours;

            time_of_day() = default;
            constexpr explicit time_of_day(chrono::hours since_midnight) noexcept;

            constexpr chrono::hours hours() const noexcept;

            constexpr explicit operator precision() const noexcept;
            constexpr precision to_duration() const noexcept;

            constexpr void make24() noexcept;
            constexpr void make12() noexcept;
    };
}

```

- ¹ [Note: This specialization handles hours since midnight. — *end note*]

```
constexpr explicit time_of_day(chrono::hours since_midnight) noexcept;
```

- ² *Effects:* Constructs an object of type `time_of_day` in 24-hour format corresponding to `since_midnight` hours after 00:00:00.

3 *Ensures:* `hours()` returns the integral number of hours `since_midnight` is after 00:00:00.

```
constexpr chrono::hours hours() const noexcept;
```

4 *Returns:* The stored hour of `*this`.

```
constexpr explicit operator precision() const noexcept;
```

5 *Returns:* The number of hours since midnight.

```
constexpr precision to_duration() const noexcept;
```

6 *Returns:* `precision{*this}`.

```
constexpr void make24() noexcept;
```

7 *Effects:* If `*this` is a 12-hour time, converts to a 24-hour time. Otherwise, no effects.

```
constexpr void make12() noexcept;
```

8 *Effects:* If `*this` is a 24-hour time, converts to a 12-hour time. Otherwise, no effects.

26.9.3 Minutes precision

[time.tod.minutes]

```
namespace std::chrono {
    template<>
    class time_of_day<minutes> {
        public:
            using precision = chrono::minutes;

            time_of_day() = default;
            constexpr explicit time_of_day(chrono::minutes since_midnight) noexcept;

            constexpr chrono::hours    hours()    const noexcept;
            constexpr chrono::minutes minutes() const noexcept;

            constexpr explicit operator precision()    const noexcept;
            constexpr      precision to_duration() const noexcept;

            constexpr void make24() noexcept;
            constexpr void make12() noexcept;
    };
}
```

1 [Note: This specialization handles hours and minutes since midnight. — *end note*]

```
constexpr explicit time_of_day(minutes since_midnight) noexcept;
```

2 *Effects:* Constructs an object of type `time_of_day` in 24-hour format corresponding to `since_midnight` minutes after 00:00:00.

3 *Ensures:* `hours()` returns the integral number of hours `since_midnight` is after 00:00:00. `minutes()` returns the integral number of minutes `since_midnight` is after (00:00:00 + `hours()`).

```
constexpr chrono::hours hours() const noexcept;
```

4 *Returns:* The stored hour of `*this`.

```
constexpr chrono::minutes minutes() const noexcept;
```

5 *Returns:* The stored minute of `*this`.

```
constexpr explicit operator precision() const noexcept;
```

6 *Returns:* The number of minutes since midnight.

```
constexpr precision to_duration() const noexcept;
```

7 *Returns:* `precision{*this}`.

```
constexpr void make24() noexcept;
```

8 *Effects:* If `*this` is a 12-hour time, converts to a 24-hour time. Otherwise, no effects.

```
constexpr void make12() noexcept;
```

9 *Effects:* If *this is a 24-hour time, converts to a 12-hour time. Otherwise, no effects.

26.9.4 Seconds precision

[time.tod.seconds]

```
namespace std::chrono {
    template<>
    class time_of_day<seconds> {
        public:
            using precision = chrono::seconds;

            time_of_day() = default;
            constexpr explicit time_of_day(chrono::seconds since_midnight) noexcept;

            constexpr chrono::hours hours() const noexcept;
            constexpr chrono::minutes minutes() const noexcept;
            constexpr chrono::seconds seconds() const noexcept;

            constexpr explicit operator precision() const noexcept;
            constexpr      precision to_duration() const noexcept;

            constexpr void make24() noexcept;
            constexpr void make12() noexcept;
    };
}
```

1 [Note: This specialization handles hours, minutes, and seconds since midnight. —end note]

```
constexpr explicit time_of_day(seconds since_midnight) noexcept;
```

2 *Effects:* Constructs an object of type time_of_day in 24-hour format corresponding to since_midnight seconds after 00:00:00.

3 *Ensures:* hours() returns the integral number of hours since_midnight is after 00:00:00. minutes() returns the integral number of minutes since_midnight is after (00:00:00 + hours()). seconds() returns the integral number of seconds since_midnight is after (00:00:00 + hours() + minutes()).

```
constexpr chrono::hours hours() const noexcept;
```

4 *Returns:* The stored hour of *this.

```
constexpr chrono::minutes minutes() const noexcept;
```

5 *Returns:* The stored minute of *this.

```
constexpr chrono::seconds seconds() const noexcept;
```

6 *Returns:* The stored second of *this.

```
constexpr explicit operator precision() const noexcept;
```

7 *Returns:* The number of seconds since midnight.

```
constexpr precision to_duration() const noexcept;
```

8 *Returns:* precision{*this}.

```
constexpr void make24() noexcept;
```

9 *Effects:* If *this is a 12-hour time, converts to a 24-hour time. Otherwise, no effects.

```
constexpr void make12() noexcept;
```

10 *Effects:* If *this is a 24-hour time, converts to a 12-hour time. Otherwise, no effects.

26.9.5 Sub-second precision

[time.tod.subsecond]

```
namespace std::chrono {
    template<class Rep, class Period>
    class time_of_day<duration<Rep, Period>> {
        public:
```

```

    using precision = duration<Rep, Period>;

    time_of_day() = default;
    constexpr explicit time_of_day(precision since_midnight) noexcept;

    constexpr chrono::hours hours() const noexcept;
    constexpr chrono::minutes minutes() const noexcept;
    constexpr chrono::seconds seconds() const noexcept;
    constexpr precision subseconds() const noexcept;

    constexpr explicit operator precision() const noexcept;
    constexpr precision to_duration() const noexcept;

    constexpr void make24() noexcept;
    constexpr void make12() noexcept;
};

}

```

- ¹ This specialization shall not exist unless `treat_as_floating_point_v<Rep>` is `false` and `duration<Rep, Period>` is not convertible to `seconds`. [Note: This specialization handles hours, minutes, seconds, and fractional seconds since midnight. Typical uses are with `milliseconds`, `microseconds` and `nanoseconds`. — end note]

`constexpr explicit time_of_day(precision since_midnight) noexcept;`

- ² *Effects:* Constructs an object of type `time_of_day` in 24-hour format corresponding to `since_midnight` fractional seconds after 00:00:00.

- ³ *Ensures:* `hours()` returns the integral number of hours `since_midnight` is after 00:00:00. `minutes()` returns the integral number of minutes `since_midnight` is after (00:00:00 + `hours()`). `seconds()` returns the integral number of seconds `since_midnight` is after (00:00:00 + `hours()` + `minutes()`). `subseconds()` returns the integral number of fractional seconds `since_midnight` is after (00:00:00 + `hours()` + `minutes()` + `seconds()`).

`constexpr chrono::hours hours() const noexcept;`

- ⁴ *Returns:* The stored hour of `*this`.

`constexpr chrono::minutes minutes() const noexcept;`

- ⁵ *Returns:* The stored minute of `*this`.

`constexpr chrono::seconds seconds() const noexcept;`

- ⁶ *Returns:* The stored second of `*this`.

`constexpr duration<Rep, Period> subseconds() const noexcept;`

- ⁷ *Returns:* The stored subsecond of `*this`.

`constexpr explicit operator precision() const noexcept;`

- ⁸ *Returns:* The number of subseconds since midnight.

`constexpr precision to_duration() const noexcept;`

- ⁹ *Returns:* `precision{*this}`.

`constexpr void make24() noexcept;`

- ¹⁰ *Effects:* If `*this` is a 12-hour time, converts to a 24-hour time. Otherwise, no effects.

`constexpr void make12() noexcept;`

- ¹¹ *Effects:* If `*this` is a 24-hour time, converts to a 12-hour time. Otherwise, no effects.

26.9.6 Formatted output

[time.tod.io]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const time_of_day<hours>& t);
```

1 *Effects:* If *t* is a 24-hour time, outputs to *os* according to the format "%H00" (26.11). Otherwise outputs to *os* according to the format "%I%p" (26.11).

2 *Returns:* *os*.

3 *[Example:*

```
for (hours h : {1h, 18h}) {
    time_of_day<hours> tod(h);
    os << tod << '\n';
    tod.make12();
    os << tod << '\n';
}
```

Produces the output:

```
0100
1am
1800
6pm
```

— end example]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const time_of_day<minutes>& t);
```

4 *Effects:* If *t* is a 24-hour time, outputs to *os* according to the format "%H:%M" (26.11). Otherwise outputs to *os* according to the format "%I:%M%p" (26.11).

5 *Returns:* *os*.

6 *[Example:*

```
for (minutes m : {68min, 1095min}) {
    time_of_day<minutes> tod(m);
    os << tod << '\n';
    tod.make12();
    os << tod << '\n';
}
```

Produces the output:

```
01:08
1:08am
18:15
6:15pm
```

— end example]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const time_of_day<seconds>& t);
```

6 *Effects:* If *t* is a 24-hour time, outputs to *os* according to the format "%T" (26.11). Otherwise outputs to *os* according to the format "%I:%M:%S%p" (26.11).

7 *Returns:* *os*.

8 *[Example:*

```
for (seconds s : {4083s, 65745s}) {
    time_of_day<seconds> tod(s);
    os << tod << '\n';
    tod.make12();
    os << tod << '\n';
}
```

Produces the output:

```
01:08:03
1:08:03am
```

18:15:45
6:15:45pm

— end example]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const time_of_day<duration<Rep, Period>>& t);
```

8 *Effects:* If *t* is a 24-hour time, outputs to *os* according to the format "%T" (26.11). Otherwise outputs to *os* according to the format "%I:%M:%S%p" (26.11).

9 *Returns:* *os*.

[*Example:*

```
for (milliseconds ms : {4083007ms, 65745123ms}) {
    time_of_day<seconds> tod(ms);
    os << tod << '\n';
    tod.make12();
    os << tod << '\n';
}
```

Produces the output:

```
01:08:03.007
1:08:03.007am
18:15:45.123
6:15:45.123pm
```

— end example]

26.10 Time zones

[time.zone]

26.10.1 In general

[time.zone.general]

1 26.10 describes an interface for accessing the IANA Time Zone database described in RFC 6557, that interoperates with *sys_time* and *local_time*. This interface provides time zone support to both the civil calendar types (26.8) and to user-defined calendars.

26.10.2 Time zone database

[time.zone.db]

26.10.2.1 Class tzdb

[time.zone.db.tzdb]

```
namespace std::chrono {
    struct tzdb {
        string          version;
        vector<time_zone> zones;
        vector<link>      links;
        vector<leap>      leaps;

        const time_zone* locate_zone(string_view tz_name) const;
        const time_zone* current_zone() const;
    };
}
```

1 Each *vector* in a *tzdb* object is sorted to enable fast lookup.

```
const time_zone* locate_zone(string_view tz_name) const;
```

2 *Returns:* If a *time_zone* is found for which *name()* == *tz_name*, returns a pointer to that *time_zone*. Otherwise if a *link* is found for which *tz_name* == *link.name()*, then a pointer is returned to the *time_zone* for which *zone.name()* == *link.target()*. [Note: A *link* specifies an alternative name for a *time_zone*. — end note]

Throws: If a *const time_zone** cannot be found as described in the *Returns:* clause, throws a *runtime_error*. [Note: On non-exceptional return, the return value is always a pointer to a valid *time_zone*. — end note]

```
const time_zone* current_zone() const;
```

3 *Returns:* A pointer to the time zone which the computer has set as its local time zone.

26.10.2.2 Class `tzdb_list`[`time.zone.db.list`]

```
namespace std::chrono {
    class tzdb_list {
        public:
            tzdb_list(const tzdb_list&) = delete;
            tzdb_list& operator=(const tzdb_list&) = delete;

            // unspecified additional constructors

            class const_iterator;

            const tzdb& front() const noexcept;

            const_iterator erase_after(const_iterator p);

            const_iterator begin() const noexcept;
            const_iterator end() const noexcept;

            const_iterator cbegin() const noexcept;
            const_iterator cend() const noexcept;
    };
}
```

¹ The `tzdb_list` database is a singleton; the unique object of type `tzdb_list` can be accessed via the `get_tzdb_list()` function. [Note: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the `front()` of this list via the read-only namespace scope functions `get_tzdb()`, `locate_zone()`, and `current_zone()`. —end note] The `tzdb_list` object contains a list of `tzdb` objects.

² `tzdb_list::const_iterator` is a constant iterator which meets the *Cpp17ForwardIterator* requirements and has a value type of `tzdb`.

`const tzdb& front() const noexcept;`

³ *Returns:* A reference to the first `tzdb` in the container.

⁴ *Remarks:* This operation is thread-safe with respect to `reload_tzdb()`. [Note: `reload_tzdb()` pushes a new `tzdb` onto the front of this container. —end note]

`const_iterator erase_after(const_iterator p);`

⁵ *Requires:* The iterator following `p` is dereferenceable.

⁶ *Effects:* Erases the `tzdb` referred to by the iterator following `p`.

⁷ *Returns:* An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

⁸ *Remarks:* No pointers, references, or iterators are invalidated except those referring to the erased `tzdb`. [Note: It is not possible to erase the `tzdb` referred to by `begin()`. —end note]

⁹ *Throws:* Nothing.

`const_iterator begin() const noexcept;`

¹⁰ *Returns:* An iterator referring to the first `tzdb` in the container.

`const_iterator end() const noexcept;`

¹¹ *Returns:* An iterator referring to the position one past the last `tzdb` in the container.

`const_iterator cbegin() const noexcept;`

¹² *Returns:* `begin()`.

`const_iterator cend() const noexcept;`

¹³ *Returns:* `end()`.

26.10.2.3 Time zone database access

[time.zone.db.access]

```
tzdb_list& get_tzdb_list();
```

1 Effects: If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a `tzdb_list` holding a single initialized `tzdb`.

2 Returns: A reference to the database.

3 Remarks: It is safe to call this function from multiple threads at one time.

4 Throws: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb_list` containing one or more valid `tzdb`s.

```
const tzdb& get_tzdb();
```

5 Returns: `get_tzdb_list().front()`.

```
const time_zone* locate_zone(string_view tz_name);
```

6 Returns: `get_tzdb().locate_zone(tz_name)`.

7 [Note: The time zone database will be initialized if this is the first reference to the database. — end note]

```
const time_zone* current_zone();
```

8 Returns: `get_tzdb().current_zone()`.

26.10.2.4 Remote time zone database support

[time.zone.db.remote]

1 The local time zone database is that supplied by the implementation when the program first accesses the database, for example via `current_zone()`. While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the *remote time zone database*.

```
const tzdb& reload_tzdb();
```

2 Effects: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the `tzdb_list` accessed by `get_tzdb_list()`.

3 Returns: `get_tzdb_list().front()`.

4 Remarks: No pointers, references, or iterators are invalidated.

5 Remarks: This function is thread-safe with respect to `get_tzdb_list().front()` and `get_tzdb_list().erase_after()`.

6 Throws: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb`.

```
string remote_version();
```

7 Returns: The latest remote database version.

[*Note:* This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent. — end note]

26.10.3 Exception classes

[time.zone.exception]

26.10.3.1 Class nonexistent_local_time

[time.zone.exception.nonexist]

```
namespace std::chrono {
    class nonexistent_local_time : public runtime_error {
        public:
            template<class Duration>
            nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}
```

1 `nonexistent_local_time` is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```

template<class Duration>
nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
2   Requires: i.result == local_info::nonexistent.
3   Effects: Constructs a nonexistent_local_time by initializing the base class with a sequence of char
equivalent to that produced by os.str() initialized as shown below:

```

```

ostringstream os;
os << tp << " is in a gap between\n"
<< local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ', '
<< i.first.abbrev << " and\n"
<< local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ', '
<< i.second.abbrev
<< " which are both equivalent to\n"
<< i.first.end << " UTC";

```

4 [Example:

```

#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
                             local_days{Sunday[2]/March/2016} + 2h + 30min};
    } catch (const nonexistent_local_time& e) {
        std::cout << e.what() << '\n';
    }
}

```

Produces the output:

```

2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC

```

— end example]

26.10.3.2 Class ambiguous_local_time

[time.zone.exception.ambig]

```

namespace std::chrono {
    class ambiguous_local_time : public runtime_error {
public:
    template<class Duration>
    ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}

```

¹ ambiguous_local_time is thrown when an attempt is made to convert an ambiguous local_time to a sys_time without specifying choose::earliest or choose::latest.

```

template<class Duration>
ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
2   Requires: i.result == local_info::ambiguous.
3   Effects: Constructs an ambiguous_local_time by initializing the base class with a sequence of char
equivalent to that produced by os.str() initialized as shown below:

```

```

ostringstream os;
os << tp << " is ambiguous. It could be\n"
<< tp << ' ' << i.first.abbrev << " == "
<< tp - i.first.offset << " UTC or\n"
<< tp << ' ' << i.second.abbrev << " == "
<< tp - i.second.offset << " UTC";

```

4 [Example:

```
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
            local_days{Sunday[1]/November/2016} + 1h + 30min};
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << '\n';
    }
}
```

Produces the output:

```
2016-11-06 01:30:00 is ambiguous. It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC
```

— end example]

26.10.4 Information classes

[time.zone.info]

26.10.4.1 Class sys_info

[time.zone.info.sys]

```
namespace std::chrono {
    struct sys_info {
        sys_seconds begin;
        sys_seconds end;
        seconds offset;
        minutes save;
        string abbrev;
    };
}
```

¹ A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.

² [Note: This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly. — end note]

³ The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range [`begin`, `end`). This information can be used to efficiently iterate the transitions of a `time_zone`.

⁴ The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:

```
offset = local_time - sys_time
```

⁵ The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0min`, this `sys_info` is said to be on “daylight saving” time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range [`begin`, `end`) (if `save != 0min` for this `sys_info`).

⁶ The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

⁷ Effects: Streams out the `sys_info` object `r` in an unspecified format.

26.10.4.2 Class local_info

[time.zone.info.local]

```
namespace std::chrono {
    struct local_info {
        static constexpr int unique      = 0;
        static constexpr int nonexistent = 1;
        static constexpr int ambiguous   = 2;

        int result;
        sys_info first;
        sys_info second;
    };
}
```

¹ [Note: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly. —end note]

² Describes the result of converting a `local_time` to a `sys_time` as follows:

- (2.1) — When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.
- (2.2) — If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.
- (2.3) — If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

³ Streams out the `local_info` object `r` in an unspecified format.

26.10.5 Class time_zone

[time.zone.timezone]

26.10.5.1 Overview

[time.zone.overview]

```
namespace std::chrono {
    class time_zone {
        public:
            time_zone(time_zone&&) = default;
            time_zone& operator=(time_zone&&) = default;

            // unspecified additional constructors

            string_view name() const noexcept;

            template<class Duration> sys_info get_info(const sys_time<Duration>& st) const;
            template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

            template<class Duration>
            sys_time<common_type_t<Duration, seconds>>
            to_sys(const local_time<Duration>& tp) const;

            template<class Duration>
            sys_time<common_type_t<Duration, seconds>>
            to_sys(const local_time<Duration>& tp, choose z) const;

            template<class Duration>
            local_time<common_type_t<Duration, seconds>>
            to_local(const sys_time<Duration>& tp) const;
    };
}
```

¹ A `time_zone` represents all time zone transitions for a specific geographic area. `time_zone` construction is unspecified, and performed as part of database initialization. [Note: `const time_zone` objects can be accessed via functions such as `locate_zone`. — end note]

26.10.5.2 Member functions

[`time.zone.members`]

```
string_view name() const noexcept;
1   Returns: The name of the time_zone.
2   [Example: "America/New_York". — end example]

template<class Duration>
sys_info get_info(const sys_time<Duration>& st) const;
3   Returns: A sys_info i for which st is in the range [i.begin, i.end].

template<class Duration>
local_info get_info(const local_time<Duration>& tp) const;
4   Returns: A local_info for tp.

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
to_sys(const local_time<Duration>& tp) const;
5   Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has finer precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone.
6   Throws: If the conversion from tp to a sys_time is ambiguous, throws ambiguous_local_time. If the tp represents a non-existent time between two UTC time_points, throws nonexistent_local_time.

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
to_sys(const local_time<Duration>& tp, choose z) const;
7   Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has finer precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone. If the conversion from tp to a sys_time is ambiguous, returns the earlier sys_time if z == choose::earliest, and returns the later sys_time if z == choose::latest. If the tp represents a non-existent time between two UTC time_points, then the two UTC time_points will be the same, and that UTC time_point will be returned.

template<class Duration>
local_time<common_type_t<Duration, seconds>>
to_local(const sys_time<Duration>& tp) const;
8   Returns: The local_time associated with tp and this time_zone.
```

26.10.5.3 Non-member functions

[`time.zone.nonmembers`]

```
bool operator==(const time_zone& x, const time_zone& y) noexcept;
1   Returns: x.name() == y.name().
bool operator<(const time_zone& x, const time_zone& y) noexcept;
2   Returns: x.name() < y.name().
```

26.10.6 Class template `zoned_traits`

[`time.zone.zonedtraits`]

```
namespace std::chrono {
    template<class T> struct zoned_traits {};
}
```

¹ `zoned_traits` provides a means for customizing the behavior of `zoned_time<Duration, TimeZonePtr>` for the `zoned_time` default constructor, and constructors taking `string_view`. A specialization for `const time_zone*` is provided by the implementation:

```
namespace std::chrono {
    template<> struct zoned_traits<const time_zone*> {
        static const time_zone* default_zone();
    };
}
```

```

        static const time_zone* locate_zone(string_view name);
    };
}

static const time_zone* default_zone();
2     Returns: std::chrono::locate_zone("UTC").

static const time_zone* locate_zone(string_view name);
3     Returns: std::chrono::locate_zone(name).

```

26.10.7 Class template zoned_time

[time.zone.zonedtime]

26.10.7.1 Overview

[time.zone.zonedtime.overview]

```

namespace std::chrono {
    template<class Duration, class TimeZonePtr = const time_zone*>
    class zoned_time {
    public:
        using duration = common_type_t<Duration, seconds>;
        private:
            TimeZonePtr          zone_;           // exposition only
            sys_time<duration> tp_;             // exposition only
            using traits = zoned_traits<TimeZonePtr>; // exposition only
        public:
            zoned_time();
            zoned_time(const zoned_time&) = default;
            zoned_time& operator=(const zoned_time&) = default;

            zoned_time(const sys_time<Duration>& st);
            explicit zoned_time(TimeZonePtr z);
            explicit zoned_time(string_view name);

            template<class Duration2>
            zoned_time(const zoned_time<Duration2, TimeZonePtr>& zt) noexcept;

            zoned_time(TimeZonePtr z,      const sys_time<Duration>& st);
            zoned_time(string_view name, const sys_time<Duration>& st);

            zoned_time(TimeZonePtr z,      const local_time<Duration>& tp);

template<class Duration>
zoned_time(string_view, local_time<Duration>, choose = choose::earliest)
-> zoned_time<common_type_t<Duration, seconds>>;

template<class Duration, class TimeZonePtr, class TimeZonePtr2>
zoned_time(TimeZonePtr, zoned_time<Duration, TimeZonePtr2>, choose = choose::earliest)
-> zoned_time<Duration, TimeZonePtr>;
}

```

¹ `zoned_time` represents a logical pairing of a `time_zone` and a `time_point` with precision `Duration`. `zoned_time<Duration>` maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

² If `Duration` is not a specialization of `chrono::duration`, the program is ill-formed.

26.10.7.2 Constructors

[[time.zone.zonedtime.ctor](#)]

`zoned_time();`

¹ *Remarks:* This constructor does not participate in overload resolution unless `traits::default_zone()` is a well-formed expression.

² *Effects:* Constructs a `zoned_time` by initializing `zone_` with `traits::default_zone()` and default constructing `tp_`.

`zoned_time(const sys_time<Duration>& st);`

³ *Remarks:* This constructor does not participate in overload resolution unless `traits::default_zone()` is a well-formed expression.

⁴ *Effects:* Constructs a `zoned_time` by initializing `zone_` with `traits::default_zone()` and `tp_` with `st`.

`explicit zoned_time(TimeZonePtr z);`

⁵ *Requires:* `z` refers to a time zone.

⁶ *Effects:* Constructs a `zoned_time` by initializing `zone_` with `std::move(z)`.

`explicit zoned_time(string_view name);`

⁷ *Remarks:* This constructor does not participate in overload resolution unless `traits::locate_zone(string_view{})` is a well-formed expression and `zoned_time` is constructible from the return type of `traits::locate_zone(string_view{})`.

8 *Effects:* Constructs a `zoned_time` by initializing `zone_` with `traits::locate_zone(name)` and default
constructing `tp_`.

```
template<class Duration2>
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y) noexcept;
```

9 *Remarks:* Does not participate in overload resolution unless `sys_time<Duration2>` is implicitly con-
vertible to `sys_time<Duration>`.

10 *Effects:* Constructs a `zoned_time` by initializing `zone_` with `y.zone_` and `tp_` with `y.tp_`.

```
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
```

11 *Requires:* `z` refers to a time zone.

12 *Effects:* Constructs a `zoned_time` by initializing `zone_` with `std::move(z)` and `tp_` with `st`.

```
zoned_time(string_view name, const sys_time<Duration>& st);
```

13 *Remarks:* This constructor does not participate in overload resolution unless `zoned_time` is constructible
from the return type of `traits::locate_zone(name)` and `st`.

14 *Effects:* Equivalent to construction with `{traits::locate_zone(name), st}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
```

15 *Requires:* `z` refers to a time zone.

16 *Remarks:* This constructor does not participate in overload resolution unless
`decltype(declval<TimeZonePtr&>()>to_sys(local_time<Duration>{}))`
is convertible to `sys_time<duration>`.

17 *Effects:* Constructs a `zoned_time` by initializing `zone_` with `std::move(z)` and `tp_` with `zone_->to_-`
`sys(tp)`.

```
zoned_time(string_view name, const local_time<Duration>& tp);
```

18 *Remarks:* This constructor does not participate in overload resolution unless `zoned_time` is constructible
from the return type of `traits::locate_zone(name)` and `tp`.

19 *Effects:* Equivalent to construction with `{traits::locate_zone(name), tp}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

20 *Requires:* `z` refers to a time zone.

21 *Remarks:* This constructor does not participate in overload resolution unless
`decltype(declval<TimeZonePtr&>()>to_sys(local_time<Duration>{}, choose::earliest))`
is convertible to `sys_time<duration>`.

22 *Effects:* Constructs a `zoned_time` by initializing `zone_` with `std::move(z)` and `tp_` with `zone_->to_-`
`sys(tp, c)`.

```
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

23 *Remarks:* This constructor does not participate in overload resolution unless `zoned_time` is constructible
from the return type of `traits::locate_zone(name)`, `local_time<Duration>`, and `choose`.

24 *Effects:* Equivalent to construction with `{traits::locate_zone(name), tp, c}`.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

25 *Remarks:* Does not participate in overload resolution unless `sys_time<Duration2>` is implicitly con-
vertible to `sys_time<Duration>`.

26 *Requires:* `z` refers to a valid time zone.

27 *Effects:* Constructs a `zoned_time` by initializing `zone_` with `std::move(z)` and `tp_` with `y.tp_`.

```
template<class Duration2, class TimeZonePtr2>
```

```

zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
28   Remarks: Does not participate in overload resolution unless sys_time<Duration2> is implicitly convertible to sys_time<Duration>.
29   Requires: z refers to a valid time zone.
30   Effects: Equivalent to construction with {z, y}.
31   [Note: The choose parameter has no effect. —end note]

zoned_time(string_view name, const zoned_time<Duration>& y);
32   Remarks: This constructor does not participate in overload resolution unless zoned_time is constructible from the return type of traits::locate_zone(name) and zoned_time.
33   Effects: Equivalent to construction with {traits::locate_zone(name), y}.

zoned_time(string_view name, const zoned_time<Duration>& y, choose c);
34   Remarks: This constructor does not participate in overload resolution unless zoned_time is constructible from the return type of traits::locate_zone(name), zoned_time, and choose.
35   Effects: Equivalent to construction with {traits::locate_zone(name), y, c}.
36   [Note: The choose parameter has no effect. —end note]

```

26.10.7.3 Member functions

[time.zone.zonedtime.members]

```

zoned_time& operator=(const sys_time<Duration>& st);
1   Effects: After assignment, get_sys_time() == st. This assignment has no effect on the return value of get_time_zone().
2   Returns: *this.

zoned_time& operator=(const local_time<Duration>& lt);
3   Effects: After assignment, get_local_time() == lt. This assignment has no effect on the return value of get_time_zone().
4   Returns: *this.

operator sys_time<duration>() const;
5   Returns: get_sys_time().

explicit operator local_time<duration>() const;
6   Returns: get_local_time().

TimeZonePtr get_time_zone() const;
7   Returns: zone_.

local_time<duration> get_local_time() const;
8   Returns: zone_->to_local(tp_).

sys_time<duration> get_sys_time() const;
9   Returns: tp_.

sys_info get_info() const;
10  Returns: zone_->get_info(tp_).

```

26.10.7.4 Non-member functions

[time.zone.zonedtime.nonmembers]

```

template<class Duration1, class Duration2, class TimeZonePtr>
bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
                  const zoned_time<Duration2, TimeZonePtr>& y);

1   Returns: x.zone_ == y.zone_ && x.tp_ == y.tp_.

```

```

template<class Duration1, class Duration2, class TimeZonePtr>
bool operator!=(const zoned_time<Duration1, TimeZonePtr>& x,
                  const zoned_time<Duration2, TimeZonePtr>& y);
2   Returns: !(x == y).

template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
            const zoned_time<Duration, TimeZonePtr>& t);

3   Effects: Streams the value returned from t.get_local_time() to os using the format "%F %T %Z".
4   Returns: os.

template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt,
           const zoned_time<Duration, TimeZonePtr>& tp);

5   Effects: First obtains a sys_info via tp.get_info() which for exposition purposes will be referred to
as info. Then calls to_stream(os, fmt, tp.get_local_time(), &info.abbrev, &info.offset).
6   Returns: os.

```

26.10.8 Class leap

[time.zone.leap]

26.10.8.1 Overview

[time.zone.leap.overview]

```

namespace std::chrono {
    class leap {
        public:
            leap(const leap&) = default;
            leap& operator=(const leap&) = default;

            // unspecified additional constructors

            constexpr sys_seconds date() const noexcept;
    };
}

```

¹ Objects of type leap representing the date of the leap second insertions are constructed and stored in the time zone database when initialized.

² [Example:

```

for (auto& l : get_tzdb().leaps)
    if (l <= 2018y/March/17d)
        cout << l.date() << '\n';

```

Produces the output:

```

1972-07-01 00:00:00
1973-01-01 00:00:00
1974-01-01 00:00:00
1975-01-01 00:00:00
1976-01-01 00:00:00
1977-01-01 00:00:00
1978-01-01 00:00:00
1979-01-01 00:00:00
1980-01-01 00:00:00
1981-07-01 00:00:00
1982-07-01 00:00:00
1983-07-01 00:00:00
1985-07-01 00:00:00
1988-01-01 00:00:00
1990-01-01 00:00:00
1991-01-01 00:00:00
1992-07-01 00:00:00
1993-07-01 00:00:00
1994-07-01 00:00:00

```

```
1996-01-01 00:00:00
1997-07-01 00:00:00
1999-01-01 00:00:00
2006-01-01 00:00:00
2009-01-01 00:00:00
2012-07-01 00:00:00
2015-07-01 00:00:00
2017-01-01 00:00:00
```

— end example]

26.10.8.2 Member functions

[time.zone.leap.members]

```
constexpr sys_seconds date() const noexcept;
```

1 *Returns:* The date and time at which the leap second was inserted.

26.10.8.3 Non-member functions

[time.zone.leap.nonmembers]

```
constexpr bool operator==(const leap& x, const leap& y) noexcept;
```

1 *Returns:* `x.date() == y.date()`.

```
constexpr bool operator<(const leap& x, const leap& y) noexcept;
```

2 *Returns:* `x.date() < y.date()`.

```
template<class Duration>
```

```
constexpr bool operator==(const leap& x, const sys_time<Duration>& y) noexcept;
```

3 *Returns:* `x.date() == y`.

```
template<class Duration>
```

```
constexpr bool operator==(const sys_time<Duration>& x, const leap& y) noexcept;
```

4 *Returns:* `y == x`.

```
template<class Duration>
```

```
constexpr bool operator!=(const leap& x, const sys_time<Duration>& y) noexcept;
```

5 *Returns:* `!(x == y)`.

```
template<class Duration>
```

```
constexpr bool operator!=(const sys_time<Duration>& x, const leap& y) noexcept;
```

6 *Returns:* `!(x == y)`.

```
template<class Duration>
```

```
constexpr bool operator<(const leap& x, const sys_time<Duration>& y) noexcept;
```

7 *Returns:* `x.date() < y`.

```
template<class Duration>
```

```
constexpr bool operator<(const sys_time<Duration>& x, const leap& y) noexcept;
```

8 *Returns:* `x < y.date()`.

```
template<class Duration>
```

```
constexpr bool operator>(const leap& x, const sys_time<Duration>& y) noexcept;
```

9 *Returns:* `y < x`.

```
template<class Duration>
```

```
constexpr bool operator>(const sys_time<Duration>& x, const leap& y) noexcept;
```

10 *Returns:* `y < x`.

```
template<class Duration>
```

```
constexpr bool operator<=(const leap& x, const sys_time<Duration>& y) noexcept;
```

11 *Returns:* `!(y < x)`.

```

template<class Duration>
constexpr bool operator<=(const sys_time<Duration>& x, const leap& y) noexcept;
12   Returns: !(y < x).

template<class Duration>
constexpr bool operator>=(const leap& x, const sys_time<Duration>& y) noexcept;
13   Returns: !(x < y).

template<class Duration>
constexpr bool operator>=(const sys_time<Duration>& x, const leap& y) noexcept;
14   Returns: !(x < y).

```

26.10.9 Class link

[time.zone.link]

26.10.9.1 Overview

[time.zone.link.overview]

```

namespace std::chrono {
    class link {
        public:
            link(link&&) = default;
            link& operator=(link&&) = default;

            // unspecified additional constructors

            string_view name() const noexcept;
            string_view target() const noexcept;
    };
}

```

- ¹ A link specifies an alternative name for a `time_zone`. links are constructed when the time zone database is initialized.

26.10.9.2 Member functions

[time.zone.link.members]

```

string_view name() const noexcept;
1   Returns: The alternative name for the time zone.

string_view target() const noexcept;
2   Returns: The name of the time_zone for which this link provides an alternative name.

```

26.10.9.3 Non-member functions

[time.zone.link.nonmembers]

```

bool operator==(const link& x, const link& y) noexcept;
1   Returns: x.name() == y.name().

bool operator<(const link& x, const link& y) noexcept;
2   Returns: x.name() < y.name().

```

26.11 Formatting

[time.format]

- ¹ Each format overload specified in this subclause calls `to_stream` unqualified, so as to enable argument dependent lookup ([6.4.2](#)).

```

template<class charT, class Streamable>
basic_string<charT>
format(const charT* fmt, const Streamable& s);
2   Remarks: This function shall not participate in overload resolution unless
              to_stream(declval<basic_ostream<charT>&>() , fmt, s)
is a valid expression.

```

- ³ Effects: Constructs a local variable of type `basic_ostringstream<charT>` (named `os` for exposition purposes). Executes `os.exceptions(ios::failbit | ios::badbit)`. Then calls `to_stream(os, fmt, s)`.

4 >Returns: `os.str()`.

```
template<class charT, class Streamable>
basic_string<charT>
format(const locale& loc, const charT* fmt, const Streamable& s);
```

5 *Remarks:* This function shall not participate in overload resolution unless

```
to_stream(declval<basic_ostream<charT>&>(), fmt, s)
```

is a valid expression.

6 *Effects:* Constructs a local variable of type `basic_ostringstream<charT>` (named `os` for exposition purposes). Executes `os.exceptions(ios::failbit | ios::badbit)`. Then calls `os.imbue(loc)`. Then calls `to_stream(os, fmt, s)`.

7 >Returns: `os.str()`.

```
template<class charT, class traits, class Alloc, class Streamable>
basic_string<charT, traits, Alloc>
format(const basic_string<charT, traits, Alloc>& fmt, const Streamable& s);
```

8 *Remarks:* This function shall not participate in overload resolution unless

```
to_stream(declval<basic_ostringstream<charT, traits, Alloc>&>(), fmt.c_str(), s)
```

is a valid expression.

9 *Effects:* Constructs a local variable of type `basic_ostringstream<charT, traits, Alloc>` (named `os` for exposition purposes). Executes `os.exceptions(ios::failbit | ios::badbit)`. Then calls `to_stream(os, fmt.c_str(), s)`.

10 >Returns: `os.str()`.

```
template<class charT, class traits, class Alloc, class Streamable>
basic_string<charT, traits, Alloc>
format(const locale& loc, const basic_string<charT, traits, Alloc>& fmt, const Streamable& s);
```

11 *Remarks:* This function shall not participate in overload resolution unless

```
to_stream(declval<basic_ostringstream<charT, traits, Alloc>&>(), fmt.c_str(), s)
```

is a valid expression.

12 *Effects:* Constructs a local variable of type `basic_ostringstream<charT, traits, Alloc>` (named `os` for exposition purposes). Then calls `os.imbue(loc)`. Executes `os.exceptions(ios::failbit | ios::badbit)`. Then calls `to_stream(os, fmt.c_str(), s)`.

13 >Returns: `os.str()`.

14 The `format` functions call a `to_stream` function with a `basic_ostream`, a formatting string specifier, and a `Streamable` argument. Each `to_stream` overload is customized for each `Streamable` type. However all `to_stream` overloads treat the formatting string specifier according to the following specification:

15 The `fmt` string consists of zero or more conversion specifiers and ordinary multibyte characters. A conversion specifier consists of a `%` character, possibly followed by an `E` or `O` modifier character (described below), followed by a character that determines the behavior of the conversion specifier. All ordinary multibyte characters (excluding the terminating null character) are streamed unchanged into the `basic_ostream`.

16 Each conversion specifier is replaced by appropriate characters as described in Table 87. Some of the conversion specifiers depend on the locale which is imbued to the `basic_ostream`. If the `Streamable` object does not contain the information the conversion specifier refers to, the value streamed to the `basic_ostream` is unspecified.

17 Unless explicitly specified, `Streamable` types will not contain time zone abbreviation and time zone offset information. If available, the conversion specifiers `%Z` and `%z` will format this information (respectively). If the information is not available, and `%Z` or `%z` are contained in `fmt`, `os.setstate(ios_base::failbit)` shall be called.

Table 87 — Meaning of `format` conversion specifiers

Specifier	Replacement
%a	The locale's abbreviated weekday name. If the value does not contain a valid weekday, <code>setstate(ios::failbit)</code> is called.
%A	The locale's full weekday name. If the value does not contain a valid weekday, <code>setstate(ios::failbit)</code> is called.
%b	The locale's abbreviated month name. If the value does not contain a valid month, <code>setstate(ios::failbit)</code> is called.
%B	The locale's full month name. If the value does not contain a valid month, <code>setstate(ios::failbit)</code> is called.
%c	The locale's date and time representation. The modified command %Ec produces the locale's alternate date and time representation.
%C	The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with 0. The modified command %EC produces the locale's alternative representation of the century.
%d	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with 0. The modified command %0d produces the locale's alternative representation.
%D	Equivalent to %m/%d/%y.
%e	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command %0e produces the locale's alternative representation.
%F	Equivalent to %Y-%m-%d.
%g	The last two decimal digits of the ISO week-based year. If the result is a single digit it is prefixed by 0.
%G	The ISO week-based year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits.
%h	Equivalent to %b.
%H	The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %0H produces the locale's alternative representation.
%I	The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %0I produces the locale's alternative representation.
%j	The day of the year as a decimal number. Jan 1 is 001. If the result is less than three digits, it is left-padded with 0 to three digits.
%m	The month as a decimal number. Jan is 01. If the result is a single digit, it is prefixed with 0. The modified command %0m produces the locale's alternative representation.
%M	The minute as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %0M produces the locale's alternative representation.
%n	A new-line character.
%p	The locale's equivalent of the AM/PM designations associated with a 12-hour clock.
%r	The locale's 12-hour clock time.
%R	Equivalent to %H:%M.
%S	Seconds as a decimal number. If the number of seconds is less than 10, the result is prefixed with 0. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command %0S produces the locale's alternative representation.
%t	A horizontal-tab character.
%T	Equivalent to %H:%M:%S.
%u	The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %0u produces the locale's alternative representation.

Table 87 — Meaning of `format` conversion specifiers (continued)

Specifier	Replacement
<code>%U</code>	The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command <code>%0U</code> produces the locale's alternative representation.
<code>%V</code>	The ISO week-based week number as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command <code>%0V</code> produces the locale's alternative representation.
<code>%w</code>	The weekday as a decimal number (0-6), where Sunday is 0. The modified command <code>%0w</code> produces the locale's alternative representation.
<code>%W</code>	The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command <code>%0W</code> produces the locale's alternative representation.
<code>%x</code>	The locale's date representation. The modified command <code>%Ex</code> produces the locale's alternate date representation.
<code>%X</code>	The locale's time representation. The modified command <code>%EX</code> produces the locale's alternate time representation.
<code>%y</code>	The last two decimal digits of the year. If the result is a single digit it is prefixed by 0.
<code>%Y</code>	The year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits.
<code>%z</code>	The offset from UTC in the ISO 8601 format. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands <code>%Ez</code> and <code>%0z</code> insert a : between the hours and minutes: -04:30. If the offset information is not available, <code>setstate(ios_base::failbit)</code> shall be called.
<code>%Z</code>	The time zone abbreviation. If the time zone abbreviation is not available, <code>setstate(ios_base::failbit)</code> shall be called.
<code>%%</code>	A % character.

26.12 Parsing

[time.parse]

- ¹ Each `parse` overload specified in this subclause calls `from_stream` unqualified, so as to enable argument dependent lookup (6.4.2).

```
template<class charT, class traits, class Alloc, class Parsable>
unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);
```

- ² *Remarks:* This function shall not participate in overload resolution unless
`from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp)`
is a valid expression.
- ³ *Returns:* A manipulator that, when extracted from a `basic_istream<charT, traits>` is, calls `from_stream(is, fmt.c_str(), tp)`.

```
template<class charT, class traits, class Alloc, class Parsable>
unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev);
```

- ⁴ *Remarks:* This function shall not participate in overload resolution unless
`from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp, addressof(abbrev))`
is a valid expression.
- ⁵ *Returns:* A manipulator that, when extracted from a `basic_istream<charT, traits>` is, calls `from_stream(is, fmt.c_str(), tp, addressof(abbrev))`.

```
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
      minutes& offset);
```

6 *Remarks:* This function shall not participate in overload resolution unless
`from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp, nullptr, &offset)`
is a valid expression.

7 *Returns:* A manipulator that, when extracted from a `basic_istream<charT, traits>` is, calls
`from_stream(is, fmt.c_str(), tp, nullptr, &offset).`

```
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
      basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

8 *Remarks:* This function shall not participate in overload resolution unless
`from_stream(declval<basic_istream<charT, traits>&>(),
 fmt.c_str(), tp, addressof(abbrev), &offset)`

is a valid expression.

9 *Returns:* A manipulator that, when extracted from a `basic_istream<charT, traits>` is, calls
`from_stream(is, fmt.c_str(), tp, addressof(abbrev), &offset).`

10 All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a %. Some flags can be modified by E or O. During parsing each flag interprets characters as parts of date and time types according to the table below. Some flags can be modified by a width parameter given as a positive decimal integer called out as *N* below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in the table below, except for white space, are parsed unchanged from the stream. A white space character matches zero or more white space characters in the input stream.

11 If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

Table 88 — Meaning of `parse` flags

Flag	Parsed value
%a	The locale's full or abbreviated case-insensitive weekday name.
%A	Equivalent to %a.
%b	The locale's full or abbreviated case-insensitive month name.
%B	Equivalent to %b.
%c	The locale's date and time representation. The modified command %Ec interprets the locale's alternate date and time representation.
%C	The century as a decimal number. The modified command %NC specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands %EC and %OC interpret the locale's alternative representation of the century.
%d	The day of the month as a decimal number. The modified command %Nd specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %Ed interprets the locale's alternative representation of the day of the month.
%D	Equivalent to %m/%d/%y.
%e	Equivalent to %d and can be modified like %d.
%F	Equivalent to %Y-%m-%d. If modified with a width <i>N</i> , the width is applied to only %Y.
%g	The last two decimal digits of the ISO week-based year. The modified command %Ng specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.

Table 88 — Meaning of `parse` flags (continued)

Flag	Parsed value
%G	The ISO week-based year as a decimal number. The modified command <code>%NG</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required.
%h	Equivalent to %b.
%H	The hour (24-hour clock) as a decimal number. The modified command <code>%NH</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OH</code> interprets the locale's alternative representation.
%I	The hour (12-hour clock) as a decimal number. The modified command <code>%NI</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.
%j	The day of the year as a decimal number. Jan 1 is 1. The modified command <code>%Nj</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 3. Leading zeroes are permitted but not required.
%m	The month as a decimal number. Jan is 1. The modified command <code>%Nm</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%Om</code> interprets the locale's alternative representation.
%M	The minutes as a decimal number. The modified command <code>%NM</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OM</code> interprets the locale's alternative representation.
%n	Matches one white space character. [Note: %n, %t, and a space can be combined to match a wide range of white-space patterns. For example, "%n " matches one or more white space characters, and "%n%t%t" matches one to three white space characters. —end note]
%p	The locale's equivalent of the AM/PM designations associated with a 12-hour clock. The command %I must precede %p in the format string.
%r	The locale's 12-hour clock time.
%R	Equivalent to %H:%M.
%S	The seconds as a decimal number. The modified command <code>%NS</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a long double in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command <code>%OS</code> interprets the locale's alternative representation.
%t	Matches zero or one white space characters.
%T	Equivalent to %H:%M:%S.
%u	The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command <code>%Nu</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command <code>%Ou</code> interprets the locale's alternative representation.
%U	The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command <code>%NU</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.
%V	The ISO week-based week number as a decimal number. The modified command <code>%NV</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.
%w	The weekday as a decimal number (0-6), where Sunday is 0. The modified command <code>%Nw</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command <code>%Ow</code> interprets the locale's alternative representation.

Table 88 — Meaning of `parse` flags (continued)

Flag	Parsed value
<code>%W</code>	The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command <code>%NW</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.
<code>%x</code>	The locale's date representation. The modified command <code>%Ex</code> produces the locale's alternate date representation.
<code>%X</code>	The locale's time representation. The modified command <code>%EX</code> produces the locale's alternate time representation.
<code>%y</code>	The last two decimal digits of the year. If the century is not otherwise specified (e.g. with <code>%C</code>), values in the range [69, 99] are presumed to refer to the years 1969 to 1999, and values in the range [00, 68] are presumed to refer to the years 2000 to 2068. The modified command <code>%Ny</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands <code>%Ey</code> and <code>%Oy</code> interpret the locale's alternative representation.
<code>%Y</code>	The year as a decimal number. The modified command <code>%NY</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command <code>%EY</code> interprets the locale's alternative representation.
<code>%z</code>	The offset from UTC in the format <code>[+ -]hh[mm]</code> . For example <code>-0430</code> refers to 4 hours 30 minutes behind UTC, and <code>04</code> refers to 4 hours ahead of UTC. The modified commands <code>%Ez</code> and <code>%Oz</code> parse a <code>:</code> between the hours and minutes and render leading zeroes on the hour field optional: <code>[+ -]h[h] [:mm]</code> . For example <code>-04:30</code> refers to 4 hours 30 minutes behind UTC, and <code>4</code> refers to 4 hours ahead of UTC.
<code>%Z</code>	The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic source character set (5.3) that are alphanumeric, or one of <code>'_'</code> , <code>'/'</code> , <code>'-'</code> , or <code>'+'</code> .
<code>%%</code>	A <code>%</code> character is extracted.

26.13 Header `<ctime>` synopsis

[`ctime.syn`]

```
#define NULL see 16.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {
    using size_t = see 16.2.4;
    using clock_t = see below;
    using time_t = see below;

    struct timespec;
    struct tm;

    clock_t clock();
    double difftime(time_t time1, time_t time0);
    time_t mktime(struct tm* timeptr);
    time_t time(time_t* timer);
    int timespec_get(timespec* ts, int base);
    char* asctime(const struct tm* timeptr);
    char* ctime(const time_t* timer);
    struct tm* gmtime(const time_t* timer);
    struct tm* localtime(const time_t* timer);
    size_t strftime(char* s, size_t maxsize, const char* format, const struct tm* timeptr);
}
```

¹ The contents of the header `<ctime>` are the same as the C standard library header `<time.h>`.²⁵⁹

²⁵⁹) `strftime` supports the C conversion specifiers C, D, e, F, g, G, h, r, R, t, T, u, V, and z, and the modifiers E and O.

² The functions `asctime`, `ctime`, `gmtime`, and `localtime` are not required to avoid data races ([15.5.5.9](#)).

27 Localization library

[localization]

27.1 General

[localization.general]

- ¹ This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.
- ² The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in Table 89.

Table 89 — Localization library summary

Subclause	Header(s)
27.3 Locales	<locale>
27.4 Standard <code>locale</code> Categories	
27.5 C library locales	<clocale>

27.2 Header <locale> synopsis

[locale.syn]

```

namespace std {
    // 27.3.1, locale
    class locale;
    template<class Facet> const Facet& use_facet(const locale& loc);
    template<class Facet> bool has_facet(const locale& loc) noexcept;

    // 27.3.3, convenience interfaces
    template<class charT> bool isspace (charT c, const locale& loc);
    template<class charT> bool isprint (charT c, const locale& loc);
    template<class charT> bool iscntrl (charT c, const locale& loc);
    template<class charT> bool isupper (charT c, const locale& loc);

// 27.4.7, message retrieval
class messages_base;
template<class charT> class messages;
template<class charT> class messages_byname;
}

```

¹ The header <locale> defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.²⁶⁰

27.3 Locales

27.3.1 Class locale

[locales]

[locale]

```

namespace std {
class locale {
public:
// types
class facet;
class id;
using category = int;
static const category // values assigned here are for exposition only
    none      = 0,
    collate   = 0x010, ctype     = 0x020,
    monetary  = 0x040, numeric   = 0x080,
    time      = 0x100, messages  = 0x200,
    all       = collate | ctype | monetary | numeric | time | messages;

// construct/copy/destroy
locale() noexcept;
locale(const locale& other) noexcept;
explicit locale(const char* std_name);
explicit locale(const string& std_name);
locale(const locale& other, const char* std_name, category);
locale(const locale& other, const string& std_name, category);
template<class Facet> locale(const locale& other, Facet* f);

```

²⁶⁰⁾ In this subclause, the type name **struct tm** is an incomplete type that is defined in <ctime>.

```

locale(const locale& other, const locale& one, category);
~locale();                                // not virtual
const locale& operator=(const locale& other) noexcept;
template<class Facet> locale combine(const locale& other) const;

// locale operations
basic_string<char> name() const;

bool operator==(const locale& other) const;
bool operator!=(const locale& other) const;

template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
                 const basic_string<charT, traits, Allocator>& s2) const;

// global locale objects
static      locale  global(const locale&);
static const locale& classic();
};

}

```

- ¹ Class `locale` implements a type-safe polymorphic set of facets, indexed by facet *type*. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.
- ² Access to the facets of a `locale` is via two function templates, `use_facet<>` and `has_facet<>`.
- ³ [Example: An iostream `operator<<` might be implemented as:²⁶¹

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
    typename basic_ostream<charT, traits>::sentry cerberos(s);
    if (cerberos) {
        ios_base::iostate err = ios_base::iostate::goodbit;
        tm tmbuf; d.extract(tmbuf);
        use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(s.getloc())
            .put(s, s, s.fill(), err, &tmbuf, 'x');
        s.setstate(err);           // might throw
    }
    return s;
}

— end example]

```

- ⁴ In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets.
- ⁵ [Note: All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:
 - (5.1) — A member operator template `operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)` is provided so that a locale may be used as a predicate argument to the standard collections, to collate strings.
 - (5.2) — Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c, loc)`. (This eases upgrading existing extractors (28.7.4.2).)
 — end note]
- ⁶ Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

²⁶¹ Note that in the call to `put` the stream is implicitly converted to an `ostreambuf_iterator<charT, traits>`.

- 7 In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.
- 8 A `locale` constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "*".
- 9 Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (15.5.9).

27.3.1.1 Types

[`locale.types`]

27.3.1.1.1 Type `locale::category`

[`locale.category`]

```
using category = int;
```

- ¹ Valid `category` values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is `true`, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

- ² `locale` member functions expecting a `category` argument require one of the `category` values defined above, or the union of two or more such values. Such a `category` value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 90.

Table 90 — Locale category facets

Category	Includes facets
<code>collate</code>	<code>collate<char>, collate<wchar_t></code>
<code>ctype</code>	<code>ctype<char>, ctype<wchar_t></code> <code>codecvt<char, char, mbstate_t></code> <code>codecvt<char16_t, char8_t, mbstate_t></code> <code>codecvt<char32_t, char8_t, mbstate_t></code> <code>codecvt<wchar_t, char, mbstate_t></code>
<code>monetary</code>	<code>moneypunct<char>, moneypunct<wchar_t></code> <code>moneypunct<char, true>, moneypunct<wchar_t, true></code> <code>money_get<char>, money_get<wchar_t></code> <code>money_put<char>, money_put<wchar_t></code>
<code>numeric</code>	<code>numpunct<char>, numpunct<wchar_t></code> <code>num_get<char>, num_get<wchar_t></code> <code>num_put<char>, num_put<wchar_t></code>
<code>time</code>	<code>time_get<char>, time_get<wchar_t></code> <code>time_put<char>, time_put<wchar_t></code>
<code>messages</code>	<code>messages<char>, messages<wchar_t></code>

- ³ For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 90, `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.
- ⁴ An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 91.
- ⁵ The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(1)` only for facet `F` of types `numpunct<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.
- ⁶ In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that satisfy the `Cpp17InputIterator` requirements or

Table 91 — Required specializations

Category	Includes facets
collate	collate_byname<char>, collate_byname<wchar_t>
ctype	ctype_byname<char>, ctype_byname<wchar_t> codecvt_byname<char, char, mbstate_t> codecvt_byname<char16_t, char8_t, mbstate_t> codecvt_byname<char32_t, char8_t, mbstate_t> codecvt_byname<wchar_t, char, mbstate_t>
monetary	moneypunct_byname<char, International> moneypunct_byname<wchar_t, International> money_get<C, InputIterator> money_put<C, OutputIterator>
numeric	numpunct_byname<char>, numpunct_byname<wchar_t> num_get<C, InputIterator>, num_put<C, OutputIterator>
time	time_get<char, InputIterator> time_get_byname<char, InputIterator> time_get<wchar_t, InputIterator> time_get_byname<wchar_t, InputIterator> time_put<char, OutputIterator> time_put_byname<char, OutputIterator> time_put<wchar_t, OutputIterator> time_put_byname<wchar_t, OutputIterator>
messages	messages_byname<char>, messages_byname<wchar_t>

Cpp17OutputIterator requirements, respectively (22.3). A template parameter with name *C* represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that satisfy the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a `bool` parameter.

27.3.1.1.2 Class `locale::facet`

[`locale.facet`]

```
namespace std {
    class locale::facet {
protected:
    explicit facet(size_t refs = 0);
    virtual ~facet();
    facet(const facet&) = delete;
    void operator=(const facet&) = delete;
};
}
```

- 1 Class `facet` is the base class for locale feature sets. A class is a *facet* if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:²⁶²

```
static ::std::locale::id id;
```
- 2 Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.
- 3 The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.
- 4 Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are *explicit*, preventing their participation in automatic conversions.

²⁶²⁾ This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.

- ⁵ For some standard facets a standard “..._byname” class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no “..._byname” version of a facet, the base class implements named locale semantics itself by reference to other facets.

27.3.1.1.3 Class `locale::id`

[`locale.id`]

```
namespace std {
    class locale::id {
    public:
        id();
        void operator=(const id&) = delete;
        id(const id&) = delete;
    };
}
```

- ¹ The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.
- ² [Note: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet’s `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.8.3.2). — end note]

27.3.1.2 Constructors and destructor

[`locale.cons`]

```
locale() noexcept;
```

- ¹ Default constructor: a snapshot of the current global locale.
- ² *Effects:* Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`. [Note: This constructor is commonly used as the default value for arguments of functions that take a `const locale&` argument. — end note]

```
locale(const locale& other) noexcept;
```

- ³ *Effects:* Constructs a locale which is a copy of `other`.

```
explicit locale(const char* std_name);
```

- ⁴ *Effects:* Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

- ⁵ *Throws:* `runtime_error` if the argument is not valid, or is null.

- ⁶ *Remarks:* The set of valid string argument values is "C", "", and any implementation-defined values.

```
explicit locale(const string& std_name);
```

- ⁷ *Effects:* The same as `locale(std_name.c_str())`.

```
locale(const locale& other, const char* std_name, category);
```

- ⁸ *Effects:* Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

- ⁹ *Throws:* `runtime_error` if the argument is not valid, or is null.

- ¹⁰ *Remarks:* The locale has a name if and only if `other` has a name.

```
locale(const locale& other, const string& std_name, category cat);
```

- ¹¹ *Effects:* The same as `locale(other, std_name.c_str(), cat)`.

```

template<class Facet> locale(const locale& other, Facet* f);
12   Effects: Constructs a locale incorporating all facets from the first argument except that of type Facet, and installs the second argument as the remaining facet. If f is null, the resulting object is a copy of other.
13   Remarks: The resulting locale has no name.

locale(const locale& other, const locale& one, category cats);
14   Effects: Constructs a locale incorporating all facets from the first argument except those that implement cats, which are instead incorporated from the second argument.
15   Remarks: The resulting locale has a name if and only if the first two arguments have names.

const locale& operator=(const locale& other) noexcept;
16   Effects: Creates a copy of other, replacing the current value.
17   Returns: *this.

~locale();
18   A non-virtual destructor that throws no exceptions.

```

27.3.1.3 Members

[**locale.members**]

```

template<class Facet> locale combine(const locale& other) const;
1   Effects: Constructs a locale incorporating all facets from *this except for that one facet of other that is identified by Facet.
2   Returns: The newly created locale.
3   Throws: runtime_error if has_facet<Facet>(other) is false.
4   Remarks: The resulting locale has no name.

basic_string<char> name() const;
5   Returns: The name of *this, if it has one; otherwise, the string "*".

```

27.3.1.4 Operators

[**locale.operators**]

```

bool operator==(const locale& other) const;
1   Returns: true if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; false otherwise.

bool operator!=(const locale& other) const;
2   Returns: !(*this == other).

template<class charT, class traits, class Allocator>
  bool operator()(const basic_string<charT, traits, Allocator>& s1,
                  const basic_string<charT, traits, Allocator>& s2) const;
3   Effects: Compares two strings according to the collate<charT> facet.
4   Remarks: This member operator template (and therefore locale itself) satisfies requirements for a comparator predicate template argument (Clause 24) applied to strings.
5   Returns:
    use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
                                              s2.data(), s2.data() + s2.size()) < 0
6   [Example: A vector of strings v can be collated according to collation rules in locale loc simply by (24.7.1, 21.3.11):]
    std::sort(v.begin(), v.end(), loc);
  — end example]

```

27.3.1.5 Static members

[locale.statics]

```
static locale global(const locale& loc);
```

1 Sets the global locale to its argument.

2 *Effects:* Causes future calls to the constructor `locale()` to return a copy of the argument. If the argument has a name, does

```
setlocale(LC_ALL, loc.name().c_str());
```

otherwise, the effect on the C locale, if any, is implementation-defined. No library function other than `locale::global()` shall affect the value returned by `locale()`. [Note: See 27.5 for data race considerations when `setlocale` is invoked. — end note]

3 *Returns:* The previous value of `locale()`.

```
static const locale& classic();
```

4 The "C" locale.

5 *Returns:* A locale that implements the classic "C" locale semantics, equivalent to the value `locale("C")`.

6 *Remarks:* This locale, its facets, and their member functions, do not change with time.

27.3.2 locale globals

[locale.global.templates]

```
template<class Facet> const Facet& use_facet(const locale& loc);
```

1 *Requires:* Facet is a facet class whose definition contains the public static member `id` as defined in 27.3.1.2.

2 *Returns:* A reference to the corresponding facet of `loc`, if present.

3 *Throws:* `bad_cast` if `has_facet<Facet>(loc)` is `false`.

4 *Remarks:* The reference returned remains valid at least as long as any copy of `loc` exists.

```
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

5 *Returns:* `true` if the facet requested is present in `loc`; otherwise `false`.

27.3.3 Convenience interfaces

[locale.convenience]

27.3.3.1 Character classification

[classification]

```
template<class charT> bool isspace (charT c, const locale& loc);
template<class charT> bool isprint (charT c, const locale& loc);
template<class charT> bool iscntrl (charT c, const locale& loc);
template<class charT> bool isupper (charT c, const locale& loc);
template<class charT> bool islower (charT c, const locale& loc);
template<class charT> bool isalpha (charT c, const locale& loc);
template<class charT> bool isdigit (charT c, const locale& loc);
template<class charT> bool ispunct (charT c, const locale& loc);
template<class charT> bool isxdigit(charT c, const locale& loc);
template<class charT> bool isalnum (charT c, const locale& loc);
template<class charT> bool isgraph (charT c, const locale& loc);
template<class charT> bool isblank (charT c, const locale& loc);
```

1 Each of these functions `isF` returns the result of the expression:

```
use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
```

where `F` is the `ctype_base::mask` value corresponding to that function (27.4.1).²⁶³

27.3.3.2 Conversions

[conversions]

27.3.3.2.1 Character conversions

[conversions.character]

```
template<class charT> charT toupper(charT c, const locale& loc);
```

1 *Returns:* `use_facet<ctype<charT>>(loc).toupper(c)`.

²⁶³) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>::is`.

```
template<class charT> charT tolower(charT c, const locale& loc);
2   Returns: use_facet<ctype<charT>>(loc).tolower(c).
```

27.4 Standard locale categories

[**locale.categories**]

- 1 Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators << and >>, as members put() and get(), respectively. Each such member function takes an `ios_base&` argument whose members `flags()`, `precision()`, and `width()`, specify the format of the corresponding datum (28.5.3). Those functions which need to use other facets call its member `getloc()` to retrieve the locale imbued there. Formatting facets use the character argument `fill` to fill out the specified width where necessary.
- 2 The `put()` members make no provision for error reporting. (Any failures of the `OutputIterator` argument can be extracted from the returned iterator.) The `get()` members take an `ios_base::iostate&` argument whose value they ignore, but set to `ios_base::failbit` in case of a parse error.
- 3 Within this clause it is unspecified whether one virtual function calls another virtual function.

27.4.1 The ctype category

[**category.ctype**]

```
namespace std {
    class ctype_base {
        public:
            using mask = see below;

            // numeric values are for exposition only.
            static const mask space = 1 << 0;
            static const mask print = 1 << 1;
            static const mask cntrl = 1 << 2;
            static const mask upper = 1 << 3;
            static const mask lower = 1 << 4;
            static const mask alpha = 1 << 5;
            static const mask digit = 1 << 6;
            static const mask punct = 1 << 7;
            static const mask xdigit = 1 << 8;
            static const mask blank = 1 << 9;
            static const mask alnum = alpha | digit;
            static const mask graph = alnum | punct;
    };
}
```

- 1 The type `mask` is a bitmask type (15.4.2.1.4).

27.4.1.1 Class template ctype

[**locale.ctype**]

```
namespace std {
    template<class charT>
    class ctype : public locale::facet, public ctype_base {
        public:
            using char_type = charT;

            explicit ctype(size_t refs = 0);

            bool is(mask m, charT c) const;
            const charT* is(const charT* low, const charT* high, mask* vec) const;
            const charT* scan_is(mask m, const charT* low, const charT* high) const;
            const charT* scan_not(mask m, const charT* low, const charT* high) const;
            charT toupper(charT c) const;
            const charT* toupper(charT* low, const charT* high) const;
            charT tolower(charT c) const;
            const charT* tolower(charT* low, const charT* high) const;

            charT widen(char c) const;
            const char* widen(const char* low, const char* high, charT* to) const;
            char narrow(charT c, char default) const;
            const charT* narrow(const charT* low, const charT* high, char default, char* to) const;
    };
}
```

```

    static locale::id id;

protected:
    ~ctype();
    virtual bool      do_is(mask m, charT c) const;
    virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
    virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
    virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
    virtual charT      do_toupper(charT) const;
    virtual const charT* do_toupper(charT* low, const charT* high) const;
    virtual charT      do_tolower(charT) const;
    virtual const charT* do_tolower(charT* low, const charT* high) const;
    virtual charT      do_widen(char) const;
    virtual const char* do_widen(const char* low, const char* high, charT* dest) const;
    virtual char       do_narrow(charT, char default) const;
    virtual const charT* do_narrow(const charT* low, const charT* high,
                                  char default, char* dest) const;
};

}

```

- ¹ Class `ctype` encapsulates the C library `<cctype>` features. `istream` members are required to use `ctype<>` for character classing during input parsing.
- ² The specializations required in Table 90 (27.3.1.1.1), namely `ctype<char>` and `ctype<wchar_t>`, implement character classing appropriate to the implementation's native character set.

27.4.1.1.1 ctype members

[`locale.ctype.members`]

```

bool      is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;
1      Returns: do_is(m, c) or do_is(low, high, vec).

const charT* scan_is(mask m, const charT* low, const charT* high) const;
2      Returns: do_scan_is(m, low, high).

const charT* scan_not(mask m, const charT* low, const charT* high) const;
3      Returns: do_scan_not(m, low, high).

charT      toupper(charT) const;
const charT* toupper(charT* low, const charT* high) const;
4      Returns: do_toupper(c) or do_toupper(low, high).

charT      tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;
5      Returns: do_tolower(c) or do_tolower(low, high).

charT      widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;
6      Returns: do_widen(c) or do_widen(low, high, to).

char      narrow(charT c, char default) const;
const charT* narrow(const charT* low, const charT* high, char default, char* to) const;
7      Returns: do_narrow(c, default) or do_narrow(low, high, default, to).

```

27.4.1.1.2 ctype virtual functions

[`locale.ctype.virtuals`]

```

bool      do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;
1      Effects: Classifies a character or sequence of characters. For each argument character, identifies a value M of type ctype_base::mask. The second form identifies a value M of type ctype_base::mask for each *p where (low <= p && p < high), and places it into vec[p - low].

```

2 *Returns:* The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```
const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
```

3 *Effects:* Locates a character in a buffer that conforms to a classification `m`.

4 *Returns:* The smallest pointer `p` in the range `[low, high]` such that `is(m, *p)` would return `true`; otherwise, returns `high`.

```
const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
```

5 *Effects:* Locates a character in a buffer that fails to conform to a classification `m`.

6 *Returns:* The smallest pointer `p`, if any, in the range `[low, high]` such that `is(m, *p)` would return `false`; otherwise, returns `high`.

```
charT      do_toupper(charT c) const;
```

```
const charT* do_toupper(charT* low, const charT* high) const;
```

7 *Effects:* Converts a character or characters to upper case. The second form replaces each character `*p` in the range `[low, high]` for which a corresponding upper-case character exists, with that character.

8 *Returns:* The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT      do_tolower(charT c) const;
```

```
const charT* do_tolower(charT* low, const charT* high) const;
```

9 *Effects:* Converts a character or characters to lower case. The second form replaces each character `*p` in the range `[low, high]` and for which a corresponding lower-case character exists, with that character.

10 *Returns:* The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT      do_widen(char c) const;
```

```
const char*  do_widen(const char* low, const char* high, charT* dest) const;
```

11 *Effects:* Applies the simplest reasonable transformation from a `char` value or sequence of `char` values to the corresponding `charT` value or values.²⁶⁴ The only characters for which unique transformations are required are those in the basic source character set (5.3).

For any named `ctype` category with a `ctype <charT>` facet `ctc` and valid `ctype_base::mask` value `M`, `(ctc.is(M, c) || !is(M, do_widen(c)))` is `true`.²⁶⁵

The second form transforms each character `*p` in the range `[low, high]`, placing the result in `dest[p - low]`.

12 *Returns:* The first form returns the transformed value. The second form returns `high`.

```
char      do_narrow(charT c, char dfault) const;
```

```
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;
```

13 *Effects:* Applies the simplest reasonable transformation from a `charT` value or sequence of `charT` values to the corresponding `char` value or values.

For any character `c` in the basic source character set (5.3) the transformation is such that

```
do_widen(do_narrow(c, 0)) == c
```

For any named `ctype` category with a `ctype<char>` facet `ctc` however, and `ctype_base::mask` value `M`,

```
(is(M, c) || !ctc.is(M, do_narrow(c, dfault)))
```

is `true` (unless `do_narrow` returns `dfault`). In addition, for any digit character `c`, the expression `(do_narrow(c, dfault) - '0')` evaluates to the digit value of the character. The second form transforms each character `*p` in the range `[low, high]`, placing the result (or `dfault` if no simple transformation is readily available) in `dest[p - low]`.

²⁶⁴) The `char` argument of `do_widen` is intended to accept values derived from character literals for conversion to the locale's encoding.

²⁶⁵) In other words, the transformed character is not a member of any character classification that `c` is not also a member of.

14 >Returns: The first form returns the transformed value; or `default` if no mapping is readily available. The second form returns `high`.

27.4.1.2 Class template `ctype_byname`

[`locale.ctypebyname`]

```
namespace std {
    template<class charT>
    class ctype_byname : public ctype<charT> {
public:
    using mask = typename ctype<charT>::mask;
    explicit ctype_byname(const char*, size_t refs = 0);
    explicit ctype_byname(const string&, size_t refs = 0);

protected:
    ~ctype_byname();
};

}
```

27.4.1.3 `ctype<char>` specialization

[`facet.ctype.special`]

```
namespace std {
    template<>
    class ctype<char> : public locale::facet, public ctype_base {
public:
    using char_type = char;

    explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

    bool is(mask m, char c) const;
    const char* is(const char* low, const char* high, mask* vec) const;
    const char* scan_is (mask m, const char* low, const char* high) const;
    const char* scan_not(mask m, const char* low, const char* high) const;

    char      toupper(char c) const;
    const char* toupper(char* low, const char* high) const;
    char      tolower(char c) const;
    const char* tolower(char* low, const char* high) const;

    char      widen(char c) const;
    const char* widen(const char* low, const char* high, char* to) const;
    char      narrow(char c, char default) const;
    const char* narrow(const char* low, const char* high, char default, char* to) const;

    static locale::id id;
    static const size_t table_size = implementation-defined;

    const mask* table() const noexcept;
    static const mask* classic_table() noexcept;

protected:
    ~ctype();
    virtual char      do_toupper(char c) const;
    virtual const char* do_toupper(char* low, const char* high) const;
    virtual char      do_tolower(char c) const;
    virtual const char* do_tolower(char* low, const char* high) const;

    virtual char      do_widen(char c) const;
    virtual const char* do_widen(const char* low, const char* high, char* to) const;
    virtual char      do_narrow(char c, char default) const;
    virtual const char* do_narrow(const char* low, const char* high,
                                  char default, char* to) const;
};

}
```

- ¹ A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.²⁶⁶ The implementation-defined value of member `table_size` is at least 256.

27.4.1.3.1 Destructor

[facet.ctype.char.dtor]

```
~ctype();
```

- ¹ *Effects:* If the constructor's first argument was nonzero, and its second argument was `true`, does `delete [] table()`.

27.4.1.3.2 Members

[facet.ctype.char.members]

- ¹ In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table() [v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);
```

- ² *Requires:* `tbl` either 0 or an array of at least `table_size` elements.

- ³ *Effects:* Passes its `refs` argument to its base class constructor.

```
bool      is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;
```

- ⁴ *Effects:* The second form, for all `*p` in the range `[low, high)`, assigns into `vec[p - low]` the value `table() [(unsigned char)*p]`.

- ⁵ *Returns:* The first form returns `table() [(unsigned char)c] & m`; the second form returns `high`.

```
const char* scan_is(mask m, const char* low, const char* high) const;
```

- ⁶ *Returns:* The smallest `p` in the range `[low, high)` such that

```
table() [(unsigned char) *p] & m
```

is true.

```
const char* scan_not(mask m, const char* low, const char* high) const;
```

- ⁷ *Returns:* The smallest `p` in the range `[low, high)` such that

```
table() [(unsigned char) *p] & m
```

is false.

```
char      toupper(char c) const;
const char* toupper(char* low, const char* high) const;
```

- ⁸ *Returns:* `do_toupper(c)` or `do_toupper(low, high)`, respectively.

```
char      tolower(char c) const;
const char* tolower(char* low, const char* high) const;
```

- ⁹ *Returns:* `do_tolower(c)` or `do_tolower(low, high)`, respectively.

```
char widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;
```

- ¹⁰ *Returns:* `do_widen(c)` or `do_widen(low, high, to)`, respectively.

```
char narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;
```

- ¹¹ *Returns:* `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`, respectively.

```
const mask* table() const noexcept;
```

- ¹² *Returns:* The first constructor argument, if it was nonzero, otherwise `classic_table()`.

²⁶⁶ Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.

27.4.1.3.3 Static members

[facet.ctype.char.statics]

```
static const mask* classic_table() noexcept;
```

- ¹ *Returns:* A pointer to the initial element of an array of size `table_size` which represents the classifications of characters in the "C" locale.

27.4.1.3.4 Virtual functions

[facet.ctype.char.virtuals]

```
char      do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char      do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;

virtual char      do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char      do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high,
                           char dfault, char* to) const;
```

- ¹ These functions are described identically as those members of the same name in the `ctype` class template ([27.4.1.1.1](#)).

27.4.1.4 Class template codecvt

[locale.codecvt]

```
namespace std {
    class codecvt_base {
public:
    enum result { ok, partial, error, noconv };
};

template<class internT, class externT, class stateT>
class codecvt : public locale::facet, public codecvt_base {
public:
    using intern_type = internT;
    using extern_type = externT;
    using state_type = stateT;

    explicit codecvt(size_t refs = 0);

    result out(
        stateT& state,
        const internT* from, const internT* from_end, const internT*& from_next,
        externT* to,       externT* to_end,       externT*& to_next) const;

    result unshift(
        stateT& state,
        externT* to,       externT* to_end,       externT*& to_next) const;

    result in(
        stateT& state,
        const externT* from, const externT* from_end, const externT*& from_next,
        internT* to,       internT* to_end,       internT*& to_next) const;

    int encoding() const noexcept;
    bool always_noconv() const noexcept;
    int length(stateT&, const externT* from, const externT* end, size_t max) const;
    int max_length() const noexcept;

    static locale::id id;

protected:
    ~codecvt();
    virtual result do_out(
        stateT& state,
        const internT* from, const internT* from_end, const internT*& from_next,
        externT* to,       externT* to_end,       externT*& to_next) const;
```

```

        virtual result do_in(
            stateT& state,
            const externT* from, const externT* from_end, const externT*& from_next,
                internT* to,           internT* to_end,           internT*& to_next) const;
        virtual result do_unshift(
            stateT& state,
            externT* to,           externT* to_end,           externT*& to_next) const;

        virtual int do_encoding() const noexcept;
        virtual bool do_always_noconv() const noexcept;
        virtual int do_length(stateT&, const externT* from, const externT* end, size_t max) const;
        virtual int do_max_length() const noexcept;
    };
}

```

- ¹ The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as Unicode and EUC.
- ² The `stateT` argument selects the pair of character encodings being mapped between.
- ³ The specializations required in Table 90 (27.3.1.1.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

27.4.1.4.1 Members

[`locale.codecvt.members`]

```

result out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

1   Returns: do_out(state, from, from_end, from_next, to, to_end, to_next).

result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

2   Returns: do_unshift(state, to, to_end, to_next).

result in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;

3   Returns: do_in(state, from, from_end, from_next, to, to_end, to_next).

int encoding() const noexcept;

4   Returns: do_encoding().

bool always_noconv() const noexcept;

5   Returns: do_always_noconv().

int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;

6   Returns: do_length(state, from, from_end, max).

int max_length() const noexcept;

7   Returns: do_max_length().

```

27.4.1.4.2 Virtual functions

[locale.codecvt.virtuals]

```
result do_out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

result do_in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;
```

- 1 *Requires:* (`from <= from_end && to <= to_end`) well-defined and `true`; `state` initialized, if at the beginning of a sequence, or else equal to the result of converting the preceding characters in the sequence.
- 2 *Effects:* Translates characters in the source range [`from`, `from_end`), placing the results in sequential positions starting at destination `to`. Converts no more than (`from_end - from`) source elements, and stores no more than (`to_end - to`) destination elements.
Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If returns `noconv`, `internT` and `externT` are the same type and the converted sequence is identical to the input sequence [`from`, `from_end`). `to_next` is set equal to `to`, the value of `state` is unchanged, and there are no changes to the values in [`to`, `to_end`].
- 3 A `codecvt` facet that is used by `basic_filebuf` (28.9) shall have the property that if
`do_out(state, from, from_end, from_next, to, to_end, to_next)`
would return `ok`, where `from != from_end`, then
`do_out(state, from, from + 1, from_next, to, to_end, to_next)`
shall also return `ok`, and that if
`do_in(state, from, from_end, from_next, to, to_end, to_next)`
would return `ok`, where `to != to_end`, then
`do_in(state, from, from_end, from_next, to, to + 1, to_next)`
shall also return `ok`.²⁶⁷ [Note: As a result of operations on `state`, it can return `ok` or `partial` and set `from_next == from` and `to_next != to`. —end note]
- 4 *Remarks:* Its operations on `state` are unspecified. [Note: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets. —end note]
- 5 *Returns:* An enumeration value, as summarized in Table 92.

Table 92 — `do_in/do_out` result values

Value	Meaning
<code>ok</code>	completed the conversion
<code>partial</code>	not all source characters converted
<code>error</code>	encountered a character in [<code>from</code> , <code>from_end</code>) that it could not convert
<code>noconv</code>	<code>internT</code> and <code>externT</code> are the same type, and input sequence is identical to converted sequence

A return value of `partial`, if (`from_next == from_end`), indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

²⁶⁷⁾ Informally, this means that `basic_filebuf` assumes that the mappings from internal to external characters is 1 to N: a `codecvt` facet that is used by `basic_filebuf` must be able to translate characters one internal character at a time.

result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

6 *Requires:* (*to* \leq *to_end*) well-defined and **true**; *state* initialized, if at the beginning of a sequence, or else equal to the result of converting the preceding characters in the sequence.

7 *Effects:* Places characters starting at *to* that should be appended to terminate a sequence when the current *stateT* is given by *state*.²⁶⁸ Stores no more than (*to_end* - *to*) destination elements, and leaves the *to_next* pointer pointing one beyond the last element successfully stored.

8 *Returns:* An enumeration value, as summarized in Table 93.

Table 93 — do_unshift result values

Value	Meaning
ok	completed the sequence
partial	space for more than <i>to_end</i> - <i>to</i> destination elements was needed to terminate a sequence given the value of <i>state</i>
error	an unspecified error has occurred
noconv	no termination is needed for this <i>state_type</i>

int do_encoding() const noexcept;

9 *Returns:* -1 if the encoding of the *externT* sequence is state-dependent; else the constant number of *externT* characters needed to produce an internal character; or 0 if this number is not a constant.²⁶⁹

bool do_always_noconv() const noexcept;

10 *Returns:* **true** if *do_in()* and *do_out()* return *noconv* for all valid argument values. *codecvt<char, char, mbstate_t>* returns **true**.

int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;

11 *Requires:* (*from* \leq *from_end*) well-defined and **true**; *state* initialized, if at the beginning of a sequence, or else equal to the result of converting the preceding characters in the sequence.

12 *Effects:* The effect on the *state* argument is “as if” it called *do_in(state, from, from_end, from, to, to+max, to)* for *to* pointing to a buffer of at least *max* elements.

13 *Returns:* (*from_next*-*from*) where *from_next* is the largest value in the range [*from*, *from_end*] such that the sequence of values in the range [*from*, *from_next*) represents *max* or fewer valid complete characters of type *internT*. The specialization *codecvt<char, char, mbstate_t>*, returns the lesser of *max* and (*from_end*-*from*).

int do_max_length() const noexcept;

14 *Returns:* The maximum value that *do_length(state, from, from_end, 1)* can return for any valid range [*from*, *from_end*) and *stateT* value *state*. The specialization *codecvt<char, char, mbstate_t>::do_max_length()* returns 1.

27.4.1.5 Class template codecvt_byname

[locale.codecvtbyname]

```
namespace std {
    template<class internT, class externT, class stateT>
    class codecvt_byname : public codecvt<internT, externT, stateT> {
        public:
            explicit codecvt_byname(const char*, size_t refs = 0);
            explicit codecvt_byname(const string&, size_t refs = 0);

        protected:
            ~codecvt_byname();
        };
    }
}
```

268) Typically these will be characters to return the state to *stateT()*.269) If *encoding()* yields -1, then more than *max_length()* *externT* elements may be consumed when producing a single *internT* character, and additional *externT* elements may appear at the end of a sequence after those that yield the final *internT* character.

27.4.2 The numeric category

[category.numeric]

- 1 The classes `num_get`<> and `num_put`<> handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.²⁷⁰
- 2 All specifications of member functions for `num_put` and `num_get` in the subclauses of 27.4.2 only apply to the specializations required in Tables 90 and 91 (27.3.1.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (27.4), and to its imbued locale for the `numpunct`<> facet to identify all numeric punctuation preferences, and also for the `ctype`<> facet to perform character classification.
- 3 Extractor and inserter members of the standard iostreams use `num_get`<> and `num_put`<> member functions for formatting and parsing numeric values (28.7.4.2.1, 28.7.5.2.1).

27.4.2.1 Class template `num_get`

[locale.num.get]

```
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;

            explicit num_get(size_t refs = 0);

            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, bool& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned short& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned int& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, float& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, void*& v) const;

            static locale::id id;

        protected:
            ~num_get();
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, bool& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, long long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, unsigned short& v) const;
}
```

²⁷⁰⁾ Parsing "-1" correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.

```

        virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                ios_base::iostate& err, unsigned int& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, unsigned long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, unsigned long long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, float& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, double& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, long double& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, void*& v) const;
}
}

```

¹ The facet num_get is used to parse numeric values from an input sequence such as an istream.

27.4.2.1.1 Members

[facet.num.get.members]

```

iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, float& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, void*& val) const;

```

¹ Returns: do_get(in, end, str, err, val).

27.4.2.1.2 Virtual functions

[facet.num.get.virtuals]

```

iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                  ios_base::iostate& err, long double& val) const;

```

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, void*& val) const;
```

1 *Effects:* Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT>>(loc)`, and `use_facet<numpunct<charT>>(loc)`, where `loc` is `str.getloc()`.

2 The details of this operation occur in three stages

(2.1) — Stage 1: Determine a conversion specifier

(2.2) — Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.

(2.3) — Stage 3: Store results

3 The details of the stages are presented below.

Stage 1: The function initializes local variables via

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);
```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 94. The table is ordered. That is, the first line whose condition is true applies.

Table 94 — Integer conversions

State	stdio equivalent
basefield == oct	%o
basefield == hex	%X
basefield == 0	%i
signed integral type	%d
unsigned integral type	%u

For conversions to a floating-point type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in Table 95.

Table 95 — Length modifier

Type	Length modifier
short	h
unsigned short	h
long	l
unsigned long	l
long long	ll
unsigned long long	ll
double	l
long double	L

Stage 2: If `in == end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

```
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
    c = '.';
bool discard =
    ct == use_facet<numpunct<charT>>(loc).thousands_sep()
    && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
```

where the values `src` and `atoms` are defined as if by:

```
static const char src[] = "0123456789abcdefxABCDEx+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of `loc`.

If `discard` is `true`, then if `'.'` has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if `'.'` has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a check is made to determine if `c` is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then `in` is advanced by `++in` and processing returns to the beginning of stage 2.

Stage 3: The sequence of `chars` accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header `<cstdlib>`:

- (3.1) — For a signed integer value, the function `strtoll`.
- (3.2) — For an unsigned integer value, the function `strtoull`.
- (3.3) — For a `float` value, the function `strtof`.
- (3.4) — For a `double` value, the function `strtod`.
- (3.5) — For a `long double` value, the function `strtold`.

The numeric value to be stored can be one of:

- (3.6) — zero, if the conversion function does not convert the entire field.
- (3.7) — the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in `val`.
- (3.8) — the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in `val`.
- (3.9) — the converted value, otherwise.

The resultant numeric value is stored in `val`. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to `err`.

4 Digit grouping is checked. That is, the positions of discarded separators is examined for consistency with `use_facet<numpunct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to `err`.

5 In any case, if stage 2 processing was terminated by the test for `in == end` then `err |= ios_base::eofbit` is performed.

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, bool& val) const;
```

6 *Effects:* If `(str.flags()&ios_base::boolalpha) == 0` then input proceeds as it would for a long except that if a value is being stored into `val`, the value is determined according to the following: If the value to be stored is 0 then `false` is stored. If the value is 1 then `true` is stored. Otherwise `true` is stored and `ios_base::failbit` is assigned to `err`.

7 Otherwise target sequences are determined “as if” by calling the members `falsename()` and `truename()` of the facet obtained by `use_facet<numpunct<charT>>(str.getloc())`. Successive characters in the range `[in, end]` (see 21.2.3) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator `in` is compared to `end` only when necessary to obtain a character. If a target sequence is uniquely matched, `val` is set to the corresponding value. Otherwise `false` is stored and `ios_base::failbit` is assigned to `err`.

8 The `in` iterator is always left pointing one position beyond the last character successfully matched. If `val` is set, then `err` is set to `str.goodbit`; or to `str.eofbit` if, when seeking another character to match, it is found that `(in == end)`. If `val` is not set, then `err` is set to `str.failbit`; or to `(str.failbit|str.eofbit)` if the reason for the failure was that `(in == end)`. [Example: For targets `true: "a"` and `false: "abb"`, the input sequence `"a"` yields `val == true` and `err == str.eofbit`; the input sequence `"abc"` yields `err = str.failbit`, with `in` ending at the '`c`' element. For targets `true: "1"` and `false: "0"`, the input sequence `"1"` yields `val == true` and `err == str.goodbit`. For empty targets (""), any input sequence yields `err == str.failbit`. —end example]

9 *Returns:* `in`.

27.4.2.2 Class template num_put

[locale.nm.put]

```

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
public:
    using char_type = charT;
    using iter_type = OutputIterator;

    explicit num_put(size_t refs = 0);

    iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

    static locale::id id;
};

protected:
    ~num_put();
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
};

}

```

¹ The facet num_put is used to format numeric values to a character sequence such as an ostream.

27.4.2.2.1 Members

[facet.num.put.members]

```

iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;

```

¹ Returns: do_put(out, str, fill, val).

27.4.2.2.2 Virtual functions

[facet.num.put.virtuals]

```

iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;

```

¹ Effects: Writes characters to the sequence out, formatting val as desired. In the following description, loc names a local variable initialized as

```
locale loc = str.getloc();
```

² The details of this operation occur in several stages:

(2.1) — Stage 1: Determine a printf conversion specifier spec and determine the characters that would be printed by printf (28.12) given this conversion specifier for

```
printf(spec, val)
assuming that the current locale is the "C" locale.
```

- (2.2) — Stage 2: Adjust the representation by converting each `char` determined by stage 1 to a `charT` using a conversion and values returned by members of `use_facet<numpunct<charT>>(loc)`
- (2.3) — Stage 3: Determine where padding is required.
- (2.4) — Stage 4: Insert the sequence into the `out`.

3 Detailed descriptions of each stage follow.

4 *Returns:* `out`.

5

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply. For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 96.

Table 96 — Integer conversions

State	stdio equivalent
<code>basefield == ios_base::oct</code>	<code>%o</code>
<code>(basefield == ios_base::hex) && !uppercase</code>	<code>%x</code>
<code>(basefield == ios_base::hex)</code>	<code>%X</code>
for a signed integral type	<code>%d</code>
for an unsigned integral type	<code>%u</code>

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 97.

Table 97 — Floating-point conversions

State	stdio equivalent
<code>floatfield == ios_base::fixed</code>	<code>%f</code>
<code>floatfield == ios_base::scientific && !uppercase</code>	<code>%e</code>
<code>floatfield == ios_base::scientific</code>	<code>%E</code>
<code>floatfield == (ios_base::fixed ios_base::scientific) && !uppercase</code>	<code>%a</code>
<code>floatfield == (ios_base::fixed ios_base::scientific)</code>	<code>%A</code>
<code>!uppercase</code>	<code>%g</code>
<code>otherwise</code>	<code>%G</code>

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 98.

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 99.

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

For conversion from `void*` the specifier is `%p`.

Table 98 — Length modifier

Type	Length modifier
long	1
long long	11
unsigned long	1
unsigned long long	11
long double	L
otherwise	none

Table 99 — Numeric conversions

Type(s)	State	stdio equivalent
an integral type	showpos	+
	showbase	#
a floating-point type	showpos	+
	showpoint	#

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

Stage 2: Any character `c` other than a decimal point(.) is converted to a `charT` via

```
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet<numpunct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 27.4.3.1.2

Decimal point characters(.) are replaced by `punct.decimal_point()`

Stage 3: A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding²⁷¹ is determined according to Table 100.

Table 100 — Fill padding

State	Location
adjustfield == ios_base::left	pad after
adjustfield == ios_base::right	pad before
adjustfield == internal and a sign occurs in the representation	pad after the sign
adjustfield == internal and representation after stage 1 began with 0x or 0X	pad after x or X
otherwise	pad before

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough fill characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

Stage 4: The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;
```

6 *Returns:* If (`str.flags() & ios_base::boolalpha`) == 0 returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

²⁷¹) The conversion specification #o generates a leading 0 which is *not* a padding character.

```
string_type s =
    val ? use_facet<numpunct<charT>>(loc).truename()
        : use_facet<numpunct<charT>>(loc).falsename();
```

and then inserts each character *c* of *s* into *out* via **out++ = c* and returns *out*.

27.4.3 The numeric punctuation facet

[facet.numpunct]

27.4.3.1 Class template numpunct

[locale.numpunct]

```
namespace std {
    template<class charT>
    class numpunct : public locale::facet {
public:
    using char_type = charT;
    using string_type = basic_string<charT>;

    explicit numpunct(size_t refs = 0);

    char_type decimal_point() const;
    char_type thousands_sep() const;
    string grouping() const;
    string_type truename() const;
    string_type falsename() const;

    static locale::id id;

protected:
    ~numpunct(); // virtual
    virtual char_type do_decimal_point() const;
    virtual char_type do_thousands_sep() const;
    virtual string do_grouping() const;
    virtual string_type do_truename() const; // for bool
    virtual string_type do_falsename() const; // for bool
};

}
```

¹ *numpunct*<> specifies numeric punctuation. The specializations required in Table 90 (27.3.1.1.1), namely *numpunct<wchar_t>* and *numpunct<char>*, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to *widen*.

² The syntax for number formats is as follows, where *digit* represents the radix set specified by the *fmtflags* argument value, and *thousands-sep* and *decimal-point* are the results of corresponding *numpunct<charT>* members. Integer values have the format:

```
integer ::= [sign] units
sign ::= plusminus
plusminus ::= '+' | '-'
units ::= digits [thousands-sep units]
digits ::= digit [digits]
```

and floating-point values have:

```
floatval ::= [sign] units [decimal-point [digits]] [e [sign] digits] |
            [sign] decimal-point digits [e [sign] digits]
e ::= 'e' | 'E'
```

where the number of digits between *thousands-seps* is as specified by *do_grouping()*. For parsing, if the *digits* portion contains no thousands-separators, no grouping constraint is applied.

27.4.3.1.1 Members

[facet.numpunct.members]

char_type decimal_point() const;

¹ *Returns:* *do_decimal_point()*.

char_type thousands_sep() const;

² *Returns:* *do_thousands_sep()*.

```

string grouping() const;
3   Returns: do_grouping().

string_type truename() const;
string_type falsename() const;
4   Returns: do_truename() or do_falsename(), respectively.

```

27.4.3.1.2 Virtual functions

[facet.numpunct.virtuals]

```

char_type do_decimal_point() const;
1   Returns: A character for use as the decimal radix separator. The required specializations return '.' or
         L'.'.

char_type do_thousands_sep() const;
2   Returns: A character for use as the digit group separator. The required specializations return ',' or
         L','.

string do_grouping() const;
3   Returns: A basic_string<char> vec used as a vector of integer values, in which each element vec[i]
         represents the number of digits272 in the group at position i, starting with position 0 as the rightmost
         group. If vec.size() <= i, the number is the same as group (i - 1); if (i < 0 || vec[i] <= 0
         || vec[i] == CHAR_MAX), the size of the digit group is unlimited.

4   The required specializations return the empty string, indicating no grouping.

```

```

string_type do_truename() const;
string_type do_falsename() const;
5   Returns: A string representing the name of the boolean value true or false, respectively.
6   In the base class implementation these names are "true" and "false", or L"true" and L"false".

```

27.4.3.2 Class template numpunct_byname

[locale.numpunctbyname]

```

namespace std {
    template<class charT>
    class numpunct_byname : public numpunct<charT> {
        // this class is specialized for char and wchar_t.
        public:
            using char_type = charT;
            using string_type = basic_string<charT>

            explicit numpunct_byname(const char*, size_t refs = 0);
            explicit numpunct_byname(const string&, size_t refs = 0);

        protected:
            ~numpunct_byname();
    };
}

```

27.4.4 The collate category

[category.collate]

27.4.4.1 Class template collate

[locale.collate]

```

namespace std {
    template<class charT>
    class collate : public locale::facet {
        public:
            using char_type = charT;
            using string_type = basic_string<charT>

            explicit collate(size_t refs = 0);

```

²⁷²⁾ Thus, the string "\003" specifies groups of 3 digits each, and "3" probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of "3".

```

        int compare(const charT* low1, const charT* high1,
                    const charT* low2, const charT* high2) const;
        string_type transform(const charT* low, const charT* high) const;
        long hash(const charT* low, const charT* high) const;

        static locale::id id;

protected:
    ~collate();
    virtual int do_compare(const charT* low1, const charT* high1,
                           const charT* low2, const charT* high2) const;
    virtual string_type do_transform(const charT* low, const charT* high) const;
    virtual long do_hash (const charT* low, const charT* high) const;
};

}

```

- ¹ The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms ([Clause 24](#)) and containers operating on strings. The specializations required in Table 90 ([27.3.1.1.1](#)), namely `collate<char>` and `collate<wchar_t>`, apply lexicographic ordering ([24.7.10](#)).

- ² Each function compares a string of characters `*p` in the range `[low, high)`.

27.4.4.1.1 Members

[`locale.collate.members`]

```

int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;

1   Returns: do_compare(low1, high1, low2, high2).

string_type transform(const charT* low, const charT* high) const;

2   Returns: do_transform(low, high).

long hash(const charT* low, const charT* high) const;

3   Returns: do_hash(low, high).

```

27.4.4.1.2 Virtual functions

[`locale.collate.virtuals`]

```

int do_compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;

1   Returns: 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations required in Table 90 (27.3.1.1.1), namely collate<char> and collate<wchar_t>, implement a lexicographical comparison (24.7.10).

string_type do_transform(const charT* low, const charT* high) const;

2   Returns: A basic_string<charT> value that, compared lexicographically with the result of calling transform() on another string, yields the same result as calling do_compare() on the same two strings.273

long do_hash(const charT* low, const charT* high) const;

3   Returns: An integer value equal to the result of calling hash() on any other string for which do_compare() returns 0 (equal) when passed the two strings. [Note: The probability that the result equals that for another string which does not compare equal should be very small, approaching (1.0/numeric_limits<unsigned long>::max()). — end note]

```

27.4.4.2 Class template `collate_byname`

[`locale.collatebyname`]

```

namespace std {
    template<class charT>
    class collate_byname : public collate<charT> {
public:
    using string_type = basic_string<charT>;
}

```

²⁷³⁾ This function is useful when one string is being compared to many other strings.

```

    explicit collate_byname(const char*, size_t refs = 0);
    explicit collate_byname(const string&, size_t refs = 0);

protected:
    ~collate_byname();
};

}

```

27.4.5 The time category

[category.time]

- ¹ Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclauses of 27.4.5 only apply to the specializations required in Tables 90 and 91 (27.3.1.1.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 27.4, and the `ctype<>` facet, to determine formatting details.

27.4.5.1 Class template `time_get`

[locale.time.get]

```

namespace std {
    class time_base {
public:
    enum dateorder { no_order, dmy, mdy, ymd, ydm };
};

template<class charT, class InputIterator = istreambuf_iterator<charT>>
class time_get : public locale::facet, public time_base {
public:
    using char_type = charT;
    using iter_type = InputIterator;

    explicit time_get(size_t refs = 0);

    dateorder date_order() const { return do_date_order(); }
    iter_type get_time(iter_type s, iter_type end, ios_base& f,
                       ios_base::iostate& err, tm* t) const;
    iter_type get_date(iter_type s, iter_type end, ios_base& f,
                       ios_base::iostate& err, tm* t) const;
    iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                          ios_base::iostate& err, tm* t) const;
    iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                           ios_base::iostate& err, tm* t) const;
    iter_type get_year(iter_type s, iter_type end, ios_base& f,
                      ios_base::iostate& err, tm* t) const;
    iter_type get(iter_type s, iter_type end, ios_base& f,

```

        virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
                                  ios_base::iostate& err, tm* t, char format, char modifier) const;
    };
}

```

¹ `time_get` is used to parse a character sequence, extracting components of a time or date into a `struct tm` object. Each `get` member parses a format as produced by a corresponding format specifier to `time_put<>::put`. If the sequence being parsed matches the correct format, the corresponding members of the `struct tm` argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.²⁷⁴

² If the end iterator is reached during parsing by any of the `get()` member functions, the member sets `ios_base::eofbit` in `err`.

27.4.5.1.1 Members

[`locale.time.get.members`]

`dateorder date_order() const;`

¹ *Returns:* `do_date_order()`.

```

iter_type get_time(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;

```

² *Returns:* `do_get_time(s, end, str, err, t)`.

```

iter_type get_date(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;

```

³ *Returns:* `do_get_date(s, end, str, err, t)`.

```

iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;

```

```

iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
                       ios_base::iostate& err, tm* t) const;

```

⁴ *Returns:* `do_get_weekday(s, end, str, err, t)` or `do_get_monthname(s, end, str, err, t)`.

```

iter_type get_year(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;

```

⁵ *Returns:* `do_get_year(s, end, str, err, t)`.

```

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
              tm* t, char format, char modifier = 0) const;

```

⁶ *Returns:* `do_get(s, end, f, err, t, format, modifier)`.

```

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
              tm* t, const char_type* fmt, const char_type* fmtend) const;

```

⁷ *Requires:* `[fmt, fmtend]` shall be a valid range.

⁸ *Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then enters a loop, reading zero or more characters from `s` at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

- (8.1) — The expression `fmt == fmtend` evaluates to `true`.
- (8.2) — The expression `err == ios_base::goodbit` evaluates to `false`.
- (8.3) — The expression `s == end` evaluates to `true`, in which case the function evaluates `err = ios_base::eofbit | ios_base::failbit`.
- (8.4) — The next element of `fmt` is equal to `'%`, optionally followed by a modifier character, followed by a conversion specifier character, `format`, together forming a conversion specification valid for the ISO/IEC 9945 function `strptime`. If the number of elements in the range `[fmt, fmtend)` is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates `err = ios_base::failbit`. Otherwise, the function evaluates `s = do_get(s, end, f, err, t, format, modifier)`, where the value of `modifier` is `'\0'` when

²⁷⁴) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.

the optional modifier is absent from the conversion specification. If `err == ios_base::goodbit` holds after the evaluation of the expression, the function increments `fmt` to point just past the end of the conversion specification and continues looping.

- (8.5) — The expression `isspace(*fmt, f.getloc())` evaluates to `true`, in which case the function first increments `fmt` until `fmt == fmtend || !isspace(*fmt, f.getloc())` evaluates to `true`, then advances `s` until `s == end || !isspace(*s, f.getloc())` is `true`, and finally resumes looping.

- (8.6) — The next character read from `s` matches the element pointed to by `fmt` in a case-insensitive comparison, in which case the function evaluates `++fmt`, `++s` and continues looping. Otherwise, the function evaluates `err = ios_base::failbit`.

9 [Note: The function uses the `ctype<charT>` facet installed in `f`'s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. — *end note*]

10 *Returns:* `s`.

27.4.5.1.2 Virtual functions

[**locale.time.get.virtuals**]

`dateorder do_date_order() const;`

1 *Returns:* An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.²⁷⁵ Returns `no_order` if the date format specified by 'x' contains other variable components (e.g., Julian day, week number, week day).

`iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
ios_base::iostate& err, tm* t) const;`

2 *Effects:* Reads characters starting at `s` until it has extracted those `struct tm` members, and remaining format characters, used by `time_put<>::put` to produce the format specified by "%H:%M:%S", or until it encounters an error or end of sequence.

3 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

`iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
ios_base::iostate& err, tm* t) const;`

4 *Effects:* Reads characters starting at `s` until it has extracted those `struct tm` members and remaining format characters used by `time_put<>::put` to produce one of the following formats, or until it encounters an error. The format depends on the value returned by `date_order()` as shown in Table 101.

Table 101 — `do_get_date` effects

<code>date_order()</code>	Format
<code>no_order</code>	"%m%d%y"
<code>dmy</code>	"%d%m%y"
<code>mdy</code>	"%m%d%y"
<code>ymd</code>	"%y%m%d"
<code>ydm</code>	"%y%d%m"

5 An implementation may also accept additional implementation-defined formats.

6 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

`iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
ios_base::iostate& err, tm* t) const;`

7 *Effects:* Reads characters starting at `s` until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that could match a full

²⁷⁵) This function is intended as a convenience only, for common formats, and may return `no_order` in valid locales.

name, it continues reading until it matches the full name or fails. It sets the appropriate `struct tm` member accordingly.

8 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid name.

```
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

9 *Effects:* Reads characters starting at `s` until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the `t->tm_year` member accordingly.

10 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```
iter_type do_get(iter_type s, iter_type end, ios_base& f,
                 ios_base::iostate& err, tm* t, char format, char modifier) const;
```

11 *Requires:* `t` shall point to an object.

12 *Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then reads characters starting at `s` until it encounters an error, or until it has extracted and assigned those `struct tm` members, and any remaining format characters, corresponding to a conversion directive appropriate for the ISO/IEC 9945 function `strptime`, formed by concatenating `'%'`, the `modifier` character, when non-NUL, and the `format` character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to `true` after reading a character the function evaluates `err |= ios_base::eofbit`.

13 For complex conversion directives such as `%c`, `%x`, or `%X`, or directives that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `struct tm` members from the input sequence `[s, end)`, it evaluates `err |= ios_base::eofbit`. In such cases the values of those `struct tm` members are unspecified and may be outside their valid range.

14 *Remarks:* It is unspecified whether multiple calls to `do_get()` with the address of the same `struct tm` object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

15 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given `format` and `modifier`.

27.4.5.2 Class template `time_get_byname`

[`locale.time.getbyname`]

```
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get_byname : public time_get<charT, InputIterator> {
        public:
            using dateorder = time_base::dateorder;
            using iter_type = InputIterator;

            explicit time_get_byname(const char*, size_t refs = 0);
            explicit time_get_byname(const string&, size_t refs = 0);

        protected:
            ~time_get_byname();
        };
}
```

27.4.5.3 Class template `time_put`

[`locale.time.put`]

```
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit time_put(size_t refs = 0);
```

```

// the following is implemented in terms of other member functions.
iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
              const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& f, char_type fill,
              const tm* tmb, char format, char modifier = 0) const;

static locale::id id;

protected:
    ~time_put();
    virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                            char format, char modifier) const;
};

}

```

27.4.5.3.1 Members

[locale.time.put.members]

```

iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              char format, char modifier = 0) const;

```

- 1 *Effects:* The first form steps through the sequence from `pattern` to `pat_end`, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to `s` immediately, and each format sequence, as it is identified, results in a call to `do_put`; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character `c` to a `char` value as if by `ct.narrow(c, 0)`, where `ct` is a reference to `ctype<charT>` obtained from `str.getloc()`. The first character of each sequence is equal to `'%`, followed by an optional modifier character `mod`²⁷⁶ and a format specifier character `spec` as defined for the function `strftime`. If no modifier character is present, `mod` is zero. For each valid format sequence identified, calls `do_put(s, str, fill, t, spec, mod)`.
- 2 The second form calls `do_put(s, str, fill, t, format, modifier)`.
- 3 [Note: The `fill` argument may be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. —end note]
- 4 *Returns:* An iterator pointing immediately after the last character produced.

27.4.5.3.2 Virtual functions

[locale.time.put.virtuals]

```

iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
                 char format, char modifier) const;

```

- 1 *Effects:* Formats the contents of the parameter `t` into characters placed on the output sequence `s`. Formatting is controlled by the parameters `format` and `modifier`, interpreted identically as the format specifiers in the string argument to the standard library function `strftime()`²⁷⁷, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.²⁷⁸
- 2 *Returns:* An iterator pointing immediately after the last character produced. [Note: The `fill` argument may be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. —end note]

27.4.5.4 Class template time_put_byname

[locale.time.putbyname]

```

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname : public time_put<charT, OutputIterator> {
public:
    using char_type = charT;
    using iter_type = OutputIterator;
}

```

²⁷⁶) Although the C programming language defines no modifiers, most vendors do.

²⁷⁷) Interpretation of the `modifier` argument is implementation-defined, but should follow POSIX conventions.

²⁷⁸) Implementations should refer to other standards such as POSIX for these definitions.

```

    explicit time_put_byname(const char*, size_t refs = 0);
    explicit time_put_byname(const string&, size_t refs = 0);

protected:
    ~time_put_byname();
};

}

```

27.4.6 The monetary category

[category.monetary]

- ¹ These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.
- ² All specifications of member functions for `money_put` and `money_get` in the subclauses of 27.4.6 only apply to the specializations required in Tables 90 and 91 (27.3.1.1.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 27.4, and the `moneypunct<>` and `ctype<>` facets, to determine formatting details.

27.4.6.1 Class template `money_get`

[locale.money.get]

```

namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get : public locale::facet {
public:
    using char_type = charT;
    using iter_type = InputIterator;
    using string_type = basic_string<charT>;

    explicit money_get(size_t refs = 0);

    iter_type get(iter_type s, iter_type end, bool intl,
                  ios_base& f, ios_base::iostate& err,
                  long double& units) const;
    iter_type get(iter_type s, iter_type end, bool intl,
                  ios_base& f, ios_base::iostate& err,
                  string_type& digits) const;

    static locale::id id;

protected:
    ~money_get();
    virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                            ios_base::iostate& err, long double& units) const;
    virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                            ios_base::iostate& err, string_type& digits) const;
};

}

```

27.4.6.1.1 Members

[locale.money.get.members]

```

iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, string_type& quant) const;

```

- ¹ Returns: `do_get(s, end, intl, f, err, quant)`.

27.4.6.1.2 Virtual functions

[locale.money.get.virtuals]

```

iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, string_type& digits) const;

```

- ¹ Effects: Reads characters from `s` to parse and construct a monetary value according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`.

If a valid sequence is recognized, does not change `err`; otherwise, sets `err` to (`err|str.failbit`), or (`err|str.failbit|str.eofbit`) if no more characters are available, and does not change `units` or `digits`. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in `units` or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where `c` is `'-'` or in the range from `'0'` through `'9'`, inclusive) stored in `digits`. [Example: The sequence `$1,056.23` in a common United States locale would yield, for `units`, `105623`, or, for `digits`, `"105623"`. — end example] If `mp.grouping()` indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

- 2 Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no white space is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one white space character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, white space is allowed but not required. If (`str.flags() & str.showbase`) is false, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.
- 3 If the first character (if any) in the string `pos` returned by `mp.positive_sign()` or the string `neg` returned by `mp.negative_sign()` is recognized in the position indicated by `sign` in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components. [Example: If `showbase` is off, then for a `neg` value of `"()"` and a currency symbol of `"L"`, in `"(100 L)"` the `"L"` is consumed; but if `neg` is `"-"`, the `"L"` in `"-100 L"` is not consumed. — end example] If `pos` or `neg` is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of `pos` or `neg`, and the result is given the corresponding sign. If the first character of `pos` is equal to the first character of `neg`, or if both strings are empty, the result is given a positive sign.
- 4 Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by²⁷⁹

```
for (int i = 0; i < n; ++i)
    buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

- 5 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

27.4.6.2 Class template `money_put`

[`locale.money.put`]

```
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;
            using string_type = basic_string<charT>;
            explicit money_put(size_t refs = 0);

            iter_type put(iter_type s, bool intl, ios_base& f,
                          char_type fill, long double units) const;
            iter_type put(iter_type s, bool intl, ios_base& f,
                          char_type fill, const string_type& digits) const;
```

²⁷⁹ The semantics here are different from `ct.narrow`.

```

    static locale::id id;

protected:
    ~money_put();
    virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                           long double units) const;
    virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                           const string_type& digits) const;
};

}

```

27.4.6.2.1 Members

[locale.money.put.members]

```
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

¹ Returns: do_put(s, intl, f, loc, quant).

27.4.6.2.2 Virtual functions

[locale.money.put.virtuals]

```
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, const string_type& digits) const;
```

¹ Effects: Writes characters to s according to the format specified by a `moneypunct<charT, Intl>` facet reference mp and the character mapping specified by a `ctype<charT>` facet reference ct obtained from the locale returned by `str.getloc()`, and `str.flags()`. The argument units is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%.0Lf", units), buf2)
```

for character buffers buf1 and buf2. If the first character in digits or buf2 is equal to `ct.widen('')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in digits or buf2. In digits, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to ct) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

² Remarks: The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of fill are inserted as necessary to pad to the specified width. For the value af equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is true, the fill characters are placed where none or space appears in the formatting pattern; otherwise if `(af == str.left)` is true, they are placed after the other characters; otherwise, they are placed before the other characters. [Note: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get`. — end note]

³ Returns: An iterator pointing immediately after the last character produced.

27.4.6.3 Class template moneypunct

[locale.moneypunct]

```

namespace std {
    class money_base {
public:
    enum part { none, space, symbol, sign, value };
    struct pattern { char field[4]; };
};

template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
public:
    using char_type = charT;
    using string_type = basic_string<charT>

    explicit moneypunct(size_t refs = 0);

```

```

charT      decimal_point() const;
charT      thousands_sep() const;
string     grouping() const;
string_type curr_symbol() const;
string_type positive_sign() const;
string_type negative_sign() const;
int        frac_digits() const;
pattern    pos_format() const;
pattern    neg_format() const;

static locale::id id;
static const bool intl = International;

protected:
~moneypunct();
virtual charT      do_decimal_point() const;
virtual charT      do_thousands_sep() const;
virtual string     do_grouping() const;
virtual string_type do_curr_symbol() const;
virtual string_type do_positive_sign() const;
virtual string_type do_negative_sign() const;
virtual int         do_frac_digits() const;
virtual pattern    do_pos_format() const;
virtual pattern    do_neg_format() const;
};

}

```

- ¹ The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the i^{th} component of the format²⁸⁰. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.
- ² Where `none` or `space` appears, white space is permitted in the format, except where `none` appears at the end, in which case no white space is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.
- ³ The format of the numeric monetary value is a decimal number:

```

value ::= units [ decimal-point [ digits ] ] |
          decimal-point digits
if frac_digits() returns a positive value, or
  value ::= units

```

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

```

units ::= digits [ thousands-sep units ]
digits ::= adigit [ digits ]

```

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range '0' through '9', inclusive, and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. White space characters are those characters `c` for which `ct.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

- ⁴ The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `numpunct<>::do_grouping()`.

²⁸⁰) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

27.4.6.3.1 Members

[`locale.money punct.members`]

```
charT      decimal_point() const;
charT      thousands_sep() const;
string     grouping()      const;
string_type curr_symbol() const;
string_type positive_sign() const;
string_type negative_sign() const;
int        frac_digits()   const;
pattern    pos_format()   const;
pattern    neg_format()   const;
```

- ¹ Each of these functions F returns the result of calling the corresponding virtual member function `do_` F `()`.

27.4.6.3.2 Virtual functions

[`locale.money punct.virtuals`]

```
charT do_decimal_point() const;
```

- ¹ *Returns:* The radix separator to use in case `do_frac_digits()` is greater than zero.²⁸¹

```
charT do_thousands_sep() const;
```

- ² *Returns:* The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.²⁸²

```
string do_grouping() const;
```

- ³ *Returns:* A pattern defined identically as, but not necessarily equal to, the result of `num_punct<charT>::do_grouping()`.²⁸³

```
string_type do_curr_symbol() const;
```

- ⁴ *Returns:* A string to use as the currency identifier symbol. [Note: For specializations where the second template parameter is `true`, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space. — *end note*]

```
string_type do_positive_sign() const;
string_type do_negative_sign() const;
```

- ⁵ *Returns:* `do_positive_sign()` returns the string to use to indicate a positive monetary value;²⁸⁴ `do_negative_sign()` returns the string to use to indicate a negative value.

```
int do_frac_digits() const;
```

- ⁶ *Returns:* The number of digits after the decimal radix separator, if any.²⁸⁵

```
pattern do_pos_format() const;
pattern do_neg_format() const;
```

- ⁷ *Returns:* The specializations required in Table 91 (27.3.1.1.1), namely `money_punct<char>`, `money_punct<wchar_t>`, `money_punct<char, true>`, and `money_punct<wchar_t, true>`, return an object of type `pattern` initialized to { `symbol`, `sign`, `none`, `value` }.²⁸⁶

27.4.6.4 Class template `money_punct_byname`

[`locale.money punctbyname`]

```
namespace std {
    template<class charT, bool Intl = false>
    class money_punct_byname : public money_punct<charT, Intl> {
        public:
            using pattern     = money_base::pattern;
            using string_type = basic_string<charT>

            explicit money_punct_byname(const char*, size_t refs = 0);
            explicit money_punct_byname(const string&, size_t refs = 0);
```

281) In common U.S. locales this is ‘.’.

282) In common U.S. locales this is ‘,’.

283) To specify grouping by 3s, the value is “\003” *not* “3”.

284) This is usually the empty string.

285) In common U.S. locales, this is 2.

286) Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, “USD ”.

```

protected:
    ~moneypunct_byname();
};

}

```

27.4.7 The message retrieval category

[category.messages]

- 1 Class `messages<charT>` implements retrieval of strings from message catalogs.

27.4.7.1 Class template `messages`

[locale.messages]

```

namespace std {
    class messages_base {
        public:
            using catalog = unspecified signed integer type;
    };

    template<class charT>
    class messages : public locale::facet, public messages_base {
        public:
            using char_type   = charT;
            using string_type = basic_string<charT>;

            explicit messages(size_t refs = 0);

            catalog open(const basic_string<char>& fn, const locale&) const;
            string_type get(catalog c, int set, int msgid,
                            const string_type& dfault) const;
            void close(catalog c) const;

            static locale::id id;

        protected:
            ~messages();
            virtual catalog do_open(const basic_string<char>&, const locale&) const;
            virtual string_type do_get(catalog, int set, int msgid,
                                       const string_type& dfault) const;
            virtual void do_close(catalog) const;
    };
}

```

- 1 Values of type `messages_base::catalog` usable as arguments to members `get` and `close` can be obtained only by calling member `open`.

27.4.7.1.1 Members

[locale.messages.members]

- catalog `open(const basic_string<char>& name, const locale& loc)` const;
 - 1 *Returns:* `do_open(name, loc)`.
- string_type `get(catalog cat, int set, int msgid, const string_type& dfault)` const;
 - 2 *Returns:* `do_get(cat, set, msgid, dfault)`.
- `void close(catalog cat)` const;
 - 3 *Effects:* Calls `do_close(cat)`.

27.4.7.1.2 Virtual functions

[locale.messages.virtuals]

- catalog `do_open(const basic_string<char>& name, const locale& loc)` const;
 - 1 *Returns:* A value that may be passed to `get()` to retrieve a message from the message catalog identified by the string `name` according to an implementation-defined mapping. The result can be used until it is passed to `close()`.
 - 2 Returns a value less than 0 if no such catalog can be opened.
 - 3 *Remarks:* The locale argument `loc` is used for character set code conversion when retrieving messages, if needed.

```

string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
4   Requires: cat shall be a catalog obtained from open() and not yet closed.
5   Returns: A message identified by arguments set, msgid, and dfault, according to an implementation-
      defined mapping. If no such message can be found, returns dfault.

void do_close(catalog cat) const;
6   Requires: cat shall be a catalog obtained from open() and not yet closed.
7   Effects: Releases unspecified resources associated with cat.
8   Remarks: The limit on such resources, if any, is implementation-defined.

```

27.4.7.2 Class template messages_byname

[locale.messagesbyname]

```

namespace std {
    template<class charT>
    class messages_byname : public messages<charT> {
public:
    using catalog      = messages_base::catalog;
    using string_type = basic_string<charT>

    explicit messages_byname(const char*, size_t refs = 0);
    explicit messages_byname(const string&, size_t refs = 0);

protected:
    ~messages_byname();
};

}

```

27.5 C library locales

[c.locales]

27.5.1 Header <clocale> synopsis

[clocale.syn]

```

namespace std {
    struct lconv;

    char* setlocale(int category, const char* locale);
    lconv* localeconv();
}

#define NULL see 16.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below

```

¹ The contents and meaning of the header <clocale> are the same as the C standard library header <locale.h>.

² Calls to the function setlocale may introduce a data race (15.5.5.9) with other calls to setlocale or with calls to the functions listed in Table 102.

SEE ALSO: ISO C 7.11

28 Input/output library [input.output]

28.1 General

[`input.output.general`]

- ¹ This Clause describes components that C++ programs may use to perform input/output operations.
- ² The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 103.

Table 103 — Input/output library summary

Subclause	Header(s)
28.2 Requirements	
28.3 Forward declarations	<code><iostreamfwd></code>
28.4 Standard iostream objects	<code><iostream></code>
28.5 Iostreams base classes	<code><ios></code>
28.6 Stream buffers	<code><streambuf></code>
28.7 Formatting and manipulators	<code><iostream></code> <code><ostream></code> <code><iomanip></code>
28.8 String streams	<code><sstream></code>
28.9 File streams	<code><fstream></code>
28.10 Synchronized output streams	<code><syncstream></code>
28.11 File systems	<code><filesystem></code>
28.12 C library files	<code><cstdio></code> <code><cinttypes></code>

- ³ Figure 7 illustrates relationships among various types described in this clause. A line from **A** to **B** indicates that **A** is an alias (e.g., a `typedef`) for **B** or that **A** is defined in terms of **B**.

Figure 7 — Stream position, offset, and size types [non-normative]

28.2 Iostreams requirements

[`iostreams.requirements`]

28.2.1 Imbue limitations

[`iostream.limits.imbue`]

- ¹ No function described in [Clause 28](#) except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in [Clause 28](#) or as an overriding virtual function of any class declared in [Clause 28](#) calls `imbue`, the behavior is undefined.

28.2.2 Positioning type limitations

[**iostreams.limits.pos**]

- 1 The classes of [Clause 28](#) with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.
- 2 In the classes of [Clause 28](#), a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that satisfy the requirements for a character on which any of the iostream components can be instantiated.

28.2.3 Thread safety

[**iostreams.threadsafety**]

- 1 Concurrent access to a stream object ([28.8](#), [28.9](#)), stream buffer object ([28.6](#)), or C Library stream ([28.12](#)) by multiple threads may result in a data race ([6.8.2](#)) unless otherwise specified ([28.4](#)). [Note: Data races result in undefined behavior ([6.8.2](#)). — *end note*]
- 2 If one thread makes a library call *a* that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call *b* such that this does not result in a data race, then *a*'s write synchronizes with *b*'s read.

28.3 Forward declarations

[**iostream.forward**]

28.3.1 Header <iosfwd> synopsis

[**iosfwd.syn**]

```
namespace std {
    template<class charT> class char_traits;
    template<> class char_traits<char>;
    template<> class char_traits<char8_t>;

}

```

¹ Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.²⁸⁷

²⁸⁷⁾ It is the implementation's responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.

28.3.2 Overview

[**iostream.forward.overview**]

- 1 The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.
- 2 The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`.
- 3 The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_iostream` and `basic_ifstream`.
- 4 The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, and `basic_osyncstream`.
- 5 The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.
- 6 [Note: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (20.2). — end note]
- 7 Other *typedef-names* define instances of class templates specialized for `char` or `wchar_t` types.
- 8 Specializations of the class template `fpos` are used for specifying file position information. [Example: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. — end example]
- 9 [Note: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. — end note]

28.4 Standard iostream objects

[**iostream.objects**]

28.4.1 Header <iostream> synopsis

[**iostream.syn**]

```
#include <ios>           // see 28.5.1
#include <streambuf>     // see 28.6.1
#include <iostream>       // see 28.7.1
#include <ostream>        // see 28.7.2
```

```
namespace std {
    extern istream cin;
    extern ostream cout;
    extern ostream cerr;
    extern ostream clog;

    extern wistream wcin;
    extern wostream wcout;
    extern wostream wcerr;
    extern wostream wclog;
}
```

28.4.2 Overview

[**iostream.objects.overview**]

- 1 In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (28.12.1).
- 2 The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>` (28.12), and includes all the headers necessary to use these objects.
- 3 The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.8.3.1) begins execution.²⁸⁸ The objects are not destroyed during program execution.²⁸⁹ The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration.
- 4 Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on `FILE`s, as specified in the C standard library.

²⁸⁸⁾ If it is possible for them to do so, implementations should initialize the objects earlier than required.

²⁸⁹⁾ Constructors and destructors for static objects can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

- ⁵ Concurrent access to a synchronized (28.5.3.4) standard iostream object's formatted and unformatted input (28.7.4.1) and output (28.7.5.1) functions or a standard C stream by multiple threads shall not result in a data race (6.8.2). [Note: Users must still synchronize concurrent use of these objects and streams by multiple threads if they wish to avoid interleaved characters. — *end note*]

SEE ALSO: ISO C 7.21.2

28.4.3 Narrow stream objects

[narrow.stream.objects]

`istream cin;`

- 1 The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (28.12.1).
- 2 After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (28.5.5.2).

`ostream cout;`

- 3 The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (28.12.1).

`ostream cerr;`

- 4 The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (28.12.1).
- 5 After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (28.5.5.2).

`ostream clog;`

- 6 The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (28.12.1).

28.4.4 Wide stream objects

[wide.stream.objects]

`wistream wcin;`

- 1 The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (28.12.1).
- 2 After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (28.5.5.2).

`wostream wcout;`

- 3 The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (28.12.1).

`wostream wcerr;`

- 4 The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (28.12.1).
- 5 After the object `wcerr` is initialized, `wcerr.flags() & unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (28.5.5.2).

`wostream wclog;`

- 6 The object `wclog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (28.12.1).

28.5 Iostreams base classes

[iostreams.base]

28.5.1 Header `<iostream>` synopsis

[ios.syn]

```
#include <iostfwd> // see 28.3.1

namespace std {
    using streamoff = implementation-defined;
    using streamsize = implementation-defined;
```

```

template<class stateT> class fpos;

class ios_base;
template<class charT, class traits = char_traits<charT>>
    class basic_ios;

// 28.5.6, manipulators
ios_base& boolalpha (ios_base& str);
ios_base& noboolalpha(ios_base& str);

ios_base& showbase   (ios_base& str);
ios_base& noshowbase (ios_base& str);

ios_base& showpoint  (ios_base& str);
ios_base& noshowpoint(ios_base& str);

ios_base& showpos    (ios_base& str);
ios_base& noshowpos  (ios_base& str);

ios_base& skipws     (ios_base& str);
ios_base& noskipws   (ios_base& str);

ios_base& uppercase   (ios_base& str);
ios_base& nouppercase(ios_base& str);

ios_base& unitbuf     (ios_base& str);
ios_base& nounitbuf   (ios_base& str);

// 28.5.6.2, adjustfield
ios_base& internal   (ios_base& str);
ios_base& left        (ios_base& str);
ios_base& right       (ios_base& str);

// 28.5.6.3, basefield
ios_base& dec         (ios_base& str);
ios_base& hex         (ios_base& str);
ios_base& oct         (ios_base& str);

// 28.5.6.4, floatfield
ios_base& fixed       (ios_base& str);
ios_base& scientific   (ios_base& str);
ios_base& hexfloat    (ios_base& str);
ios_base& defaultfloat(ios_base& str);

// 28.5.7, error reporting
enum class io_errc {
    stream = 1
};

template<> struct is_error_code_enum<io_errc> : public true_type { };
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;
}

```

28.5.2 Types

[stream.types]

using streamoff = *implementation-defined*;

¹ The type **streamoff** is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.²⁹⁰

²⁹⁰ Typically `long long`.

```
using streamsize = implementation-defined;
```

- 2 The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.²⁹¹

28.5.3 Class `ios_base`

[`ios.base`]

```
namespace std {
    class ios_base {
        public:
            class failure; // see below

            // 28.5.3.1.2, fmtflags
            using fmtflags = T1;
            static constexpr fmtflags boolalpha = unspecified;
            static constexpr fmtflags dec = unspecified;
            static constexpr fmtflags fixed = unspecified;
            static constexpr fmtflags hex = unspecified;
            static constexpr fmtflags internal = unspecified;
            static constexpr fmtflags left = unspecified;
            static constexpr fmtflags oct = unspecified;
            static constexpr fmtflags right = unspecified;
            static constexpr fmtflags scientific = unspecified;
            static constexpr fmtflags showbase = unspecified;
            static constexpr fmtflags showpoint = unspecified;
            static constexpr fmtflags showpos = unspecified;
            static constexpr fmtflags skipws = unspecified;
            static constexpr fmtflags unitbuf = unspecified;
            static constexpr fmtflags uppercase = unspecified;
            static constexpr fmtflags adjustfield = see below;
            static constexpr fmtflags basefield = see below;
            static constexpr fmtflags floatfield = see below;

            // 28.5.3.1.3, iostate
            using iostate = T2;
            static constexpr iostate badbit = unspecified;
            static constexpr iostate eofbit = unspecified;
            static constexpr iostate failbit = unspecified;
            static constexpr iostate goodbit = see below;

            // 28.5.3.1.4, openmode
            using openmode = T3;
            static constexpr openmode app = unspecified;
            static constexpr openmode ate = unspecified;
            static constexpr openmode binary = unspecified;
            static constexpr openmode in = unspecified;
            static constexpr openmode out = unspecified;
            static constexpr openmode trunc = unspecified;

            // 28.5.3.1.5, seekdir
            using seekdir = T4;
            static constexpr seekdir beg = unspecified;
            static constexpr seekdir cur = unspecified;
            static constexpr seekdir end = unspecified;

        class Init;

        // 28.5.3.2, fmtflags state
        fmtflags flags() const;
        fmtflags flags(fmtflags fmtfl);
        fmtflags setf(fmtflags fmtfl);
        fmtflags setf(fmtflags fmtfl, fmtflags mask);
        void unsetf(fmtflags mask);
```

²⁹¹⁾ `streamsize` is used in most places where ISO C would use `size_t`.

```

    streamsize precision() const;
    streamsize precision(streamsize prec);
    streamsize width() const;
    streamsize width(streamsize wide);

    // 28.5.3.3, locales
    locale imbue(const locale& loc);
    locale getloc() const;

    // 28.5.3.5, storage
    static int xalloc();
    long& iword(int idx);
    void*& pword(int idx);

    // destructor
    virtual ~ios_base();

    // 28.5.3.6, callbacks
    enum event { erase_event, imbue_event, copyfmt_event };
    using event_callback = void (*) (event, ios_base&, int idx);
    void register_callback(event_callback fn, int idx);

    ios_base(const ios_base&) = delete;
    ios_base& operator=(const ios_base&) = delete;

    static bool sync_with_stdio(bool sync = true);

protected:
    ios_base();

private:
    static int index; // exposition only
    long* iarray; // exposition only
    void** parray; // exposition only
};

}

1 ios_base defines several member types:
(1.1) — a type failure, defined as either a class derived from system_error or a synonym for a class derived from system_error;
(1.2) — a class Init;
(1.3) — three bitmask types, fmtflags, iostate, and openmode;
(1.4) — an enumerated type, seekdir.

```

2 It maintains several kinds of data:

- (2.1) — state information that reflects the integrity of the stream buffer;
- (2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;
- (2.3) — additional information that is stored by the program for its private use.

3 [Note: For the sake of exposition, the maintained data is presented here as:

- (3.1) — **static int index**, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;
 - (3.2) — **long* iarray**, points to the first element of an arbitrary-length **long** array maintained for the private use of the program;
 - (3.3) — **void** parray**, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.
- end note]

28.5.3.1 Types

28.5.3.1.1 Class `ios_base::failure`

[`ios.types`][`ios::failure`]

```
namespace std {
    class ios_base::failure : public system_error {
public:
    explicit failure(const string& msg, const error_code& ec = io_errc::stream);
    explicit failure(const char* msg, const error_code& ec = io_errc::stream);
};
}
```

- ¹ An implementation is permitted to define `ios_base::failure` as a synonym for a class with equivalent functionality to class `ios_base::failure` shown in this subclause. [Note: When `ios_base::failure` is a synonym for another type it shall provide a nested type `failure`, to emulate the injected class name. —end note] The class `failure` defines the base class for the types of all objects thrown as exceptions, by functions in the iostreams library, to report errors detected during stream buffer operations.
- ² When throwing `ios_base::failure` exceptions, implementations should provide values of `ec` that identify the specific reason for the failure. [Note: Errors arising from the operating system would typically be reported as `system_category()` errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as `error_code(io_errc::stream, iostream_category())`. —end note]

```
explicit failure(const string& msg, const error_code& ec = io_errc::stream);
```

- ³ *Effects:* Constructs an object of class `failure` by constructing the base class with `msg` and `ec`.

```
explicit failure(const char* msg, const error_code& ec = io_errc::stream);
```

- ⁴ *Effects:* Constructs an object of class `failure` by constructing the base class with `msg` and `ec`.

28.5.3.1.2 Type `ios_base::fmtflags`

[`ios::fmtflags`]

```
using fmtflags = T1;
```

- ¹ The type `fmtflags` is a bitmask type (15.4.2.1.4). Setting its elements has the effects indicated in Table 104.

Table 104 — `fmtflags` effects

Element	Effect(s) if set
<code>boolalpha</code>	insert and extract <code>bool</code> type in alphabetic format
<code>dec</code>	converts integer input or generates integer output in decimal base
<code>fixed</code>	generate floating-point output in fixed-point notation
<code>hex</code>	converts integer input or generates integer output in hexadecimal base
<code>internal</code>	adds fill characters at a designated internal point in certain generated output, or identical to <code>right</code> if no such point is designated
<code>left</code>	adds fill characters on the right (final positions) of certain generated output
<code>oct</code>	converts integer input or generates integer output in octal base
<code>right</code>	adds fill characters on the left (initial positions) of certain generated output
<code>scientific</code>	generates floating-point output in scientific notation
<code>showbase</code>	generates a prefix indicating the numeric base of generated integer output
<code>showpoint</code>	generates a decimal-point character unconditionally in generated floating-point output
<code>showpos</code>	generates a + sign in non-negative generated numeric output
<code>skipws</code>	skips leading whitespace before certain input operations
<code>unitbuf</code>	flushes output after each output operation
<code>uppercase</code>	replaces certain lowercase letters with their uppercase equivalents in generated output

- ² Type `fmtflags` also defines the constants indicated in Table 105.

Table 105 — `fmtflags` constants

Constant	Allowable values
<code>adjustfield</code>	<code>left</code> <code>right</code> <code>internal</code>
<code>basefield</code>	<code>dec</code> <code>oct</code> <code>hex</code>
<code>floatfield</code>	<code>scientific</code> <code>fixed</code>

28.5.3.1.3 Type `ios_base::iostate`[`ios::iostate`]`using iostate = T2;`

- 1 The type `iostate` is a bitmask type (15.4.2.1.4) that contains the elements indicated in Table 106.

Table 106 — `iostate` effects

Element	Effect(s) if set
<code>badbit</code>	indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);
<code>eofbit</code>	indicates that an input operation reached the end of an input sequence;
<code>failbit</code>	indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

2 Type `iostate` also defines the constant:

- (2.1) — `goodbit`, the value zero.

28.5.3.1.4 Type `ios_base::openmode`[`ios::openmode`]`using openmode = T3;`

- 1 The type `openmode` is a bitmask type (15.4.2.1.4). It contains the elements indicated in Table 107.

Table 107 — `openmode` effects

Element	Effect(s) if set
<code>app</code>	seek to end before each write
<code>ate</code>	open and seek to end immediately after opening
<code>binary</code>	perform input and output in binary mode (as opposed to text mode)
<code>in</code>	open for input
<code>out</code>	open for output
<code>trunc</code>	truncate an existing stream when opening

28.5.3.1.5 Type `ios_base::seekdir`[`ios::seekdir`]`using seekdir = T4;`

- 1 The type `seekdir` is an enumerated type (15.4.2.1.3) that contains the elements indicated in Table 108.

Table 108 — `seekdir` effects

Element	Meaning
<code>beg</code>	request a seek (for subsequent input or output) relative to the beginning of the stream
<code>cur</code>	request a seek relative to the current position within the sequence
<code>end</code>	request a seek relative to the current end of the sequence

28.5.3.1.6 Class ios_base::Init

[ios::Init]

```
namespace std {
    class ios_base::Init {
        public:
            Init();
            Init(const Init&) = default;
            ~Init();
            Init& operator=(const Init&) = default;
        private:
            static int init_cnt; // exposition only
    };
}
```

- ¹ The class **Init** describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (28.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (28.12.1).
- ² For the sake of exposition, the maintained data is presented here as:

(2.1) — `static int init_cnt`, counts the number of constructor and destructor calls for class **Init**, initialized to zero.

`Init();`

³ *Effects:* Constructs an object of class **Init**. Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

`~Init();`

⁴ *Effects:* Destroys an object of class **Init**. If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

28.5.3.2 State functions

[fmtflags.state]

`fmtflags flags() const;`

¹ *Returns:* The format control information for both input and output.

`fmtflags flags(fmtflags fmtfl);`

² *Ensures:* `fmtfl == flags()`.

³ *Returns:* The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl);`

⁴ *Effects:* Sets `fmtfl` in `flags()`.

⁵ *Returns:* The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl, fmtflags mask);`

⁶ *Effects:* Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

⁷ *Returns:* The previous value of `flags()`.

`void unsetf(fmtflags mask);`

⁸ *Effects:* Clears `mask` in `flags()`.

`streamsize precision() const;`

⁹ *Returns:* The precision to generate on certain output conversions.

`streamsize precision(streamsize prec);`

¹⁰ *Ensures:* `prec == precision()`.

¹¹ *Returns:* The previous value of `precision()`.

`streamsize width() const;`

¹² *Returns:* The minimum field width (number of characters) to generate on certain output conversions.

```
streamsize width(streamsize wide);
13   Ensures: wide == width().
14   Returns: The previous value of width().
```

28.5.3.3 Functions

[ios.base.locales]

```
locale imbue(const locale& loc);
```

1 *Effects:* Calls each registered callback pair (*fn*, *idx*) (28.5.3.6) as (**fn*)(imbue_event, *this, *idx*) at such a time that a call to *ios_base::getloc()* from within *fn* returns the new locale value *loc*.

2 *Returns:* The previous value of *getloc()*.

3 *Ensures:* *loc* == *getloc()*.

```
locale getloc() const;
```

4 *Returns:* If no locale has been imbued, a copy of the global C++ locale, *locale()*, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

28.5.3.4 Static members

[ios.members.static]

```
bool sync_with_stdio(bool sync = true);
```

1 *Returns:* *true* if the previous state of the standard iostream objects (28.4) was synchronized and otherwise returns *false*. The first time it is called, the function returns *true*.

2 *Effects:* If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a *false* argument, it allows the standard streams to operate independently of the standard C streams.

3 When a standard iostream object *str* is *synchronized* with a standard stdio stream *f*, the effect of inserting a character *c* by

```
fputc(f, c);
```

is the same as the effect of

```
str.rdbuf()->sputc(c);
```

for any sequences of characters; the effect of extracting a character *c* by

```
c = fgetc(f);
```

is the same as the effect of

```
c = str.rdbuf()->sbumpc();
```

for any sequences of characters; and the effect of pushing back a character *c* by

```
ungetc(c, f);
```

is the same as the effect of

```
str.rdbuf()->sputbackc(c);
```

for any sequence of characters.²⁹²

28.5.3.5 Storage functions

[ios.base.storage]

```
static int xalloc();
```

1 *Returns:* *index* ++.

2 *Remarks:* Concurrent access to this function by multiple threads shall not result in a data race (6.8.2).

```
long& iword(int idx);
```

3 *Requires:* *idx* is a value obtained by a call to *xalloc*.

4 *Effects:* If *iarray* is a null pointer, allocates an array of *long* of unspecified size and stores a pointer to its first element in *iarray*. The function then extends the array pointed at by *iarray* as necessary

²⁹²⁾ This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.

to include the element `iarray[idx]`. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operations on the object.²⁹³ However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `iword` with the same index yields another reference to the same value. If the function fails²⁹⁴ and `*this` is a base class subobject of a `basic_ios`<> object or subobject, the effect is equivalent to calling `basic_ios`<>::`setstate(badbit)` on the derived object (which may throw `failure`).

5 *Returns:* On success `iarray[idx]`. On failure, a valid `long&` initialized to 0.

```
void*& pword(int idx);
```

6 *Requires:* `idx` is a value obtained by a call to `xalloc`.

7 *Effects:* If `parray` is a null pointer, allocates an array of pointers to `void` of unspecified size and stores a pointer to its first element in `parray`. The function then extends the array pointed at by `parray` as necessary to include the element `parray[idx]`. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operations on the object. However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `pword` with the same index yields another reference to the same value. If the function fails²⁹⁵ and `*this` is a base class subobject of a `basic_ios`<> object or subobject, the effect is equivalent to calling `basic_ios`<>::`setstate(badbit)` on the derived object (which may throw `failure`).

8 *Returns:* On success `parray[idx]`. On failure a valid `void*&` initialized to 0.

9 *Remarks:* After a subsequent call to `pword(int)` for the same object, the earlier return value may no longer be valid.

28.5.3.6 Callbacks

[ios.base.callback]

```
void register_callback(event_callback fn, int idx);
```

1 *Effects:* Registers the pair `(fn, idx)` such that during calls to `imbue()` (28.5.3.3), `copyfmt()`, or `~ios_base()` (28.5.3.7), the function `fn` is called with argument `idx`. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

2 *Requires:* The function `fn` shall not throw exceptions.

3 *Remarks:* Identical pairs are not merged. A function registered twice will be called twice.

28.5.3.7 Constructors and destructor

[ios.base.cons]

```
ios_base();
```

1 *Effects:* Each `ios_base` member has an indeterminate value after construction. The object's members shall be initialized by calling `basic_ios::init` before the object's first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~ios_base();
```

2 *Effects:* Destroys an object of class `ios_base`. Calls each registered callback pair `(fn, idx)` (28.5.3.6) as `(*fn)(erase_event, *this, idx)` at such time that any `ios_base` member function called from within `fn` has well-defined results.

28.5.4 Class template fpos

[fpos]

```
namespace std {
    template<class stateT> class fpos {
        public:
            // 28.5.4.1, members
            stateT state() const;
            void state(stateT);
        private:
            stateT st; // exposition only
    };
}
```

293) An implementation is free to implement both the integer array pointed at by `iarray` and the pointer array pointed at by `parray` as sparse data structures, possibly with a one-element cache for each.

294) For example, because it cannot allocate space.

295) For example, because it cannot allocate space.

```
    };
```

28.5.4.1 Members

[**fpos.members**]

```
void state(stateT s);
```

¹ *Effects:* Assigns *s* to *st*.

```
stateT state() const;
```

² *Returns:* Current value of *st*.

28.5.4.2 Requirements

[**fpos.operations**]

¹ An **fpos** type specifies file position information. It holds a state object whose type is equal to the template parameter **stateT**. Type **stateT** shall meet the *Cpp17DefaultConstructible* (Table 25), *Cpp17CopyConstructible* (Table 27), *Cpp17CopyAssignable* (Table 29), and *Cpp17Destructible* (Table 30) requirements. If *is_trivially_copy_constructible_v<stateT>* is true, then **fpos<stateT>** has a trivial copy constructor. If *is_trivially_copy_assignable<stateT>* is true, then **fpos<stateT>** has a trivial copy assignment operator. If *is_trivially_destructible_v<stateT>* is true, then **fpos<stateT>** has a trivial destructor. All specializations of **fpos** satisfy the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, *Cpp17Destructible*, and *Cpp17EqualityComparable* (Table 23) requirements. In addition, the expressions shown in Table 109 are valid and have the indicated semantics. In that table,

- (1.1) — *P* refers to an instance of **fpos**,
- (1.2) — *p* and *q* refer to values of type *P* or *const P*,
- (1.3) — *p1* and *q1* refer to modifiable lvalues of type *P*,
- (1.4) — *O* refers to type **streamoff**, and
- (1.5) — *o* refers to a value of type **streamoff** or *const streamoff*.

Table 109 — Position type requirements

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
<i>P(o)</i>	<i>P</i>	converts from offset	<i>Effects:</i> Value-initializes the state object.
<i>P p(o);</i> <i>P p = o;</i>			<i>Effects:</i> Value-initializes the state object. <i>Ensures:</i> <i>p == P(o)</i>
<i>P()</i>	<i>P</i>	<i>P(O)</i>	
<i>P p;</i>		<i>P p(O);</i>	
<i>O(p)</i>	streamoff	converts to offset	<i>P(O(p)) == p</i>
<i>p != q</i>	convertible to bool	<i>!(p == q)</i>	
<i>p + o</i>	<i>P</i>	+ offset	<i>Remarks:</i> With <i>q1 = p + o</i> ; then: <i>q1 - o == p</i>
<i>p1 += o</i>	<i>P&</i>	+ = offset	<i>Remarks:</i> With <i>q1 = p1</i> ; before the <i>+=</i> , then: <i>p1 - o == q1</i>
<i>p - o</i>	<i>P</i>	- offset	<i>Remarks:</i> With <i>q1 = p - o</i> ; then: <i>q1 + o == p</i>
<i>p1 -= o</i>	<i>P&</i>	- = offset	<i>Remarks:</i> With <i>q1 = p1</i> ; before the <i>-=</i> , then: <i>p1 + o == q1</i>
<i>o + p</i>	convertible to <i>P</i>	<i>p + o</i>	<i>P(o + p) == p + o</i>
<i>p - q</i>	streamoff	distance	<i>p == q + (p - q)</i>

- ² Stream operations that return a value of type **traits::pos_type** return *P(O(-1))* as an invalid value to signal an error. If this value is used as an argument to any **istream**, **ostream**, or **streambuf** member that accepts a value of type **traits::pos_type** then the behavior of that function is undefined.

28.5.5 Class template `basic_ios`

[ios]

28.5.5.1 Overview

[ios.overview]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ios : public ios_base {
public:
    using char_type    = charT;
    using int_type     = typename traits::int_type;
    using pos_type     = typename traits::pos_type;
    using off_type     = typename traits::off_type;
    using traits_type  = traits;

    // 28.5.5.4, flags functions
    explicit operator bool() const;
    bool operator!() const;
    iostate rdstate() const;
    void clear(iostate state = goodbit);
    void setstate(iostate state);
    bool good() const;
    bool eof() const;
    bool fail() const;
    bool bad() const;

    iostate exceptions() const;
    void exceptions(iostate except);

    // 28.5.5.2, constructor/destructor
    explicit basic_ios(basic_streambuf<charT, traits>* sb);
    virtual ~basic_ios();

    // 28.5.5.3, members
    basic_ostream<charT, traits>* tie() const;
    basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);

    basic_streambuf<charT, traits>* rdbuf() const;
    basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

    basic_ios& copyfmt(const basic_ios& rhs);

    char_type fill() const;
    char_type fill(char_type ch);

    locale imbue(const locale& loc);

    char      narrow(char_type c, char dfault) const;
    char_type widen(char c) const;

    basic_ios(const basic_ios&) = delete;
    basic_ios& operator=(const basic_ios&) = delete;

protected:
    basic_ios();
    void init(basic_streambuf<charT, traits>* sb);
    void move(basic_ios& rhs);
    void move(basic_ios&& rhs);
    void swap(basic_ios& rhs) noexcept;
    void set_rdbuf(basic_streambuf<charT, traits>* sb);

};

}

```

28.5.5.2 Constructors

[basic.ios.cons]

```
explicit basic_ios(basic_streambuf<charT, traits>* sb);
```

- 1 *Effects:* Constructs an object of class `basic_ios`, assigning initial values to its member objects by calling `init(sb)`.

```
basic_ios();
```

- 2 *Effects:* Constructs an object of class `basic_ios` (28.5.3.7) leaving its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~basic_ios();
```

- 3 *Remarks:* The destructor does not destroy `rdbuf()`.

```
void init(basic_streambuf<charT, traits>* sb);
```

- 4 *Ensures:* The postconditions of this function are indicated in Table 110.

Table 110 — `basic_ios::init()` effects

Element	Value
<code>rdbuf()</code>	<code>sb</code>
<code>tie()</code>	<code>0</code>
<code>rdstate()</code>	goodbit if <code>sb</code> is not a null pointer, otherwise badbit.
<code>exceptions()</code>	goodbit
<code>flags()</code>	<code>skipws dec</code>
<code>width()</code>	<code>0</code>
<code>precision()</code>	<code>6</code>
<code>fill()</code>	<code>widen(' ')</code>
<code>getloc()</code>	a copy of the value returned by <code>locale()</code>
<code>iarray</code>	a null pointer
<code>parray</code>	a null pointer

28.5.5.3 Member functions

[basic.ios.members]

```
basic_ostream<charT, traits>* tie() const;
```

- 1 *Returns:* An output sequence that is tied to (synchronized with) the sequence controlled by the stream buffer.

```
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

- 2 *Requires:* If `tiestr` is not null, `tiestr` shall not be reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

- 3 *Ensures:* `tiestr == tie()`.

- 4 *Returns:* The previous value of `tie()`.

```
basic_streambuf<charT, traits>* rdbuf() const;
```

- 5 *Returns:* A pointer to the `streambuf` associated with the stream.

```
basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
```

- 6 *Ensures:* `sb == rdbuf()`.

- 7 *Effects:* Calls `clear()`.

- 8 *Returns:* The previous value of `rdbuf()`.

```
locale imbue(const locale& loc);
```

- 9 *Effects:* Calls `ios_base::imbue(loc)` (28.5.3.3) and if `rdbuf() != 0` then `rdbuf()->pubimbue(loc)` (28.6.3.2.1).

10 *Returns:* The prior value of `ios_base::imbue()`.

```
char narrow(char_type c, char dfault) const;
11      Returns: use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)
```

12 *Returns:* `use_facet<ctype<char_type>>(getloc()).widen(c)`

13 *Returns:* The character used to pad (fill) an output conversion to the specified field width.

```
char_type fill() const;
14      Ensures: traits::eq(fillch, fill()).
15      Returns: The previous value of fill().
```

16 *Effects:* If `(this == addressof(rhs))` does nothing. Otherwise assigns to the member objects of `*this` the corresponding member objects of `rhs` as follows:

- (16.1) — calls each registered callback pair `(fn, idx)` as `(*fn)(erase_event, *this, idx)`;
- (16.2) — then, assigns to the member objects of `*this` the corresponding member objects of `rhs`, except that
 - (16.2.1) — `rdstate()`, `rdbuf()`, and `exceptions()` are left unchanged;
 - (16.2.2) — the contents of arrays pointed at by `pword` and `iword` are copied, not the pointers themselves;²⁹⁶ and
 - (16.2.3) — if any newly stored pointer values in `*this` point at objects stored outside the object `rhs` and those objects are destroyed when `rhs` is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
- (16.3) — then, calls each callback pair that was copied from `rhs` as `(*fn)(copyfmt_event, *this, idx)`;
- (16.4) — then, calls `exceptions(rhs.exceptions())`.

17 *[Note:* The second pass through the callback pairs permits a copied `pword` value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. — *end note*]

18 *Ensures:* The postconditions of this function are indicated in Table 111.

Table 111 — `basic_ios::copyfmt()` effects

Element	Value
<code>rdbuf()</code>	<i>unchanged</i>
<code>tie()</code>	<code>rhs.tie()</code>
<code>rdstate()</code>	<i>unchanged</i>
<code>exceptions()</code>	<code>rhs.exceptions()</code>
<code>flags()</code>	<code>rhs.flags()</code>
<code>width()</code>	<code>rhs.width()</code>
<code>precision()</code>	<code>rhs.precision()</code>
<code>fill()</code>	<code>rhs.fill()</code>
<code>getloc()</code>	<code>rhs.getloc()</code>

19 *Returns:* `*this`.

```
void move(basic_ios& rhs);
```

296) This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.

```

void move(basic_ios&& rhs);

20   Ensures: *this shall have the state that rhs had before the function call, except that rdbuf() shall
      return 0. rhs shall be in a valid but unspecified state, except that rhs.rdbuf() shall return the same
      value as it returned before the function call, and rhs.tie() shall return 0.

void swap(basic_ios& rhs) noexcept;

21   Effects: The states of *this and rhs shall be exchanged, except that rdbuf() shall return the same
      value as it returned before the function call, and rhs.rdbuf() shall return the same value as it returned
      before the function call.

void set_rdbuf(basic_streambuf<charT, traits>* sb);

22   Requires: sb != nullptr.

23   Effects: Associates the basic_streambuf object pointed to by sb with this stream without calling
      clear().

24   Ensures: rdbuf() == sb.

25   Throws: Nothing.

```

28.5.5.4 Flags functions

[iostate.flags]

```

explicit operator bool() const;

1    Returns: !fail().

bool operator!() const;

2    Returns: fail().

iostate rdstate() const;

3    Returns: The error state of the stream buffer.

void clear(iostate state = goodbit);

4    Ensures: If rdbuf() != 0 then state == rdstate(); otherwise rdstate() == (state | ios_
      base::badbit).

5    Effects: If ((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0, returns. Otherwise,
      the function throws an object of class basic_ios::failure (28.5.3.1.1), constructed with
      implementation-defined argument values.

void setstate(iostate state);

6    Effects: Calls clear(rdstate() | state) (which may throw basic_ios::failure (28.5.3.1.1)).

bool good() const;

7    Returns: rdstate() == 0

bool eof() const;

8    Returns: true if eofbit is set in rdstate().

bool fail() const;

9    Returns: true if failbit or badbit is set in rdstate().297

bool bad() const;

10   Returns: true if badbit is set in rdstate().

iostate exceptions() const;

11   Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.

void exceptions(iostate except);

12   Ensures: except == exceptions().

```

²⁹⁷) Checking badbit also for fail() is historical practice.

13 *Effects:* Calls `clear(rdstate())`.

28.5.6 `ios_base` manipulators

[`std.ios.manip`]

28.5.6.1 `fmtflags` manipulators

[`fmtflags.manip`]

1 Each function specified in this subclause is a designated addressable function (15.5.4.2.1).

ios_base& `boolalpha(ios_base& str)`;

2 *Effects:* Calls `str.setf(ios_base::boolalpha)`.

3 *Returns:* `str`.

ios_base& `noboolalpha(ios_base& str)`;

4 *Effects:* Calls `str.unsetf(ios_base::boolalpha)`.

5 *Returns:* `str`.

ios_base& `showbase(ios_base& str)`;

6 *Effects:* Calls `str.setf(ios_base::showbase)`.

7 *Returns:* `str`.

ios_base& `noshowbase(ios_base& str)`;

8 *Effects:* Calls `str.unsetf(ios_base::showbase)`.

9 *Returns:* `str`.

ios_base& `showpoint(ios_base& str)`;

10 *Effects:* Calls `str.setf(ios_base::showpoint)`.

11 *Returns:* `str`.

ios_base& `noshowpoint(ios_base& str)`;

12 *Effects:* Calls `str.unsetf(ios_base::showpoint)`.

13 *Returns:* `str`.

ios_base& `showpos(ios_base& str)`;

14 *Effects:* Calls `str.setf(ios_base::showpos)`.

15 *Returns:* `str`.

ios_base& `noshowpos(ios_base& str)`;

16 *Effects:* Calls `str.unsetf(ios_base::showpos)`.

17 *Returns:* `str`.

ios_base& `skipws(ios_base& str)`;

18 *Effects:* Calls `str.setf(ios_base::skipws)`.

19 *Returns:* `str`.

ios_base& `noskipws(ios_base& str)`;

20 *Effects:* Calls `str.unsetf(ios_base::skipws)`.

21 *Returns:* `str`.

ios_base& `uppercase(ios_base& str)`;

22 *Effects:* Calls `str.setf(ios_base::uppercase)`.

23 *Returns:* `str`.

ios_base& `nouppercase(ios_base& str)`;

24 *Effects:* Calls `str.unsetf(ios_base::uppercase)`.

25 *Returns:* `str`.

```

ios_base& unitbuf(ios_base& str);
26   Effects: Calls str.setf(ios_base::unitbuf).
27   Returns: str.

ios_base& nounitbuf(ios_base& str);
28   Effects: Calls str.unsetf(ios_base::unitbuf).
29   Returns: str.

```

28.5.6.2 adjustfield manipulators

[adjustfield.manip]

- ¹ Each function specified in this subclause is a designated addressable function (15.5.4.2.1).

```

ios_base& internal(ios_base& str);
2   Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).
3   Returns: str.

ios_base& left(ios_base& str);
4   Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).
5   Returns: str.

ios_base& right(ios_base& str);
6   Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).
7   Returns: str.

```

28.5.6.3 basefield manipulators

[basefield.manip]

- ¹ Each function specified in this subclause is a designated addressable function (15.5.4.2.1).

```

ios_base& dec(ios_base& str);
2   Effects: Calls str.setf(ios_base::dec, ios_base::basefield).
3   Returns: str298.

ios_base& hex(ios_base& str);
4   Effects: Calls str.setf(ios_base::hex, ios_base::basefield).
5   Returns: str.

ios_base& oct(ios_base& str);
6   Effects: Calls str.setf(ios_base::oct, ios_base::basefield).
7   Returns: str.

```

28.5.6.4 floatfield manipulators

[floatfield.manip]

- ¹ Each function specified in this subclause is a designated addressable function (15.5.4.2.1).

```

ios_base& fixed(ios_base& str);
2   Effects: Calls str.setf(ios_base::fixed, ios_base::floatfield).
3   Returns: str.

ios_base& scientific(ios_base& str);
4   Effects: Calls str.setf(ios_base::scientific, ios_base::floatfield).
5   Returns: str.

ios_base& hexfloat(ios_base& str);
6   Effects: Calls str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield).
7   Returns: str.

```

²⁹⁸) The function signature `dec(ios_base&)` can be called by the function signature `basic_ostream& stream::operator<<(ios_base& (*)(ios_base&))` to permit expressions of the form `cout << dec` to change the format flags stored in `cout`.

⁸ [Note: The more obvious use of `ios_base::hex` to specify hexadecimal floating-point format would change the meaning of existing well-defined programs. C++ 2003 gives no meaning to the combination of `fixed` and `scientific`. — end note]

```
ios_base& defaultfloat(ios_base& str);
Effects: Calls str.unsetf(ios_base::floatfield).
Returns: str.
```

28.5.7 Error reporting

[error.reporting]

```
error_code make_error_code(io_errc e) noexcept;
>Returns: error_code(static_cast<int>(e), iostream_category());
error_condition make_error_condition(io_errc e) noexcept;
>Returns: error_condition(static_cast<int>(e), iostream_category());
const error_category& iostream_category() noexcept;
>Returns: A reference to an object of a type derived from class error_category.
The object's default_error_condition and equivalent virtual functions shall behave as specified for the class error_category. The object's name virtual function shall return a pointer to the string "iostream".
```

28.6 Stream buffers

[stream.buffers]

28.6.1 Header <streambuf> synopsis

[streambuf.syn]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf;
    using streambuf = basic_streambuf<char>;
    using wstreambuf = basic_streambuf<wchar_t>;
}
```

¹ The header <streambuf> defines types that control input from and output to *character* sequences.

28.6.2 Stream buffer requirements

[streambuf.reqts]

- ¹ Stream buffers can impose various constraints on the sequences they control. Some constraints are:
 - (1.1) — The controlled input sequence can be not readable.
 - (1.2) — The controlled output sequence can be not writable.
 - (1.3) — The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.
 - (1.4) — The controlled sequences can support operations *directly* to or from associated sequences.
 - (1.5) — The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.
- ² Each sequence is characterized by three pointers which, if non-null, all point into the same `charT` array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:
 - (2.1) — the *beginning pointer*, or lowest element address in the array (called `xbeg` here);
 - (2.2) — the *next pointer*, or next element address that is a current candidate for reading or writing (called `xnext` here);
 - (2.3) — the *end pointer*, or first element address beyond the end of the array (called `xend` here).
- ³ The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:

- (3.1) — If `xnext` is not a null pointer, then `xbeg` and `xend` shall also be non-null pointers into the same `charT` array, as described above; otherwise, `xbeg` and `xend` shall also be null.
- (3.2) — If `xnext` is not a null pointer and `xnext < xend` for an output sequence, then a *write position* is available. In this case, `*xnext` shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
- (3.3) — If `xnext` is not a null pointer and `xbeg < xnext` for an input sequence, then a *putback position* is available. In this case, `xnext[-1]` shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.
- (3.4) — If `xnext` is not a null pointer and `xnext < xend` for an input sequence, then a *read position* is available. In this case, `*xnext` shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

28.6.3 Class template `basic_streambuf`

[`streambuf`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf {
        public:
            using char_type    = charT;
            using int_type     = typename traits::int_type;
            using pos_type     = typename traits::pos_type;
            using off_type     = typename traits::off_type;
            using traits_type  = traits;

            virtual ~basic_streambuf();

            // 28.6.3.2.1, locales
            locale pubimbue(const locale& loc);
            locale getloc() const;

            // 28.6.3.2.2, buffer and positioning
            basic_streambuf* pubsetbuf(char_type* s, streamsize n);
            pos_type pubseekoff(off_type off, ios_base::seekdir way,
                                ios_base::openmode which
                                = ios_base::in | ios_base::out);
            pos_type pubseekpos(pos_type sp,
                                ios_base::openmode which
                                = ios_base::in | ios_base::out);
            int pubsync();

            // get and put areas
            // 28.6.3.2.3, get area
            streamsize in_avail();
            int_type snextc();
            int_type sbumpc();
            int_type sgetc();
            streamsize sgetn(char_type* s, streamsize n);

            // 28.6.3.2.4, putback
            int_type sputbackc(char_type c);
            int_type sungetc();

            // 28.6.3.2.5, put area
            int_type sputc(char_type c);
            streamsize sputn(const char_type* s, streamsize n);

        protected:
            basic_streambuf();
            basic_streambuf(const basic_streambuf& rhs);
            basic_streambuf& operator=(const basic_streambuf& rhs);

            void swap(basic_streambuf& rhs);
    };
}
```

```

// 28.6.3.3.2, get area access
char_type* eback() const;
char_type* gptr() const;
char_type* egptr() const;
void        gbump(int n);
void        setg(char_type* gbeg, char_type* gnext, char_type* gend);

// 28.6.3.3.3, put area access
char_type* pbase() const;
char_type* pptr() const;
char_type* epptr() const;
void        pbump(int n);
void        setp(char_type* pbeg, char_type* pend);

// 28.6.3.4, virtual functions
// 28.6.3.4.1, locales
virtual void imbue(const locale& loc);

// 28.6.3.4.2, buffer management and positioning
virtual basic_streambuf* setbuf(char_type* s, streamsize n);
virtual pos_type seekoff(off_type off, ios_base::seekdir way,
                        ios_base::openmode which
                        = ios_base::in | ios_base::out);
virtual pos_type seekpos(pos_type sp,
                        ios_base::openmode which
                        = ios_base::in | ios_base::out);
virtual int      sync();

// 28.6.3.4.3, get area
virtual streamsize showmany();
virtual streamsize xsgetn(char_type* s, streamsize n);
virtual int_type   underflow();
virtual int_type   uflow();

// 28.6.3.4.4, putback
virtual int_type   pbackfail(int_type c = traits::eof());

// 28.6.3.4.5, put area
virtual streamsize xsputn(const char_type* s, streamsize n);
virtual int_type   overflow(int_type c = traits::eof());
};

}

```

¹ The class template `basic_streambuf` serves as an abstract base class for deriving various *stream buffers* whose objects each control two *character sequences*:

- (1.1) — a character *input sequence*;
- (1.2) — a character *output sequence*.

28.6.3.1 Constructors

[`streambuf.cons`]

`basic_streambuf();`

- 1 *Effects:* Constructs an object of class `basic_streambuf<charT, traits>` and initializes:²⁹⁹
 - (1.1) — all its pointer member objects to null pointers,
 - (1.2) — the `getloc()` member to a copy the global locale, `locale()`, at the time of construction.
- 2 *Remarks:* Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

²⁹⁹) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class may be constructed.

```
basic_streambuf(const basic_streambuf& rhs);
3   Effects: Constructs a copy of rhs.
4   Ensures:
(4.1)   — eback() == rhs.eback()
(4.2)   — gptr() == rhs.gptr()
(4.3)   — egptr() == rhs.egptr()
(4.4)   — pbase() == rhs.pbase()
(4.5)   — pptr() == rhs.ptr()
(4.6)   — eptr() == rhs.eptr()
(4.7)   — getloc() == rhs.getloc()

~basic_streambuf();

5   Effects: None.
```

28.6.3.2 Public member functions

[streambuf.members]

28.6.3.2.1 Locales

[streambuf.locales]

```
locale pubimbue(const locale& loc);
1   Ensures: loc == getloc().
2   Effects: Calls imbue(loc).
3   Returns: Previous value of getloc().
```

```
locale getloc() const;
4   Returns: If pubimbue() has ever been called, then the last value of loc supplied, otherwise the current global locale, locale(), in effect at the time of construction. If called after pubimbue() has been called but before pubimbue has returned (i.e., from within the call of imbue()) then it returns the previous value.
```

28.6.3.2.2 Buffer management and positioning

[streambuf.buffer]

```
basic_streambuf* pubsetbuf(char_type* s, streamsize n);
1   Returns: setbuf(s, n).

pos_type pubseekoff(off_type off, ios_base::seekdir way,
                    ios_base::openmode which
                    = ios_base::in | ios_base::out);
2   Returns: seekoff(off, way, which).

pos_type pubseekpos(pos_type sp,
                    ios_base::openmode which
                    = ios_base::in | ios_base::out);
3   Returns: seekpos(sp, which).

int pubsync();
4   Returns: sync().
```

28.6.3.2.3 Get area

[streambuf.pub.get]

```
streamsize in_avail();
1   Returns: If a read position is available, returns egptr() - gptr(). Otherwise returns showmany()
```

(28.6.3.4.3).

```
int_type snextc();
2   Effects: Calls sbumpc().
3   Returns: If that function returns traits::eof(), returns traits::eof(). Otherwise, returns sgetc().
```

```

int_type sbumpc();
4   Returns: If the input sequence read position is not available, returns uflow(). Otherwise, returns
   traits::to_int_type(*gptr()) and increments the next pointer for the input sequence.

int_type sgetc();
5   Returns: If the input sequence read position is not available, returns underflow(). Otherwise, returns
   traits::to_int_type(*gptr()).

streamsize sgetn(char_type* s, streamsize n);
6   Returns: xsgetn(s, n).

```

28.6.3.2.4 Putback [streambuf.pub.pback]

```

int_type sputbackc(char_type c);
1   Returns: If the input sequence putback position is not available, or if traits::eq(c, gptr()[-1])
   is false, returns pbackfail(traits::to_int_type(c)). Otherwise, decrements the next pointer for
   the input sequence and returns traits::to_int_type(*gptr()).

```

```

int_type sungetc();
2   Returns: If the input sequence putback position is not available, returns pbackfail(). Otherwise,
   decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

```

28.6.3.2.5 Put area [streambuf.pub.put]

```

int_type sputc(char_type c);
1   Returns: If the output sequence write position is not available, returns overflow(traits::to_int_
   type(c)). Otherwise, stores c at the next pointer for the output sequence, increments the pointer, and
   returns traits::to_int_type(c).

```

```

streamsize sputn(const char_type* s, streamsize n);
2   Returns: xsputn(s, n).

```

28.6.3.3 Protected member functions [streambuf.protected]

28.6.3.3.1 Assignment [streambuf.assign]

```

basic_streambuf& operator=(const basic_streambuf& rhs);

```

1 *Effects:* Assigns the data members of `rhs` to `*this`.

2 *Ensures:*

- (2.1) — `eback() == rhs.eback()`
- (2.2) — `gptr() == rhs.gptr()`
- (2.3) — `egptr() == rhs.egptr()`
- (2.4) — `pbase() == rhs.pbase()`
- (2.5) — `pptr() == rhs.pptr()`
- (2.6) — `eptr() == rhs.eptr()`
- (2.7) — `getloc() == rhs.getloc()`

3 *Returns:* `*this`.

```

void swap(basic_streambuf& rhs);

```

4 *Effects:* Swaps the data members of `rhs` and `*this`.

28.6.3.3.2 Get area access [streambuf.get.area]

```

char_type* eback() const;

```

1 *Returns:* The beginning pointer for the input sequence.

```

char_type* gptr() const;
2     Returns: The next pointer for the input sequence.

char_type* egptr() const;
3     Returns: The end pointer for the input sequence.

void gbump(int n);
4     Effects: Adds n to the next pointer for the input sequence.

void setg(char_type* gbeg, char_type* gnex, char_type* gend);
5     Ensures: gbeg == eback(), gnex == gptr(), and gend == egptr().

```

28.6.3.3.3 Put area access

[streambuf.put.area]

```

char_type* pbase() const;
1     Returns: The beginning pointer for the output sequence.

char_type* pptr() const;
2     Returns: The next pointer for the output sequence.

char_type* epptr() const;
3     Returns: The end pointer for the output sequence.

void pbump(int n);
4     Effects: Adds n to the next pointer for the output sequence.

void setp(char_type* pbeg, char_type* pend);
5     Ensures: pbeg == pbase(), pbeg == pptr(), and pend == epptr().

```

28.6.3.4 Virtual functions

[streambuf.virtuals]

28.6.3.4.1 Locales

[streambuf.virt.locales]

```

void imbue(const locale&);
1     Effects: Change any translations based on locale.

Remarks: Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.

3     Default behavior: Does nothing.

```

28.6.3.4.2 Buffer management and positioning

[streambuf.virt.buffer]

```

basic_streambuf* setbuf(char_type* s, streamsize n);
1     Effects: Influences stream buffering in a way that is defined separately for each class derived from basic_streambuf in this Clause (28.8.2.4, 28.9.2.4).

2     Default behavior: Does nothing. Returns this.

```

```

pos_type seekoff(off_type off, ios_base::seekdir way,
                  ios_base::openmode which
                  = ios_base::in | ios_base::out);

3     Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (28.8.2.4, 28.9.2.4).

4     Default behavior: Returns pos_type(off_type(-1)).

```

```

pos_type seekpos(pos_type sp,
                  ios_base::openmode which
                  = ios_base::in | ios_base::out);

5     Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (28.8.2, 28.9.2).

```

6 *Default behavior:* Returns `pos_type(off_type(-1))`.

```
int sync();
```

7 *Effects:* Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

8 *Returns:* -1 on failure. What constitutes failure is determined by each derived class (28.9.2.4).

9 *Default behavior:* Returns zero.

28.6.3.4.3 Get area

[`streambuf.virt.get`]

```
streamsize showmany();300
```

1 *Returns:* An estimate of the number of characters available in the sequence, or -1. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmany()` returns -1, then calls to `underflow()` or `uflow()` will fail.³⁰¹

2 *Default behavior:* Returns zero.

3 *Remarks:* Uses `traits::eof()`.

```
streamsize xsgetn(char_type* s, streamsize n);
```

4 *Effects:* Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `smpc()`. Assigning stops when either `n` characters have been assigned or a call to `smpc()` would return `traits::eof()`.

5 *Returns:* The number of characters assigned.³⁰²

6 *Remarks:* Uses `traits::eof()`.

```
int_type underflow();
```

7 *Remarks:* The public members of `basic_streambuf` call this virtual function only if `gptr()` is null or `gptr() >= egptr()`

8 *Returns:* `traits::to_int_type(c)`, where `c` is the first *character* of the *pending sequence*, without moving the input sequence position past it. If the pending sequence is null then the function returns `traits::eof()` to indicate failure.

9 The *pending sequence* of characters is defined as the concatenation of

- (9.1) — the empty sequence if `gptr()` is null, otherwise the characters in `[gptr(), egptr())`, followed by
- (9.2) — some (possibly empty) sequence of characters read from the input sequence.

10 The *result character* is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

11 The *backup sequence* is the empty sequence if `eback()` is null, otherwise the characters in `[eback(), gptr())`.

12 *Effects:* The function sets up the `gptr()` and `egptr()` such that if the pending sequence is non-empty, then `egptr()` is non-null and the characters in `[gptr(), egptr())` are the characters in the pending sequence, otherwise either `gptr()` is null or `gptr() == egptr()`.

13 If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either

- (13.1) — the backup sequence contains at least `gptr() - eback()` characters, in which case the characters in `[eback(), gptr())` agree with the last `gptr() - eback()` characters of the backup sequence,
- or

³⁰⁰) The morphemes of `showmany` are “es-how-many-see”, not “show-manic”.

³⁰¹) `underflow` or `uflow` might fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately”.

³⁰²) Classes derived from `basic_streambuf` can provide more efficient ways to implement `xsgetn()` and `xspoutn()` by overriding these definitions from the base class.

(13.2) — the characters in $[\text{gptr}() - n, \text{gptr}())$ agree with the backup sequence (where n is the length of the backup sequence).

14 *Default behavior:* Returns `traits::eof()`.

```
int_type uflow();
```

15 *Requires:* The constraints are the same as for `underflow()`, except that the result character shall be transferred from the pending sequence to the backup sequence, and the pending sequence shall not be empty before the transfer.

16 *Default behavior:* Calls `underflow()`. If `underflow()` returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns the value of `traits::to_int_type(*gptr())` and increment the value of the next pointer for the input sequence.

17 *Returns:* `traits::eof()` to indicate failure.

28.6.3.4.4 Putback

[`streambuf.virt.pback`]

```
int_type pbackfail(int_type c = traits::eof());
```

1 *Remarks:* The public functions of `basic_streambuf` call this virtual function only when `gptr()` is null, `gptr() == eback()`, or `traits::eq(traits::to_char_type(c), gptr()[-1])` returns `false`. Other calls shall also satisfy that constraint.

The *pending sequence* is defined as for `underflow()`, with the modifications that

(1.1) — If `traits::eq_int_type(c, traits::eof())` returns `true`, then the input sequence is backed up one character before the pending sequence is determined.

(1.2) — If `traits::eq_int_type(c, traits::eof())` returns `false`, then `c` is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

2 *Ensures:* On return, the constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

3 *Returns:* `traits::eof()` to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers could not be set consistent with the constraints. `pbackfail()` is called only when put back has really failed.

4 Returns some value other than `traits::eof()` to indicate success.

5 *Default behavior:* Returns `traits::eof()`.

28.6.3.4.5 Put area

[`streambuf.virt.put`]

```
streamsize xsputn(const char_type* s, streamsize n);
```

1 *Effects:* Writes up to n characters to the output sequence as if by repeated calls to `sputc(c)`. The characters written are obtained from successive elements of the array whose first element is designated by `s`. Writing stops when either n characters have been written or a call to `sputc(c)` would return `traits::eof()`. It is unspecified whether the function calls `overflow()` when `pptr() == epptr()` becomes `true` or whether it achieves the same effects by other means.

2 *Returns:* The number of characters written.

```
int_type overflow(int_type c = traits::eof());
```

3 *Effects:* Consumes some initial subsequence of the characters of the *pending sequence*. The pending sequence is defined as the concatenation of

(3.1) — the empty sequence if `pbase()` is null, otherwise the `pptr() - pbase()` characters beginning at `pbase()`, followed by

(3.2) — the empty sequence if `traits::eq_int_type(c, traits::eof())` returns `true`, otherwise the sequence consisting of `c`.

4 *Remarks:* The member functions `sputc()` and `sputn()` call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

5 *Requires:* Every overriding definition of this virtual function shall obey the following constraints:

- (5.1) — The effect of consuming a character on the associated output sequence is specified.³⁰³
- (5.2) — Let r be the number of characters in the pending sequence not consumed. If r is nonzero then $\text{pbase}()$ and $\text{pptr}()$ shall be set so that: $\text{pptr}() - \text{pbase}() == r$ and the r characters starting at $\text{pbase}()$ are the associated output stream. In case r is zero (all characters of the pending sequence have been consumed) then either $\text{pbase}()$ is set to `nullptr`, or $\text{pbase}()$ and $\text{pptr}()$ are both set to the same non-null value.
- (5.3) — The function may fail if either appending some character to the associated output stream fails or if it is unable to establish $\text{pbase}()$ and $\text{pptr}()$ according to the above rules.

6 *Returns:* `traits::eof()` or throws an exception if the function fails.

Otherwise, returns some value other than `traits::eof()` to indicate success.³⁰⁴

7 *Default behavior:* Returns `traits::eof()`.

28.7 Formatting and manipulators

[**iostream.format**]

28.7.1 Header <iostream> synopsis

[**istream.syn**]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_istream;

    using istream = basic_istream<char>;
    using wistream = basic_istream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_iostream;

    using iostream = basic_iostream<char>;
    using wiostream = basic_iostream<wchar_t>;

    template<class charT, class traits>
        basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

    template<class charT, class traits, class T>
        basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&& is, T&& x);
}
```

28.7.2 Header <ostream> synopsis

[**ostream.syn**]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_ostream;

    using ostream = basic_ostream<char>;
    using wostream = basic_ostream<wchar_t>;

    template<class charT, class traits>
        basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
    template<class charT, class traits>
        basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
    template<class charT, class traits>
        basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);

    template<class charT, class traits>
        basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
    template<class charT, class traits>
        basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
    template<class charT, class traits>
        basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);
```

303) That is, for each class derived from an instance of `basic_streambuf` in this Clause (28.8.2, 28.9.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.

304) Typically, `overflow` returns `c` to indicate success, except when `traits::eq_int_type(c, traits::eof())` returns `true`, in which case it returns `traits::not_eof(c)`.

```
template<class charT, class traits, class T>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&& os, const T& x);
}
```

28.7.3 Header <iomanip> synopsis

[iomanip.syn]

```
namespace std {
    // types T1, T2, ... are unspecified implementation types
    T1 resetiosflags(ios_base::fmtflags mask);
    T2 setiosflags (ios_base::fmtflags mask);
    T3 setbase(int base);
    template<class charT> T4 setfill(charT c);
    T5 setprecision(int n);
    T6 setw(int n);
    template<class moneyT> T7 get_money(moneyT& mon, bool intl = false);
    template<class moneyT> T8 put_money(const moneyT& mon, bool intl = false);
    template<class charT> T9 get_time(struct tm* tmb, const charT* fmt);
    template<class charT> T10 put_time(const struct tm* tmb, const charT* fmt);

    template<class charT>
        T11 quoted(const charT* s, charT delim = charT(')'), charT escape = charT('\\'));

    template<class charT, class traits, class Allocator>
        T12 quoted(const basic_string<charT, traits, Allocator>& s,
                   charT delim = charT(')'), charT escape = charT('\\'));

    template<class charT, class traits, class Allocator>
        T13 quoted(basic_string<charT, traits, Allocator>& s,
                   charT delim = charT(')'), charT escape = charT('\\'));

    template<class charT, class traits>
        T14 quoted(basic_string_view<charT, traits> s,
                   charT delim = charT(')'), charT escape = charT('\\'));
}
```

28.7.4 Input streams

[input.streams]

- ¹ The header <iostream> defines two types and a function signature that control input from a stream buffer along with a function template that extracts from stream rvalues.

28.7.4.1 Class template basic_istream

[iostream]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_istream : virtual public basic_ios<charT, traits> {
    public:
        // types (inherited from basic_ios (28.5.5))
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 28.7.4.1.1, constructor/destructor
        explicit basic_istream(basic_streambuf<charT, traits>* sb);
        virtual ~basic_istream();

        // 28.7.4.1.3, prefix/suffix
        class sentry;

        // 28.7.4.2, formatted input
        basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& (*pf)(basic_istream<charT, traits>&));
        basic_istream<charT, traits>&
            operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
}
```

```

basic_istream<charT, traits>&
operator>>(ios_base& (*pf)(ios_base&));

basic_istream<charT, traits>& operator>>(bool& n);
basic_istream<charT, traits>& operator>>(short& n);
basic_istream<charT, traits>& operator>>(unsigned short& n);
basic_istream<charT, traits>& operator>>(int& n);
basic_istream<charT, traits>& operator>>(unsigned int& n);
basic_istream<charT, traits>& operator>>(long& n);
basic_istream<charT, traits>& operator>>(unsigned long& n);
basic_istream<charT, traits>& operator>>(long long& n);
basic_istream<charT, traits>& operator>>(unsigned long long& n);
basic_istream<charT, traits>& operator>>(float& f);
basic_istream<charT, traits>& operator>>(double& f);
basic_istream<charT, traits>& operator>>(long double& f);

basic_istream<charT, traits>& operator>>(void*& p);
basic_istream<charT, traits>& operator>>(basic_streambuf<char_type, traits>* sb);

// 28.7.4.3, unformatted input
streamsize gcount() const;
int_type get();
basic_istream<charT, traits>& get(char_type& c);
basic_istream<charT, traits>& get(char_type* s, streamsize n);
basic_istream<charT, traits>& get(char_type* s, streamsize n, char_type delim);
basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb);
basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb, char_type delim);

basic_istream<charT, traits>& getline(char_type* s, streamsize n);
basic_istream<charT, traits>& getline(char_type* s, streamsize n, char_type delim);

basic_istream<charT, traits>& ignore(streamsize n = 1, int_type delim = traits::eof());
int_type peek();
basic_istream<charT, traits>& read    (char_type* s, streamsize n);
streamsize      readsome(char_type* s, streamsize n);

basic_istream<charT, traits>& putback(char_type c);
basic_istream<charT, traits>& unget();
int sync();

pos_type tellg();
basic_istream<charT, traits>& seekg(pos_type);
basic_istream<charT, traits>& seekg(off_type, ios_base::seekdir);

protected:
// 28.7.4.1.1, copy/move constructor
basic_istream(const basic_istream& rhs) = delete;
basic_istream(basic_istream&& rhs);

// 28.7.4.1.2, assign and swap
basic_istream& operator=(const basic_istream& rhs) = delete;
basic_istream& operator=(basic_istream&& rhs);
void swap(basic_istream& rhs);
};

// 28.7.4.2.3, character extraction templates
template<class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char&);

```

```

template<class charT, class traits, size_t N>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT(&)[N]);
template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char(&)[N]);
template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char(&)[N]);
}

```

- ¹ The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.
- ² Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions*. Both groups of input functions are described as if they obtain (or *extract*) input *characters* by calling `rdbuf()>sbumpc()` or `rdbuf()>sgetc()`. They may use other public members of `istream`.
- ³ If `rdbuf()>sbumpc()` or `rdbuf()>sgetc()` returns `traits::eof()`, then the input function, except as explicitly noted otherwise, completes its actions and does `setstate(eofbit)`, which may throw `ios-base::failure` (28.5.5.4), before returning.
- ⁴ If one of these called functions throws an exception, then unless explicitly noted otherwise, the input function sets `badbit` in error state. If `badbit` is on in `exceptions()`, the input function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

28.7.4.1.1 Constructors

[istream.cons]

```
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

- ¹ *Effects:* Constructs an object of class `basic_istream`, initializing the base class subobject with `basic_ios::init(sb)` (28.5.5.2).
- ² *Ensures:* `gcount() == 0`.

```
basic_istream(basic_istream&& rhs);
```

- ³ *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class, copying the `gcount()` from `rhs`, calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and setting the `gcount()` for `rhs` to 0.

```
virtual ~basic_istream();
```

- ⁴ *Effects:* Destroys an object of class `basic_istream`.
- ⁵ *Remarks:* Does not perform any operations of `rdbuf()`.

28.7.4.1.2 Assignment and swap

[istream.assign]

```
basic_istream& operator=(basic_istream&& rhs);
```

- ¹ *Effects:* As if by `swap(rhs)`.
- ² *Returns:* `*this`.

```
void swap(basic_istream& rhs);
```

- ³ *Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.

28.7.4.1.3 Class `basic_istream::sentry`

[istream::sentry]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream<charT, traits>::sentry {
        using traits_type = traits;
        bool ok_; // exposition only
    public:
        explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);
        ~sentry();
        explicit operator bool() const { return ok_; }
        sentry(const sentry&) = delete;
    };
}
```

```

    sentry& operator=(const sentry&) = delete;
};

}

```

1 The class **sentry** defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);
```

2 *Effects:* If **is.good()** is **false**, calls **is.setstate(failbit)**. Otherwise, prepares for formatted or unformatted input. First, if **is.tie()** is not a null pointer, the function calls **is.tie()->flush()** to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of **is.tie()** is empty. Further an implementation is allowed to defer the call to **flush** until a call of **is.rdbuf()->underflow()** occurs. If no such call occurs before the **sentry** object is destroyed, the call to **flush** may be eliminated entirely.³⁰⁵ If **noskipws** is zero and **is.flags() & ios_base::skipws** is nonzero, the function extracts and discards each character as long as the next available input character **c** is a whitespace character. If **is.rdbuf()->sbufpc()** or **is.rdbuf()->sgetc()** returns **traits::eof()**, the function calls **setstate(failbit | eofbit)** (which may throw **ios_base::failure**).

3 *Remarks:* The constructor

```
explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false)
```

uses the currently imbued locale in **is**, to determine whether the next input character is whitespace or not.

4 To decide if the character **c** is a whitespace character, the constructor performs as if it executes the following code fragment:

```

const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
    // c is a whitespace character.

```

5 If, after any preparation is completed, **is.good()** is **true**, **ok_ != false** otherwise, **ok_ == false**. During preparation, the constructor may call **setstate(failbit)** (which may throw **ios_base::failure** (28.5.5.4))³⁰⁶

```
~sentry();
```

6 *Effects:* None.

```
explicit operator bool() const;
```

7 *Effects:* Returns **ok_**.

28.7.4.2 Formatted input functions

[istream.formatted]

28.7.4.2.1 Common requirements

[istream.formatted.reqmts]

1 Each formatted input function begins execution by constructing an object of class **sentry** with the **noskipws** (second) argument **false**. If the **sentry** object returns **true**, when converted to a value of type **bool**, the function endeavors to obtain the requested input. If an exception is thrown during input then **ios::badbit** is turned on³⁰⁷ in ***this**'s error state. If **(exceptions()&badbit) != 0** then the exception is rethrown. In any case, the formatted input function destroys the **sentry** object. If no exception has been thrown, it returns ***this**.

28.7.4.2.2 Arithmetic extractors

[istream.formatted.arithmetic]

```

operator>>(unsigned short& val);
operator>>(unsigned int& val);
operator>>(long& val);
operator>>(unsigned long& val);
operator>>(long long& val);
operator>>(unsigned long long& val);
operator>>(float& val);
operator>>(double& val);

```

305) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

306) The **sentry** constructor and destructor can also perform additional implementation-dependent operations.

307) This is done without causing an **ios::failure** to be thrown.

```
operator>>(long double& val);
operator>>(bool& val);
operator>>(void*& val);
```

- 1 As in the case of the inserters, these extractors depend on the locale's `num_get<>` (27.4.2.1) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 28.7.4.2.1). After a sentry object is constructed, the conversion occurs as if performed by the following code fragment:

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = iostate::goodbit;
use_facet<numget>(loc).get(*this, 0, *this, err, val);
setstate(err);
```

In the above fragment, `loc` stands for the private member of the `basic_ios` class. [Note: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. — end note] Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```
operator>>(short& val);
```

- 2 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<short>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<short>::max();
} else
    val = static_cast<short>(lval);
setstate(err);
```

```
operator>>(int& val);
```

- 3 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<int>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::max();
} else
    val = static_cast<int>(lval);
setstate(err);
```

28.7.4.2.3 basic_istream::operator>>

[istream.extractors]

```
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& (*pf)(basic_istream<charT, traits>&));
```

- 1 *Effects:* None. This extractor does not behave as a formatted input function (as described in 28.7.4.2.1).
- 2 *Returns:* `pf(*this)`.³⁰⁸

³⁰⁸) See, for example, the function signature `ws(basic_istream&)` (28.7.4.4).

```

basic_istream<charT, traits>&
operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
3   Effects: Calls pf(*this). This extractor does not behave as a formatted input function (as described
in 28.7.4.2.1).
4   Returns: *this.

basic_istream<charT, traits>& operator>>(ios_base& (*pf)(ios_base&));
5   Effects: Calls pf(*this).309 This extractor does not behave as a formatted input function (as described
in 28.7.4.2.1).
6   Returns: *this.

template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);
7   Effects: Behaves like a formatted input member (as described in 28.7.4.2.1) of in. After a sentry
object is constructed, operator>> extracts characters and stores them into s. If width() is greater
than zero, n is min(size_t(width()), N). Otherwise n is N. n is the maximum number of characters
stored.
8   Characters are extracted and stored until any of the following occurs:
(8.1) — n-1 characters are stored;
(8.2) — end of file occurs on the input sequence;
(8.3) — letting ct be use_facet<ctype<charT>>(in.getloc()), ct.is(ct.space, c) is true.
9   operator>> then stores a null byte (charT()) in the next position, which may be the first position if
no characters were extracted. operator>> then calls width(0).
10  If the function extracted no characters, it calls setstate(failbit), which may throw ios_base::
failure (28.5.5.4).
11  Returns: in.

template<class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);
12  Effects: Behaves like a formatted input member (as described in 28.7.4.2.1) of in. After a sentry
object is constructed a character is extracted from in, if one is available, and stored in c. Otherwise,
the function calls in.setstate(failbit).
13  Returns: in.

basic_istream<charT, traits>& operator>>(basic_streambuf<charT, traits>* sb);
14  Effects: Behaves as an unformatted input function (28.7.4.3). If sb is null, calls setstate(fail-
bit), which may throw ios_base::failure (28.5.5.4). After a sentry object is constructed, extracts
characters from *this and inserts them in the output sequence controlled by sb. Characters are
extracted and inserted until any of the following occurs:
(14.1) — end-of-file occurs on the input sequence;
(14.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
(14.3) — an exception occurs (in which case the exception is caught).
15  If the function inserts no characters, it calls setstate(failbit), which may throw ios_base::
failure (28.5.5.4). If it inserted no characters because it caught an exception thrown while extracting

```

³⁰⁹ See, for example, the function signature dec(ios_base&) (28.5.6.3).

characters from `*this` and `failbit` is on in `exceptions()` (28.5.5.4), then the caught exception is rethrown.

16 *Returns:* `*this`.

28.7.4.3 Unformatted input functions

[**istream.unformatted**]

- 1 Each unformatted input function begins execution by constructing an object of class `sentry` with the default argument `noskipws` (second) argument `true`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object returns `false`, when converted to a value of type `bool`, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using `charT()`) in the first location of the array. If an exception is thrown during input then `ios::badbit` is turned on³¹⁰ in `*this`'s error state. (Exceptions thrown from `basic_ios<>::clear()` are not caught or rethrown.) If `(exceptions() & badbit) != 0` then the exception is rethrown. It also counts the number of characters extracted. If no exception has been thrown it ends by storing the count in a member object and returning the value specified. In any event the `sentry` object is destroyed before leaving the unformatted input function.

`streamsize gcount() const;`

- 2 *Effects:* None. This member function does not behave as an unformatted input function (as described above).

- 3 *Returns:* The number of characters extracted by the last unformatted input member function called for the object.

`int_type get();`

- 4 *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character `c`, if one is available. Otherwise, the function calls `setstate(failbit)`, which may throw `ios_base::failure` (28.5.5.4),

- 5 *Returns:* `c` if available, otherwise `traits::eof()`.

`basic_istream<charT, traits>& get(char_type& c);`

- 6 *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character, if one is available, and assigns it to `c`.³¹¹ Otherwise, the function calls `setstate(failbit)` (which may throw `ios_base::failure` (28.5.5.4)).

- 7 *Returns:* `*this`.

`basic_istream<charT, traits>& get(char_type* s, streamsize n, char_type delim);`

- 8 *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.³¹² Characters are extracted and stored until any of the following occurs:

- (8.1) — `n` is less than one or `n - 1` characters are stored;
- (8.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`);
- (8.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted).

- 9 If the function stores no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (28.5.5.4)). In any case, if `n` is greater than zero it then stores a null character into the next successive location of the array.

- 10 *Returns:* `*this`.

`basic_istream<charT, traits>& get(char_type* s, streamsize n);`

- 11 *Effects:* Calls `get(s, n, widen('\n'))`.

- 12 *Returns:* Value returned by the call.

310) This is done without causing an `ios::failure` to be thrown.

311) Note that this function is not overloaded on types `signed char` and `unsigned char`.

312) Note that this function is not overloaded on types `signed char` and `unsigned char`.

`basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb, char_type delim);`

13 *Effects:* Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

- (13.1) — end-of-file occurs on the input sequence;
- (13.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (13.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted);
- (13.4) — an exception occurs (in which case, the exception is caught but not rethrown).

14 If the function inserts no characters, it calls `setstate(failbit)`, which may throw `ios_base::failure` (28.5.5.4).

15 *Returns:* `*this`.

`basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb);`

16 *Effects:* Calls `get(sb, widen('\n'))`.

17 *Returns:* Value returned by the call.

`basic_istream<charT, traits>& getline(char_type* s, streamsize n, char_type delim);`

18 *Effects:* Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.³¹³ Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`);
2. `traits::eq(c, delim)` for the next available input character `c` (in which case the input character is extracted but not stored);³¹⁴
3. `n` is less than one or `n - 1` characters are stored (in which case the function calls `setstate(failbit)`).

19 These conditions are tested in the order shown.³¹⁵

20 If the function extracts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (28.5.5.4)).³¹⁶

21 In any case, if `n` is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

22 *Returns:* `*this`.

23 *[Example:*

```
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;

    char buffer[line_buffer_size];
    int line_number = 0;
    while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line"; // cin.fail() is false
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
            count--;
            // Don't include newline in count
    }
}
```

313) Note that this function is not overloaded on types `signed char` and `unsigned char`.

314) Since the final input character is “extracted”, it is counted in the `gcount()`, even though it is not stored.

315) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.

316) This implies an empty input line will not cause `failbit` to be set.

```

        cout << "Line " << ++line_number;
    }
    cout << "(" << count << " chars): " << buffer << endl;
}
}

— end example]

basic_istream<charT, traits>& getline(char_type* s, streamsize n);
24   Returns: getline(s, n, widen('\n'))

basic_istream<charT, traits>& ignore(streamsize n = 1, int_type delim = traits::eof());
25   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:
(25.1)   — n != numeric_limits<streamsize>::max() (16.3.4) and n characters have been extracted so far
(25.2)   — end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit), which may throw ios_base::failure (28.5.5.4));
(25.3)   — traits::eq_int_type(traits::to_int_type(c), delim) for the next available input character c (in which case c is extracted).
26   Remarks: The last condition will never occur if traits::eq_int_type(delim, traits::eof()).
27   Returns: *this.

int_type peek();

28   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, reads but does not extract the current input character.
29   Returns: traits::eof() if good() is false. Otherwise, returns rdbuf()->sgetc().

basic_istream<charT, traits>& read(char_type* s, streamsize n);
30   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s.317 Characters are extracted and stored until either of the following occurs:
(30.1)   — n characters are stored;
(30.2)   — end-of-file occurs on the input sequence (in which case the function calls setstate(failbit | eofbit), which may throw ios_base::failure (28.5.5.4)).
31   Returns: *this.

streamsize readsome(char_type* s, streamsize n);
32   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. If rdbuf()->in_avail() == -1, calls setstate(eofbit) (which may throw ios_base::failure (28.5.5.4)), and extracts no characters;
(32.1)   — If rdbuf()->in_avail() == 0, extracts no characters
(32.2)   — If rdbuf()->in_avail() > 0, extracts min(rdbuf()->in_avail(), n)).
33   Returns: The number of characters extracted.

basic_istream<charT, traits>& putback(char_type c);
34   Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sputbackc(c). If rdbuf()

```

³¹⁷ Note that this function is not overloaded on types `signed char` and `unsigned char`.

is null, or if `sputbackc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (28.5.5.4)). [Note: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

35 >Returns: `*this`.

```
basic_istream<charT, traits>& unget();
```

36 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()>sungetc()`. If `rdbuf()` is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (28.5.5.4)). [Note: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

37 >Returns: `*this`.

```
int sync();
```

38 *Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `rdbuf()` is a null pointer, returns `-1`. Otherwise, calls `rdbuf()>pubsync()` and, if that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (28.5.5.4)), and returns `-1`. Otherwise, returns zero.

```
pos_type tellg();
```

39 *Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

40 >Returns: After constructing a sentry object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()>pubseekoff(0, cur, in)`.

```
basic_istream<charT, traits>& seekg(pos_type pos);
```

41 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `fail() != true`, executes `rdbuf()>pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

42 >Returns: `*this`.

```
basic_istream<charT, traits>& seekg(off_type off, ios_base::seekdir dir);
```

43 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `fail() != true`, executes `rdbuf()>pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

44 >Returns: `*this`.

28.7.4.4 Standard `basic_istream` manipulators

[`istream.manip`]

¹ Each instantiation of the function template specified in this subclause is a designated addressable function (15.5.4.2.1).

```
template<class charT, class traits>
basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);
```

2 *Effects:* Behaves as an unformatted input function (28.7.4.3), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a sentry object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (28.7.4.1.3). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

3 >Returns: `is`.

28.7.4.5 Rvalue stream extraction

[istream.rvalue]

```
template<class charT, class traits, class T>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, T&& x);
```

¹ *Effects:* Equivalent to:

```
is >> std::forward<T>(x);
return is;
```

² *Remarks:* This function shall not participate in overload resolution unless the expression `is >> std::forward<T>(x)` is well-formed.

28.7.4.6 Class template `basic_iostream`

[iostreamclass]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_iostream
        : public basic_istream<charT, traits>,
        public basic_ostream<charT, traits> {
    public:
        using char_type    = charT;
        using int_type     = typename traits::int_type;
        using pos_type     = typename traits::pos_type;
        using off_type     = typename traits::off_type;
        using traits_type  = traits;

        // 28.7.4.6.1, constructor
        explicit basic_iostream(basic_streambuf<charT, traits>* sb);

        // 28.7.4.6.2, destructor
        virtual ~basic_iostream();

    protected:
        // 28.7.4.6.1, constructor
        basic_iostream(const basic_iostream& rhs) = delete;
        basic_iostream(basic_iostream&& rhs);

        // 28.7.4.6.3, assign and swap
        basic_iostream& operator=(const basic_iostream& rhs) = delete;
        basic_iostream& operator=(basic_iostream&& rhs);
        void swap(basic_iostream& rhs);
    };
}
```

¹ The class template `basic_iostream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

28.7.4.6.1 Constructors

[iostream.cons]

```
explicit basic_iostream(basic_streambuf<charT, traits>* sb);
```

¹ *Effects:* Constructs an object of class `basic_iostream`, initializing the base class subobjects with `basic_istream<charT, traits>(sb)` (28.7.4.1) and `basic_ostream<charT, traits>(sb)` (28.7.5.1).

² *Ensures:* `rdbuf() == sb` and `gcount() == 0`.

```
basic_iostream(basic_iostream&& rhs);
```

³ *Effects:* Move constructs from the rvalue `rhs` by constructing the `basic_istream` base class with `move(rhs)`.

28.7.4.6.2 Destructor

[iostream.dest]

```
virtual ~basic_iostream();
```

¹ *Effects:* Destroys an object of class `basic_iostream`.

² *Remarks:* Does not perform any operations on `rdbuf()`.

28.7.4.6.3 Assignment and swap

[iostream.assign]

```
basic_iostream& operator=(basic_iostream&& rhs);

1   Effects: As if by swap(rhs).

void swap(basic_iostream& rhs);

2   Effects: Calls basic_istream<charT, traits>::swap(rhs).
```

28.7.5 Output streams

[output.streams]

- 1 The header <ostream> defines a type and several function signatures that control output to a stream buffer along with a function template that inserts into stream rvalues.

28.7.5.1 Class template basic_ostream

[ostream]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream : virtual public basic_ios<charT, traits> {
public:
    // types (inherited from basic_ios (28.5.5))
    using char_type     = charT;
    using int_type      = typename traits::int_type;
    using pos_type      = typename traits::pos_type;
    using off_type      = typename traits::off_type;
    using traits_type   = traits;

    // 28.7.5.1.1, constructor/destructor
    explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
    virtual ~basic_ostream();

    // 28.7.5.1.3, prefix/suffix
    class sentry;

    // 28.7.5.2, formatted output
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& (*pf)(basic_ostream<charT, traits>&));
    basic_ostream<charT, traits>&
        operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
    basic_ostream<charT, traits>&
        operator<<(ios_base& (*pf)(ios_base&));

    basic_ostream<charT, traits>& operator<<(bool n);
    basic_ostream<charT, traits>& operator<<(short n);
    basic_ostream<charT, traits>& operator<<(unsigned short n);
    basic_ostream<charT, traits>& operator<<(int n);
    basic_ostream<charT, traits>& operator<<(unsigned int n);
    basic_ostream<charT, traits>& operator<<(long n);
    basic_ostream<charT, traits>& operator<<(unsigned long n);
    basic_ostream<charT, traits>& operator<<(long long n);
    basic_ostream<charT, traits>& operator<<(unsigned long long n);
    basic_ostream<charT, traits>& operator<<(float f);
    basic_ostream<charT, traits>& operator<<(double f);
    basic_ostream<charT, traits>& operator<<(long double f);

    basic_ostream<charT, traits>& operator<<(const void* p);
    basic_ostream<charT, traits>& operator<<(nullptr_t);
    basic_ostream<charT, traits>& operator<<(basic_streambuf<char_type, traits>* sb);

    // 28.7.5.3, unformatted output
    basic_ostream<charT, traits>& put(char_type c);
    basic_ostream<charT, traits>& write(const char_type* s, streamsize n);

    basic_ostream<charT, traits>& flush();
```

```

// 28.7.5.1.4, seeks
pos_type tellp();
basic_ostream<charT, traits>& seekp(pos_type);
basic_ostream<charT, traits>& seekp(off_type, ios_base::seekdir);

protected:
// 28.7.5.1.1, copy/move constructor
basic_ostream(const basic_ostream& rhs) = delete;
basic_ostream(basic_ostream&& rhs);

// 28.7.5.1.2, assign and swap
basic_ostream& operator=(const basic_ostream& rhs) = delete;
basic_ostream& operator=(basic_ostream&& rhs);
void swap(basic_ostream& rhs);
};

// 28.7.5.2.4, character inserters
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, charT);
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, char);
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, char);

template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, signed char);
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, unsigned char);

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const charT*);
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const char*);
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, const char*);

template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, const signed char*);
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, const unsigned char*);
}

```

- ¹ The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.
- ² Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or *insert*) output *characters* by actions equivalent to calling `rdbuf()>sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xspoutn()`, and `sync()`.
- ³ If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in error state. If `badbit` is on in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and treat as an error.

28.7.5.1.1 Constructors

[`ostream.cons`]

```
explicit basic_ostream(basic_streambuf<charT, traits>* sb);
```

- ¹ *Effects:* Constructs an object of class `basic_ostream`, initializing the base class subobject with `basic_ios<charT, traits>::init(sb)` (28.5.5.2).
- ² *Ensures:* `rdbuf() == sb`.

```
basic_ostream(basic_ostream&& rhs);
```

- 3 *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class and calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class.

```
virtual ~basic_ostream();
```

- 4 *Effects:* Destroys an object of class `basic_ostream`.

- 5 *Remarks:* Does not perform any operations on `rdbuf()`.

28.7.5.1.2 Assignment and swap

[`ostream.assign`]

```
basic_ostream& operator=(basic_ostream&& rhs);
```

- 1 *Effects:* As if by `swap(rhs)`.

- 2 *Returns:* `*this`.

```
void swap(basic_ostream& rhs);
```

- 3 *Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`.

28.7.5.1.3 Class `basic_ostream::sentry`

[`ostream::sentry`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream<charT, traits>::sentry {
        bool ok_; // exposition only
    public:
        explicit sentry(basic_ostream<charT, traits>& os);
        ~sentry();
        explicit operator bool() const { return ok_; }

        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

- 1 The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_ostream<charT, traits>& os);
```

- 2 If `os.good()` is nonzero, prepares for formatted or unformatted output. If `os.tie()` is not a null pointer, calls `os.tie()->flush()`.³¹⁸

- 3 If, after any preparation is completed, `os.good()` is true, `ok_ == true` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (28.5.5.4))³¹⁹

```
~sentry();
```

- 4 If `(os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good() is true`, calls `os.rdbuf()->pubsync()`. If that function returns -1, sets `badbit` in `os.rdstate()` without propagating an exception.

```
explicit operator bool() const;
```

- 5 *Effects:* Returns `ok_`.

28.7.5.1.4 Seek members

[`ostream.seeks`]

- 1 Each seek member function begins execution by constructing an object of class `sentry`. It returns by destroying the `sentry` object.

```
pos_type tellp();
```

- 2 *Returns:* If `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, out)`.

³¹⁸) The call `os.tie()->flush()` does not necessarily occur if the function can determine that no synchronization is necessary.

³¹⁹) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

```
basic_ostream<charT, traits>& seekp(pos_type pos);
3   Effects: If fail() != true, executes rdbuf()->pubseekpos(pos, ios_base::out). In case of failure,
the function calls setstate(failbit) (which may throw ios_base::failure).
4   Returns: *this.

basic_ostream<charT, traits>& seekp(off_type off, ios_base::seekdir dir);
5   Effects: If fail() != true, executes rdbuf()->pubseekoff(off, dir, ios_base::out). In case of
failure, the function calls setstate(failbit) (which may throw ios_base::failure).
6   Returns: *this.
```

28.7.5.2 Formatted output functions

[ostream.formatted]

28.7.5.2.1 Common requirements

[ostream.formatted.reqmts]

- 1 Each formatted output function begins execution by constructing an object of class `sentry`. If this object returns `true` when converted to a value of type `bool`, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does `setstate(ios_base::failbit)`, which might throw an exception. If an exception is thrown during output, then `ios::badbit` is turned on³²⁰ in `*this`'s error state. If `(exceptions()&badbit) != 0` then the exception is rethrown. Whether or not an exception is thrown, the `sentry` object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is `*this`.
- 2 The descriptions of the individual formatted output functions describe how they perform output and do not mention the `sentry` object.
- 3 If a formatted output function of a stream `os` determines padding, it does so as follows. Given a `charT` character sequence `seq` where `charT` is the character type of the stream, if the length of `seq` is less than `os.width()`, then enough copies of `os.fill()` are added to this sequence as necessary to pad to a width of `os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is `true`, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

28.7.5.2.2 Arithmetic inserters

[ostream.inserters.arithmetic]

```
operator<<(bool val);
operator<<(short val);
operator<<(unsigned short val);
operator<<(int val);
operator<<(unsigned int val);
operator<<(long val);
operator<<(unsigned long val);
operator<<(long long val);
operator<<(unsigned long long val);
operator<<(float val);
operator<<(double val);
operator<<(long double val);
operator<<(const void* val);
```

- 1 Effects: The classes `num_get`<> and `num_put`<> handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued `locale` value to perform numeric formatting. When `val` is of type `bool`, `long`, `unsigned long`, `long long`, `unsigned long long`, `double`, `long double`, or `const void*`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
```

³²⁰) without causing an `ios::failure` to be thrown.

```

bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
        >(getloc()).put(*this, *this, fill(),
            baseflags == ios_base::oct || baseflags == ios_base::hex
                ? static_cast<long>(static_cast<unsigned short>(val))
                : static_cast<long>(val)).failed();

```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```

ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
        >(getloc()).put(*this, *this, fill(),
            baseflags == ios_base::oct || baseflags == ios_base::hex
                ? static_cast<long>(static_cast<unsigned int>(val))
                : static_cast<long>(val)).failed();

```

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```

bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
        >(getloc()).put(*this, *this, fill(),
            static_cast<unsigned long>(val)).failed();

```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

```

bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
        >(getloc()).put(*this, *this, fill(),
            static_cast<double>(val)).failed();

```

- 2 The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<>`. It bypasses `ostreams` and uses `streambufs` directly. Class `locale` relies on these types as its interface to `streams`, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

- 3 *Returns:* `*this`.

28.7.5.2.3 `basic_ostream::operator<<`

[`ostream.inserters`]

```

basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& (*pf)(basic_ostream<charT, traits>&));

```

- 1 *Effects:* None. Does not behave as a formatted output function (as described in [28.7.5.2.1](#)).

- 2 *Returns:* `pf(*this)`.³²¹

```

basic_ostream<charT, traits>&
operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));

```

- 3 *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in [28.7.5.2.1](#)).

- 4 *Returns:* `*this`.³²²

```

basic_ostream<charT, traits>& operator<<(ios_base& (*pf)(ios_base&));

```

- 5 *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in [28.7.5.2.1](#)).

- 6 *Returns:* `*this`.

³²¹) See, for example, the function signature `endl(basic_ostream&)` ([28.7.5.4](#)).

³²²) See, for example, the function signature `dec(ios_base&)` ([28.5.6.3](#)).

```
basic_ostream<charT, traits>& operator<<(basic_streambuf<charT, traits>* sb);
```

Effects: Behaves as an unformatted output function (28.7.5.3). After the sentry object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`). Gets characters from `sb` and inserts them in `*this`. Characters are read from `sb` and inserted until any of the following occurs:

- end-of-file occurs on the input sequence;
- inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- an exception occurs while getting a character from `sb`.

If the function inserts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (28.5.5.4)). If an exception was thrown while extracting a character, the function sets `failbit` in error state, and if `failbit` is on in `exceptions()` the caught exception is rethrown.

Returns: `*this`.

28.7.5.2.4 Character inserter function templates

[ostream.inserters.character]

```

template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
// specialization
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
// signed and unsigned
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, unsigned char c);

```

Requires: `s` shall not be a null pointer.

Effects: Behaves like a formatted inserter (as described in [28.7.5.2.1](#)) of `out`. Creates a character sequence `seq` of `n` characters starting at `s`, each widened using `out.widen()` ([28.5.5.3](#)), where `n` is the number that would be computed as if by:

(4.1) — `traits::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const charT*`, and also for the overload where the first argument is of type `basic_ostream<char, traits>&` and the second is of type `const char*`,

- (4.2) — `char_traits<char>::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const char*`,
- (4.3) — `traits::length(reinterpret_cast<const char*>(s))` for the other two overloads.

Determines padding for `seq` as described in 28.7.5.2.1. Inserts `seq` into `out`. Calls `width(0)`.

5 *Returns:* `out`.

28.7.5.3 Unformatted output functions

[`ostream.unformatted`]

- 1 Each unformatted output function begins execution by constructing an object of class `sentry`. If this object returns `true`, while converting to a value of type `bool`, the function endeavors to generate the requested output. If an exception is thrown during output, then `ios::badbit` is turned on³²³ in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. In any case, the unformatted output function ends by destroying the `sentry` object, then, if no exception was thrown, returning the value specified for the unformatted output function.

`basic_ostream<charT, traits>& put(char_type c);`

- 2 *Effects:* Behaves as an unformatted output function (as described above). After constructing a `sentry` object, inserts the character `c`, if possible.³²⁴
- 3 Otherwise, calls `setstate(badbit)` (which may throw `ios_base::failure` (28.5.5.4)).
- 4 *Returns:* `*this`.

`basic_ostream& write(const char_type* s, streamsize n);`

- 5 *Effects:* Behaves as an unformatted output function (as described above). After constructing a `sentry` object, obtains characters to insert from successive locations of an array whose first element is designated by `s`.³²⁵ Characters are inserted until either of the following occurs:
- (5.1) — `n` characters are inserted;
- (5.2) — inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (28.5.5.4)).
- 6 *Returns:* `*this`.

`basic_ostream& flush();`

- 7 *Effects:* Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a `sentry` object. If this object returns `true` when converted to a value of type `bool` the function calls `rdbuf()->pubsync()`. If that function returns -1 calls `setstate(badbit)` (which may throw `ios_base::failure` (28.5.5.4)). Otherwise, if the `sentry` object returns `false`, does nothing.
- 8 *Returns:* `*this`.

28.7.5.4 Standard manipulators

[`ostream.manip`]

- 1 Each instantiation of any of the function templates specified in this subclause is a designated addressable function (15.5.4.2.1).

`template<class charT, class traits>
 basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);`

- 2 *Effects:* Calls `os.put(os.widen('\n'))`, then `os.flush()`.
- 3 *Returns:* `os`.

`template<class charT, class traits>
 basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);`

- 4 *Effects:* Inserts a null character into the output sequence: calls `os.put(charT())`.
- 5 *Returns:* `os`.

323) without causing an `ios::failure` to be thrown.

324) Note that this function is not overloaded on types `signed char` and `unsigned char`.

325) Note that this function is not overloaded on types `signed char` and `unsigned char`.

```

template<class charT, class traits>
basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);

6   Effects: Calls os.flush().

7   Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);

8   Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called buf for the purpose
of exposition, calls buf->set_emit_on_sync(true). Otherwise this manipulator has no effect. [Note:
To work around the issue that the Allocator template argument cannot be deduced, implementations
can introduce an intermediate base class to basic_syncbuf that manages its emit_on_sync flag. —end
note]

9   Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);

10  Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called buf for the purpose
of exposition, calls buf->set_emit_on_sync(false). Otherwise this manipulator has no effect.

11  Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);

12  Effects: Calls os.flush(). Then, if os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called
buf for the purpose of exposition, calls buf->emit().

13  Returns: os.

```

28.7.5.5 Rvalue stream insertion

[ostream.rvalue]

```

template<class charT, class traits, class T>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&& os, const T& x);

1   Effects: As if by: os << x;

2   Returns: os.

3   Remarks: This function shall not participate in overload resolution unless the expression os << x is
well-formed.

```

28.7.6 Standard manipulators

[std.manip]

- 1 The header <iomanip> defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

unspecified `resetiosflags(ios_base::fmtflags mask);`

- 2 Returns: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:³²⁶

```

void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}

```

The expression `out << resetiosflags(mask)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` shall have type `basic_istream<charT, traits>&` and value `in`.

³²⁶) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

unspecified `setiosflags(ios_base::fmtflags mask);`

- 3 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```
void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}
```

The expression `out << setiosflags(mask)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` shall have type `basic_istream<charT, traits>&` and value `in`.

unspecified `setbase(int base);`

- 4 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```
void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
        base == 10 ? ios_base::dec :
        base == 16 ? ios_base::hex :
        ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression `out << setbase(base)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` shall have type `basic_istream<charT, traits>&` and value `in`.

unspecified `setfill(char_type c);`

- 5 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
    // set fill character
    str.fill(c);
}
```

The expression `out << setfill(c)` shall have type `basic_ostream<charT, traits>&` and value `out`.

unspecified `setprecision(int n);`

- 6 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setprecision(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setprecision(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
    // set precision
    str.precision(n);
}
```

The expression `out << setprecision(n)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setprecision(n)` shall have type `basic_istream<charT, traits>&` and value `in`.

unspecified `setw(int n);`

- 7 *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream<charT, traits>` then the expression `out << setw(n)` behaves as if it called `f(out, n)`, or if `in` is an object

of type `basic_istream<charT, traits>` then the expression `in >> setw(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
    // set width
    str.width(n);
}
```

The expression `out << setw(n)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setw(n)` shall have type `basic_istream<charT, traits>&` and value `in`.

28.7.7 Extended manipulators

[[ext.manip](#)]

- ¹ The header `<iomanip>` defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

`template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);`

- ² *Requires:* The type `moneyT` shall be either `long double` or a specialization of the `basic_string` template ([Clause 20](#)).

- ³ *Effects:* The expression `in >> get_money(mon, intl)` described below behaves as a formatted input function ([28.7.4.2.1](#)).

- ⁴ *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_money(mon, intl)` behaves as if it called `f(in, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
    using Iter      = istreambuf_iterator<charT, traits>;
    using MoneyGet = money_get<charT, Iter>;

    ios_base::iostate err = ios_base::goodbit;
    const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());

    mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);

    if (ios_base::goodbit != err)
        str.setstate(err);
}
```

The expression `in >> get_money(mon, intl)` shall have type `basic_istream<charT, traits>&` and value `in`.

`template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);`

- ⁵ *Requires:* The type `moneyT` shall be either `long double` or a specialization of the `basic_string` template ([Clause 20](#)).

- ⁶ *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_money(mon, intl)` behaves as a formatted output function ([28.7.5.2.1](#)) that calls `f(out, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
    using Iter      = ostreambuf_iterator<charT, traits>;
    using MoneyPut = money_put<charT, Iter>;

    const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
    const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

    if (end.failed())
        str.setstate(ios::badbit);
}
```

The expression `out << put_money(mon, intl)` shall have type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT> unspecified get_time(struct tm* tmb, const charT* fmt);
```

7 *Requires:* The argument `tmb` shall be a valid pointer to an object of type `struct tm`. The argument `fmt` shall be a valid pointer to an array of objects of type `charT` with `char_traits<charT>::length(fmt)` elements.

8 *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, struct tm* tmb, const charT* fmt) {
    using Iter = istreambuf_iterator<charT, traits>;
    using TimeGet = time_get<charT, Iter>;

    ios_base::iostate err = ios_base::goodbit;
    const TimeGet& tg = use_facet<TimeGet>(str.getloc());

    tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
           fmt, fmt + traits::length(fmt));

    if (err != ios_base::goodbit)
        str.setstate(err);
}
```

The expression `in >> get_time(tmb, fmt)` shall have type `basic_istream<charT, traits>&` and value `in`.

```
template<class charT> unspecified put_time(const struct tm* tmb, const charT* fmt);
```

9 *Requires:* The argument `tmb` shall be a valid pointer to an object of type `struct tm`, and the argument `fmt` shall be a valid pointer to an array of objects of type `charT` with `char_traits<charT>::length(fmt)` elements.

10 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostringstream<charT, traits>` then the expression `out << put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, const struct tm* tmb, const charT* fmt) {
    using Iter = ostreambuf_iterator<charT, traits>;
    using TimePut = time_put<charT, Iter>;

    const TimePut& tp = use_facet<TimePut>(str.getloc());
    const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
                           fmt, fmt + traits::length(fmt));

    if (end.failed())
        str.setstate(ios_base::badbit);
}
```

The expression `out << put_time(tmb, fmt)` shall have type `basic_oostream<charT, traits>&` and value `out`.

28.7.8 Quoted manipulators

[[quoted.manip](#)]

1 [Note: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — *end note*]

```
template<class charT>
unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT('\\'));
template<class charT, class traits, class Allocator>
unspecified quoted(const basic_string<charT, traits, Allocator>& s,
                  charT delim = charT('"'), charT escape = charT('\\'));
```

```
template<class charT, class traits>
unspecified quoted(basic_string_view<charT, traits> s,
                  charT delim = charT('\"'), charT escape = charT('\\'));
```

2 >Returns: An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second and third forms is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (28.7.5.2.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

- (2.1) — `delim`.
- (2.2) — Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.
- (2.3) — `delim`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 28.7.5.2.1, `seq` is inserted as if by calling `out.rdbuf()>=sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` shall have type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT, class traits, class Allocator>
unspecified quoted(basic_string<charT, traits, Allocator>& s,
                  charT delim = charT('\"'), charT escape = charT('\\'));
```

3 >Returns: An object of unspecified type such that:

- (3.1) — If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using operator`>>(basic_istream<charT, traits>&, charT&)` (28.7.4.2.3) which may throw `ios_base::failure` (28.5.3.1.1):
 - (3.1.1) — If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:
 - (3.1.1.1) — Turn off the `skipws` flag.
 - (3.1.1.2) — `s.clear()`
 - (3.1.1.3) — Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.
 - (3.1.1.4) — Discard the final `delim` character.
 - (3.1.1.5) — Restore the `skipws` flag to its original value.
 - (3.1.2) — Otherwise, `in >> s`.
- (3.2) — If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the `const basic_string<charT, traits, Allocator>&` overload of the `quoted` function.

The expression `in >> quoted(s, delim, escape)` shall have type `basic_istream<charT, traits>&` and value `in`. The expression `out << quoted(s, delim, escape)` shall have type `basic_ostream<charT, traits>&` and value `out`.

28.8 String-based streams

[string.streams]

28.8.1 Header <sstream> synopsis

[sstream.syn]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_stringbuf;

    using stringbuf = basic_stringbuf<char>;
    using wstringbuf = basic_stringbuf<wchar_t>;
```

```

template<class charT, class traits = char_traits<charT>,
         class Allocator = allocator<charT>>
class basic_istringstream;

using istringstream = basic_istringstream<char>;
using wistringstream = basic_istringstream<wchar_t>;

template<class charT, class traits = char_traits<charT>,
         class Allocator = allocator<charT>>
class basic_ostringstream;
using ostringstream = basic_ostringstream<char>;
using wostringstream = basic_ostringstream<wchar_t>;

template<class charT, class traits = char_traits<charT>,
         class Allocator = allocator<charT>>
class basic_stringstream;
using stringstream = basic_stringstream<char>;
using wstringstream = basic_stringstream<wchar_t>;
}

```

- ¹ The header <sstream> defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 20.3.

28.8.2 Class template `basic_stringbuf`

[`stringbuf`]

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_stringbuf : public basic_streambuf<charT, traits> {
        public:
            using char_type      = charT;
            using int_type       = typename traits::int_type;
            using pos_type       = typename traits::pos_type;
            using off_type       = typename traits::off_type;
            using traits_type   = traits;
            using allocator_type = Allocator;

            // 28.8.2.1, constructors
            basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
            explicit basic_stringbuf(ios_base::openmode which);
            explicit basic_stringbuf(
                const basic_string<charT, traits, Allocator>& str,
                ios_base::openmode which = ios_base::in | ios_base::out);
            basic_stringbuf(const basic_stringbuf& rhs) = delete;
            basic_stringbuf(basic_stringbuf&& rhs);

            // 28.8.2.2, assign and swap
            basic_stringbuf& operator=(const basic_stringbuf& rhs) = delete;
            basic_stringbuf& operator=(basic_stringbuf&& rhs);
            void swap(basic_stringbuf& rhs);

            // 28.8.2.3, get and set
            basic_string<charT, traits, Allocator> str() const;
            void str(const basic_string<charT, traits, Allocator>& s);

        protected:
            // 28.8.2.4, overridden virtual functions
            int_type underflow() override;
            int_type pbackfail(int_type c = traits::eof()) override;
            int_type overflow (int_type c = traits::eof()) override;
            basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;

            pos_type seekoff(off_type off, ios_base::seekdir way,
                            ios_base::openmode which
                            = ios_base::in | ios_base::out) override;
    }
}

```

```

    pos_type seekpos(pos_type sp,
                     ios_base::openmode which
                     = ios_base::in | ios_base::out) override;

private:
    ios_base::openmode mode; // exposition only
};

template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
          basic_stringbuf<charT, traits, Allocator>& y);
}

```

- ¹ The class `basic_stringbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary *characters*. The sequence can be initialized from, or made available as, an object of class `basic_string`.
- ² For the sake of exposition, the maintained data is presented here as:

(2.1) — `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.

28.8.2.1 Constructors

[`stringbuf.cons`]

```
explicit basic_stringbuf(ios_base::openmode which);
```

¹ *Effects*: Constructs an object of class `basic_stringbuf`, initializing the base class with `basic_streambuf()` (28.6.3.1), and initializing `mode` with `which`. It is implementation-defined whether the sequence pointers (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `eptr()`) are initialized to null pointers.

² *Ensures*: `str() == ""`.

```
explicit basic_stringbuf(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
```

³ *Effects*: Constructs an object of class `basic_stringbuf`, initializing the base class with `basic_streambuf()` (28.6.3.1), and initializing `mode` with `which`. Then calls `str(s)`.

```
basic_stringbuf(basic_stringbuf&& rhs);
```

⁴ *Effects*: Move constructs from the rvalue `rhs`. It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `eptr()`) obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. The openmode, locale and any other state of `rhs` is also copied.

⁵ *Ensures*: Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

- (5.1) — `str() == rhs_p.str()`
- (5.2) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
- (5.3) — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
- (5.4) — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
- (5.5) — `eptr() - pbase() == rhs_p.eptr() - rhs_p.pbase()`
- (5.6) — `if (eback()) eback() != rhs_a.eback()`
- (5.7) — `if (gptr()) gptr() != rhs_a.gptr()`
- (5.8) — `if (egptr()) egptr() != rhs_a.egptr()`
- (5.9) — `if (pbase()) pbase() != rhs_a.pbase()`
- (5.10) — `if (pptr()) pptr() != rhs_a.pptr()`
- (5.11) — `if (eptr()) eptr() != rhs_a.eptr()`

28.8.2.2 Assignment and swap

[stringbuf.assign]

```
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

1 *Effects:* After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 28.8.2.1).

2 *Returns:* `*this`.

```
void swap(basic_stringbuf& rhs);
```

3 *Effects:* Exchanges the state of `*this` and `rhs`.

```
template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
          basic_stringbuf<charT, traits, Allocator>& y);
```

4 *Effects:* As if by `x.swap(y)`.

28.8.2.3 Member functions

[stringbuf.members]

```
basic_string<charT, traits, Allocator> str() const;
```

1 *Returns:* A `basic_string` object whose content is equal to the `basic_stringbuf` underlying character sequence. If the `basic_stringbuf` was created only in input mode, the resultant `basic_string` contains the character sequence in the range `[eback(), egptr()`). If the `basic_stringbuf` was created with `which & ios_base::out` being nonzero then the resultant `basic_string` contains the character sequence in the range `[pbase(), high_mark)`, where `high_mark` represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the `basic_stringbuf` with a `basic_string`, or by calling the `str(basic_string)` member function. In the case of calling the `str(basic_string)` member function, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new `basic_string`). Otherwise the `basic_stringbuf` has been created in neither input nor output mode and a zero length `basic_string` is returned.

```
void str(const basic_string<charT, traits, Allocator>& s);
```

2 *Effects:* Copies the content of `s` into the `basic_stringbuf` underlying character sequence and initializes the input and output sequences according to `mode`.

3 *Ensures:* If `mode & ios_base::out` is nonzero, `pbase()` points to the first underlying character and `eptr() >= pbase() + s.size()` holds; in addition, if `mode & ios_base::ate` is nonzero, `pptr() == pbase() + s.size()` holds, otherwise `pptr() == pbase()` is true. If `mode & ios_base::in` is nonzero, `eback()` points to the first underlying character, and both `gptr() == eback()` and `egptr() == eback() + s.size()` hold.

28.8.2.4 Overridden virtual functions

[stringbuf.virtuals]

```
int_type underflow() override;
```

1 *Returns:* If the input sequence has a read position available, returns `traits::to_int_type(*gptr())`. Otherwise, returns `traits::eof()`. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

2 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(2.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, assigns `gptr() - 1` to `gptr()`.

Returns: `c`.

(2.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `--gptr()`.

Returns: `c`.

(2.3) — If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.

Returns: `traits::not_eof(c)`.

3 *Returns:* As specified above, or `traits::eof()` to indicate failure.

4 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```
int_type overflow(int_type c = traits::eof()) override;
```

5 *Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

- (5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.

 Signals success by returning `c`.

- (5.2) — If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.

 Signals success by returning a value other than `traits::eof()`.

6 *Remarks:* The function can alter the number of write positions available as a result of any call.

7 *Returns:* As specified above, or `traits::eof()` to indicate failure.

8 The function can make a write position available only if `(mode & ios_base::out) != 0`. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `(mode & ios_base::in) != 0`, the function alters the read end pointer `egptr()` to point just past the new write position.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                  ios_base::openmode which
                  = ios_base::in | ios_base::out) override;
```

9 *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 112.

Table 112 — `seekoff` positioning

Conditions	Result
<code>(which & ios_base::in) == ios_base::in</code>	positions the input sequence
<code>(which & ios_base::out) == ios_base::out</code>	positions the output sequence
<code>(which & (ios_base::in ios_base::out)) == (ios_base::in ios_base::out)</code> and <code>way ==</code> either <code>ios_base::beg</code> or <code>ios_base::end</code>	positions both the input and the output sequences
Otherwise	the positioning operation fails.

10 For a sequence to be positioned, the function determines `newoff` as indicated in Table 113. If the sequence's next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

11 If `(newoff + off) < 0`, or if `newoff + off` refers to an uninitialized character (28.8.2.3), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

12 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

Table 113 — newoff values

Condition	newoff Value
way == ios_base::beg	0
way == ios_base::cur	the next pointer minus the beginning pointer (<i>xnext</i> - <i>xbeg</i>).
way == ios_base::end	the high mark pointer minus the beginning pointer (<i>high_mark</i> - <i>xbeg</i>).

```
pos_type seekpos(pos_type sp,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;
```

13 *Effects:* Equivalent to seekoff(off_type(sp), ios_base::beg, which).

14 *Returns:* sp to indicate success, or pos_type(off_type(-1)) to indicate failure.

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n);
```

15 *Effects:* implementation-defined, except that setbuf(0, 0) has no effect.

16 *Returns:* this.

28.8.3 Class template basic_istringstream

[istringstream]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_istringstream : public basic_istream<charT, traits> {
public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type        = typename traits::pos_type;
    using off_type        = typename traits::off_type;
    using traits_type     = traits;
    using allocator_type  = Allocator;

    // 28.8.3.1, constructors
    basic_istringstream() : basic_istringstream(ios_base::in) {}
    explicit basic_istringstream(ios_base::openmode which);
    explicit basic_istringstream(
        const basic_string<charT, traits, Allocator>& str,
        ios_base::openmode which = ios_base::in);
    basic_istringstream(const basic_istringstream& rhs) = delete;
    basic_istringstream(basic_istringstream&& rhs);

    // 28.8.3.2, assign and swap
    basic_istringstream& operator=(const basic_istringstream& rhs) = delete;
    basic_istringstream& operator=(basic_istringstream&& rhs);
    void swap(basic_istringstream& rhs);

    // 28.8.3.3, members
    basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

    basic_string<charT, traits, Allocator> str() const;
    void str(const basic_string<charT, traits, Allocator>& s);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
          basic_istringstream<charT, traits, Allocator>& y);
```

¹ The class `basic_istringstream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `stringbuf` object.

28.8.3.1 Constructors

[`istringstream.cons`]

```
explicit basic_istringstream(ios_base::openmode which);
```

¹ *Effects:* Constructs an object of class `basic_istringstream<charT, traits>`, initializing the base class with `basic_istream<charT, traits>(addressof(sb))` (28.7.4.1) and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (28.8.2.1).

```
explicit basic_istringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::in);
```

² *Effects:* Constructs an object of class `basic_istringstream<charT, traits>`, initializing the base class with `basic_istream<charT, traits>(addressof(sb))` (28.7.4.1) and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(str, which | ios_base::in)` (28.8.2.1).

```
basic_istringstream(basic_istringstream&& rhs);
```

³ *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Next `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_stringbuf`.

28.8.3.2 Assignment and swap

[`istringstream.assign`]

```
basic_istringstream& operator=(basic_istringstream&& rhs);
```

¹ *Effects:* Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.

² *Returns:* `*this`.

```
void swap(basic_istringstream& rhs);
```

³ *Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_istream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
          basic_istringstream<charT, traits, Allocator>& y);
```

⁴ *Effects:* As if by `x.swap(y)`.

28.8.3.3 Member functions

[`istringstream.members`]

```
basic_stringbuf<charT, traits, Allocator>*> rdbuf() const;
```

¹ *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const;
```

² *Returns:* `rdbuf()->str()`.

```
void str(const basic_string<charT, traits, Allocator>& s);
```

³ *Effects:* Calls `rdbuf()->str(s)`.

28.8.4 Class template `basic_ostringstream`

[`osstream`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_ostringstream : public basic_ostream<charT, traits> {
public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type        = typename traits::pos_type;
```

```

using off_type      = typename traits::off_type;
using traits_type   = traits;
using allocator_type = Allocator;

// 28.8.4.1, constructors
basic_ostringstream() : basic_ostringstream(ios_base::out) {}
explicit basic_ostringstream(ios_base::openmode which);
explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::out);
basic_ostringstream(const basic_ostringstream& rhs) = delete;
basic_ostringstream(basic_ostringstream&& rhs);

// 28.8.4.2, assign and swap
basic_ostringstream& operator=(const basic_ostringstream& rhs) = delete;
basic_ostringstream& operator=(basic_ostringstream&& rhs);
void swap(basic_ostringstream& rhs);

// 28.8.4.3, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const;
void str(const basic_string<charT, traits, Allocator>& s);
private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
          basic_ostringstream<charT, traits, Allocator>& y);
}

```

- ¹ The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `stringbuf` object.

28.8.4.1 Constructors

[`ostringstream.cons`]

```
explicit basic_ostringstream(ios_base::openmode which);
```

- ¹ *Effects:* Constructs an object of class `basic_ostringstream<charT, traits>`, initializing the base class with `basic_ostream<charT, traits>(addressof(sb))` (28.7.5.1) and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out)` (28.8.2.1).

```
explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::out);
```

- ² *Effects:* Constructs an object of class `basic_ostringstream<charT, traits>`, initializing the base class with `basic_ostream<charT, traits>(addressof(sb))` (28.7.5.1) and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(str, which | ios_base::out)` (28.8.2.1).

```
basic_ostringstream(basic_ostringstream&& rhs);
```

- ³ *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Next `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_stringbuf`.

28.8.4.2 Assignment and swap

[`ostringstream.assign`]

```
basic_ostringstream& operator=(basic_ostringstream&& rhs);
```

- ¹ *Effects:* Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.
- ² *Returns:* `*this`.

```

void swap(basic_ostringstream& rhs);
3   Effects: Exchanges the state of *this and rhs by calling basic_ostream<charT, traits>::swap(rhs)
              and sb.swap(rhs.sb).

template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
          basic_ostringstream<charT, traits, Allocator>& y);

4   Effects: As if by x.swap(y).

```

28.8.4.3 Member functions

[[ostringstream.members](#)]

```

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
1   Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

basic_string<charT, traits, Allocator> str() const;
2   Returns: rdbuf()->str().

void str(const basic_string<charT, traits, Allocator>& s);
3   Effects: Calls rdbuf()->str(s).

```

28.8.5 Class template basic_stringstream

[[stringstream](#)]

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_stringstream : public basic_iostream<charT, traits> {
public:
    using char_type      = charT;
