- 2 Throughout subclause 21.4, the names of template parameters are used to express type requirements. If a template parameter is named `R1` or `R2`, and the template argument is not a specialization of the `ratio` template, the program is ill-formed.

21.4.2 Header `<ratio>` synopsis

[ratio.syn]

```

namespace std {
    // 21.4.3, class template ratio
    template<intmax_t N, intmax_t D = 1> class ratio;

    // 21.4.4, ratio arithmetic
    template<class R1, class R2> using ratio_add = see below;
    template<class R1, class R2> using ratio_subtract = see below;
    template<class R1, class R2> using ratio_multiply = see below;
    template<class R1, class R2> using ratio_divide = see below;

    // 21.4.5, ratio comparison
    template<class R1, class R2> struct ratio_equal;
    template<class R1, class R2> struct ratio_not_equal;
    template<class R1, class R2> struct ratio_less;
    template<class R1, class R2> struct ratio_less_equal;
    template<class R1, class R2> struct ratio_greater;
    template<class R1, class R2> struct ratio_greater_equal;

```

```

template<class R1, class R2>
    inline constexpr bool ratio_equal_v = ratio_equal<R1, R2>::value;
template<class R1, class R2>
    inline constexpr bool ratio_not_equal_v = ratio_not_equal<R1, R2>::value;
template<class R1, class R2>
    inline constexpr bool ratio_less_v = ratio_less<R1, R2>::value;
template<class R1, class R2>
    inline constexpr bool ratio_less_equal_v = ratio_less_equal<R1, R2>::value;
template<class R1, class R2>
    inline constexpr bool ratio_greater_v = ratio_greater<R1, R2>::value;
template<class R1, class R2>
    inline constexpr bool ratio_greater_equal_v = ratio_greater_equal<R1, R2>::value;

// 21.4.6, convenience SI typedefs
using yocto = ratio<1, 1'000'000'000'000'000'000'000'000>; // see below
using zepto = ratio<1, 1'000'000'000'000'000'000'000'000>; // see below
using atto = ratio<1, 1'000'000'000'000'000'000'000>;
using femto = ratio<1, 1'000'000'000'000'000'000>;
using pico = ratio<1, 1'000'000'000'000'000>;
using nano = ratio<1, 1'000'000'000'000>;
using micro = ratio<1, 1'000'000>;
using milli = ratio<1, 1'000>;
using centi = ratio<1, 100>;
using deci = ratio<1, 10>;
using deca = ratio<10, 1>;
using hecto = ratio<100, 1>;
using kilo = ratio<1'000, 1>;
using mega = ratio<1'000'000, 1>;
using giga = ratio<1'000'000'000, 1>;
using tera = ratio<1'000'000'000'000, 1>;
using peta = ratio<1'000'000'000'000'000, 1>;
using exa = ratio<1'000'000'000'000'000'000, 1>;
using zetta = ratio<1'000'000'000'000'000'000'000, 1>; // see below
using yotta = ratio<1'000'000'000'000'000'000'000'000, 1>; // see below
}

```

21.4.3 Class template ratio

[ratio.ratio]

```

namespace std {
    template<intmax_t N, intmax_t D = 1> class ratio {
    public:
        static constexpr intmax_t num;
        static constexpr intmax_t den;
        using type = ratio<num, den>;
    };
}

```

- ¹ If the template argument D is zero or the absolute values of either of the template arguments N and D is not representable by type intmax_t, the program is ill-formed.

[Note 1: These rules ensure that infinite ratios are avoided and that for any negative input, there exists a representable value of its absolute value which is positive. This excludes the most negative value. — end note]

- ² The static data members num and den shall have the following values, where gcd represents the greatest common divisor of the absolute values of N and D:

- (2.1) — num shall have the value $\text{sign}(N) * \text{sign}(D) * \text{abs}(N) / \text{gcd}$.
- (2.2) — den shall have the value $\text{abs}(D) / \text{gcd}$.

21.4.4 Arithmetic on ratios

[ratio.arithmetic]

- ¹ Each of the alias templates ratio_add, ratio_subtract, ratio_multiply, and ratio_divide denotes the result of an arithmetic computation on two ratios R1 and R2. With X and Y computed (in the absence of arithmetic overflow) as specified by Table 55, each alias denotes a ratio<U, V> such that U is the same as ratio<X, Y>::num and V is the same as ratio<X, Y>::den.

- ² If it is not possible to represent U or V with `intmax_t`, the program is ill-formed. Otherwise, an implementation should yield correct values of U and V . If it is not possible to represent X or Y with `intmax_t`, the program is ill-formed unless the implementation yields correct values of U and V .

Table 55: Expressions used to perform ratio arithmetic [tab:ratio.arithmetic]

Type	Value of x	Value of y
<code>ratio_add<R1, R2></code>	$R1::num * R2::den + R2::num * R1::den$	$R1::den * R2::den$
<code>ratio_subtract<R1, R2></code>	$R1::num * R2::den - R2::num * R1::den$	$R1::den * R2::den$
<code>ratio_multiply<R1, R2></code>	$R1::num * R2::num$	$R1::den * R2::den$
<code>ratio_divide<R1, R2></code>	$R1::num * R2::den$	$R1::den * R2::num$

- ³ [Example 1:

```
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::num == 1, "1/3+1/6 == 1/2");
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::den == 2, "1/3+1/6 == 1/2");
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::num == 1, "1/3*3/2 == 1/2");
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::den == 2, "1/3*3/2 == 1/2");
```

// The following cases may cause the program to be ill-formed under some implementations

```
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::num == 2,
    "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::den == INT_MAX,
    "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::num == 1,
    "1/MAX * MAX/2 == 1/2");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::den == 2,
    "1/MAX * MAX/2 == 1/2");
```

—end example]

21.4.5 Comparison of ratios

[ratio.comparison]

```
template<class R1, class R2>
    struct ratio_equal : bool_constant<R1::num == R2::num && R1::den == R2::den> { };

template<class R1, class R2>
    struct ratio_not_equal : bool_constant<!ratio_equal_v<R1, R2>> { };

template<class R1, class R2>
    struct ratio_less : bool_constant<see below> { };
```

- ¹ If $R1::num \times R2::den$ is less than $R2::num \times R1::den$, `ratio_less<R1, R2>` shall be derived from `bool_constant<true>`; otherwise it shall be derived from `bool_constant<false>`. Implementations may use other algorithms to compute this relationship to avoid overflow. If overflow occurs, the program is ill-formed.

```
template<class R1, class R2>
    struct ratio_less_equal : bool_constant<!ratio_less_v<R2, R1>> { };

template<class R1, class R2>
    struct ratio_greater : bool_constant<ratio_less_v<R2, R1>> { };

template<class R1, class R2>
    struct ratio_greater_equal : bool_constant<!ratio_less_v<R1, R2>> { };
```

21.4.6 SI types for ratio

[ratio.si]

- ¹ For each of the *typedef-names* `yocto`, `zepto`, `zetta`, and `yotta`, if both of the constants used in its specification are representable by `intmax_t`, the typedef is defined; if either of the constants is not representable by `intmax_t`, the typedef is not defined.

22 General utilities library

[utilities]

22.1 General

[utilities.general]

- ¹ This Clause describes utilities that are generally useful in C++ programs; some of these utilities are used by other elements of the C++ standard library. These utilities are summarized in [Table 56](#).

Table 56: General utilities library summary [tab:utilities.summary]

	Subclause	Header
22.2	Utility components	<utility>
22.3	Pairs	
22.4	Tuples	<tuple>
22.5	Optional objects	<optional>
22.6	Variants	<variant>
22.7	Storage for any type	<any>
22.8	Expected objects	<expected>
22.9	Fixed-size sequences of bits	<bitset>
22.10	Function objects	<functional>
22.11	Type indexes	<typeindex>
22.12	Execution policies	<execution>
22.13	Primitive numeric conversions	<charconv>
22.14	Formatting	<format>
22.15	Bit manipulation	<bit>

22.2 Utility components

[utility]

22.2.1 Header <utility> synopsis

[utility.syn]

- ¹ The header <utility> contains some basic function and class templates that are used throughout the rest of the library.

```
#include <compare>           // see 17.11.1
#include <initializer_list>  // see 17.10.2

namespace std {
    // 22.2.2, swap
    template<class T>
        constexpr void swap(T& a, T& b) noexcept(see below);
    template<class T, size_t N>
        constexpr void swap(T (&a)[N], T (&b)[N]) noexcept(is_nothrow_swappable_v<T>);

    // 22.2.3, exchange
    template<class T, class U = T>
        constexpr T exchange(T& obj, U&& new_val) noexcept(see below);

    // 22.2.4, forward/move
    template<class T>
        constexpr T&& forward(remove_reference_t<T>& t) noexcept;
    template<class T>
        constexpr T&& forward(remove_reference_t<T>&& t) noexcept;
    template<class T>
        constexpr remove_reference_t<T>&& move(T&&) noexcept;
    template<class T>
        constexpr conditional_t<
            !is_nothrow_move_constructible_v<T> && is_copy_constructible_v<T>, const T&, T&&>
            move_if_noexcept(T& x) noexcept;
```

```

// 22.2.5, as_const
template<class T>
constexpr add_const_t<T>& as_const(T& t) noexcept;
template<class T>
void as_const(const T&&) = delete;

// 22.2.6, declval
template<class T>
add_rvalue_reference_t<T> declval() noexcept; // as unevaluated operand

// 22.2.7, integer comparison functions
template<class T, class U>
constexpr bool cmp_equal(T t, U u) noexcept;
template<class T, class U>
constexpr bool cmp_not_equal(T t, U u) noexcept;

template<class T, class U>

template<class T1, class T2>
constexpr T1& get(pair<T1, T2>& p) noexcept;
template<class T1, class T2>
constexpr const T1& get(const pair<T1, T2>& p) noexcept;
template<class T1, class T2>
constexpr T1&& get(pair<T1, T2>&& p) noexcept;
template<class T1, class T2>
constexpr const T1&& get(const pair<T1, T2>&& p) noexcept;
template<class T2, class T1>
constexpr T2& get(pair<T1, T2>& p) noexcept;
template<class T2, class T1>
constexpr const T2& get(const pair<T1, T2>& p) noexcept;
template<class T2, class T1>
constexpr T2&& get(pair<T1, T2>&& p) noexcept;
template<class T2, class T1>
constexpr const T2&& get(const pair<T1, T2>&& p) noexcept;

// 22.3.5, pair piecewise construction
struct piecewise_construct_t {
    explicit piecewise_construct_t() = default;
};
inline constexpr piecewise_construct_t piecewise_construct{};
template<class... Types> class tuple; // defined in <tuple> (22.4.2)

// in-place construction
struct in_place_t {
    explicit in_place_t() = default;
};

```

```

inline constexpr in_place_t in_place{};

template<class T>
struct in_place_type_t {
    explicit in_place_type_t() = default;
};
template<class T> inline constexpr in_place_type_t<T> in_place_type{};

template<size_t I>
struct in_place_index_t {
    explicit in_place_index_t() = default;
};
template<size_t I> inline constexpr in_place_index_t<I> in_place_index{};
}

```

22.2.2 swap

[utility.swap]

```

template<class T>
constexpr void swap(T& a, T& b) noexcept(see below);

```

1 *Constraints:* `is_move_constructible_v<T>` is true and `is_move_assignable_v<T>` is true.

2 *Preconditions:* Type `T` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.

3 *Effects:* Exchanges values stored in two locations.

4 *Remarks:* This function is a designated customization point (16.4.5.2.1). The exception specification is equivalent to:

```

    is_nothrow_move_constructible_v<T> && is_nothrow_move_assignable_v<T>

```

```

template<class T, size_t N>
constexpr void swap(T (&a)[N], T (&b)[N]) noexcept(is_nothrow_swappable_v<T>);

```

5 *Constraints:* `is_swappable_v<T>` is true.

6 *Preconditions:* `a[i]` is swappable with (16.4.4.3) `b[i]` for all `i` in the range `[0, N)`.

7 *Effects:* As if by `swap_ranges(a, a + N, b)`.

22.2.3 exchange

[utility.exchange]

```

template<class T, class U = T>
constexpr T exchange(T& obj, U&& new_val) noexcept(see below);

```

1 *Effects:* Equivalent to:

```

    T old_val = std::move(obj);
    obj = std::forward<U>(new_val);
    return old_val;

```

2 *Remarks:* The exception specification is equivalent to:

```

    is_nothrow_move_constructible_v<T> && is_nothrow_assignable_v<T&, U>

```

22.2.4 Forward/move helpers

[forward]

- 1 The library provides templated helper functions to simplify applying move semantics to an lvalue and to simplify the implementation of forwarding functions. All functions specified in this subclause are signal-safe (17.13.5).

```

template<class T> constexpr T&& forward(remove_reference_t<T>& t) noexcept;
template<class T> constexpr T&& forward(remove_reference_t<T>&& t) noexcept;

```

- 2 *Mandates:* For the second overload, `is_lvalue_reference_v<T>` is false.
- 3 *Returns:* `static_cast<T&&>(t)`.
- 4 *[Example 1:*

```

template<class T, class A1, class A2>
shared_ptr<T> factory(A1&& a1, A2&& a2) {
    return shared_ptr<T>(new T(std::forward<A1>(a1), std::forward<A2>(a2)));
}

struct A {
    A(int&, const double&);
};

void g() {
    shared_ptr<A> sp1 = factory<A>(2, 1.414); // error: 2 will not bind to int&
    int i = 2;
    shared_ptr<A> sp2 = factory<A>(i, 1.414); // OK
}

```

In the first call to `factory`, `A1` is deduced as `int`, so `2` is forwarded to `A`'s constructor as an rvalue. In the second call to `factory`, `A1` is deduced as `int&`, so `i` is forwarded to `A`'s constructor as an lvalue. In both cases, `A2` is deduced as `double`, so `1.414` is forwarded to `A`'s constructor as an rvalue. — *end example*]

```

template<class T> constexpr remove_reference_t<T>&& move(T&& t) noexcept;

```

5 *Returns:* `static_cast<remove_reference_t<T>&&>(t)`.

6 *[Example 2:*

```

template<class T, class A1>
shared_ptr<T> factory(A1&& a1) {
    return shared_ptr<T>(new T(std::forward<A1>(a1)));
}

struct A {
    A();
    A(const A&); // copies from lvalues
    A(A&&); // moves from rvalues
};

void g() {
    A a;
    shared_ptr<A> sp1 = factory<A>(a); // "a" binds to A(const A&)
    shared_ptr<A> sp2 = factory<A>(std::move(a)); // "a" binds to A(A&&)
}

```

In the first call to `factory`, `A1` is deduced as `A&`, so `a` is forwarded as a non-const lvalue. This binds to the constructor `A(const A&)`, which copies the value from `a`. In the second call to `factory`, because of the call `std::move(a)`, `A1` is deduced as `A`, so `a` is forwarded as an rvalue. This binds to the constructor `A(A&&)`, which moves the value from `a`. — *end example*]

```

template<class T> constexpr conditional_t<
    !is_nothrow_move_constructible_v<T> && is_copy_constructible_v<T>, const T&, T&&>
move_if_noexcept(T& x) noexcept;

```

7 *Returns:* `std::move(x)`.

22.2.5 Function template `as_const`

[utility.as.const]

```

template<class T> constexpr add_const_t<T>& as_const(T& t) noexcept;

```

1 *Returns:* `t`.

22.2.6 Function template `declval`

[declval]

1 The library provides the function template `declval` to simplify the definition of expressions which occur as unevaluated operands (7.2.3).

```

template<class T> add_rvalue_reference_t<T> declval() noexcept; // as unevaluated operand

```

2 *Mandates:* This function is not odr-used (6.3).

3 *Remarks:* The template parameter `T` of `declval` may be an incomplete type.

4 *[Example 1:*

```
template<class To, class From> decltype(static_cast<To>(declval<From>())) convert(From&&);
```

declares a function template `convert` which only participates in overload resolution if the type `From` can be explicitly converted to type `To`. For another example see class template `common_type` (21.3.8.7). — *end example*

22.2.7 Integer comparison functions

[utility.intcmp]

```
template<class T, class U>
constexpr bool cmp_equal(T t, U u) noexcept;
```

1 *Mandates:* Both `T` and `U` are standard integer types or extended integer types (6.8.2).

2 *Effects:* Equivalent to:

```
using UT = make_unsigned_t<T>;
using UU = make_unsigned_t<U>;
if constexpr (is_signed_v<T> == is_signed_v<U>)
    return t == u;
else if constexpr (is_signed_v<T>)
    return t < 0 ? false : UT(t) == u;
else
    return u < 0 ? false : t == UU(u);
```

```
template<class T, class U>
constexpr bool cmp_not_equal(T t, U u) noexcept;
```

3 *Effects:* Equivalent to: `return !cmp_equal(t, u);`

```
template<class T, class U>
constexpr bool cmp_less(T t, U u) noexcept;
```

4 *Mandates:* Both `T` and `U` are standard integer types or extended integer types (6.8.2).

5 *Effects:* Equivalent to:

```
using UT = make_unsigned_t<T>;
using UU = make_unsigned_t<U>;
if constexpr (is_signed_v<T> == is_signed_v<U>)
    return t < u;
else if constexpr (is_signed_v<T>)
    return t < 0 ? true : UT(t) < u;
else
    return u < 0 ? false : t < UU(u);
```

```
template<class T, class U>
constexpr bool cmp_greater(T t, U u) noexcept;
```

6 *Effects:* Equivalent to: `return cmp_less(u, t);`

```
template<class T, class U>
constexpr bool cmp_less_equal(T t, U u) noexcept;
```

7 *Effects:* Equivalent to: `return !cmp_greater(t, u);`

```
template<class T, class U>
constexpr bool cmp_greater_equal(T t, U u) noexcept;
```

8 *Effects:* Equivalent to: `return !cmp_less(t, u);`

```
template<class R, class T>
constexpr bool in_range(T t) noexcept;
```

9 *Mandates:* Both `T` and `R` are standard integer types or extended integer types (6.8.2).

10 *Effects:* Equivalent to:

```
return cmp_greater_equal(t, numeric_limits<R>::min()) &&
       cmp_less_equal(t, numeric_limits<R>::max());
```

11 [Note 1: These function templates cannot be used to compare `byte`, `char`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and `bool`. — *end note*]

22.2.8 Function template `to_underlying`**[utility.underlying]**

```
template<class T>
constexpr underlying_type_t<T> to_underlying(T value) noexcept;
```

1 *Returns:* `static_cast<underlying_type_t<T>>(value)`.

22.2.9 Function `unreachable`**[utility.unreachable]**

```
[[noreturn]] void unreachable();
```

1 *Preconditions:* `false` is true.

[*Note 1:* This precondition cannot be satisfied, thus the behavior of calling `unreachable` is undefined. — *end note*]

2 [*Example 1:*

```
int f(int x) {
    switch (x) {
        case 0:
        case 1:
            return x;
        default:
            std::unreachable();
    }
}
int a = f(1);           // OK, a has value 1
int b = f(3);         // undefined behavior
—end example]
```

22.3 Pairs**[pairs]****22.3.1 In general****[pairs.general]**

1 The library provides a template for heterogeneous pairs of values. The library also provides a matching function template to simplify their construction and several templates that provide access to pair objects as if they were tuple objects (see 22.4.6 and 22.4.7).

22.3.2 Class template `pair`**[pairs.pair]**

```
namespace std {
    template<class T1, class T2>
    struct pair {
        using first_type = T1;
        using second_type = T2;

        T1 first;
        T2 second;

        pair(const pair&) = default;
        pair(pair&&) = default;
        constexpr explicit(see below) pair();
        constexpr explicit(see below) pair(const T1& x, const T2& y);
        template<class U1 = T1, class U2 = T2>
            constexpr explicit(see below) pair(U1&& x, U2&& y);
        template<class U1, class U2>
            constexpr explicit(see below) pair(pair<U1, U2>& p);
        template<class U1, class U2>
            constexpr explicit(see below) pair(const pair<U1, U2>& p);
        template<class U1, class U2>
            constexpr explicit(see below) pair(pair<U1, U2>&& p);
        template<class U1, class U2>
            constexpr explicit(see below) pair(const pair<U1, U2>&& p);
        template<class... Args1, class... Args2>
            constexpr pair(piecewise_construct_t,
                tuple<Args1...> first_args, tuple<Args2...> second_args);
    };
}
```

```

constexpr pair& operator=(const pair& p);
constexpr const pair& operator=(const pair& p) const;
template<class U1, class U2>
    constexpr pair& operator=(const pair<U1, U2>& p);
template<class U1, class U2>
    constexpr const pair& operator=(const pair<U1, U2>& p) const;
constexpr pair& operator=(pair&& p) noexcept(see below);
constexpr const pair& operator=(pair&& p) const;
template<class U1, class U2>
    constexpr pair& operator=(pair<U1, U2>&& p);
template<class U1, class U2>
    constexpr const pair& operator=(pair<U1, U2>&& p) const;

constexpr void swap(pair& p) noexcept(see below);
constexpr void swap(const pair& p) const noexcept(see below);
};

```

```

template<class T1, class T2>
    pair(T1, T2) -> pair<T1, T2>;
}

```

- 1 Constructors and member functions of `pair` do not throw exceptions unless one of the element-wise operations specified to be called for that operation throws an exception.
- 2 The defaulted move and copy constructor, respectively, of `pair` is a `constexpr` function if and only if all required element-wise initializations for move and copy, respectively, would satisfy the requirements for a `constexpr` function.
- 3 If `(is_trivially_destructible_v<T1> && is_trivially_destructible_v<T2>)` is true, then the destructor of `pair` is trivial.
- 4 `pair<T, U>` is a structural type (13.2) if `T` and `U` are both structural types. Two values `p1` and `p2` of type `pair<T, U>` are template-argument-equivalent (13.6) if and only if `p1.first` and `p2.first` are template-argument-equivalent and `p1.second` and `p2.second` are template-argument-equivalent.

```
constexpr explicit(see below) pair();
```

5 **Constraints:**

- (5.1) — `is_default_constructible_v<T1>` is true and
- (5.2) — `is_default_constructible_v<T2>` is true.

6 **Effects:** Value-initializes `first` and `second`.

7 **Remarks:** The expression inside `explicit` evaluates to true if and only if either `T1` or `T2` is not implicitly default-constructible.

[Note 1: This behavior can be implemented with a trait that checks whether a `const T1&` or a `const T2&` can be initialized with `{}`. — end note]

```
constexpr explicit(see below) pair(const T1& x, const T2& y);
```

8 **Constraints:**

- (8.1) — `is_copy_constructible_v<T1>` is true and
- (8.2) — `is_copy_constructible_v<T2>` is true.

9 **Effects:** Initializes `first` with `x` and `second` with `y`.

10 **Remarks:** The expression inside `explicit` is equivalent to:

```
!is_convertible_v<const T1&, T1> || !is_convertible_v<const T2&, T2>
```

```
template<class U1 = T1, class U2 = T2> constexpr explicit(see below) pair(U1&& x, U2&& y);
```

11 **Constraints:**

- (11.1) — `is_constructible_v<T1, U1>` is true and
- (11.2) — `is_constructible_v<T2, U2>` is true.

12 **Effects:** Initializes `first` with `std::forward<U1>(x)` and `second` with `std::forward<U2>(y)`.

13 **Remarks:** The expression inside `explicit` is equivalent to:

```
!is_convertible_v<U1, T1> || !is_convertible_v<U2, T2>
```

This constructor is defined as deleted if `reference_constructs_from_temporary_v<first_type, U1&&>` is true or `reference_constructs_from_temporary_v<second_type, U2&&>` is true.

```
template<class U1, class U2> constexpr explicit(see below) pair(pair<U1, U2&& p>);
template<class U1, class U2> constexpr explicit(see below) pair(const pair<U1, U2&& p>);
template<class U1, class U2> constexpr explicit(see below) pair(pair<U1, U2&&& p>);
template<class U1, class U2> constexpr explicit(see below) pair(const pair<U1, U2&&& p>);
```

14 Let `FWD(u)` be `static_cast<decltype(u)>(u)`.

15 **Constraints:**

(15.1) — `is_constructible_v<T1, decltype(get<0>(FWD(p)))>` is true and

(15.2) — `is_constructible_v<T2, decltype(get<1>(FWD(p)))>` is true.

16 **Effects:** Initializes `first` with `get<0>(FWD(p))` and `second` with `get<1>(FWD(p))`.

17 **Remarks:** The expression inside `explicit` is equivalent to:

```
!is_convertible_v<decltype(get<0>(FWD(p))), T1> ||
!is_convertible_v<decltype(get<1>(FWD(p))), T2>
```

The constructor is defined as deleted if

```
reference_constructs_from_temporary_v<first_type, decltype(get<0>(FWD(p)))> ||
reference_constructs_from_temporary_v<second_type, decltype(get<1>(FWD(p)))>
```

is true.

```
template<class... Args1, class... Args2>
constexpr pair(piecewise_construct_t,
              tuple<Args1...> first_args, tuple<Args2...> second_args);
```

18 **Mandates:**

(18.1) — `is_constructible_v<T1, Args1...>` is true and

(18.2) — `is_constructible_v<T2, Args2...>` is true.

19 **Effects:** Initializes `first` with arguments of types `Args1...` obtained by forwarding the elements of `first_args` and initializes `second` with arguments of types `Args2...` obtained by forwarding the elements of `second_args`. (Here, forwarding an element `x` of type `U` within a `tuple` object means calling `std::forward<U>(x)`.) This form of construction, whereby constructor arguments for `first` and `second` are each provided in a separate `tuple` object, is called *piecewise construction*.

[*Note 2:* If a data member of `pair` is of reference type and its initialization binds it to a temporary object, the program is ill-formed (11.9.3). — *end note*]

```
constexpr pair& operator=(const pair& p);
```

20 **Effects:** Assigns `p.first` to `first` and `p.second` to `second`.

21 **Returns:** `*this`.

22 **Remarks:** This operator is defined as deleted unless `is_copy_assignable_v<T1>` is true and `is_copy_assignable_v<T2>` is true.

```
constexpr const pair& operator=(const pair& p) const;
```

23 **Constraints:**

(23.1) — `is_copy_assignable_v<const T1>` is true and

(23.2) — `is_copy_assignable_v<const T2>` is true.

24 **Effects:** Assigns `p.first` to `first` and `p.second` to `second`.

25 **Returns:** `*this`.

```
template<class U1, class U2> constexpr pair& operator=(const pair<U1, U2&& p>);
```

26 **Constraints:**

(26.1) — `is_assignable_v<T1&, const U1&>` is true and

(26.2) — `is_assignable_v<T2&, const U2&>` is true.

27 *Effects:* Assigns `p.first` to `first` and `p.second` to `second`.

28 *Returns:* `*this`.

```
template<class U1, class U2> constexpr const pair& operator=(const pair<U1, U2>& p) const;
```

29 *Constraints:*

(29.1) — `is_assignable_v<const T1&, const U1&>` is true, and

(29.2) — `is_assignable_v<const T2&, const U2&>` is true.

30 *Effects:* Assigns `p.first` to `first` and `p.second` to `second`.

31 *Returns:* `*this`.

```
constexpr pair& operator=(pair&& p) noexcept(see below);
```

32 *Constraints:*

(32.1) — `is_move_assignable_v<T1>` is true and

(32.2) — `is_move_assignable_v<T2>` is true.

33 *Effects:* Assigns to `first` with `std::forward<T1>(p.first)` and to `second` with `std::forward<T2>(p.second)`.

34 *Returns:* `*this`.

35 *Remarks:* The exception specification is equivalent to:

```
is_nothrow_move_assignable_v<T1> && is_nothrow_move_assignable_v<T2>
```

```
constexpr const pair& operator=(pair&& p) const;
```

36 *Constraints:*

(36.1) — `is_assignable_v<const T1&, T1>` is true and

(36.2) — `is_assignable_v<const T2&, T2>` is true.

37 *Effects:* Assigns `std::forward<T1>(p.first)` to `first` and `std::forward<T2>(p.second)` to `second`.

38 *Returns:* `*this`.

```
template<class U1, class U2> constexpr pair& operator=(pair<U1, U2>&& p);
```

39 *Constraints:*

(39.1) — `is_assignable_v<T1&, U1>` is true and

(39.2) — `is_assignable_v<T2&, U2>` is true.

40 *Effects:* Assigns to `first` with `std::forward<U1>(p.first)` and to `second` with `std::forward<U2>(p.second)`.

41 *Returns:* `*this`.

```
template<class U1, class U2> constexpr const pair& operator=(pair<U1, U2>&& p) const;
```

42 *Constraints:*

(42.1) — `is_assignable_v<const T1&, U1>` is true, and

(42.2) — `is_assignable_v<const T2&, U2>` is true.

43 *Effects:* Assigns `std::forward<U1>(p.first)` to `first` and `std::forward<U2>(u.second)` to `second`.

44 *Returns:* `*this`.

```
constexpr void swap(pair& p) noexcept(see below);
```

```
constexpr void swap(const pair& p) const noexcept(see below);
```

45 *Mandates:*

(45.1) — For the first overload, `is_swappable_v<T1>` is true and `is_swappable_v<T2>` is true.

(45.2) — For the second overload, `is_swappable_v<const T1>` is true and `is_swappable_v<const T2>` is true.

46 *Preconditions:* first is swappable with (16.4.4.3) p.first and second is swappable with p.second.

47 *Effects:* Swaps first with p.first and second with p.second.

48 *Remarks:* The exception specification is equivalent to:

(48.1) — is_nothrow_swappable_v<T1> && is_nothrow_swappable_v<T2> for the first overload, and

(48.2) — is_nothrow_swappable_v<const T1> && is_nothrow_swappable_v<const T2> for the second overload.

22.3.3 Specialized algorithms

[pairs.spec]

```
template<class T1, class T2>
constexpr bool operator==(const pair<T1, T2>& x, const pair<T1, T2>& y);
```

1 *Returns:* x.first == y.first && x.second == y.second.

```
template<class T1, class T2>
constexpr common_comparison_category_t<synth-three-way-result<T1>,
                                       synth-three-way-result<T2>>
operator<=>(const pair<T1, T2>& x, const pair<T1, T2>& y);
```

2 *Effects:* Equivalent to:

```
if (auto c = synth-three-way(x.first, y.first); c != 0) return c;
return synth-three-way(x.second, y.second);
```

```
template<class T1, class T2>
constexpr void swap(pair<T1, T2>& x, pair<T1, T2>& y) noexcept(noexcept(x.swap(y)));
template<class T1, class T2>
constexpr void swap(const pair<T1, T2>& x, const pair<T1, T2>& y) noexcept(noexcept(x.swap(y)));
```

3 *Constraints:*

(3.1) — For the first overload, is_swappable_v<T1> is true and is_swappable_v<T2> is true.

(3.2) — For the second overload, is_swappable_v<const T1> is true and is_swappable_v<const T2> is true.

4 *Effects:* Equivalent to x.swap(y).

```
template<class T1, class T2>
constexpr pair<unwrap_ref_decay_t<T1>, unwrap_ref_decay_t<T2>> make_pair(T1&& x, T2&& y);
```

5 *Returns:*

```
pair<unwrap_ref_decay_t<T1>,
     unwrap_ref_decay_t<T2>>(std::forward<T1>(x), std::forward<T2>(y))
```

6 [Example 1: In place of:

```
return pair<int, double>(5, 3.1415926); // explicit types
```

a C++ program may contain:

```
return make_pair(5, 3.1415926); // types are deduced
```

— end example]

22.3.4 Tuple-like access to pair

[pair.astuple]

```
template<class T1, class T2>
struct tuple_size<pair<T1, T2>> : integral_constant<size_t, 2> { };
```

```
template<size_t I, class T1, class T2>
struct tuple_element<I, pair<T1, T2>> {
    using type = see below ;
};
```

1 *Mandates:* I < 2.

2 *Type:* The type T1 if I is 0, otherwise the type T2.

```
template<size_t I, class T1, class T2>
constexpr tuple_element_t<I, pair<T1, T2>>& get(pair<T1, T2>& p) noexcept;
template<size_t I, class T1, class T2>
constexpr const tuple_element_t<I, pair<T1, T2>>& get(const pair<T1, T2>& p) noexcept;
```

```

template<size_t I, class T1, class T2>
constexpr tuple_element_t<I, pair<T1, T2>&& p> noexcept;
template<size_t I, class T1, class T2>
constexpr const tuple_element_t<I, pair<T1, T2>&& p> noexcept;

```

3 *Mandates:* $I < 2$.

4 *Returns:*

(4.1) — If I is 0, returns a reference to `p.first`.

(4.2) — If I is 1, returns a reference to `p.second`.

```

template<class T1, class T2>
constexpr T1& get(pair<T1, T2>& p) noexcept;
template<class T1, class T2>
constexpr const T1& get(const pair<T1, T2>& p) noexcept;
template<class T1, class T2>
constexpr T1&& get(pair<T1, T2>&& p) noexcept;
template<class T1, class T2>
constexpr const T1&& get(const pair<T1, T2>&& p) noexcept;

```

5 *Mandates:* $T1$ and $T2$ are distinct types.

6 *Returns:* A reference to `p.first`.

```

template<class T2, class T1>
constexpr T2& get(pair<T1, T2>& p) noexcept;
template<class T2, class T1>
constexpr const T2& get(const pair<T1, T2>& p) noexcept;
template<class T2, class T1>
constexpr T2&& get(pair<T1, T2>&& p) noexcept;
template<class T2, class T1>
constexpr const T2&& get(const pair<T1, T2>&& p) noexcept;

```

7 *Mandates:* $T1$ and $T2$ are distinct types.

8 *Returns:* A reference to `p.second`.

22.3.5 Piecewise construction

[pair.piecewise]

```

struct piecewise_construct_t {
    explicit piecewise_construct_t() = default;
};
inline constexpr piecewise_construct_t piecewise_construct{};

```

¹ The struct `piecewise_construct_t` is an empty class type used as a unique type to disambiguate constructor and function overloading. Specifically, `pair` has a constructor with `piecewise_construct_t` as the first argument, immediately followed by two `tuple` (22.4) arguments used for piecewise construction of the elements of the `pair` object.

22.4 Tuples

[tuple]

22.4.1 In general

[tuple.general]

¹ Subclause 22.4 describes the tuple library that provides a tuple type as the class template `tuple` that can be instantiated with any number of arguments. Each template argument specifies the type of an element in the `tuple`. Consequently, tuples are heterogeneous, fixed-size collections of values. An instantiation of `tuple` with two arguments is similar to an instantiation of `pair` with the same two arguments. See 22.3.

22.4.2 Header <tuple> synopsis

[tuple.syn]

```

#include <compare> // see 17.11.1

namespace std {
    // 22.4.3, class template tuple
    template<class... Types>
        class tuple;

```

```

template<class... TTypes, class... UTypes, template<class> class TQual,
        template<class> class UQual>
    requires requires { typename tuple<common_reference_t<TQual<TTypes>, UQual<UTypes>>...>; }
struct basic_common_reference<tuple<TTypes...>, tuple<UTypes...>, TQual, UQual> {
    using type = tuple<common_reference_t<TQual<TTypes>, UQual<UTypes>>...>;
};

template<class... TTypes, class... UTypes>
    requires requires { typename tuple<common_type_t<TTypes, UTypes>...>; }
struct common_type<tuple<TTypes...>, tuple<UTypes...>> {
    using type = tuple<common_type_t<TTypes, UTypes>...>;
};

// 22.4.4, tuple creation functions
inline constexpr unspecified ignore;

template<class... TTypes>
    constexpr tuple<unwrap_ref_decay_t<TTypes>...> make_tuple(TTypes&&...);

template<class... TTypes>
    constexpr tuple<TTypes&&...> forward_as_tuple(TTypes&&...) noexcept;

template<class... TTypes>
    constexpr tuple<TTypes&...> tie(TTypes&...) noexcept;

template<class... Tuples>
    constexpr tuple<CTypes...> tuple_cat(Tuples&&...);

// 22.4.5, calling a function with a tuple of arguments
template<class F, class Tuple>
    constexpr decltype(auto) apply(F&& f, Tuple&& t);

template<class T, class Tuple>
    constexpr T make_from_tuple(Tuple&& t);

// 22.4.6, tuple helper classes
template<class T> struct tuple_size; // not defined
template<class T> struct tuple_size<const T>;

template<size_t I, class... Types>
    constexpr const tuple_element_t<I, tuple<Types...>&& get(const tuple<Types...>&&) noexcept;
template<class T, class... Types>
    constexpr T& get(tuple<Types...>& t) noexcept;
template<class T, class... Types>
    constexpr T&& get(tuple<Types...>&& t) noexcept;

```

```

template<class T, class... Types>
    constexpr const T& get(const tuple<Types...>& t) noexcept;
template<class T, class... Types>
    constexpr const T&& get(const tuple<Types...>&& t) noexcept;

// 22.4.8, relational operators
template<class... TTypes, class... UTypes>
    constexpr bool operator==(const tuple<TTypes...>&, const tuple<UTypes...>&);
template<class... TTypes, class... UTypes>
    constexpr common_comparison_category_t<synth-three-way-result<TTypes, UTypes>...>
        operator<=>(const tuple<TTypes...>&, const tuple<UTypes...>&);

// 22.4.9, allocator-related traits
template<class... Types, class Alloc>
    struct uses_allocator<tuple<Types...>, Alloc>;

// 22.4.10, specialized algorithms
template<class... Types>
    constexpr void swap(tuple<Types...>& x, tuple<Types...>& y) noexcept(see below);
template<class... Types>
    constexpr void swap(const tuple<Types...>& x, const tuple<Types...>& y) noexcept(see below);

// 22.4.6, tuple helper classes
template<class T>
    inline constexpr size_t tuple_size_v = tuple_size<T>::value;
}

```

22.4.3 Class template tuple

[tuple(tuple)]

```

namespace std {
    template<class... Types>
    class tuple {
    public:
        // 22.4.3.1, tuple construction
        constexpr explicit(see below) tuple();
        constexpr explicit(see below) tuple(const Types&...); // only if sizeof...(Types) >= 1
        template<class... UTypes>
            constexpr explicit(see below) tuple(UTypes&&...); // only if sizeof...(Types) >= 1

        tuple(const tuple&) = default;
        tuple(tuple&&) = default;

        template<class... UTypes>
            constexpr explicit(see below) tuple(tuple<UTypes...>&);
        template<class... UTypes>
            constexpr explicit(see below) tuple(const tuple<UTypes...>&);
        template<class... UTypes>
            constexpr explicit(see below) tuple(tuple<UTypes...>&&);
        template<class... UTypes>
            constexpr explicit(see below) tuple(const tuple<UTypes...>&&);

        template<class U1, class U2>
            constexpr explicit(see below) tuple(pair<U1, U2>&); // only if sizeof...(Types) == 2
        template<class U1, class U2>
            constexpr explicit(see below) tuple(const pair<U1, U2>&); // only if sizeof...(Types) == 2
        template<class U1, class U2>
            constexpr explicit(see below) tuple(pair<U1, U2>&&); // only if sizeof...(Types) == 2
        template<class U1, class U2>
            constexpr explicit(see below) tuple(const pair<U1, U2>&&); // only if sizeof...(Types) == 2

        // allocator-extended constructors
        template<class Alloc>
            constexpr explicit(see below)
                tuple(allocator_arg_t, const Alloc& a);
    };
}

```

```

template<class Alloc>
    constexpr explicit(see below)
        tuple(allocator_arg_t, const Alloc& a, const Types&...);
template<class Alloc, class... UTypes>

  tuple(allocator_arg_t, Alloc, tuple<UTypes...>) -> tuple<UTypes...>;
}

```

22.4.3.1 Construction

[tuple.cnstr]

- 1 In the descriptions that follow, let i be in the range $[0, \text{sizeof} \dots (\text{Types}))$ in order, T_i be the i^{th} type in Types , and U_i be the i^{th} type in a template parameter pack named UTypes , where indexing is zero-based.
- 2 For each tuple constructor, an exception is thrown only if the construction of one of the types in Types throws an exception.
- 3 The defaulted move and copy constructor, respectively, of `tuple` is a constexpr function if and only if all required element-wise initializations for move and copy, respectively, would satisfy the requirements for a constexpr function. The defaulted move and copy constructor of `tuple<>` are constexpr functions.
- 4 If `is_trivially_destructible_v<Ti>` is true for all T_i , then the destructor of `tuple` is trivial.
- 5 The default constructor of `tuple<>` is trivial.

```
constexpr explicit(see below) tuple();
```

- 6 *Constraints:* `is_default_constructible_v<Ti>` is true for all i .

- 7 *Effects:* Value-initializes each element.

- 8 *Remarks:* The expression inside `explicit` evaluates to true if and only if T_i is not copy-list-initializable from an empty list for at least one i .

[Note 1: This behavior can be implemented with a trait that checks whether a `const Ti&` can be initialized with `{}`. — end note]

```
constexpr explicit(see below) tuple(const Types&...);
```

- 9 *Constraints:* `sizeof... (Types) ≥ 1` and `is_copy_constructible_v<Ti>` is true for all i .

- 10 *Effects:* Initializes each element with the value of the corresponding parameter.

- 11 *Remarks:* The expression inside `explicit` is equivalent to:

```
!conjunction_v<is_convertible<const Types&, Types>...>
```

```
template<class... UTypes> constexpr explicit(see below) tuple(UTypes&&... u);
```

- 12 Let *disambiguating-constraint* be:

- (12.1) — `negation<is_same<remove_cvref_t<U0>, tuple>>` if `sizeof... (Types)` is 1;

- (12.2) — `otherwise, bool_constant<!is_same_v<remove_cvref_t<U0>, allocator_arg_t> || is_same_v<remove_cvref_t<T0>, allocator_arg_t>>` if `sizeof... (Types)` is 2 or 3;

- (12.3) — `otherwise, true_type`.

- 13 *Constraints:*

- (13.1) — `sizeof... (Types)` equals `sizeof... (UTypes)`,

- (13.2) — `sizeof... (Types) ≥ 1`, and

- (13.3) — `conjunction_v<disambiguating-constraint, is_constructible<Types, UTypes>...>` is true.

- 14 *Effects:* Initializes the elements in the tuple with the corresponding value in `std::forward<UTypes>(u)`.

- 15 *Remarks:* The expression inside `explicit` is equivalent to:

```
!conjunction_v<is_convertible<UTypes, Types>...>
```

This constructor is defined as deleted if

```
(reference_constructs_from_temporary_v<Types, UTypes\&\&> || ...)
```

is true.

```
tuple(const tuple& u) = default;
```

16 **Mandates:** `is_copy_constructible_v<Ti>` is true for all *i*.

17 **Effects:** Initializes each element of `*this` with the corresponding element of `u`.

```
tuple(tuple&& u) = default;
```

18 **Constraints:** `is_move_constructible_v<Ti>` is true for all *i*.

19 **Effects:** For all *i*, initializes the *i*th element of `*this` with `std::forward<Ti>(get<i>(u))`.

```
template<class... UTypes> constexpr explicit(see below) tuple(tuple<UTypes...& u);
template<class... UTypes> constexpr explicit(see below) tuple(const tuple<UTypes...& u);
template<class... UTypes> constexpr explicit(see below) tuple(tuple<UTypes...&& u);
template<class... UTypes> constexpr explicit(see below) tuple(const tuple<UTypes...&& u);
```

20 Let *I* be the pack `0, 1, ..., (sizeof...(Types) - 1)`.

Let `FWD(u)` be `static_cast<decltype(u)>(u)`.

21 **Constraints:**

(21.1) — `sizeof...(Types)` equals `sizeof...(UTypes)`, and

(21.2) — `(is_constructible_v<Types, decltype(get<I>(FWD(u)))> && ...)` is true, and

(21.3) — either `sizeof...(Types)` is not 1, or (when `Types...` expands to `T` and `UTypes...` expands to `U`) `is_convertible_v<decltype(u), T>`, `is_constructible_v<T, decltype(u)>`, and `is_same_v<T, U>` are all false.

22 **Effects:** For all *i*, initializes the *i*th element of `*this` with `get<i>(FWD(u))`.

23 **Remarks:** The expression inside `explicit` is equivalent to:

```
!(is_convertible_v<decltype(get<I>(FWD(u))), Types> && ...)
```

The constructor is defined as deleted if

```
(reference_constructs_from_temporary_v<Types, decltype(get<I>(FWD(u)))> || ...)
```

is true.

```
template<class U1, class U2> constexpr explicit(see below) tuple(pair<U1, U2>& u);
template<class U1, class U2> constexpr explicit(see below) tuple(const pair<U1, U2>& u);
template<class U1, class U2> constexpr explicit(see below) tuple(pair<U1, U2>&& u);
template<class U1, class U2> constexpr explicit(see below) tuple(const pair<U1, U2>&& u);
```

24 Let `FWD(u)` be `static_cast<decltype(u)>(u)`.

25 **Constraints:**

(25.1) — `sizeof...(Types)` is 2,

(25.2) — `is_constructible_v<T0, decltype(get<0>(FWD(u)))>` is true, and

(25.3) — `is_constructible_v<T1, decltype(get<1>(FWD(u)))>` is true.

26 **Effects:** Initializes the first element with `get<0>(FWD(u))` and the second element with `get<1>(FWD(u))`.

27 **Remarks:** The expression inside `explicit` is equivalent to:

```
!is_convertible_v<decltype(get<0>(FWD(u))), T0> ||
!is_convertible_v<decltype(get<1>(FWD(u))), T1>
```

The constructor is defined as deleted if

```
reference_constructs_from_temporary_v<T0, decltype(get<0>(FWD(u)))> ||
reference_constructs_from_temporary_v<T1, decltype(get<1>(FWD(u)))>
```

is true.

```

template<class Alloc>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a);
template<class Alloc>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, const Types&...);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, UTypes&&...);
template<class Alloc>
constexpr tuple(allocator_arg_t, const Alloc& a, const tuple&);
template<class Alloc>
constexpr tuple(allocator_arg_t, const Alloc& a, tuple&&);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, tuple<UTypes...>&&);
template<class Alloc, class... UTypes>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, const tuple<UTypes...>&&);
template<class Alloc, class U1, class U2>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&);
template<class Alloc, class U1, class U2>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&);
template<class Alloc, class U1, class U2>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, pair<U1, U2>&&);
template<class Alloc, class U1, class U2>
constexpr explicit(see below)
tuple(allocator_arg_t, const Alloc& a, const pair<U1, U2>&&);

```

28 *Preconditions:* Alloc meets the *Cpp17Allocator* requirements (16.4.4.6.1).

29 *Effects:* Equivalent to the preceding constructors except that each element is constructed with uses-allocator construction (20.2.7.2).

22.4.3.2 Assignment

[tuple.assign]

- 1 For each tuple assignment operator, an exception is thrown only if the assignment of one of the types in Types throws an exception. In the function descriptions that follow, let i be in the range $[0, \text{sizeof} \dots (\text{Types}))$ in order, T_i be the i^{th} type in Types, and U_i be the i^{th} type in a template parameter pack named UTypes, where indexing is zero-based.

```
constexpr tuple& operator=(const tuple& u);
```

2 *Effects:* Assigns each element of u to the corresponding element of *this.

3 *Returns:* *this.

4 *Remarks:* This operator is defined as deleted unless `is_copy_assignable_v<Ti>` is true for all i .

```
constexpr const tuple& operator=(const tuple& u) const;
```

5 *Constraints:* (`is_copy_assignable_v<const Types> && ...`) is true.

6 *Effects:* Assigns each element of u to the corresponding element of *this.

7 *Returns:* *this.

```
constexpr tuple& operator=(tuple&& u) noexcept(see below);
```

8 *Constraints:* `is_move_assignable_v<Ti>` is true for all i .

9 *Effects:* For all i , assigns `std::forward<Ti>(get<i>(u))` to `get<i>(*this)`.

10 *Returns:* *this.

11 *Remarks:* The exception specification is equivalent to the logical AND of the following expressions:

is_nothrow_move_assignable_v<T_i>

where T_i is the *i*th type in Types.

```
constexpr const tuple& operator=(tuple&& u) const;
```

12 *Constraints:* (is_assignable_v<const Types&, Types> && ...) is true.

13 *Effects:* For all *i*, assigns std::forward<T_i>(get<*ii*

14 *Returns:* *this.

```
template<class... UTypes> constexpr tuple& operator=(const tuple<UTypes...& u);
```

15 *Constraints:*

(15.1) — sizeof...(Types) equals sizeof...(UTypes) and

(15.2) — is_assignable_v<T_i&, const U_i&> is true for all *i*.

16 *Effects:* Assigns each element of u to the corresponding element of *this.

17 *Returns:* *this.

```
template<class... UTypes> constexpr const tuple& operator=(const tuple<UTypes...& u) const;
```

18 *Constraints:*

(18.1) — sizeof...(Types) equals sizeof...(UTypes) and

(18.2) — (is_assignable_v<const Types&, const UTypes&> && ...) is true.

19 *Effects:* Assigns each element of u to the corresponding element of *this.

20 *Returns:* *this.

```
template<class... UTypes> constexpr tuple& operator=(tuple<UTypes...&& u);
```

21 *Constraints:*

(21.1) — sizeof...(Types) equals sizeof...(UTypes) and

(21.2) — is_assignable_v<T_i&, U_i> is true for all *i*.

22 *Effects:* For all *i*, assigns std::forward<U_i>(get<*ii*

23 *Returns:* *this.

```
template<class... UTypes> constexpr const tuple& operator=(tuple<UTypes...&& u) const;
```

24 *Constraints:*

(24.1) — sizeof...(Types) equals sizeof...(UTypes) and

(24.2) — (is_assignable_v<const Types&, UTypes> && ...) is true.

25 *Effects:* For all *i*, assigns std::forward<U_i>(get<*ii*

26 *Returns:* *this.

```
template<class U1, class U2> constexpr tuple& operator=(const pair<U1, U2>& u);
```

27 *Constraints:*

(27.1) — sizeof...(Types) is 2 and

(27.2) — is_assignable_v<T₀&, const U1&> is true, and

(27.3) — is_assignable_v<T₁&, const U2&> is true.

28 *Effects:* Assigns u.first to the first element of *this and u.second to the second element of *this.

29 *Returns:* *this.

```
template<class U1, class U2> constexpr const tuple& operator=(const pair<U1, U2>& u) const;
```

30 *Constraints:*

- (30.1) — `sizeof...(Types)` is 2,
 (30.2) — `is_assignable_v<const T0&, const U1&>` is true, and
 (30.3) — `is_assignable_v<const T1&, const U2&>` is true.
 31 *Effects:* Assigns `u.first` to the first element and `u.second` to the second element.
 32 *Returns:* `*this`.

```
template<class U1, class U2> constexpr tuple& operator=(pair<U1, U2>&& u);
```

- 33 *Constraints:*
 (33.1) — `sizeof...(Types)` is 2 and
 (33.2) — `is_assignable_v<T0&, U1>` is true, and
 (33.3) — `is_assignable_v<T1&, U2>` is true.
 34 *Effects:* Assigns `std::forward<U1>(u.first)` to the first element of `*this` and
`std::forward<U2>(u.second)` to the second element of `*this`.
 35 *Returns:* `*this`.

```
template<class U1, class U2> constexpr const tuple& operator=(pair<U1, U2>&& u) const;
```

- 36 *Constraints:*
 (36.1) — `sizeof...(Types)` is 2,
 (36.2) — `is_assignable_v<const T0&, U1>` is true, and
 (36.3) — `is_assignable_v<const T1&, U2>` is true.
 37 *Effects:* Assigns `std::forward<U1>(u.first)` to the first element and
`std::forward<U2>(u.second)` to the second element.
 38 *Returns:* `*this`.

22.4.3.3 swap

[tuple.swap]

```
constexpr void swap(tuple& rhs) noexcept(see below);  

constexpr void swap(const tuple& rhs) const noexcept(see below);
```

- 1 *Mandates:*
 (1.1) — For the first overload, `(is_swappable_v<Types> && ...)` is true.
 (1.2) — For the second overload, `(is_swappable_v<const Types> && ...)` is true.
 2 *Preconditions:* Each element in `*this` is swappable with (16.4.4.3) the corresponding element in `rhs`.
 3 *Effects:* Calls `swap` for each element in `*this` and its corresponding element in `rhs`.
 4 *Throws:* Nothing unless one of the element-wise `swap` calls throws an exception.
 5 *Remarks:* The exception specification is equivalent to
 (5.1) — `(is_nothrow_swappable_v<Types> && ...)` for the first overload and
 (5.2) — `(is_nothrow_swappable_v<const Types> && ...)` for the second overload.

22.4.4 Tuple creation functions

[tuple.creation]

```
template<class... TTypes>  

constexpr tuple<unwrap_ref_decay_t<TTypes>...> make_tuple(TTypes&&... t);
```

- 1 *Returns:* `tuple<unwrap_ref_decay_t<TTypes>...>(std::forward<TTypes>(t)...)`.

2 [Example 1:

```
int i; float j;  

make_tuple(1, ref(i), cref(j))
```

creates a tuple of type `tuple<int, int&, const float&>`. — end example]

```
template<class... TTypes>
constexpr tuple<TTypes&&...> forward_as_tuple(TTypes&&... t) noexcept;
```

3 *Effects:* Constructs a tuple of references to the arguments in `t` suitable for forwarding as arguments to a function. Because the result may contain references to temporary objects, a program shall ensure that the return value of this function does not outlive any of its arguments (e.g., the program should typically not store the result in a named variable).

4 *Returns:* `tuple<TTypes&&...>(std::forward<TTypes>(t)...) .`

```
template<class... TTypes>
constexpr tuple<TTypes&...> tie(TTypes&... t) noexcept;
```

5 *Returns:* `tuple<TTypes&...>(t...)`. When an argument in `t` is `ignore`, assigning any value to the corresponding tuple element has no effect.

6 [Example 2: `tie` functions allow one to create tuples that unpack tuples into variables. `ignore` can be used for elements that are not needed:

```
int i; std::string s;
tie(i, ignore, s) = make_tuple(42, 3.14, "C++");
// i == 42, s == "C++"
— end example]
```

```
template<class... Tuples>
constexpr tuple<CTypes...> tuple_cat(Tuples&&... tpls);
```

7 In the following paragraphs, let T_i be the i^{th} type in `Tuples`, U_i be `remove_reference_t<T_i>`, and tp_i be the i^{th} parameter in the function parameter pack `tpls`, where all indexing is zero-based.

8 *Preconditions:* For all i , U_i is the type `cvi tuple<Argsi...>`, where `cvi` is the (possibly empty) i^{th} *cv-qualifier-seq* and `Argsi` is the template parameter pack representing the element types in U_i . Let A_{ik} be the k^{th} type in `Argsi`. For all A_{ik} the following requirements are met:

(8.1) — If T_i is deduced as an lvalue reference type, then `is_constructible_v<Aik, cvi Aik&&> == true`, otherwise

(8.2) — `is_constructible_v<Aik, cvi Aik&&> == true`.

9 *Remarks:* The types in `CTypes` are equal to the ordered sequence of the extended types `Args0...`, `Args1...`, ..., `Argsn-1...`, where n is equal to `sizeof...(Tuples)`. Let $e_i...$ be the i^{th} ordered sequence of tuple elements of the resulting tuple object corresponding to the type sequence `Argsi`.

10 *Returns:* A tuple object constructed by initializing the k_i^{th} type element e_{ik} in $e_i...$ with

```
get<ki>(std::forward<Tii))
```

for each valid k_i and each group e_i in order.

11 [Note 1: An implementation can support additional types in the template parameter pack `Tuples` that support the tuple-like protocol, such as `pair` and `array`. — end note]

22.4.5 Calling a function with a tuple of arguments

[tuple.apply]

```
template<class F, class Tuple>
constexpr decltype(auto) apply(F&& f, Tuple&& t);
```

1 *Effects:* Given the exposition-only function:

```
namespace std {
    template<class F, class Tuple, size_t... I>
    constexpr decltype(auto) apply_impl(F&& f, Tuple&& t, index_sequence<I...>) {
        // exposition only
        return INVOKE(std::forward<F>(f), get<I>(std::forward<Tuple>(t))...); // see 22.10.4
    }
}
```

Equivalent to:

```
return apply_impl(std::forward<F>(f), std::forward<Tuple>(t),
    make_index_sequence<tuple_size_v<remove_reference_t<Tuple>>>{});
```

```
template<class T, class Tuple>
constexpr T make_from_tuple(Tuple&& t);
```

2 *Mandates:* If `tuple_size_v<remove_reference_t<Tuple>>` is 1, then `reference_constructs_from_temporary_v<T, decltype(get<0>(declval<Tuple>()))>` is false.

3 *Effects:* Given the exposition-only function:

```
namespace std {
    template<class T, class Tuple, size_t... I>
        requires is_constructible_v<T, decltype(get<I>(declval<Tuple>()))...>
        constexpr T make-from-tuple-impl(Tuple&& t, index_sequence<I...>) { // exposition only
            return T(get<I>(std::forward<Tuple>(t))...);
        }
}
```

Equivalent to:

```
return make-from-tuple-impl<T>(
    std::forward<Tuple>(t),
    make_index_sequence<tuple_size_v<remove_reference_t<Tuple>>>{});
```

[*Note 1:* The type of `T` must be supplied as an explicit template parameter, as it cannot be deduced from the argument list. — *end note*]

22.4.6 Tuple helper classes

[**tuple.helper**]

```
template<class T> struct tuple_size;
```

1 All specializations of `tuple_size` meet the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of `integral_constant<size_t, N>` for some `N`.

```
template<class... Types>
struct tuple_size<tuple<Types...>> : public integral_constant<size_t, sizeof...(Types)> { };
```

```
template<size_t I, class... Types>
struct tuple_element<I, tuple<Types...>> {
    using type = TI;
};
```

2 *Mandates:* `I < sizeof...(Types)`.

3 *Type:* `TI` is the type of the I^{th} element of `Types`, where indexing is zero-based.

```
template<class T> struct tuple_size<const T>;
```

4 Let `TS` denote `tuple_size<T>` of the cv-unqualified type `T`. If the expression `TS::value` is well-formed when treated as an unevaluated operand (7.2.3), then each specialization of the template meets the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of

```
integral_constant<size_t, TS::value>
```

Otherwise, it has no member value.

5 Access checking is performed as if in a context unrelated to `TS` and `T`. Only the validity of the immediate context of the expression is considered.

[*Note 1:* The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — *end note*]

6 In addition to being available via inclusion of the `<tuple>` header, the template is available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, const T>;
```

7 Let `TE` denote `tuple_element_t<I, T>` of the cv-unqualified type `T`. Then each specialization of the template meets the *Cpp17TransformationTrait* requirements (21.3.2) with a member typedef `type` that names the type `add_const_t<TE>`.

8 In addition to being available via inclusion of the `<tuple>` header, the template is available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

22.4.7 Element access

[tuple.elem]

```

template<size_t I, class... Types>
constexpr tuple_element_t<I, tuple<Types...>&
  get(tuple<Types...>& t) noexcept;
template<size_t I, class... Types>
constexpr tuple_element_t<I, tuple<Types...>&&
  get(tuple<Types...>&& t) noexcept; // Note A
template<size_t I, class... Types>
constexpr const tuple_element_t<I, tuple<Types...>&
  get(const tuple<Types...>& t) noexcept; // Note B
template<size_t I, class... Types>
constexpr const tuple_element_t<I, tuple<Types...>&&
  get(const tuple<Types...>&& t) noexcept;

```

1 *Mandates:* $I < \text{sizeof} \dots (\text{Types})$.

2 *Returns:* A reference to the I^{th} element of t , where indexing is zero-based.

3 [Note 1: [Note A] If a type T in Types is some reference type $X\&$, the return type is $X\&$, not $X\&\&$. However, if the element type is a non-reference type T , the return type is $T\&\&$. — end note]

4 [Note 2: [Note B] Constness is shallow. If a type T in Types is some reference type $X\&$, the return type is $X\&$, not $\text{const } X\&$. However, if the element type is a non-reference type T , the return type is $\text{const } T\&$. This is consistent with how constness is defined to work for non-static data members of reference type. — end note]

```

template<class T, class... Types>
constexpr T& get(tuple<Types...>& t) noexcept;
template<class T, class... Types>
constexpr T&& get(tuple<Types...>&& t) noexcept;
template<class T, class... Types>
constexpr const T& get(const tuple<Types...>& t) noexcept;
template<class T, class... Types>
constexpr const T&& get(const tuple<Types...>&& t) noexcept;

```

5 *Mandates:* The type T occurs exactly once in Types .

6 *Returns:* A reference to the element of t corresponding to the type T in Types .

7 [Example 1:

```

    const tuple<int, const int, double, double> t(1, 2, 3.4, 5.6);
    const int& i1 = get<int>(t); // OK, i1 has value 1
    const int& i2 = get<const int>(t); // OK, i2 has value 2
    const double& d = get<double>(t); // error: type double is not unique within t

```

— end example]

8 [Note 3: The reason `get` is a non-member function is that if this functionality had been provided as a member function, code where the type depended on a template parameter would have required using the `template` keyword. — end note]

22.4.8 Relational operators

[tuple.rel]

```

template<class... TTypes, class... UTypes>
constexpr bool operator==(const tuple<TTypes...>& t, const tuple<UTypes...>& u);

```

1 *Mandates:* For all i , where $0 \leq i < \text{sizeof} \dots (\text{TTypes})$, `get<i>(t) == get<i>(u)` is a valid expression returning a type that is convertible to `bool`. `sizeof \dots (\text{TTypes})` equals `sizeof \dots (\text{UTypes})`.

2 *Returns:* `true` if `get<i>(t) == get<i>(u)` for all i , otherwise `false`. For any two zero-length tuples e and f , `e == f` returns `true`.

3 *Remarks:* The elementary comparisons are performed in order from the zeroth index upwards. No comparisons or element accesses are performed after the first equality comparison that evaluates to `false`.

```

template<class... TTypes, class... UTypes>
constexpr common_comparison_category_t<synth-three-way-result<TTypes, UTypes>...>
  operator<=>(const tuple<TTypes...>& t, const tuple<UTypes...>& u);

```

4 *Effects:* Performs a lexicographical comparison between t and u . For any two zero-length tuples t and u , `t <=> u` returns `strong_ordering::equal`. Otherwise, equivalent to:

```

    if (auto c = synth-three-way(get<0>(t), get<0>(u)); c != 0) return c;

```

```
return ttail <=> utail;
```

where r_{tail} for some tuple r is a tuple containing all but the first element of r .

- ⁵ [Note 1: The above definition does not require t_{tail} (or u_{tail}) to be constructed. It might not even be possible, as t and u are not required to be copy constructible. Also, all comparison operator functions are short circuited; they do not perform element accesses beyond what is required to determine the result of the comparison. — end note]

22.4.9 Tuple traits

[tuple.traits]

```
template<class... Types, class Alloc>
struct uses_allocator<tuple<Types...>, Alloc> : true_type { };
```

- ¹ *Preconditions:* Alloc meets the *Cpp17Allocator* requirements (16.4.4.6.1).

- ² [Note 1: Specialization of this trait informs other library components that tuple can be constructed with an allocator, even though it does not have a nested allocator_type. — end note]

22.4.10 Tuple specialized algorithms

[tuple.special]

```
template<class... Types>
constexpr void swap(tuple<Types...>& x, tuple<Types...>& y) noexcept(see below);
template<class... Types>
constexpr void swap(const tuple<Types...>& x, const tuple<Types...>& y) noexcept(see below);
```

- ¹ *Constraints:*

(1.1) — For the first overload, (`is_swappable_v<Types> && ...`) is true.

(1.2) — For the second overload, (`is_swappable_v<const Types> && ...`) is true.

- ² *Effects:* As if by `x.swap(y)`.

- ³ *Remarks:* The exception specification is equivalent to:

```
noexcept(x.swap(y))
```

22.5 Optional objects

[optional]

22.5.1 In general

[optional.general]

- ¹ Subclause 22.5 describes class template `optional` that represents optional objects. An *optional object* is an object that contains the storage for another object and manages the lifetime of this contained object, if any. The contained object may be initialized after the optional object has been initialized, and may be destroyed before the optional object has been destroyed. The initialization state of the contained object is tracked by the optional object.

22.5.2 Header <optional> synopsis

[optional.syn]

```
#include <compare> // see 17.11.1

namespace std {
    // 22.5.3, class template optional
    template<class T>
    class optional;

    template<class T>
    constexpr bool is_optional = false; // exposition only
    template<class T>
    constexpr bool is_optional<optional<T>> = true; // exposition only

    // 22.5.4, no-value state indicator
    struct nullopt_t{see below};
    inline constexpr nullopt_t nullopt(unspecified);

    // 22.5.5, class bad_optional_access
    class bad_optional_access;

    // 22.5.6, relational operators
    template<class T, class U>
    constexpr bool operator==(const optional<T>&, const optional<U>&);
```

```

template<class T, class U>
    constexpr bool operator!=(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator<(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator>(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator<=(const optional<T>&, const optional<U>&);
template<class T, class U>
    constexpr bool operator>=(const optional<T>&, const optional<U>&);
template<class T, three_way_comparable_with<T> U>
    constexpr compare_three_way_result_t<T, U>
        operator<=>(const optional<T>&, const optional<U>&);

// 22.5.7, comparison with nullopt
template<class T> constexpr bool operator==(const optional<T>&, nullopt_t) noexcept;
template<class T>
    constexpr strong_ordering operator<=>(const optional<T>&, nullopt_t) noexcept;

// 22.5.8, comparison with T
template<class T, class U> constexpr bool operator==(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator==(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator!=(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator!=(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator<(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator<(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator>(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator>(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator<=(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator<=(const T&, const optional<U>&);
template<class T, class U> constexpr bool operator>=(const optional<T>&, const U&);
template<class T, class U> constexpr bool operator>=(const T&, const optional<U>&);
template<class T, class U> requires (!is_optional<U>) && three_way_comparable_with<T, U>
    constexpr compare_three_way_result_t<T, U>
        operator<=>(const optional<T>&, const U&);

// 22.5.9, specialized algorithms
template<class T>
    constexpr void swap(optional<T>&, optional<T>&) noexcept(see below);

template<class T>
    constexpr optional<see below> make_optional(T&&);
template<class T, class... Args>
    constexpr optional<T> make_optional(Args&&... args);
template<class T, class U, class... Args>
    constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);

// 22.5.10, hash support
template<class T> struct hash;
template<class T> struct hash<optional<T>>;
}

```

22.5.3 Class template optional

[optional.optional]

22.5.3.1 General

[optional.optional.general]

```

namespace std {
    template<class T>
    class optional {
    public:
        using value_type = T;

// 22.5.3.2, constructors
        constexpr optional() noexcept;
        constexpr optional(nullopt_t) noexcept;

```

```

constexpr optional(const optional&);
constexpr optional(optional&&) noexcept(see below);
template<class... Args>
    constexpr explicit optional(in_place_t, Args&&...);
template<class U, class... Args>
    constexpr explicit optional(in_place_t, initializer_list<U>, Args&&...);
template<class U = T>
    constexpr explicit(see below) optional(U&&);
template<class U>
    constexpr explicit(see below) optional(const optional<U>&);
template<class U>
    constexpr explicit(see below) optional(optional<U>&&);

// 22.5.3.3, destructor
constexpr ~optional();

// 22.5.3.4, assignment
constexpr optional& operator=(nullopt_t) noexcept;
constexpr optional& operator=(const optional&);
constexpr optional& operator=(optional&&) noexcept(see below);
template<class U = T> constexpr optional& operator=(U&&);
template<class U> constexpr optional& operator=(const optional<U>&);
template<class U> constexpr optional& operator=(optional<U>&&);
template<class... Args> constexpr T& emplace(Args&&...);
template<class U, class... Args> constexpr T& emplace(initializer_list<U>, Args&&...);

// 22.5.3.5, swap
constexpr void swap(optional&) noexcept(see below);

// 22.5.3.6, observers
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
constexpr const T& value() const &;
constexpr T& value() &;
constexpr T&& value() &&;
constexpr const T&& value() const &&;
template<class U> constexpr T value_or(U&&) const &;
template<class U> constexpr T value_or(U&&) &&;

// 22.5.3.7, monadic operations
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &;
template<class F> constexpr auto and_then(F&& f) const &&;
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &;
template<class F> constexpr auto transform(F&& f) const &&;
template<class F> constexpr optional or_else(F&& f) &&;
template<class F> constexpr optional or_else(F&& f) const &;

// 22.5.3.8, modifiers
constexpr void reset() noexcept;

private:
    T *val;           // exposition only
};

```

```

template<class T>
    optional(T) -> optional<T>;
}

```

- 1 Any instance of `optional<T>` at any given time either contains a value or does not contain a value. When an instance of `optional<T>` *contains a value*, it means that an object of type `T`, referred to as the optional object's *contained value*, is allocated within the storage of the optional object. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate its contained value. The contained value shall be allocated in a region of the `optional<T>` storage suitably aligned for the type `T`. When an object of type `optional<T>` is contextually converted to `bool`, the conversion returns `true` if the object contains a value; otherwise the conversion returns `false`.
- 2 Member `val` is provided for exposition only. When an `optional<T>` object contains a value, `val` points to the contained value.
- 3 `T` shall be a type other than `cv in_place_t` or `cv nullopt_t` that meets the *Cpp17Destructible* requirements (Table 34).

22.5.3.2 Constructors

[optional.ctor]

```

constexpr optional() noexcept;
constexpr optional(nullopt_t) noexcept;

```

- 1 *Postconditions*: `*this` does not contain a value.
- 2 *Remarks*: No contained value is initialized. For every object type `T` these constructors are `constexpr` constructors (9.2.6).

```

constexpr optional(const optional& rhs);

```

- 3 *Effects*: If `rhs` contains a value, direct-non-list-initializes the contained value with `*rhs`.
- 4 *Postconditions*: `rhs.has_value() == this->has_value()`.
- 5 *Throws*: Any exception thrown by the selected constructor of `T`.
- 6 *Remarks*: This constructor is defined as deleted unless `is_copy_constructible_v<T>` is true. If `is_trivially_copy_constructible_v<T>` is true, this constructor is trivial.

```

constexpr optional(optional&& rhs) noexcept(see below);

```

- 7 *Constraints*: `is_move_constructible_v<T>` is true.
- 8 *Effects*: If `rhs` contains a value, direct-non-list-initializes the contained value with `std::move(*rhs)`. `rhs.has_value()` is unchanged.
- 9 *Postconditions*: `rhs.has_value() == this->has_value()`.
- 10 *Throws*: Any exception thrown by the selected constructor of `T`.
- 11 *Remarks*: The exception specification is equivalent to `is_nothrow_move_constructible_v<T>`. If `is_trivially_move_constructible_v<T>` is true, this constructor is trivial.

```

template<class... Args> constexpr explicit optional(in_place_t, Args&&... args);

```

- 12 *Constraints*: `is_constructible_v<T, Args...>` is true.
- 13 *Effects*: Direct-non-list-initializes the contained value with `std::forward<Args>(args)...`.
- 14 *Postconditions*: `*this` contains a value.
- 15 *Throws*: Any exception thrown by the selected constructor of `T`.
- 16 *Remarks*: If `T`'s constructor selected for the initialization is a `constexpr` constructor, this constructor is a `constexpr` constructor.

```

template<class U, class... Args>
    constexpr explicit optional(in_place_t, initializer_list<U> il, Args&&... args);

```

- 17 *Constraints*: `is_constructible_v<T, initializer_list<U>&, Args...>` is true.
- 18 *Effects*: Direct-non-list-initializes the contained value with `il, std::forward<Args>(args)...`.
- 19 *Postconditions*: `*this` contains a value.
- 20 *Throws*: Any exception thrown by the selected constructor of `T`.

21 *Remarks:* If T 's constructor selected for the initialization is a constexpr constructor, this constructor is a constexpr constructor.

```
template<class U = T> constexpr explicit(see below) optional(U&& v);
```

22 *Constraints:* `is_constructible_v<T, U>` is true, `is_same_v<remove_cvref_t<U>, in_place_t>` is false, and `is_same_v<remove_cvref_t<U>, optional>` is false.

23 *Effects:* Direct-non-list-initializes the contained value with `std::forward<U>(v)`.

24 *Postconditions:* `*this` contains a value.

25 *Throws:* Any exception thrown by the selected constructor of T .

26 *Remarks:* If T 's selected constructor is a constexpr constructor, this constructor is a constexpr constructor. The expression inside `explicit` is equivalent to:

```
!is_convertible_v<U, T>
```

```
template<class U> constexpr explicit(see below) optional(const optional<U>& rhs);
```

27 *Constraints:*

(27.1) — `is_constructible_v<T, const U&>` is true,

(27.2) — `is_constructible_v<T, optional<U>&>` is false,

(27.3) — `is_constructible_v<T, optional<U>&&>` is false,

(27.4) — `is_constructible_v<T, const optional<U>&>` is false,

(27.5) — `is_constructible_v<T, const optional<U>&&>` is false,

(27.6) — `is_convertible_v<optional<U>&, T>` is false,

(27.7) — `is_convertible_v<optional<U>&&, T>` is false,

(27.8) — `is_convertible_v<const optional<U>&, T>` is false, and

(27.9) — `is_convertible_v<const optional<U>&&, T>` is false.

28 *Effects:* If `rhs` contains a value, direct-non-list-initializes the contained value with `*rhs`.

29 *Postconditions:* `rhs.has_value() == this->has_value()`.

30 *Throws:* Any exception thrown by the selected constructor of T .

31 *Remarks:* The expression inside `explicit` is equivalent to:

```
!is_convertible_v<const U&, T>
```

```
template<class U> constexpr explicit(see below) optional(optional<U>&& rhs);
```

32 *Constraints:*

(32.1) — `is_constructible_v<T, U>` is true,

(32.2) — `is_constructible_v<T, optional<U>&>` is false,

(32.3) — `is_constructible_v<T, optional<U>&&>` is false,

(32.4) — `is_constructible_v<T, const optional<U>&>` is false,

(32.5) — `is_constructible_v<T, const optional<U>&&>` is false,

(32.6) — `is_convertible_v<optional<U>&, T>` is false,

(32.7) — `is_convertible_v<optional<U>&&, T>` is false,

(32.8) — `is_convertible_v<const optional<U>&, T>` is false, and

(32.9) — `is_convertible_v<const optional<U>&&, T>` is false.

33 *Effects:* If `rhs` contains a value, direct-non-list-initializes the contained value with `std::move(*rhs)`. `rhs.has_value()` is unchanged.

34 *Postconditions:* `rhs.has_value() == this->has_value()`.

35 *Throws:* Any exception thrown by the selected constructor of T .

36 *Remarks:* The expression inside `explicit` is equivalent to:

```
!is_convertible_v<U, T>
```

22.5.3.3 Destructor

[optional.dtor]

```
constexpr ~optional();
```

1 *Effects:* If `is_trivially_destructible_v<T> != true` and `*this` contains a value, calls `val->T::~~T()`

2 *Remarks:* If `is_trivially_destructible_v<T>` is true, then this destructor is trivial.

22.5.3.4 Assignment

[optional.assign]

```
constexpr optional<T>& operator=(nullopt_t) noexcept;
```

1 *Effects:* If `*this` contains a value, calls `val->T::~~T()` to destroy the contained value; otherwise no effect.

2 *Postconditions:* `*this` does not contain a value.

3 *Returns:* `*this`.

```
constexpr optional<T>& operator=(const optional& rhs);
```

4 *Effects:* See Table 57.

Table 57: `optional::operator=(const optional&)` effects [tab:optional.assign.copy]

	*this contains a value	*this does not contain a value
rhs contains a value	assigns <code>*rhs</code> to the contained value	direct-non-list-initializes the contained value with <code>*rhs</code>
rhs does not contain a value	destroys the contained value by calling <code>val->T::~~T()</code>	no effect

5 *Postconditions:* `rhs.has_value() == this->has_value()`.

6 *Returns:* `*this`.

7 *Remarks:* If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s copy constructor, no effect. If an exception is thrown during the call to `T`'s copy assignment, the state of its contained value is as defined by the exception safety guarantee of `T`'s copy assignment. This operator is defined as deleted unless `is_copy_constructible_v<T>` is true and `is_copy_assignable_v<T>` is true. If `is_trivially_copy_constructible_v<T> && is_trivially_copy_assignable_v<T> && is_trivially_destructible_v<T>` is true, this assignment operator is trivial.

```
constexpr optional& operator=(optional&& rhs) noexcept(see below);
```

8 *Constraints:* `is_move_constructible_v<T>` is true and `is_move_assignable_v<T>` is true.

9 *Effects:* See Table 58. The result of the expression `rhs.has_value()` remains unchanged.

Table 58: `optional::operator=(optional&&)` effects [tab:optional.assign.move]

	*this contains a value	*this does not contain a value
rhs contains a value	assigns <code>std::move(*rhs)</code> to the contained value	direct-non-list-initializes the contained value with <code>std::move(*rhs)</code>
rhs does not contain a value	destroys the contained value by calling <code>val->T::~~T()</code>	no effect

10 *Postconditions:* `rhs.has_value() == this->has_value()`.

11 *Returns:* `*this`.

12 *Remarks:* The exception specification is equivalent to:

```
is_nothrow_move_assignable_v<T> && is_nothrow_move_constructible_v<T>
```

- 13 If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s move constructor, the state of `*rhs.val` is determined by the exception safety guarantee of `T`'s move constructor. If an exception is thrown during the call to `T`'s move assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s move assignment. If `is_trivially_move_constructible_v<T> && is_trivially_move_assignable_v<T> && is_trivially_destructible_v<T>` is true, this assignment operator is trivial.

```
template<class U = T> constexpr optional<T>& operator=(U&& v);
```

- 14 *Constraints:* `is_same_v<remove_cvref_t<U>, optional>` is false, `conjunction_v<is_scalar<T>, is_same<T, decay_t<U>>>` is false, `is_constructible_v<T, U>` is true, and `is_assignable_v<T&, U>` is true.

- 15 *Effects:* If `*this` contains a value, assigns `std::forward<U>(v)` to the contained value; otherwise direct-non-list-initializes the contained value with `std::forward<U>(v)`.

- 16 *Postconditions:* `*this` contains a value.

- 17 *Returns:* `*this`.

- 18 *Remarks:* If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s constructor, the state of `v` is determined by the exception safety guarantee of `T`'s constructor. If an exception is thrown during the call to `T`'s assignment, the state of `*val` and `v` is determined by the exception safety guarantee of `T`'s assignment.

```
template<class U> constexpr optional<T>& operator=(const optional<U>& rhs);
```

- 19 *Constraints:*

- (19.1) — `is_constructible_v<T, const U&>` is true,
 (19.2) — `is_assignable_v<T&, const U&>` is true,
 (19.3) — `is_constructible_v<T, optional<U>&>` is false,
 (19.4) — `is_constructible_v<T, optional<U>&&>` is false,
 (19.5) — `is_constructible_v<T, const optional<U>&>` is false,
 (19.6) — `is_constructible_v<T, const optional<U>&&>` is false,
 (19.7) — `is_convertible_v<optional<U>&, T>` is false,
 (19.8) — `is_convertible_v<optional<U>&&, T>` is false,
 (19.9) — `is_convertible_v<const optional<U>&, T>` is false,
 (19.10) — `is_convertible_v<const optional<U>&&, T>` is false,
 (19.11) — `is_assignable_v<T&, optional<U>&>` is false,
 (19.12) — `is_assignable_v<T&, optional<U>&&>` is false,
 (19.13) — `is_assignable_v<T&, const optional<U>&>` is false, and
 (19.14) — `is_assignable_v<T&, const optional<U>&&>` is false.

- 20 *Effects:* See Table 59.

Table 59: `optional::operator=(const optional<U>&)` effects [tab:optional.assign.copy.temp]

	*this contains a value	*this does not contain a value
rhs contains a value	assigns <code>*rhs</code> to the contained value	direct-non-list-initializes the contained value with <code>*rhs</code>
rhs does not contain a value	destroys the contained value by calling <code>val->T::~~T()</code>	no effect

- 21 *Postconditions:* `rhs.has_value() == this->has_value()`.

- 22 *Returns:* `*this`.

- 23 *Remarks:* If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to `T`'s constructor, the state of `*rhs.val` is determined by the exception safety

guarantee of T 's constructor. If an exception is thrown during the call to T 's assignment, the state of $*val$ and $*rhs.val$ is determined by the exception safety guarantee of T 's assignment.

```
template<class U> constexpr optional<T>& operator=(optional<U>&& rhs);
```

24 *Constraints:*

- (24.1) — `is_constructible_v<T, U>` is true,
- (24.2) — `is_assignable_v<T&, U>` is true,
- (24.3) — `is_constructible_v<T, optional<U>&>` is false,
- (24.4) — `is_constructible_v<T, optional<U>&&>` is false,
- (24.5) — `is_constructible_v<T, const optional<U>&>` is false,
- (24.6) — `is_constructible_v<T, const optional<U>&&>` is false,
- (24.7) — `is_convertible_v<optional<U>&, T>` is false,
- (24.8) — `is_convertible_v<optional<U>&&, T>` is false,
- (24.9) — `is_convertible_v<const optional<U>&, T>` is false,
- (24.10) — `is_convertible_v<const optional<U>&&, T>` is false,
- (24.11) — `is_assignable_v<T&, optional<U>&>` is false,
- (24.12) — `is_assignable_v<T&, optional<U>&&>` is false,
- (24.13) — `is_assignable_v<T&, const optional<U>&>` is false, and
- (24.14) — `is_assignable_v<T&, const optional<U>&&>` is false.

25 *Effects:* See Table 60. The result of the expression `rhs.has_value()` remains unchanged.

Table 60: `optional::operator=(optional<U>&&)` effects [tab:optional.assign.move.templ]

	*this contains a value	*this does not contain a value
rhs contains a value	assigns <code>std::move(*rhs)</code> to the contained value	direct-non-list-initializes the contained value with <code>std::move(*rhs)</code>
rhs does not contain a value	destroys the contained value by calling <code>val->T::~~T()</code>	no effect

26 *Postconditions:* `rhs.has_value() == this->has_value()`.

27 *Returns:* `*this`.

28 *Remarks:* If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T 's constructor, the state of $*rhs.val$ is determined by the exception safety guarantee of T 's constructor. If an exception is thrown during the call to T 's assignment, the state of $*val$ and $*rhs.val$ is determined by the exception safety guarantee of T 's assignment.

```
template<class... Args> constexpr T& emplace(Args&&... args);
```

29 *Mandates:* `is_constructible_v<T, Args...>` is true.

30 *Effects:* Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `std::forward<Args>(args)...`

31 *Postconditions:* `*this` contains a value.

32 *Returns:* A reference to the new contained value.

33 *Throws:* Any exception thrown by the selected constructor of T .

34 *Remarks:* If an exception is thrown during the call to T 's constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

```
template<class U, class... Args> constexpr T& emplace(initializer_list<U> il, Args&&... args);
```

35 *Constraints:* `is_constructible_v<T, initializer_list<U>&, Args...>` is true.

36 *Effects:* Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `il, std::forward<Args>(args)...`

37 *Postconditions:* `*this` contains a value.

38 *Returns:* A reference to the new contained value.

39 *Throws:* Any exception thrown by the selected constructor of `T`.

40 *Remarks:* If an exception is thrown during the call to `T`'s constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

22.5.3.5 Swap

[optional.swap]

```
constexpr void swap(optional& rhs) noexcept(see below);
```

1 *Mandates:* `is_move_constructible_v<T>` is true.

2 *Preconditions:* Lvalues of type `T` are swappable.

3 *Effects:* See [Table 61](#).

Table 61: `optional::swap(optional&)` effects [tab:optional.swap]

	*this contains a value	*this does not contain a value
rhs contains a value	calls <code>swap>(*this, rhs)</code>	direct-non-list-initializes the contained value of <code>*this</code> with <code>std::move(rhs)</code> , followed by <code>rhs.val->T::~~T()</code> ; postcondition is that <code>*this</code> contains a value and <code>rhs</code> does not contain a value
rhs does not contain a value	direct-non-list-initializes the contained value of <code>rhs</code> with <code>std::move(*this)</code> , followed by <code>val->T::~~T()</code> ; postcondition is that <code>*this</code> does not contain a value and <code>rhs</code> contains a value	no effect

4 *Throws:* Any exceptions thrown by the operations in the relevant part of [Table 61](#).

5 *Remarks:* The exception specification is equivalent to:

```
is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T>
```

6 If any exception is thrown, the results of the expressions `this->has_value()` and `rhs.has_value()` remain unchanged. If an exception is thrown during the call to function `swap`, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `swap` for lvalues of `T`. If an exception is thrown during the call to `T`'s move constructor, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s move constructor.

22.5.3.6 Observers

[optional.observe]

```
constexpr const T* operator->() const noexcept;
```

```
constexpr T* operator->() noexcept;
```

1 *Preconditions:* `*this` contains a value.

2 *Returns:* `val`.

3 *Remarks:* These functions are constexpr functions.

```
constexpr const T& operator*() const & noexcept;
```

```
constexpr T& operator*() & noexcept;
```

4 *Preconditions:* `*this` contains a value.

5 *Returns:* `*val`.

6 *Remarks:* These functions are constexpr functions.

```
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
```

7 *Preconditions:* *this contains a value.

8 *Effects:* Equivalent to: return std::move(*val);

```
constexpr explicit operator bool() const noexcept;
```

9 *Returns:* true if and only if *this contains a value.

10 *Remarks:* This function is a constexpr function.

```
constexpr bool has_value() const noexcept;
```

11 *Returns:* true if and only if *this contains a value.

12 *Remarks:* This function is a constexpr function.

```
constexpr const T& value() const &;
constexpr T& value() &;
```

13 *Effects:* Equivalent to:

```
return has_value() ? *val : throw bad_optional_access();
```

```
constexpr T&& value() &&;
constexpr const T&& value() const &&;
```

14 *Effects:* Equivalent to:

```
return has_value() ? std::move(*val) : throw bad_optional_access();
```

```
template<class U> constexpr T value_or(U&& v) const &;
```

15 *Mandates:* is_copy_constructible_v<T> && is_convertible_v<U&&, T> is true.

16 *Effects:* Equivalent to:

```
return has_value() ? **this : static_cast<T>(std::forward<U>(v));
```

```
template<class U> constexpr T value_or(U&& v) &&;
```

17 *Mandates:* is_move_constructible_v<T> && is_convertible_v<U&&, T> is true.

18 *Effects:* Equivalent to:

```
return has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v));
```

22.5.3.7 Monadic operations

[optional.monadic]

```
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) const &;
```

1 Let U be invoke_result_t<F, decltype(value())>.

2 *Mandates:* remove_cvref_t<U> is a specialization of optional.

3 *Effects:* Equivalent to:

```
if (*this) {
    return invoke(std::forward<F>(f), value());
} else {
    return remove_cvref_t<U>();
}
```

```
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;
```

4 Let U be invoke_result_t<F, decltype(std::move(value()))>.

5 *Mandates:* remove_cvref_t<U> is a specialization of optional.

6 *Effects:* Equivalent to:

```
if (*this) {
    return invoke(std::forward<F>(f), std::move(value()));
} else {
```

```

    return remove_cvref_t<U>();
}

```

```

template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) const &;

```

7 Let *U* be `remove_cv_t<invoke_result_t<F, decltype(value())>>`.

8 **Mandates:** *U* is a non-array object type other than `in_place_t` or `nullopt_t`. The declaration

```
U u(invoke(std::forward<F>(f), value()));
```

is well-formed for some invented variable *u*.

[*Note 1:* There is no requirement that *U* is movable (9.4.1). — *end note*]

9 **Returns:** If **this* contains a value, an `optional<U>` object whose contained value is direct-non-list-initialized with `invoke(std::forward<F>(f), value());`; otherwise, `optional<U>()`.

```

template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;

```

10 Let *U* be `remove_cv_t<invoke_result_t<F, decltype(std::move(value()))>>`.

11 **Mandates:** *U* is a non-array object type other than `in_place_t` or `nullopt_t`. The declaration

```
U u(invoke(std::forward<F>(f), std::move(value())));
```

is well-formed for some invented variable *u*.

[*Note 2:* There is no requirement that *U* is movable (9.4.1). — *end note*]

12 **Returns:** If **this* contains a value, an `optional<U>` object whose contained value is direct-non-list-initialized with `invoke(std::forward<F>(f), std::move(value()))`; otherwise, `optional<U>()`.

```

template<class F> constexpr optional or_else(F&& f) const &;

```

13 **Constraints:** *F* models `invocable<>` and *T* models `copy_constructible`.

14 **Mandates:** `is_same_v<remove_cvref_t<invoke_result_t<F>>, optional>` is true.

15 **Effects:** Equivalent to:

```

if (*this) {
    return *this;
} else {
    return std::forward<F>(f)();
}

```

```

template<class F> constexpr optional or_else(F&& f) &&;

```

16 **Constraints:** *F* models `invocable<>` and *T* models `move_constructible`.

17 **Mandates:** `is_same_v<remove_cvref_t<invoke_result_t<F>>, optional>` is true.

18 **Effects:** Equivalent to:

```

if (*this) {
    return std::move(*this);
} else {
    return std::forward<F>(f)();
}

```

22.5.3.8 Modifiers

[optional.mod]

```
constexpr void reset() noexcept;
```

1 **Effects:** If **this* contains a value, calls `val->T::~~T()` to destroy the contained value; otherwise no effect.

2 **Postconditions:** **this* does not contain a value.

22.5.4 No-value state indicator

[optional.nullopt]

```

struct nullopt_t{see below};
inline constexpr nullopt_t nullopt(unspecified);

```

- 1 The struct `nullopt_t` is an empty class type used as a unique type to indicate the state of not containing a value for optional objects. In particular, `optional<T>` has a constructor with `nullopt_t` as a single argument; this indicates that an optional object not containing a value shall be constructed.
- 2 Type `nullopt_t` shall not have a default constructor or an initializer-list constructor, and shall not be an aggregate.

22.5.5 Class `bad_optional_access`

[optional.bad.access]

```
namespace std {
    class bad_optional_access : public exception {
    public:
        // see 17.9.3 for the specification of the special member functions
        const char* what() const noexcept override;
    };
}
```

- 1 The class `bad_optional_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an optional object that does not contain a value.

```
const char* what() const noexcept override;
```

- 2 *Returns:* An implementation-defined ntbs.

22.5.6 Relational operators

[optional.relops]

```
template<class T, class U> constexpr bool operator==(const optional<T>& x, const optional<U>& y);
```

- 1 *Mandates:* The expression `*x == *y` is well-formed and its result is convertible to `bool`.

[Note 1: `T` need not be *Cpp17EqualityComparable*. — end note]

- 2 *Returns:* If `x.has_value() != y.has_value()`, `false`; otherwise if `x.has_value() == false`, `true`; otherwise `*x == *y`.

- 3 *Remarks:* Specializations of this function template for which `*x == *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator!=(const optional<T>& x, const optional<U>& y);
```

- 4 *Mandates:* The expression `*x != *y` is well-formed and its result is convertible to `bool`.

- 5 *Returns:* If `x.has_value() != y.has_value()`, `true`; otherwise, if `x.has_value() == false`, `false`; otherwise `*x != *y`.

- 6 *Remarks:* Specializations of this function template for which `*x != *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator<(const optional<T>& x, const optional<U>& y);
```

- 7 *Mandates:* `*x < *y` is well-formed and its result is convertible to `bool`.

- 8 *Returns:* If `!y`, `false`; otherwise, if `!x`, `true`; otherwise `*x < *y`.

- 9 *Remarks:* Specializations of this function template for which `*x < *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator>(const optional<T>& x, const optional<U>& y);
```

- 10 *Mandates:* The expression `*x > *y` is well-formed and its result is convertible to `bool`.

- 11 *Returns:* If `!x`, `false`; otherwise, if `!y`, `true`; otherwise `*x > *y`.

- 12 *Remarks:* Specializations of this function template for which `*x > *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator<=(const optional<T>& x, const optional<U>& y);
```

- 13 *Mandates:* The expression `*x <= *y` is well-formed and its result is convertible to `bool`.

- 14 *Returns:* If `!x`, `true`; otherwise, if `!y`, `false`; otherwise `*x <= *y`.

- 15 *Remarks:* Specializations of this function template for which `*x <= *y` is a core constant expression are `constexpr` functions.

```
template<class T, class U> constexpr bool operator>=(const optional<T>& x, const optional<U>& y);
```

16 *Mandates:* The expression `*x >= *y` is well-formed and its result is convertible to `bool`.

17 *Returns:* If `!y`, `true`; otherwise, if `!x`, `false`; otherwise `*x >= *y`.

18 *Remarks:* Specializations of this function template for which `*x >= *y` is a core constant expression are `constexpr` functions.

```
template<class T, three_way_comparable_with<T> U>
constexpr compare_three_way_result_t<T, U>
operator<=>(const optional<T>& x, const optional<U>& y);
```

19 *Returns:* If `x && y`, `*x <=> *y`; otherwise `x.has_value() <=> y.has_value()`.

20 *Remarks:* Specializations of this function template for which `*x <=> *y` is a core constant expression are `constexpr` functions.

22.5.7 Comparison with `nullopt`

[optional.nullopts]

```
template<class T> constexpr bool operator==(const optional<T>& x, nullopt_t) noexcept;
```

1 *Returns:* `!x`.

```
template<class T> constexpr strong_ordering operator<=>(const optional<T>& x, nullopt_t) noexcept;
```

2 *Returns:* `x.has_value() <=> false`.

22.5.8 Comparison with `T`

[optional.comp.with.t]

```
template<class T, class U> constexpr bool operator==(const optional<T>& x, const U& v);
```

1 *Mandates:* The expression `*x == v` is well-formed and its result is convertible to `bool`.

[Note 1: `T` need not be `Cpp17EqualityComparable`. — end note]

2 *Effects:* Equivalent to: `return x.has_value() ? *x == v : false;`

```
template<class T, class U> constexpr bool operator==(const T& v, const optional<U>& x);
```

3 *Mandates:* The expression `v == *x` is well-formed and its result is convertible to `bool`.

4 *Effects:* Equivalent to: `return x.has_value() ? v == *x : false;`

```
template<class T, class U> constexpr bool operator!=(const optional<T>& x, const U& v);
```

5 *Mandates:* The expression `*x != v` is well-formed and its result is convertible to `bool`.

6 *Effects:* Equivalent to: `return x.has_value() ? *x != v : true;`

```
template<class T, class U> constexpr bool operator!=(const T& v, const optional<U>& x);
```

7 *Mandates:* The expression `v != *x` is well-formed and its result is convertible to `bool`.

8 *Effects:* Equivalent to: `return x.has_value() ? v != *x : true;`

```
template<class T, class U> constexpr bool operator<(const optional<T>& x, const U& v);
```

9 *Mandates:* The expression `*x < v` is well-formed and its result is convertible to `bool`.

10 *Effects:* Equivalent to: `return x.has_value() ? *x < v : true;`

```
template<class T, class U> constexpr bool operator<(const T& v, const optional<U>& x);
```

11 *Mandates:* The expression `v < *x` is well-formed and its result is convertible to `bool`.

12 *Effects:* Equivalent to: `return x.has_value() ? v < *x : false;`

```
template<class T, class U> constexpr bool operator>(const optional<T>& x, const U& v);
```

13 *Mandates:* The expression `*x > v` is well-formed and its result is convertible to `bool`.

14 *Effects:* Equivalent to: `return x.has_value() ? *x > v : false;`

```
template<class T, class U> constexpr bool operator>(const T& v, const optional<U>& x);
```

15 *Mandates:* The expression `v > *x` is well-formed and its result is convertible to `bool`.

16 *Effects:* Equivalent to: `return x.has_value() ? v > *x : true;`

```
template<class T, class U> constexpr bool operator<=(const optional<T>& x, const U& v);
```

17 *Mandates:* The expression `*x <= v` is well-formed and its result is convertible to `bool`.

18 *Effects:* Equivalent to: `return x.has_value() ? *x <= v : true;`

```
template<class T, class U> constexpr bool operator<=(const T& v, const optional<U>& x);
```

19 *Mandates:* The expression `v <= *x` is well-formed and its result is convertible to `bool`.

20 *Effects:* Equivalent to: `return x.has_value() ? v <= *x : false;`

```
template<class T, class U> constexpr bool operator>=(const optional<T>& x, const U& v);
```

21 *Mandates:* The expression `*x >= v` is well-formed and its result is convertible to `bool`.

22 *Effects:* Equivalent to: `return x.has_value() ? *x >= v : false;`

```
template<class T, class U> constexpr bool operator>=(const T& v, const optional<U>& x);
```

23 *Mandates:* The expression `v >= *x` is well-formed and its result is convertible to `bool`.

24 *Effects:* Equivalent to: `return x.has_value() ? v >= *x : true;`

```
template<class T, class U> requires (!is_optional<U>) && three_way_comparable_with<T, U>
constexpr compare_three_way_result_t<T, U>
operator<=>(const optional<T>& x, const U& v);
```

25 *Effects:* Equivalent to: `return x.has_value() ? *x <=> v : strong_ordering::less;`

22.5.9 Specialized algorithms

[optional.specalg]

```
template<class T>
constexpr void swap(optional<T>& x, optional<T>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints:* `is_move_constructible_v<T>` is true and `is_swappable_v<T>` is true.

2 *Effects:* Calls `x.swap(y)`.

```
template<class T> constexpr optional<decay_t<T>> make_optional(T&& v);
```

3 *Returns:* `optional<decay_t<T>>(std::forward<T>(v))`.

```
template<class T, class... Args>
constexpr optional<T> make_optional(Args&&... args);
```

4 *Effects:* Equivalent to: `return optional<T>(in_place, std::forward<Args>(args)...);`

```
template<class T, class U, class... Args>
constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);
```

5 *Effects:* Equivalent to: `return optional<T>(in_place, il, std::forward<Args>(args)...);`

22.5.10 Hash support

[optional.hash]

```
template<class T> struct hash<optional<T>>;
```

1 The specialization `hash<optional<T>>` is enabled (22.10.19) if and only if `hash<remove_const_t<T>>` is enabled. When enabled, for an object `o` of type `optional<T>`, if `o.has_value() == true`, then `hash<optional<T>>()(o)` evaluates to the same value as `hash<remove_const_t<T>>()(o)`; otherwise it evaluates to an unspecified value. The member functions are not guaranteed to be `noexcept`.

22.6 Variants

[variant]

22.6.1 In general

[variant.general]

1 A variant object holds and manages the lifetime of a value. If the variant holds a value, that value's type has to be one of the template argument types given to `variant`. These template arguments are called alternatives.

22.6.2 Header <variant> synopsis

[variant.syn]

```
#include <compare> // see 17.11.1
```

```

namespace std {
    // 22.6.3, class template variant
    template<class... Types>
        class variant;

    // 22.6.4, variant helper classes
    template<class T> struct variant_size; // not defined
    template<class T> struct variant_size<const T>;
    template<class T>
        inline constexpr size_t variant_size_v = variant_size<T>::value;

    template<class... Types>
        struct variant_size<variant<Types...>>;

    template<size_t I, class T> struct variant_alternative; // not defined
    template<size_t I, class T> struct variant_alternative<I, const T>;
    template<size_t I, class T>
        using variant_alternative_t = typename variant_alternative<I, T>::type;

    template<size_t I, class... Types>
        struct variant_alternative<I, variant<Types...>>;

    inline constexpr size_t variant_npos = -1;

    // 22.6.5, value access
    template<class T, class... Types>
        constexpr bool holds_alternative(const variant<Types...>&) noexcept;

    template<size_t I, class... Types>
        constexpr variant_alternative_t<I, variant<Types...>&& get(variant<Types...>&);
    template<size_t I, class... Types>

}

```

22.6.3 Class template variant

[variant.variant]

22.6.3.1 General

[variant.variant.general]

```

namespace std {
    template<class... Types>
    class variant {
    public:
        // 22.6.3.2, constructors
        constexpr variant() noexcept(see below);
        constexpr variant(const variant&);
        constexpr variant(variant&&) noexcept(see below);

        template<class T>
            constexpr variant(T&&) noexcept(see below);

        template<class T, class... Args>
            constexpr explicit variant(in_place_type_t<T>, Args&&...);
        template<class T, class U, class... Args>
            constexpr explicit variant(in_place_type_t<T>, initializer_list<U>, Args&&...);

        template<size_t I, class... Args>
            constexpr explicit variant(in_place_index_t<I>, Args&&...);
        template<size_t I, class U, class... Args>
            constexpr explicit variant(in_place_index_t<I>, initializer_list<U>, Args&&...);
    };
}

```

```

// 22.6.3.3, destructor
constexpr ~variant();

// 22.6.3.4, assignment
constexpr variant& operator=(const variant&);
constexpr variant& operator=(variant&&) noexcept(see below);

template<class T> constexpr variant& operator=(T&&) noexcept(see below);

// 22.6.3.5, modifiers
template<class T, class... Args>
    constexpr T& emplace(Args&&...);
template<class T, class U, class... Args>
    constexpr T& emplace(initializer_list<U>, Args&&...);
template<size_t I, class... Args>
    constexpr variant_alternative_t<I, variant<Types...>& emplace(Args&&...);
template<size_t I, class U, class... Args>
    constexpr variant_alternative_t<I, variant<Types...>&
        emplace(initializer_list<U>, Args&&...);

// 22.6.3.6, value status
constexpr bool valueless_by_exception() const noexcept;
constexpr size_t index() const noexcept;

// 22.6.3.7, swap
constexpr void swap(variant&) noexcept(see below);
};
}

```

- 1 Any instance of `variant` at any given time either holds a value of one of its alternative types or holds no value. When an instance of `variant` holds a value of alternative type `T`, it means that a value of type `T`, referred to as the `variant` object's *contained value*, is allocated within the storage of the `variant` object. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the contained value. The contained value shall be allocated in a region of the `variant` storage suitably aligned for all types in `Types`.
- 2 All types in `Types` shall meet the *Cpp17Destructible* requirements (Table 34).
- 3 A program that instantiates the definition of `variant` with no template arguments is ill-formed.

22.6.3.2 Constructors

[variant.ctor]

- 1 In the descriptions that follow, let i be in the range $[0, \text{sizeof} \dots (\text{Types}))$, and T_i be the i^{th} type in `Types`.

```
constexpr variant() noexcept(see below);
```

- 2 **Constraints:** `is_default_constructible_v<T0>` is true.
- 3 **Effects:** Constructs a `variant` holding a value-initialized value of type `T0`.
- 4 **Postconditions:** `valueless_by_exception()` is false and `index()` is 0.
- 5 **Throws:** Any exception thrown by the value-initialization of `T0`.
- 6 **Remarks:** This function is `constexpr` if and only if the value-initialization of the alternative type `T0` would satisfy the requirements for a `constexpr` function. The exception specification is equivalent to `is_nothrow_default_constructible_v<T0>`.

[Note 1: See also class `monostate`. —end note]

```
constexpr variant(const variant& w);
```

- 7 **Effects:** If `w` holds a value, initializes the `variant` to hold the same alternative as `w` and direct-initializes the contained value with `get<j>(w)`, where j is `w.index()`. Otherwise, initializes the `variant` to not hold a value.
- 8 **Throws:** Any exception thrown by direct-initializing any T_i for all i .
- 9 **Remarks:** This constructor is defined as deleted unless `is_copy_constructible_v<Ti>` is true for all i . If `is_trivially_copy_constructible_v<Ti>` is true for all i , this constructor is trivial.

```
constexpr variant(variant&& w) noexcept(see below);
```

10 *Constraints:* `is_move_constructible_v<Ti>` is true for all *i*.

11 *Effects:* If *w* holds a value, initializes the variant to hold the same alternative as *w* and direct-initializes the contained value with `get<j>(std::move(w))`, where *j* is `w.index()`. Otherwise, initializes the variant to not hold a value.

12 *Throws:* Any exception thrown by move-constructing any T_i for all *i*.

13 *Remarks:* The exception specification is equivalent to the logical AND of `is_nothrow_move_constructible_v<Ti>` for all *i*. If `is_trivially_move_constructible_v<Ti>` is true for all *i*, this constructor is trivial.

```
template<class T> constexpr variant(T&& t) noexcept(see below);
```

14 Let T_j be a type that is determined as follows: build an imaginary function $FUN(T_i)$ for each alternative type T_i for which $T_i \ x[] = \{\text{std::forward}<T>(t)\}$; is well-formed for some invented variable *x*. The overload $FUN(T_j)$ selected by overload resolution for the expression $FUN(\text{std::forward}<T>(t))$ defines the alternative T_j which is the type of the contained value after construction.

15 *Constraints:*

(15.1) — `sizeof...(Types)` is nonzero,

(15.2) — `is_same_v<remove_cvref_t<T>, variant>` is false,

(15.3) — `remove_cvref_t<T>` is neither a specialization of `in_place_type_t` nor a specialization of `in_place_index_t`,

(15.4) — `is_constructible_v<Tj, T>` is true, and

(15.5) — the expression $FUN(\text{std::forward}<T>(t))$ (with FUN being the above-mentioned set of imaginary functions) is well-formed.

[Note 2:

```
variant<string, string> v("abc");
```

is ill-formed, as both alternative types have an equally viable constructor for the argument. — *end note*]

16 *Effects:* Initializes `*this` to hold the alternative type T_j and direct-non-list-initializes the contained value with `std::forward<T>(t)`.

17 *Postconditions:* `holds_alternative<Tj>(*this)` is true.

18 *Throws:* Any exception thrown by the initialization of the selected alternative T_j .

19 *Remarks:* The exception specification is equivalent to `is_nothrow_constructible_v<Tj, T>`. If T_j 's selected constructor is a `constexpr` constructor, this constructor is a `constexpr` constructor.

```
template<class T, class... Args> constexpr explicit variant(in_place_type_t<T>, Args&&... args);
```

20 *Constraints:*

(20.1) — There is exactly one occurrence of *T* in `Types...` and

(20.2) — `is_constructible_v<T, Args...>` is true.

21 *Effects:* Direct-non-list-initializes the contained value of type *T* with `std::forward<Args>(args)...`

22 *Postconditions:* `holds_alternative<T>(*this)` is true.

23 *Throws:* Any exception thrown by calling the selected constructor of *T*.

24 *Remarks:* If *T*'s selected constructor is a `constexpr` constructor, this constructor is a `constexpr` constructor.

```
template<class T, class U, class... Args>
constexpr explicit variant(in_place_type_t<T>, initializer_list<U> il, Args&&... args);
```

25 *Constraints:*

(25.1) — There is exactly one occurrence of *T* in `Types...` and

(25.2) — `is_constructible_v<T, initializer_list<U>&, Args...>` is true.

26 *Effects:* Direct-non-list-initializes the contained value of type *T* with `il, std::forward<Args>(args)...`

27 *Postconditions:* `holds_alternative<T>(*this)` is true.

28 *Throws:* Any exception thrown by calling the selected constructor of T .

29 *Remarks:* If T 's selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

```
template<size_t I, class... Args> constexpr explicit variant(in_place_index_t<I>, Args&&... args);
```

30 *Constraints:*

(30.1) — I is less than `sizeof...(Types)` and

(30.2) — `is_constructible_v< T_I , Args...>` is true.

31 *Effects:* Direct-non-list-initializes the contained value of type T_I with `std::forward<Args>(args)...`

32 *Postconditions:* `index()` is I .

33 *Throws:* Any exception thrown by calling the selected constructor of T_I .

34 *Remarks:* If T_I 's selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

```
template<size_t I, class U, class... Args>
constexpr explicit variant(in_place_index_t<I>, initializer_list<U> il, Args&&... args);
```

35 *Constraints:*

(35.1) — I is less than `sizeof...(Types)` and

(35.2) — `is_constructible_v< T_I , initializer_list<U>&, Args...>` is true.

36 *Effects:* Direct-non-list-initializes the contained value of type T_I with `il, std::forward<Args>(args)...`

37 *Postconditions:* `index()` is I .

38 *Remarks:* If T_I 's selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

22.6.3.3 Destructor

[variant.dtor]

```
constexpr ~variant();
```

1 *Effects:* If `valueless_by_exception()` is false, destroys the currently contained value.

2 *Remarks:* If `is_trivially_destructible_v< T_i >` is true for all T_i , then this destructor is trivial.

22.6.3.4 Assignment

[variant.assign]

```
constexpr variant& operator=(const variant& rhs);
```

1 Let j be `rhs.index()`.

2 *Effects:*

(2.1) — If neither `*this` nor `rhs` holds a value, there is no effect.

(2.2) — Otherwise, if `*this` holds a value but `rhs` does not, destroys the value contained in `*this` and sets `*this` to not hold a value.

(2.3) — Otherwise, if `index() == j`, assigns the value contained in `rhs` to the value contained in `*this`.

(2.4) — Otherwise, if either `is_nothrow_copy_constructible_v< T_j >` is true or `is_nothrow_move_constructible_v< T_j >` is false, equivalent to `emplace< j >(get< j >(rhs))`.

(2.5) — Otherwise, equivalent to `operator=(variant(rhs))`.

3 *Postconditions:* `index() == rhs.index()`.

4 *Returns:* `*this`.

5 *Remarks:* This operator is defined as deleted unless `is_copy_constructible_v< T_i > && is_copy_assignable_v< T_i >` is true for all i . If `is_trivially_copy_constructible_v< T_i > && is_trivially_copy_assignable_v< T_i > && is_trivially_destructible_v< T_i >` is true for all i , this assignment operator is trivial.

```
constexpr variant& operator=(variant&& rhs) noexcept(see below);
```

6 Let j be `rhs.index()`.

7 *Constraints:* `is_move_constructible_v< T_i > && is_move_assignable_v< T_i >` is true for all i .

8 *Effects:*

(8.1) — If neither `*this` nor `rhs` holds a value, there is no effect.

(8.2) — Otherwise, if `*this` holds a value but `rhs` does not, destroys the value contained in `*this` and sets `*this` to not hold a value.

(8.3) — Otherwise, if `index() == j`, assigns `get<j>(std::move(rhs))` to the value contained in `*this`.

(8.4) — Otherwise, equivalent to `emplace<j>(get<j>(std::move(rhs)))`.

9 **Returns:** `*this`.

10 **Remarks:** If `is_trivially_move_constructible_v<Ti>` `&&` `is_trivially_move_assignable_v<Ti>` `&&` `is_trivially_destructible_v<Ti>` is true for all i , this assignment operator is trivial. The exception specification is equivalent to `is_nothrow_move_constructible_v<Ti>` `&&` `is_nothrow_move_assignable_v<Ti>` for all i .

(10.1) — If an exception is thrown during the call to T_j 's move construction (with j being `rhs.index()`), the variant will hold no value.

(10.2) — If an exception is thrown during the call to T_j 's move assignment, the state of the contained value is as defined by the exception safety guarantee of T_j 's move assignment; `index()` will be j .

```
template<class T> constexpr variant& operator=(T&& t) noexcept(see below);
```

11 Let T_j be a type that is determined as follows: build an imaginary function $FUN(T_i)$ for each alternative type T_i for which $T_i \ x[] = \{\text{std::forward}<T>(t)\}$; is well-formed for some invented variable x . The overload $FUN(T_j)$ selected by overload resolution for the expression $FUN(\text{std::forward}<T>(t))$ defines the alternative T_j which is the type of the contained value after assignment.

12 **Constraints:**

(12.1) — `is_same_v<remove_cvref_t<T>, variant>` is false,

(12.2) — `is_assignable_v<Tj&, T>` `&&` `is_constructible_v<Tj, T>` is true, and

(12.3) — the expression $FUN(\text{std::forward}<T>(t))$ (with FUN being the above-mentioned set of imaginary functions) is well-formed.

[Note 1:

```
variant<string, string> v;
v = "abc";
```

is ill-formed, as both alternative types have an equally viable constructor for the argument. — end note]

13 **Effects:**

(13.1) — If `*this` holds a T_j , assigns `std::forward<T>(t)` to the value contained in `*this`.

(13.2) — Otherwise, if `is_nothrow_constructible_v<Tj, T>` `||` `!is_nothrow_move_constructible_v<Tj>` is true, equivalent to `emplace<j>(std::forward<T>(t))`.

(13.3) — Otherwise, equivalent to `emplace<j>(Tj(std::forward<T>(t)))`.

14 **Postconditions:** `holds_alternative<Tj is true, with T_j selected by the imaginary function overload resolution described above.`

15 **Returns:** `*this`.

16 **Remarks:** The exception specification is equivalent to:

```
is_nothrow_assignable_v<Tj&, T> && is_nothrow_constructible_v<Tj, T>
```

(16.1) — If an exception is thrown during the assignment of `std::forward<T>(t)` to the value contained in `*this`, the state of the contained value and `t` are as defined by the exception safety guarantee of the assignment expression; `valueless_by_exception()` will be false.

(16.2) — If an exception is thrown during the initialization of the contained value, the variant object is permitted to not hold a value.

22.6.3.5 Modifiers

[variant.mod]

```
template<class T, class... Args> constexpr T& emplace(Args&&... args);
```

1 **Constraints:** `is_constructible_v<T, Args...>` is true, and `T` occurs exactly once in `Types`.

2 **Effects:** Equivalent to:

```
return emplace<I>(std::forward<Args>(args)...);
```

where I is the zero-based index of T in `Types`.

```
template<class T, class U, class... Args>
constexpr T& emplace(initializer_list<U> il, Args&&... args);
```

3 *Constraints:* `is_constructible_v<T, initializer_list<U>&, Args...>` is true, and T occurs exactly once in `Types`.

4 *Effects:* Equivalent to:

```
return emplace<I>(il, std::forward<Args>(args)...);
```

where I is the zero-based index of T in `Types`.

```
template<size_t I, class... Args>
constexpr variant_alternative_t<I, variant<Types...>&& emplace(Args&&... args);
```

5 *Mandates:* $I < \text{sizeof}...(Types)$.

6 *Constraints:* `is_constructible_v<TI, Args...>` is true.

7 *Effects:* Destroys the currently contained value if `valueless_by_exception()` is false. Then direct-non-list-initializes the contained value of type T_I with the arguments `std::forward<Args>(args)...`

8 *Postconditions:* `index()` is I .

9 *Returns:* A reference to the new contained value.

10 *Throws:* Any exception thrown during the initialization of the contained value.

11 *Remarks:* If an exception is thrown during the initialization of the contained value, the variant is permitted to not hold a value.

```
template<size_t I, class U, class... Args>
constexpr variant_alternative_t<I, variant<Types...>&&
emplace(initializer_list<U> il, Args&&... args);
```

12 *Mandates:* $I < \text{sizeof}...(Types)$.

13 *Constraints:* `is_constructible_v<TI, initializer_list<U>&, Args...>` is true.

14 *Effects:* Destroys the currently contained value if `valueless_by_exception()` is false. Then direct-non-list-initializes the contained value of type T_I with `il, std::forward<Args>(args)...`

15 *Postconditions:* `index()` is I .

16 *Returns:* A reference to the new contained value.

17 *Throws:* Any exception thrown during the initialization of the contained value.

18 *Remarks:* If an exception is thrown during the initialization of the contained value, the variant is permitted to not hold a value.

22.6.3.6 Value status

[variant.status]

```
constexpr bool valueless_by_exception() const noexcept;
```

1 *Effects:* Returns false if and only if the variant holds a value.

2 [Note 1: It is possible for a variant to hold no value if an exception is thrown during a type-changing assignment or emplacement. The latter means that even a `variant<float, int>` can become `valueless_by_exception()`, for instance by

```
struct S { operator int() { throw 42; } };
variant<float, int> v{12.f};
v.emplace<1>(S());
```

—end note]

```
constexpr size_t index() const noexcept;
```

3 *Effects:* If `valueless_by_exception()` is true, returns `variant_npos`. Otherwise, returns the zero-based index of the alternative of the contained value.

22.6.3.7 Swap**[variant.swap]**

```
constexpr void swap(variant& rhs) noexcept(see below);
```

- 1 *Mandates:* `is_move_constructible_v<Ti>` is true for all *i*.
- 2 *Preconditions:* Lvalues of type `Ti` are swappable (16.4.4.3).
- 3 *Effects:*
- (3.1) — If `valueless_by_exception()` && `rhs.valueless_by_exception()` no effect.
- (3.2) — Otherwise, if `index() == rhs.index()`, calls `swap(get<i>(*this), get<i>(rhs))` where *i* is `index()`.
- (3.3) — Otherwise, exchanges values of `rhs` and `*this`.
- 4 *Throws:* If `index() == rhs.index()`, any exception thrown by `swap(get<i>(*this), get<i>(rhs))` with *i* being `index()`. Otherwise, any exception thrown by the move constructor of `Ti` or `Tj` with *i* being `index()` and *j* being `rhs.index()`.
- 5 *Remarks:* If an exception is thrown during the call to function `swap(get<i>(*this), get<i>(rhs))`, the states of the contained values of `*this` and of `rhs` are determined by the exception safety guarantee of `swap` for lvalues of `Ti` with *i* being `index()`. If an exception is thrown during the exchange of the values of `*this` and `rhs`, the states of the values of `*this` and of `rhs` are determined by the exception safety guarantee of `variant`'s move constructor. The exception specification is equivalent to the logical AND of `is_nothrow_move_constructible_v<Ti>` && `is_nothrow_swappable_v<Ti>` for all *i*.

22.6.4 variant helper classes**[variant.helper]**

```
template<class T> struct variant_size;
```

- 1 All specializations of `variant_size` meet the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of `integral_constant<size_t, N>` for some *N*.

```
template<class T> struct variant_size<const T>;
```

- 2 Let *VS* denote `variant_size<T>` of the cv-unqualified type `T`. Then each specialization of the template meets the *Cpp17UnaryTypeTrait* requirements (21.3.2) with a base characteristic of `integral_constant<size_t, VS::value>`.

```
template<class... Types>
struct variant_size<variant<Types...> : integral_constant<size_t, sizeof...(Types)> { };
```

```
template<size_t I, class T> struct variant_alternative<I, const T>;
```

- 3 Let *VA* denote `variant_alternative<I, T>` of the cv-unqualified type `T`. Then each specialization of the template meets the *Cpp17TransformationTrait* requirements (21.3.2) with a member typedef `type` that names the type `add_const_t<VA::type>`.

```
variant_alternative<I, variant<Types...>>::type
```

- 4 *Mandates:* `I < sizeof...(Types)`.
- 5 *Type:* The type `TI`.

22.6.5 Value access**[variant.get]**

```
template<class T, class... Types>
constexpr bool holds_alternative(const variant<Types...>& v) noexcept;
```

- 1 *Mandates:* The type `T` occurs exactly once in `Types`.
- 2 *Returns:* true if `index()` is equal to the zero-based index of `T` in `Types`.

```
template<size_t I, class... Types>
constexpr variant_alternative_t<I, variant<Types...>& get(variant<Types...>& v);
template<size_t I, class... Types>
constexpr variant_alternative_t<I, variant<Types...>&& get(variant<Types...>&& v);
template<size_t I, class... Types>
constexpr const variant_alternative_t<I, variant<Types...>&& get(const variant<Types...>&& v);
```

```
template<size_t I, class... Types>
constexpr const variant_alternative_t<I, variant<Types...>&& get(const variant<Types...>&& v);
```

3 *Mandates:* $I < \text{sizeof}(\dots(\text{Types}))$.

4 *Effects:* If $v.\text{index}()$ is I , returns a reference to the object stored in the variant. Otherwise, throws an exception of type `bad_variant_access`.

```
template<class T, class... Types> constexpr T& get(variant<Types...>& v);
template<class T, class... Types> constexpr T&& get(variant<Types...>&& v);
template<class T, class... Types> constexpr const T& get(const variant<Types...>& v);
template<class T, class... Types> constexpr const T&& get(const variant<Types...>&& v);
```

5 *Mandates:* The type T occurs exactly once in Types .

6 *Effects:* If v holds a value of type T , returns a reference to that value. Otherwise, throws an exception of type `bad_variant_access`.

```
template<size_t I, class... Types>
constexpr add_pointer_t<variant_alternative_t<I, variant<Types...>>
get_if(variant<Types...>* v) noexcept;
template<size_t I, class... Types>
constexpr add_pointer_t<const variant_alternative_t<I, variant<Types...>>
get_if(const variant<Types...>* v) noexcept;
```

7 *Mandates:* $I < \text{sizeof}(\dots(\text{Types}))$.

8 *Returns:* A pointer to the value stored in the variant, if $v \neq \text{nullptr}$ and $v \rightarrow \text{index}() = I$. Otherwise, returns `nullptr`.

```
template<class T, class... Types>
constexpr add_pointer_t<T>
get_if(variant<Types...>* v) noexcept;
template<class T, class... Types>
constexpr add_pointer_t<const T>
get_if(const variant<Types...>* v) noexcept;
```

9 *Mandates:* The type T occurs exactly once in Types .

10 *Effects:* Equivalent to: `return get_if<i>(v);` with i being the zero-based index of T in Types .

22.6.6 Relational operators

[variant.relops]

```
template<class... Types>
constexpr bool operator==(const variant<Types...>& v, const variant<Types...>& w);
```

1 *Mandates:* `get<i>(v) == get<i>(w)` is a valid expression that is convertible to `bool`, for all i .

2 *Returns:* If $v.\text{index}() \neq w.\text{index}()$, `false`; otherwise if $v.\text{valueless_by_exception}()$, `true`; otherwise `get<i>(v) == get<i>(w)` with i being $v.\text{index}()$.

```
template<class... Types>
constexpr bool operator!=(const variant<Types...>& v, const variant<Types...>& w);
```

3 *Mandates:* `get<i>(v) != get<i>(w)` is a valid expression that is convertible to `bool`, for all i .

4 *Returns:* If $v.\text{index}() \neq w.\text{index}()$, `true`; otherwise if $v.\text{valueless_by_exception}()$, `false`; otherwise `get<i>(v) != get<i>(w)` with i being $v.\text{index}()$.

```
template<class... Types>
constexpr bool operator<(const variant<Types...>& v, const variant<Types...>& w);
```

5 *Mandates:* `get<i>(v) < get<i>(w)` is a valid expression that is convertible to `bool`, for all i .

6 *Returns:* If $w.\text{valueless_by_exception}()$, `false`; otherwise if $v.\text{valueless_by_exception}()$, `true`; otherwise, if $v.\text{index}() < w.\text{index}()$, `true`; otherwise if $v.\text{index}() > w.\text{index}()$, `false`; otherwise `get<i>(v) < get<i>(w)` with i being $v.\text{index}()$.

```
template<class... Types>
constexpr bool operator>(const variant<Types...>& v, const variant<Types...>& w);
```

7 *Mandates:* `get<i>(v) > get<i>(w)` is a valid expression that is convertible to `bool`, for all i .

- 8 *Returns:* If `v.valueless_by_exception()`, false; otherwise if `w.valueless_by_exception()`, true; otherwise, if `v.index() > w.index()`, true; otherwise if `v.index() < w.index()`, false; otherwise `get<i>(v) > get<i>(w)` with *i* being `v.index()`.

```
template<class... Types>
constexpr bool operator<=(const variant<Types...>& v, const variant<Types...>& w);
```

- 9 *Mandates:* `get<i>(v) <= get<i>(w)` is a valid expression that is convertible to bool, for all *i*.

- 10 *Returns:* If `v.valueless_by_exception()`, true; otherwise if `w.valueless_by_exception()`, false; otherwise, if `v.index() < w.index()`, true; otherwise if `v.index() > w.index()`, false; otherwise `get<i>(v) <= get<i>(w)` with *i* being `v.index()`.

```
template<class... Types>
constexpr bool operator>=(const variant<Types...>& v, const variant<Types...>& w);
```

- 11 *Mandates:* `get<i>(v) >= get<i>(w)` is a valid expression that is convertible to bool, for all *i*.

- 12 *Returns:* If `w.valueless_by_exception()`, true; otherwise if `v.valueless_by_exception()`, false; otherwise, if `v.index() > w.index()`, true; otherwise if `v.index() < w.index()`, false; otherwise `get<i>(v) >= get<i>(w)` with *i* being `v.index()`.

```
template<class... Types> requires (three_way_comparable<Types> && ...)
constexpr common_comparison_category_t<compare_three_way_result_t<Types>...>
operator<=>(const variant<Types...>& v, const variant<Types...>& w);
```

- 13 *Effects:* Equivalent to:

```
if (v.valueless_by_exception() && w.valueless_by_exception())
    return strong_ordering::equal;
if (v.valueless_by_exception()) return strong_ordering::less;
if (w.valueless_by_exception()) return strong_ordering::greater;
if (auto c = v.index() <=> w.index(); c != 0) return c;
return get<i>(v) <=> get<i>(w);
```

with *i* being `v.index()`.

22.6.7 Visitation

[variant.visit]

```
template<class Visitor, class... Variants>
constexpr see below visit(Visitor&& vis, Variants&&... vars);
template<class R, class Visitor, class... Variants>
constexpr R visit(Visitor&& vis, Variants&&... vars);
```

- 1 Let *as-variant* denote the following exposition-only function templates:

```
template<class... Ts>
auto&& as-variant(variant<Ts...>& var) { return var; }
template<class... Ts>
auto&& as-variant(const variant<Ts...>& var) { return var; }
template<class... Ts>
auto&& as-variant(variant<Ts...>&& var) { return std::move(var); }
template<class... Ts>
auto&& as-variant(const variant<Ts...>&& var) { return std::move(var); }
```

Let *n* be `sizeof...(Variants)`. For each $0 \leq i < n$, let V_i denote the type `decltype(as-variant(std::forward<Variantsi>(varsi)))`.

- 2 *Constraints:* V_i is a valid type for all $0 \leq i < n$.

- 3 Let *v* denote the pack of types V_i .

- 4 Let *m* be a pack of *n* values of type `size_t`. Such a pack is valid if $0 \leq m_i < \text{variant_size_v}<\text{remove_reference_t}<V_i>>$ for all $0 \leq i < n$. For each valid pack *m*, let *e(m)* denote the expression:

```
INVOKE(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) // see 22.10.4
```

for the first form and

```
INVOKE<R>(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) // see 22.10.4
```

for the second form.

5 *Mandates:* For each valid pack m , $e(m)$ is a valid expression. All such expressions are of the same type and value category.

6 *Returns:* $e(m)$, where m is the pack for which m_i is $as\text{-}variant(vars_i).index()$ for all $0 \leq i < n$. The return type is $decltype(e(m))$ for the first form.

7 *Throws:* `bad_variant_access` if $(as\text{-}variant(vars).valueless_by_exception() \parallel \dots)$ is true.

8 *Complexity:* For $n \leq 1$, the invocation of the callable object is implemented in constant time, i.e., for $n = 1$, it does not depend on the number of alternative types of V_0 . For $n > 1$, the invocation of the callable object has no complexity requirements.

22.6.8 Class `monostate`

[variant.monostate]

```
struct monostate{};
```

1 The class `monostate` can serve as a first alternative type for a variant to make the variant type default constructible.

22.6.9 `monostate` relational operators

[variant.monostate.relops]

```
constexpr bool operator==(monostate, monostate) noexcept { return true; }
constexpr strong_ordering operator<=>(monostate, monostate) noexcept
{ return strong_ordering::equal; }
```

1 [Note 1: `monostate` objects have only a single state; they thus always compare equal. — end note]

22.6.10 Specialized algorithms

[variant.specalg]

```
template<class... Types>
constexpr void swap(variant<Types...& v, variant<Types...& w) noexcept(see below);
```

1 *Constraints:* `is_move_constructible_v<Ti>` && `is_swappable_v<Ti>` is true for all i .

2 *Effects:* Equivalent to `v.swap(w)`.

3 *Remarks:* The exception specification is equivalent to `noexcept(v.swap(w))`.

22.6.11 Class `bad_variant_access`

[variant.bad.access]

```
namespace std {
class bad_variant_access : public exception {
public:
// see 17.9.3 for the specification of the special member functions
const char* what() const noexcept override;
};
}
```

1 Objects of type `bad_variant_access` are thrown to report invalid accesses to the value of a variant object.

```
const char* what() const noexcept override;
```

2 *Returns:* An implementation-defined ntbs.

22.6.12 Hash support

[variant.hash]

```
template<class... Types> struct hash<variant<Types...>>;
```

1 The specialization `hash<variant<Types...>>` is enabled (22.10.19) if and only if every specialization in `hash<remove_const_t<Types>>...` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<monostate>;
```

2 The specialization is enabled (22.10.19).

22.7 Storage for any type

[any]

22.7.1 General

[any.general]

1 Subclause 22.7 describes components that C++ programs may use to perform operations on objects of a discriminated type.

- ² [Note 1: The discriminated type can contain values of different types but does not attempt conversion between them, i.e., 5 is held strictly as an `int` and is not implicitly convertible either to "5" or to 5.0. This indifference to interpretation but awareness of type effectively allows safe, generic containers of single values, with no scope for surprises from ambiguous conversions. — end note]

22.7.2 Header `<any>` synopsis

[any.synop]

```
namespace std {
    // 22.7.3, class bad_any_cast
    class bad_any_cast;

    // 22.7.4, class any
    class any;

    // 22.7.5, non-member functions
    void swap(any& x, any& y) noexcept;

    template<class T, class... Args>
        any make_any(Args&&... args);
    template<class T, class U, class... Args>
        any make_any(initializer_list<U> il, Args&&... args);

    template<class T>
        T any_cast(const any& operand);
    template<class T>
        T any_cast(any& operand);
    template<class T>
        T any_cast(any&& operand);

    template<class T>
        const T* any_cast(const any* operand) noexcept;
    template<class T>
        T* any_cast(any* operand) noexcept;
}
```

22.7.3 Class `bad_any_cast`

[any.bad.any.cast]

```
namespace std {
    class bad_any_cast : public bad_cast {
    public:
        // see 17.9.3 for the specification of the special member functions
        const char* what() const noexcept override;
    };
}
```

- ¹ Objects of type `bad_any_cast` are thrown by a failed `any_cast` (22.7.5).

```
const char* what() const noexcept override;
```

- ² Returns: An implementation-defined ntbs.

22.7.4 Class `any`

[any.class]

22.7.4.1 General

[any.class.general]

```
namespace std {
    class any {
    public:
        // 22.7.4.2, construction and destruction
        constexpr any() noexcept;

        any(const any& other);
        any(any&& other) noexcept;

        template<class T>
            any(T&& value);
    };
}
```

```

template<class T, class... Args>
    explicit any(in_place_type_t<T>, Args&&...);
template<class T, class U, class... Args>
    explicit any(in_place_type_t<T>, initializer_list<U>, Args&&...);

~any();

// 22.7.4.3, assignments
any& operator=(const any& rhs);
any& operator=(any&& rhs) noexcept;

template<class T>
    any& operator=(T&& rhs);

// 22.7.4.4, modifiers
template<class T, class... Args>
    decay_t<T>& emplace(Args&&...);
template<class T, class U, class... Args>
    decay_t<T>& emplace(initializer_list<U>, Args&&...);
void reset() noexcept;
void swap(any& rhs) noexcept;

// 22.7.4.5, observers
bool has_value() const noexcept;
const type_info& type() const noexcept;
};
}

```

- 1 An object of class `any` stores an instance of any type that meets the constructor requirements or it has no value, and this is referred to as the *state* of the class `any` object. The stored instance is called the *contained value*. Two states are equivalent if either they both have no value, or they both have a value and the contained values are equivalent.
- 2 The non-member `any_cast` functions provide type-safe access to the contained value.
- 3 Implementations should avoid the use of dynamically allocated memory for a small contained value. However, any such small-object optimization shall only be applied to types `T` for which `is_nothrow_move_constructible_v<T>` is true. [Example 1: A contained value of type `int` could be stored in an internal buffer, not in separately-allocated memory. — end example]

22.7.4.2 Construction and destruction

[any.cons]

```
constexpr any() noexcept;
```

- 1 *Postconditions:* `has_value()` is false.

```
any(const any& other);
```

- 2 *Effects:* If `other.has_value()` is false, constructs an object that has no value. Otherwise, equivalent to `any(in_place_type_t<T>, any_cast<const T&>(other))` where `T` is the type of the contained value.
- 3 *Throws:* Any exceptions arising from calling the selected constructor for the contained value.

```
any(any&& other) noexcept;
```

- 4 *Effects:* If `other.has_value()` is false, constructs an object that has no value. Otherwise, constructs an object of type `any` that contains either the contained value of `other`, or contains an object of the same type constructed from the contained value of `other` considering that contained value as an rvalue.

```
template<class T>
    any(T&& value);
```

- 5 Let `VT` be `decay_t<T>`.
- 6 *Constraints:* `VT` is not the same type as `any`, `VT` is not a specialization of `in_place_type_t`, and `is_copy_constructible_v<VT>` is true.
- 7 *Preconditions:* `VT` meets the *Cpp17CopyConstructible* requirements.
- 8 *Effects:* Constructs an object of type `any` that contains an object of type `VT` direct-initialized with `std::forward<T>(value)`.
- 9 *Throws:* Any exception thrown by the selected constructor of `VT`.

```
template<class T, class... Args>
  explicit any(in_place_type_t<T>, Args&&... args);
```

- 10 Let VT be decay_t<T>.
- 11 *Constraints:* is_copy_constructible_v<VT> is true and is_constructible_v<VT, Args...> is true.
- 12 *Preconditions:* VT meets the *Cpp17CopyConstructible* requirements.
- 13 *Effects:* Direct-non-list-initializes the contained value of type VT with std::forward<Args>(args)....
- 14 *Postconditions:* *this contains a value of type VT.
- 15 *Throws:* Any exception thrown by the selected constructor of VT.

```
template<class T, class U, class... Args>
  explicit any(in_place_type_t<T>, initializer_list<U> il, Args&&... args);
```

- 16 Let VT be decay_t<T>.
- 17 *Constraints:* is_copy_constructible_v<VT> is true and is_constructible_v<VT, initializer_list<U>&, Args...> is true.
- 18 *Preconditions:* VT meets the *Cpp17CopyConstructible* requirements.
- 19 *Effects:* Direct-non-list-initializes the contained value of type VT with il, std::forward<Args>(args)....
- 20 *Postconditions:* *this contains a value.
- 21 *Throws:* Any exception thrown by the selected constructor of VT.

```
~any();
```

- 22 *Effects:* As if by reset().

22.7.4.3 Assignment

[any.assign]

```
any& operator=(const any& rhs);
```

- 1 *Effects:* As if by any(rhs).swap(*this). No effects if an exception is thrown.
- 2 *Returns:* *this.
- 3 *Throws:* Any exceptions arising from the copy constructor for the contained value.

```
any& operator=(any&& rhs) noexcept;
```

- 4 *Effects:* As if by any(std::move(rhs)).swap(*this).
- 5 *Postconditions:* The state of *this is equivalent to the original state of rhs.
- 6 *Returns:* *this.

```
template<class T>
  any& operator=(T&& rhs);
```

- 7 Let VT be decay_t<T>.
- 8 *Constraints:* VT is not the same type as any and is_copy_constructible_v<VT> is true.
- 9 *Preconditions:* VT meets the *Cpp17CopyConstructible* requirements.
- 10 *Effects:* Constructs an object tmp of type any that contains an object of type VT direct-initialized with std::forward<T>(rhs), and tmp.swap(*this). No effects if an exception is thrown.
- 11 *Returns:* *this.
- 12 *Throws:* Any exception thrown by the selected constructor of VT.

22.7.4.4 Modifiers

[any.modifiers]

```
template<class T, class... Args>
  decay_t<T>& emplace(Args&&... args);
```

- 1 Let VT be decay_t<T>.
- 2 *Constraints:* is_copy_constructible_v<VT> is true and is_constructible_v<VT, Args...> is true.
- 3 *Preconditions:* VT meets the *Cpp17CopyConstructible* requirements.

- 4 *Effects:* Calls `reset()`. Then direct-non-list-initializes the contained value of type `VT` with `std::forward<Args>(args)...`
- 5 *Postconditions:* `*this` contains a value.
- 6 *Returns:* A reference to the new contained value.
- 7 *Throws:* Any exception thrown by the selected constructor of `VT`.
- 8 *Remarks:* If an exception is thrown during the call to `VT`'s constructor, `*this` does not contain a value, and any previously contained value has been destroyed.

```
template<class T, class U, class... Args>
decay_t<T>& emplace(initializer_list<U> il, Args&&... args);
```

- 9 Let `VT` be `decay_t<T>`.
- 10 *Constraints:* `is_copy_constructible_v<VT>` is true and `is_constructible_v<VT, initializer_list<U>&, Args...>` is true.
- 11 *Preconditions:* `VT` meets the *Cpp17CopyConstructible* requirements.
- 12 *Effects:* Calls `reset()`. Then direct-non-list-initializes the contained value of type `VT` with `il, std::forward<Args>(args)...`
- 13 *Postconditions:* `*this` contains a value.
- 14 *Returns:* A reference to the new contained value.
- 15 *Throws:* Any exception thrown by the selected constructor of `VT`.
- 16 *Remarks:* If an exception is thrown during the call to `VT`'s constructor, `*this` does not contain a value, and any previously contained value has been destroyed.

```
void reset() noexcept;
```

- 17 *Effects:* If `has_value()` is true, destroys the contained value.
- 18 *Postconditions:* `has_value()` is false.

```
void swap(any& rhs) noexcept;
```

- 19 *Effects:* Exchanges the states of `*this` and `rhs`.

22.7.4.5 Observers

[any.observers]

```
bool has_value() const noexcept;
```

- 1 *Returns:* true if `*this` contains an object, otherwise false.

```
const type_info& type() const noexcept;
```

- 2 *Returns:* `typeid(T)` if `*this` has a contained value of type `T`, otherwise `typeid(void)`.

- 3 [Note 1: Useful for querying against types known either at compile time or only at runtime. — end note]

22.7.5 Non-member functions

[any.nonmembers]

```
void swap(any& x, any& y) noexcept;
```

- 1 *Effects:* Equivalent to `x.swap(y)`.

```
template<class T, class... Args>
any make_any(Args&&... args);
```

- 2 *Effects:* Equivalent to: `return any(in_place_type<T>, std::forward<Args>(args)...);`

```
template<class T, class U, class... Args>
any make_any(initializer_list<U> il, Args&&... args);
```

- 3 *Effects:* Equivalent to: `return any(in_place_type<T>, il, std::forward<Args>(args)...);`

```
template<class T>
T any_cast(const any& operand);
template<class T>
T any_cast(any& operand);
```

```
template<class T>
  T any_cast(any&& operand);
```

4 Let U be the type `remove_cvref_t<T>`.

5 *Mandates:* For the first overload, `is_constructible_v<T, const U&>` is true. For the second overload, `is_constructible_v<T, U&>` is true. For the third overload, `is_constructible_v<T, U>` is true.

6 *Returns:* For the first and second overload, `static_cast<T>(*any_cast<U>(&operand))`. For the third overload, `static_cast<T>(std::move(*any_cast<U>(&operand)))`.

7 *Throws:* `bad_any_cast` if `operand.type() != typeid(remove_reference_t<T>)`.

8 [Example 1:

```
    any x(5); // x holds int
    assert(any_cast<int>(x) == 5); // cast to value
    any_cast<int&&>(x) = 10; // cast to reference
    assert(any_cast<int>(x) == 10);

    x = "Meow"; // x holds const char*
    assert(strcmp(any_cast<const char*>(x), "Meow") == 0);
    any_cast<const char*&&>(x) = "Harry";
    assert(strcmp(any_cast<const char*>(x), "Harry") == 0);

    x = string("Meow"); // x holds string
    string s, s2("Jane");
    s = move(any_cast<string&&>(x)); // move from any
    assert(s == "Meow");
    any_cast<string&&>(x) = move(s2); // move to any
    assert(any_cast<const string&&>(x) == "Jane");

    string cat("Meow");
    const any y(cat); // const y holds string
    assert(any_cast<const string&&>(y) == cat);

    any_cast<string&&>(y); // error: cannot any_cast away const
—end example]
```

```
template<class T>
  const T* any_cast(const any* operand) noexcept;
template<class T>
  T* any_cast(any* operand) noexcept;
```

9 *Returns:* If `operand != nullptr` && `operand->type() == typeid(T)`, a pointer to the object contained by `operand`; otherwise, `nullptr`.

10 [Example 2:

```
    bool is_string(const any& operand) {
        return any_cast<string>(&operand) != nullptr;
    }
```

—end example]

22.8 Expected objects

[expected]

22.8.1 In general

[expected.general]

1 Subclause 22.8 describes the class template `expected` that represents expected objects. An `expected<T, E>` object holds an object of type `T` or an object of type `unexpected<E>` and manages the lifetime of the contained objects.

22.8.2 Header <expected> synopsis

[expected.syn]

```
namespace std {
    // 22.8.3.2, class template unexpected
    template<class E> class unexpected;

    // 22.8.4, class template bad_expected_access
    template<class E> class bad_expected_access;
```

```

// 22.8.5, specialization for void
template<> class bad_expected_access<void>;

// in-place construction of unexpected values
struct unexpect_t {
    explicit unexpect_t() = default;
};
inline constexpr unexpect_t unexpect{};

// 22.8.6, class template expected
template<class T, class E> class expected;

// 22.8.7, partial specialization of expected for void types
template<class T, class E> requires is_void_v<T> class expected<T, E>;
}

```

22.8.3 Unexpected objects

[expected.unexpected]

22.8.3.1 General

[expected.un.general]

- ¹ Subclause 22.8.3 describes the class template unexpected that represents unexpected objects stored in expected objects.

22.8.3.2 Class template unexpected

[expected.un.object]

22.8.3.2.1 General

[expected.un.object.general]

```

namespace std {
    template<class E>
    class unexpected {
    public:
        constexpr unexpected(const unexpected&) = default;
        constexpr unexpected(unexpected&&) = default;
        template<class... Args>
            constexpr explicit unexpected(in_place_t, Args&&...);
        template<class U, class... Args>
            constexpr explicit unexpected(in_place_t, initializer_list<U>, Args&&...);
        template<class Err = E>
            constexpr explicit unexpected(Err&&);

        constexpr unexpected& operator=(const unexpected&) = default;
        constexpr unexpected& operator=(unexpected&&) = default;

        constexpr const E& value() const & noexcept;
        constexpr E& value() & noexcept;
        constexpr const E&& value() const && noexcept;
        constexpr E&& value() && noexcept;

        constexpr void swap(unexpected& other) noexcept(see below);

        template<class E2>
            friend constexpr bool operator==(const unexpected&, const unexpected<E2>&);

        friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));

    private:
        E val; // exposition only
    };

    template<class E> unexpected(E) -> unexpected<E>;
}

```

- ¹ A program that instantiates the definition of unexpected for a non-object type, an array type, a specialization of unexpected, or a cv-qualified type is ill-formed.

22.8.3.2.2 Constructors**[expected.un.ctor]**

```
template<class Err = E>
constexpr explicit unexpected(Err&& e);
```

1 *Constraints:*

(1.1) — `is_same_v<remove_cvref_t<Err>, unexpected>` is false; and

(1.2) — `is_same_v<remove_cvref_t<Err>, in_place_t>` is false; and

(1.3) — `is_constructible_v<E, Err>` is true.

2 *Effects:* Direct-non-list-initializes `val` with `std::forward<Err>(e)`.

3 *Throws:* Any exception thrown by the initialization of `val`.

```
template<class... Args>
constexpr explicit unexpected(in_place_t, Args&&... args);
```

4 *Constraints:* `is_constructible_v<E, Args...>` is true.

5 *Effects:* Direct-non-list-initializes `val` with `std::forward<Args>(args)...`

6 *Throws:* Any exception thrown by the initialization of `val`.

```
template<class U, class... Args>
constexpr explicit unexpected(in_place_t, initializer_list<U> il, Args&&... args);
```

7 *Constraints:* `is_constructible_v<E, initializer_list<U>&, Args...>` is true.

8 *Effects:* Direct-non-list-initializes `val` with `il, std::forward<Args>(args)...`

9 *Throws:* Any exception thrown by the initialization of `val`.

22.8.3.2.3 Observers**[expected.un.obs]**

```
constexpr const E& value() const & noexcept;
constexpr E& value() & noexcept;
```

1 *Returns:* `val`.

```
constexpr E&& value() && noexcept;
constexpr const E&& value() const && noexcept;
```

2 *Returns:* `std::move(val)`.

22.8.3.2.4 Swap**[expected.un.swap]**

```
constexpr void swap(unexpected& other) noexcept(is_nothrow_swappable_v<E>);
```

1 *Mandates:* `is_swappable_v<E>` is true.

2 *Effects:* Equivalent to: using `std::swap`; `swap(val, other.val)`;

```
friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));
```

3 *Constraints:* `is_swappable_v<E>` is true.

4 *Effects:* Equivalent to `x.swap(y)`.

22.8.3.2.5 Equality operator**[expected.un.eq]**

```
template<class E2>
friend constexpr bool operator==(const unexpected& x, const unexpected<E2>& y);
```

1 *Mandates:* The expression `x.value() == y.value()` is well-formed and its result is convertible to `bool`.

2 *Returns:* `x.value() == y.value()`.

22.8.4 Class template `bad_expected_access`**[expected.bad]**

```
namespace std {
template<class E>
class bad_expected_access : public bad_expected_access<void> {
public:
explicit bad_expected_access(E);
```

```

    const char* what() const noexcept override;
    E& error() & noexcept;
    const E& error() const & noexcept;
    E&& error() && noexcept;
    const E&& error() const && noexcept;
private:
    E val;           // exposition only
};
}

```

- ¹ The class template `bad_expected_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an `expected<T, E>` object for which `has_value()` is false.

```
explicit bad_expected_access(E e);
```

- ² *Effects:* Initializes `val` with `std::move(e)`.

```
const E& error() const & noexcept;
E& error() & noexcept;
```

- ³ *Returns:* `val`.

```
E&& error() && noexcept;
const E&& error() const && noexcept;
```

- ⁴ *Returns:* `std::move(val)`.

```
const char* what() const noexcept override;
```

- ⁵ *Returns:* An implementation-defined ntbs.

22.8.5 Class template specialization `bad_expected_access<void>`

[[expected.bad.void](#)]

```

namespace std {
    template<>
    class bad_expected_access<void> : public exception {
    protected:
        bad_expected_access() noexcept;
        bad_expected_access(const bad_expected_access&);
        bad_expected_access(bad_expected_access&&);
        bad_expected_access& operator=(const bad_expected_access&);
        bad_expected_access& operator=(bad_expected_access&&);
        ~bad_expected_access();
    public:
        const char* what() const noexcept override;
    };
}

```

```
const char* what() const noexcept override;
```

- ¹ *Returns:* An implementation-defined ntbs.

22.8.6 Class template `expected`

[[expected.expected](#)]

22.8.6.1 General

[[expected.object.general](#)]

```

namespace std {
    template<class T, class E>
    class expected {
    public:
        using value_type = T;
        using error_type = E;
        using unexpected_type = unexpected<E>;

        template<class U>
        using rebind = expected<U, error_type>;

        // 22.8.6.2, constructors
        constexpr expected();

```

```

constexpr explicit(see below) expected(const expected&);
constexpr explicit(see below) expected(expected&&) noexcept(see below);
template<class U, class G>

private:
    bool has_val;           // exposition only
    union {
        T val;             // exposition only
        E unex;           // exposition only
    };
};
}

```

- 1 Any object of type `expected<T, E>` either contains a value of type `T` or a value of type `E` within its own storage. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the object of type `T` or the object of type `E`. These objects are allocated in a region of the `expected<T, E>` storage suitably aligned for the types `T` and `E`. Members `has_val`, `val`, and `unex` are provided for exposition only. `has_val` indicates whether the `expected<T, E>` object contains an object of type `T`.
- 2 A program that instantiates the definition of template `expected<T, E>` for a reference type, a function type, or for possibly cv-qualified types `in_place_t`, `unexpected_t`, or a specialization of `unexpected` for the `T` parameter is ill-formed. A program that instantiates the definition of the template `expected<T, E>` with a type for the `E` parameter that is not a valid template argument for `unexpected` is ill-formed.
- 3 When `T` is not cv void, it shall meet the *Cpp17Destructible* requirements (Table 34). `E` shall meet the *Cpp17Destructible* requirements.

22.8.6.2 Constructors

[`expected.object.ctor`]

```
constexpr expected();
```

1 *Constraints:* `is_default_constructible_v<T>` is true.

2 *Effects:* Value-initializes `val`.

3 *Postconditions:* `has_value()` is true.

4 *Throws:* Any exception thrown by the initialization of `val`.

```
constexpr expected(const expected& rhs);
```

5 *Effects:* If `rhs.has_value()` is true, direct-non-list-initializes `val` with `*rhs`. Otherwise, direct-non-list-initializes `unex` with `rhs.error()`.

6 *Postconditions:* `rhs.has_value() == this->has_value()`.

7 *Throws:* Any exception thrown by the initialization of `val` or `unex`.

8 *Remarks:* This constructor is defined as deleted unless

(8.1) — `is_copy_constructible_v<T>` is true and

(8.2) — `is_copy_constructible_v<E>` is true.

9 This constructor is trivial if

(9.1) — `is_trivially_copy_constructible_v<T>` is true and

(9.2) — `is_trivially_copy_constructible_v<E>` is true.

```
constexpr expected(expected&& rhs) noexcept(see below);
```

10 *Constraints:*

(10.1) — `is_move_constructible_v<T>` is true and

(10.2) — `is_move_constructible_v<E>` is true.

11 *Effects:* If `rhs.has_value()` is true, direct-non-list-initializes `val` with `std::move(*rhs)`. Otherwise, direct-non-list-initializes `unex` with `std::move(rhs.error())`.

12 *Postconditions:* `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is true.

13 *Throws:* Any exception thrown by the initialization of `val` or `unex`.

14 *Remarks:* The exception specification is equivalent to `is_nothrow_move_constructible_v<T> && is_nothrow_move_constructible_v<E>`.

15 This constructor is trivial if

(15.1) — `is_trivially_move_constructible_v<T>` is true and

(15.2) — `is_trivially_move_constructible_v<E>` is true.

```
template<class U, class G>
constexpr explicit(see below) expected(const expected<U, G&& rhs>);
template<class U, class G>
constexpr explicit(see below) expected(expected<U, G>&& rhs);
```

16 Let:

(16.1) — `UF` be `const U&` for the first overload and `U` for the second overload.

(16.2) — `GF` be `const G&` for the first overload and `G` for the second overload.

17 *Constraints:*

(17.1) — `is_constructible_v<T, UF>` is true; and

(17.2) — `is_constructible_v<E, GF>` is true; and

(17.3) — `is_constructible_v<T, expected<U, G>&&` is false; and

(17.4) — `is_constructible_v<T, expected<U, G>>` is false; and

(17.5) — `is_constructible_v<T, const expected<U, G>&&` is false; and

(17.6) — `is_constructible_v<T, const expected<U, G>>` is false; and

(17.7) — `is_convertible_v<expected<U, G>&, T>` is false; and

(17.8) — `is_convertible_v<expected<U, G>&&, T>` is false; and

(17.9) — `is_convertible_v<const expected<U, G>&, T>` is false; and

(17.10) — `is_convertible_v<const expected<U, G>&&, T>` is false; and

(17.11) — `is_constructible_v<unexpected<E>, expected<U, G>&>` is false; and

(17.12) — `is_constructible_v<unexpected<E>, expected<U, G>>` is false; and

(17.13) — `is_constructible_v<unexpected<E>, const expected<U, G>&>` is false; and

(17.14) — `is_constructible_v<unexpected<E>, const expected<U, G>>` is false.

18 *Effects:* If `rhs.has_value()`, direct-non-list-initializes `val` with `std::forward<UF>(*rhs)`. Otherwise, direct-non-list-initializes `unex` with `std::forward<GF>(rhs.error())`.

19 *Postconditions:* `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is true.

20 *Throws:* Any exception thrown by the initialization of `val` or `unex`.

21 *Remarks:* The expression inside `explicit` is equivalent to `!is_convertible_v<UF, T> || !is_convertible_v<GF, E>`.

```
template<class U = T>
constexpr explicit(!is_convertible_v<U, T>) expected(U&& v);
```

22 *Constraints:*

(22.1) — `is_same_v<remove_cvref_t<U>, in_place_t>` is false; and

(22.2) — `is_same_v<expected<T, E>, remove_cvref_t<U>>` is false; and

(22.3) — `remove_cvref_t<U>` is not a specialization of `unexpected`; and

(22.4) — `is_constructible_v<T, U>` is true.

23 *Effects:* Direct-non-list-initializes *val* with `std::forward<U>(v)`.

24 *Postconditions:* `has_value()` is true.

25 *Throws:* Any exception thrown by the initialization of *val*.

```
template<class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>& e);
template<class G>
```

```
constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);
```

26 Let *GF* be `const G&` for the first overload and *G* for the second overload.

27 *Constraints:* `is_constructible_v<E, GF>` is true.

28 *Effects:* Direct-non-list-initializes *unex* with `std::forward<GF>(e.value())`.

29 *Postconditions:* `has_value()` is false.

30 *Throws:* Any exception thrown by the initialization of *unex*.

```
template<class... Args>
constexpr explicit expected(in_place_t, Args&&... args);
```

31 *Constraints:* `is_constructible_v<T, Args...>` is true.

32 *Effects:* Direct-non-list-initializes *val* with `std::forward<Args>(args)...`

33 *Postconditions:* `has_value()` is true.

34 *Throws:* Any exception thrown by the initialization of *val*.

```
template<class U, class... Args>
constexpr explicit expected(in_place_t, initializer_list<U> il, Args&&... args);
```

35 *Constraints:* `is_constructible_v<T, initializer_list<U>&, Args...>` is true.

36 *Effects:* Direct-non-list-initializes *val* with `il, std::forward<Args>(args)...`

37 *Postconditions:* `has_value()` is true.

38 *Throws:* Any exception thrown by the initialization of *val*.

```
template<class... Args>
constexpr explicit expected(unexpect_t, Args&&... args);
```

39 *Constraints:* `is_constructible_v<E, Args...>` is true.

40 *Effects:* Direct-non-list-initializes *unex* with `std::forward<Args>(args)...`

41 *Postconditions:* `has_value()` is false.

42 *Throws:* Any exception thrown by the initialization of *unex*.

```
template<class U, class... Args>
constexpr explicit expected(unexpect_t, initializer_list<U> il, Args&&... args);
```

43 *Constraints:* `is_constructible_v<E, initializer_list<U>&, Args...>` is true.

44 *Effects:* Direct-non-list-initializes *unex* with `il, std::forward<Args>(args)...`

45 *Postconditions:* `has_value()` is false.

46 *Throws:* Any exception thrown by the initialization of *unex*.

22.8.6.3 Destructor

[expected.object.dtor]

```
constexpr ~expected();
```

1 *Effects:* If `has_value()` is true, destroys *val*, otherwise destroys *unex*.

2 *Remarks:* If `is_trivially_destructible_v<T>` is true, and `is_trivially_destructible_v<E>` is true, then this destructor is a trivial destructor.

22.8.6.4 Assignment

[expected.object.assign]

1 This subclause makes use of the following exposition-only function:

```

template<class T, class U, class... Args>
constexpr void reinit-expected(T& newval, U& oldval, Args&&... args) { // exposition only
    if constexpr (is_nothrow_constructible_v<T, Args...>) {
        destroy_at(addressof(oldval));
        construct_at(addressof(newval), std::forward<Args>(args)...);
    } else if constexpr (is_nothrow_move_constructible_v<T>) {
        T tmp(std::forward<Args>(args)...);
        destroy_at(addressof(oldval));
        construct_at(addressof(newval), std::move(tmp));
    } else {
        U tmp(std::move(oldval));
        destroy_at(addressof(oldval));
        try {
            construct_at(addressof(newval), std::forward<Args>(args)...);
        } catch (...) {
            construct_at(addressof(oldval), std::move(tmp));
            throw;
        }
    }
}

```

```
constexpr expected& operator=(const expected& rhs);
```

2 *Effects:*

- (2.1) — If `this->has_value()` && `rhs.has_value()` is true, equivalent to `val = *rhs`.
- (2.2) — Otherwise, if `this->has_value()` is true, equivalent to:

```
reinit-expected(unex, val, rhs.error())
```
- (2.3) — Otherwise, if `rhs.has_value()` is true, equivalent to:

```
reinit-expected(val, unex, *rhs)
```
- (2.4) — Otherwise, equivalent to `unex = rhs.error()`.

Then, if no exception was thrown, equivalent to: `has_val = rhs.has_value(); return *this;`

3 *Remarks:* This operator is defined as deleted unless:

- (3.1) — `is_copy_assignable_v<T>` is true and
- (3.2) — `is_copy_constructible_v<T>` is true and
- (3.3) — `is_copy_assignable_v<E>` is true and
- (3.4) — `is_copy_constructible_v<E>` is true and
- (3.5) — `is_nothrow_move_constructible_v<T>` || `is_nothrow_move_constructible_v<E>` is true.

```
constexpr expected& operator=(expected&& rhs) noexcept(see below);
```

4 *Constraints:*

- (4.1) — `is_move_constructible_v<T>` is true and
- (4.2) — `is_move_assignable_v<T>` is true and
- (4.3) — `is_move_constructible_v<E>` is true and
- (4.4) — `is_move_assignable_v<E>` is true and
- (4.5) — `is_nothrow_move_constructible_v<T>` || `is_nothrow_move_constructible_v<E>` is true.

5 *Effects:*

- (5.1) — If `this->has_value()` && `rhs.has_value()` is true, equivalent to `val = std::move(*rhs)`.
- (5.2) — Otherwise, if `this->has_value()` is true, equivalent to:

```
reinit-expected(unex, val, std::move(rhs.error()))
```
- (5.3) — Otherwise, if `rhs.has_value()` is true, equivalent to:

```
reinit-expected(val, unex, std::move(*rhs))
```
- (5.4) — Otherwise, equivalent to `unex = std::move(rhs.error())`.

Then, if no exception was thrown, equivalent to: `has_val = rhs.has_value(); return *this;`

6 **Remarks:** The exception specification is equivalent to:

```
is_nothrow_move_assignable_v<T> && is_nothrow_move_constructible_v<T> &&
is_nothrow_move_assignable_v<E> && is_nothrow_move_constructible_v<E>
```

```
template<class U = T>
constexpr expected& operator=(U&& v);
```

7 **Constraints:**

- (7.1) — `is_same_v<expected, remove_cvref_t<U>>` is false; and
- (7.2) — `remove_cvref_t<U>` is not a specialization of `unexpected`; and
- (7.3) — `is_constructible_v<T, U>` is true; and
- (7.4) — `is_assignable_v<T&, U>` is true; and
- (7.5) — `is_nothrow_constructible_v<T, U> || is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is true.

8 **Effects:**

- (8.1) — If `has_value()` is true, equivalent to: `val = std::forward<U>(v);`
- (8.2) — Otherwise, equivalent to:

```
reinit-expected(val, unex, std::forward<U>(v));
has_val = true;
```

9 **Returns:** `*this`.

```
template<class G>
constexpr expected& operator=(const unexpected<G>& e);
template<class G>
constexpr expected& operator=(unexpected<G>&& e);
```

10 Let `GF` be `const G&` for the first overload and `G` for the second overload.

11 **Constraints:**

- (11.1) — `is_constructible_v<E, GF>` is true; and
- (11.2) — `is_assignable_v<E&, GF>` is true; and
- (11.3) — `is_nothrow_constructible_v<E, GF> || is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E>` is true.

12 **Effects:**

- (12.1) — If `has_value()` is true, equivalent to:

```
reinit-expected(unex, val, std::forward<GF>(e.value()));
has_val = false;
```
- (12.2) — Otherwise, equivalent to: `unex = std::forward<GF>(e.value());`

13 **Returns:** `*this`.

```
template<class... Args>
constexpr T& emplace(Args&&... args) noexcept;
```

14 **Constraints:** `is_nothrow_constructible_v<T, Args...>` is true.

15 **Effects:** Equivalent to:

```
if (has_value()) {
    destroy_at(addressof(val));
} else {
    destroy_at(addressof(unex));
    has_val = true;
}
return *construct_at(addressof(val), std::forward<Args>(args)...);
```

```
template<class U, class... Args>
constexpr T& emplace(initializer_list<U> il, Args&&... args) noexcept;
```

16 *Constraints:* `is_nothrow_constructible_v<T, initializer_list<U>&, Args...>` is true.

17 *Effects:* Equivalent to:

```
if (has_value()) {
    destroy_at(addressof(val));
} else {
    destroy_at(addressof(unex));
    has_val = true;
}
return *construct_at(addressof(val), il, std::forward<Args>(args)...);
```

22.8.6.5 Swap

[expected.object.swap]

```
constexpr void swap(expected& rhs) noexcept(see below);
```

1 *Constraints:*

(1.1) — `is_swappable_v<T>` is true and

(1.2) — `is_swappable_v<E>` is true and

(1.3) — `is_move_constructible_v<T>` && `is_move_constructible_v<E>` is true, and

(1.4) — `is_nothrow_move_constructible_v<T>` || `is_nothrow_move_constructible_v<E>` is true.

2 *Effects:* See [Table 62](#).

Table 62: `swap(expected&)` effects [tab:expected.object.swap]

	this->has_value()	!this->has_value()
rhs.has_value()	equivalent to: using <code>std::swap;</code> <code>swap(val, rhs.val);</code>	calls <code>rhs.swap(*this)</code>
!rhs.has_value()	see below	equivalent to: using <code>std::swap;</code> <code>swap(unex, rhs.unex);</code>

For the case where `rhs.value()` is false and `this->has_value()` is true, equivalent to:

```
if constexpr (is_nothrow_move_constructible_v<E>) {
    E tmp(std::move(rhs.unex));
    destroy_at(addressof(rhs.unex));
    try {
        construct_at(addressof(rhs.val), std::move(val));
        destroy_at(addressof(val));
        construct_at(addressof(unex), std::move(tmp));
    } catch (...) {
        construct_at(addressof(rhs.unex), std::move(tmp));
        throw;
    }
} else {
    T tmp(std::move(val));
    destroy_at(addressof(val));
    try {
        construct_at(addressof(unex), std::move(rhs.unex));
        destroy_at(addressof(rhs.unex));
        construct_at(addressof(rhs.val), std::move(tmp));
    } catch (...) {
        construct_at(addressof(val), std::move(tmp));
        throw;
    }
}
has_val = false;
rhs.has_val = true;
```

3 *Throws*: Any exception thrown by the expressions in the *Effects*.

4 *Remarks*: The exception specification is equivalent to:

```
is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T> &&
is_nothrow_move_constructible_v<E> && is_nothrow_swappable_v<E>
```

```
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

5 *Effects*: Equivalent to `x.swap(y)`.

22.8.6.6 Observers

[expected.object.obs]

```
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
```

1 *Preconditions*: `has_value()` is true.

2 *Returns*: `addressof(val)`.

```
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
```

3 *Preconditions*: `has_value()` is true.

4 *Returns*: `val`.

```
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
```

5 *Preconditions*: `has_value()` is true.

6 *Returns*: `std::move(val)`.

```
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
```

7 *Returns*: `has_val`.

```
constexpr const T& value() const &;
constexpr T& value() &;
```

8 *Returns*: `val`, if `has_value()` is true.

9 *Throws*: `bad_expected_access(error())` if `has_value()` is false.

```
constexpr T&& value() &&;
constexpr const T&& value() const &&;
```

10 *Returns*: `std::move(val)`, if `has_value()` is true.

11 *Throws*: `bad_expected_access(std::move(error()))` if `has_value()` is false.

```
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
```

12 *Preconditions*: `has_value()` is false.

13 *Returns*: `unex`.

```
constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;
```

14 *Preconditions*: `has_value()` is false.

15 *Returns*: `std::move(unex)`.

```
template<class U> constexpr T value_or(U&& v) const &;
```

16 *Mandates*: `is_copy_constructible_v<T>` is true and `is_convertible_v<U, T>` is true.

17 *Returns*: `has_value() ? **this : static_cast<T>(std::forward<U>(v))`.

```
template<class U> constexpr T value_or(U&& v) &&;
```

18 *Mandates*: `is_move_constructible_v<T>` is true and `is_convertible_v<U, T>` is true.

19 *Returns:* `has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v)).`

22.8.6.7 Equality operators

[expected.object.eq]

```
template<class T2, class E2> requires (!is_void_v<T2>)
    friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

1 *Mandates:* The expressions `*x == *y` and `x.error() == y.error()` are well-formed and their results are convertible to `bool`.

2 *Returns:* If `x.has_value()` does not equal `y.has_value()`, `false`; otherwise if `x.has_value()` is true, `*x == *y`; otherwise `x.error() == y.error()`.

```
template<class T2> friend constexpr bool operator==(const expected& x, const T2& v);
```

3 *Mandates:* The expression `*x == v` is well-formed and its result is convertible to `bool`.

[Note 1: T1 need not be *Cpp17EqualityComparable*. — end note]

4 *Returns:* `x.has_value() && static_cast<bool>(*x == v)`.

```
template<class E2> friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

5 *Mandates:* The expression `x.error() == e.value()` is well-formed and its result is convertible to `bool`.

6 *Returns:* `!x.has_value() && static_cast<bool>(x.error() == e.value())`.

22.8.7 Partial specialization of `expected` for void types

[expected.void]

22.8.7.1 General

[expected.void.general]

```
template<class T, class E> requires is_void_v<T>
class expected<T, E> {
public:
```

```
    using value_type = T;
    using error_type = E;
    using unexpected_type = unexpected<E>;
```

```
    template<class U>
    using rebind = expected<U, error_type>;
```

// 22.8.7.2, constructors

```
constexpr expected() noexcept;
constexpr explicit(see below) expected(const expected&);
constexpr explicit(see below) expected(expected&&) noexcept(see below);
template<class U, class G>
    constexpr explicit(see below) expected(const expected<U, G>&);
template<class U, class G>
    constexpr explicit(see below) expected(expected<U, G>&&);
```

```
template<class G>
    constexpr expected(const unexpected<G>&);
template<class G>
    constexpr expected(unexpected<G>&&);
```

```
constexpr explicit expected(in_place_t) noexcept;
template<class... Args>
    constexpr explicit expected(unexpect_t, Args&&...);
template<class U, class... Args>
    constexpr explicit expected(unexpect_t, initializer_list<U>, Args&&...);
```

// 22.8.7.3, destructor

```
constexpr ~expected();
```

// 22.8.7.4, assignment

```
constexpr expected& operator=(const expected&);
constexpr expected& operator=(expected&&) noexcept(see below);
```

```

template<class G>
    constexpr expected& operator=(const unexpected<G>&);
template<class G>
    constexpr expected& operator=(unexpected<G>&&);
constexpr void emplace() noexcept;

// 22.8.7.5, swap
constexpr void swap(expected&) noexcept(see below);
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));

// 22.8.7.6, observers
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
constexpr void operator*() const noexcept;
constexpr void value() const &;
constexpr void value() &&;
constexpr const E& error() const &;
constexpr E& error() &;
constexpr const E&& error() const &&;
constexpr E&& error() &&;

// 22.8.7.7, equality operators
template<class T2, class E2> requires is_void_v<T2>
    friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
template<class E2>
    friend constexpr bool operator==(const expected&, const unexpected<E2>&);

```

```

private:
    bool has_val;           // exposition only
    union {
        E unex;           // exposition only
    };
};

```

- 1 E shall meet the requirements of *Cpp17Destructible* (Table 34).

22.8.7.2 Constructors

[expected.void.ctor]

```
constexpr expected() noexcept;
```

- 1 *Postconditions*: `has_value()` is true.

```
constexpr expected(const expected& rhs);
```

- 2 *Effects*: If `rhs.has_value()` is false, direct-non-list-initializes `unex` with `rhs.error()`.

- 3 *Postconditions*: `rhs.has_value() == this->has_value()`.

- 4 *Throws*: Any exception thrown by the initialization of `unex`.

- 5 *Remarks*: This constructor is defined as deleted unless `is_copy_constructible_v<E>` is true.

- 6 This constructor is trivial if `is_trivially_copy_constructible_v<E>` is true.

```
constexpr expected(expected&& rhs) noexcept(is_nothrow_move_constructible_v<E>);
```

- 7 *Constraints*: `is_move_constructible_v<E>` is true.

- 8 *Effects*: If `rhs.has_value()` is false, direct-non-list-initializes `unex` with `std::move(rhs.error())`.

- 9 *Postconditions*: `rhs.has_value()` is unchanged; `rhs.has_value() == this->has_value()` is true.

- 10 *Throws*: Any exception thrown by the initialization of `unex`.

- 11 *Remarks*: This constructor is trivial if `is_trivially_move_constructible_v<E>` is true.

```

template<class U, class G>
    constexpr explicit(!is_convertible_v<const G&, E>) expected(const expected<U, G>& rhs);

```

```
template<class U, class G>
constexpr explicit(!is_convertible_v<G, E>) expected(expected<U, G>&& rhs);
```

12 Let GF be const G& for the first overload and G for the second overload.

13 *Constraints:*

(13.1) — is_void_v<U> is true; and

(13.2) — is_constructible_v<E, GF> is true; and

(13.3) — is_constructible_v<unexpected<E>, expected<U, G>&> is false; and

(13.4) — is_constructible_v<unexpected<E>, expected<U, G>> is false; and

(13.5) — is_constructible_v<unexpected<E>, const expected<U, G>&> is false; and

(13.6) — is_constructible_v<unexpected<E>, const expected<U, G>> is false.

14 *Effects:* If rhs.has_value() is false, direct-non-list-initializes unex with std::forward<GF>(rhs.error()).

15 *Postconditions:* rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.

16 *Throws:* Any exception thrown by the initialization of unex.

```
template<class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>&& e);
template<class G>
constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);
```

17 Let GF be const G& for the first overload and G for the second overload.

18 *Constraints:* is_constructible_v<E, GF> is true.

19 *Effects:* Direct-non-list-initializes unex with std::forward<GF>(e.value()).

20 *Postconditions:* has_value() is false.

21 *Throws:* Any exception thrown by the initialization of unex.

```
constexpr explicit expected(in_place_t) noexcept;
```

22 *Postconditions:* has_value() is true.

```
template<class... Args>
constexpr explicit expected(unexpect_t, Args&&... args);
```

23 *Constraints:* is_constructible_v<E, Args...> is true.

24 *Effects:* Direct-non-list-initializes unex with std::forward<Args>(args)....

25 *Postconditions:* has_value() is false.

26 *Throws:* Any exception thrown by the initialization of unex.

```
template<class U, class... Args>
constexpr explicit expected(unexpect_t, initializer_list<U> il, Args&&... args);
```

27 *Constraints:* is_constructible_v<E, initializer_list<U>&, Args...> is true.

28 *Effects:* Direct-non-list-initializes unex with il, std::forward<Args>(args)....

29 *Postconditions:* has_value() is false.

30 *Throws:* Any exception thrown by the initialization of unex.

22.8.7.3 Destructor

[expected.void.dtor]

```
constexpr ~expected();
```

1 *Effects:* If has_value() is false, destroys unex.

2 *Remarks:* If is_trivially_destructible_v<E> is true, then this destructor is a trivial destructor.

22.8.7.4 Assignment

[expected.void.assign]

```
constexpr expected& operator=(const expected& rhs);
```

1 *Effects:*

- (1.1) — If `this->has_value()` && `rhs.has_value()` is true, no effects.
- (1.2) — Otherwise, if `this->has_value()` is true, equivalent to: `construct_at(addressof(unex), rhs.unex); has_val = false;`
- (1.3) — Otherwise, if `rhs.has_value()` is true, destroys `unex` and sets `has_val` to true.
- (1.4) — Otherwise, equivalent to `unex = rhs.error()`.
- 2 *Returns:* `*this`.
- 3 *Remarks:* This operator is defined as deleted unless `is_copy_assignable_v<E>` is true and `is_copy_constructible_v<E>` is true.

```
constexpr expected& operator=(expected&& rhs) noexcept(see below);
```

4 *Effects:*

- (4.1) — If `this->has_value()` && `rhs.has_value()` is true, no effects.
- (4.2) — Otherwise, if `this->has_value()` is true, equivalent to:
`construct_at(addressof(unex), std::move(rhs.unex));`
`has_val = false;`
- (4.3) — Otherwise, if `rhs.has_value()` is true, destroys `unex` and sets `has_val` to true.
- (4.4) — Otherwise, equivalent to `unex = rhs.error()`.

5 *Returns:* `*this`.

6 *Remarks:* The exception specification is equivalent to `is_nothrow_move_constructible_v<E>` && `is_nothrow_move_assignable_v<E>`.

7 This operator is defined as deleted unless `is_move_constructible_v<E>` is true and `is_move_assignable_v<E>` is true.

```
template<class G>
constexpr expected& operator=(const unexpected<G>& e);
template<class G>
constexpr expected& operator=(unexpected<G>&& e);
```

8 Let `GF` be `const G&` for the first overload and `G` for the second overload.

9 *Constraints:* `is_constructible_v<E, GF>` is true and `is_assignable_v<E&, GF>` is true.

10 *Effects:*

- (10.1) — If `has_value()` is true, equivalent to:
`construct_at(addressof(unex), std::forward<GF>(e.value()));`
`has_val = false;`
- (10.2) — Otherwise, equivalent to: `unex = std::forward<GF>(e.value());`

11 *Returns:* `*this`.

```
constexpr void emplace() noexcept;
```

12 *Effects:* If `has_value()` is false, destroys `unex` and sets `has_val` to true.

22.8.7.5 Swap

[expected.void.swap]

```
constexpr void swap(expected& rhs) noexcept(see below);
```

1 *Constraints:* `is_swappable_v<E>` is true and `is_move_constructible_v<E>` is true.

2 *Effects:* See [Table 63](#).

Table 63: `swap(expected&)` effects [tab:expected.void.swap]

	this->has_value()	!this->has_value()
rhs.has_value()	no effects	calls <code>rhs.swap(*this)</code>
!rhs.has_value()	see below	equivalent to: using <code>std::swap;</code> <code>swap(unex, rhs.unex);</code>

For the case where `rhs.value()` is false and `this->has_value()` is true, equivalent to:

```
construct_at(addressof(unex), std::move(rhs.unex));
destroy_at(addressof(rhs.unex));
has_val = false;
rhs.has_val = true;
```

3 *Throws:* Any exception thrown by the expressions in the *Effects*.

4 *Remarks:* The exception specification is equivalent to `is_nothrow_move_constructible_v<E> && is_nothrow_swappable_v<E>`.

```
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

5 *Effects:* Equivalent to `x.swap(y)`.

22.8.7.6 Observers

[expected.void.obs]

```
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
```

1 *Returns:* `has_val`.

```
constexpr void operator*() const noexcept;
```

2 *Preconditions:* `has_value()` is true.

```
constexpr void value() const &;
```

3 *Throws:* `bad_expected_access(error())` if `has_value()` is false.

```
constexpr void value() &&;
```

4 *Throws:* `bad_expected_access(std::move(error()))` if `has_value()` is false.

```
constexpr const E& error() const &;
```

```
constexpr E& error() &;
```

5 *Preconditions:* `has_value()` is false.

6 *Returns:* `unex`.

```
constexpr E&& error() &&;
```

```
constexpr const E&& error() const &&;
```

7 *Preconditions:* `has_value()` is false.

8 *Returns:* `std::move(unex)`.

22.8.7.7 Equality operators

[expected.void.eq]

```
template<class T2, class E2> requires is_void_v<T2>
```

```
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

1 *Mandates:* The expression `x.error() == y.error()` is well-formed and its result is convertible to `bool`.

2 *Returns:* If `x.has_value()` does not equal `y.has_value()`, false; otherwise `x.has_value() || static_cast<bool>(x.error() == y.error())`.

```
template<class E2>
```

```
friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

3 *Mandates:* The expression `x.error() == e.value()` is well-formed and its result is convertible to `bool`.

4 *Returns:* `!x.has_value() && static_cast<bool>(x.error() == e.value())`.

22.9 Bitsets

[bitset]

22.9.1 Header <bitset> synopsis

[bitset.syn]

1 The header <bitset> defines a class template and several related functions for representing and manipulating fixed-size sequences of bits.

```
#include <string>
#include <iosfwd> // for istream (31.7.1), ostream (31.7.2), see 31.3.1
```

```

namespace std {
    template<size_t N> class bitset;

    // 22.9.4, bitset operators
    template<size_t N>
        bitset<N> operator&(const bitset<N>&, const bitset<N>&) noexcept;
    template<size_t N>
        bitset<N> operator|(const bitset<N>&, const bitset<N>&) noexcept;
    template<size_t N>
        bitset<N> operator^(const bitset<N>&, const bitset<N>&) noexcept;
    template<class charT, class traits, size_t N>
        basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, bitset<N>& x);
    template<class charT, class traits, size_t N>
        basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);
}

```

22.9.2 Class template bitset

[template.bitset]

22.9.2.1 General

[template.bitset.general]

```

namespace std {
    template<size_t N> class bitset {
    public:
        // bit reference
        class reference {
            friend class bitset;
            reference() noexcept;

        public:
            reference(const reference&) = default;
            ~reference();
            reference& operator=(bool x) noexcept;           // for b[i] = x;
            reference& operator=(const reference&) noexcept; // for b[i] = b[j];
            bool operator~() const noexcept;                 // flips the bit
            operator bool() const noexcept;                  // for x = b[i];
            reference& flip() noexcept;                       // for b[i].flip();
        };

    // 22.9.2.2, constructors
    constexpr bitset() noexcept;
    constexpr bitset(unsigned long long val) noexcept;
    template<class charT, class traits, class Allocator>
        explicit bitset(
            const basic_string<charT, traits, Allocator>& str,
            typename basic_string<charT, traits, Allocator>::size_type pos = 0,
            typename basic_string<charT, traits, Allocator>::size_type n
                = basic_string<charT, traits, Allocator>::npos,
            charT zero = charT('0'),
            charT one = charT('1'));
    template<class charT>
        explicit bitset(
            const charT* str,
            typename basic_string<charT>::size_type n = basic_string<charT>::npos,
            charT zero = charT('0'),
            charT one = charT('1'));

    // 22.9.2.3, bitset operations
    bitset& operator&=(const bitset& rhs) noexcept;
    bitset& operator|=(const bitset& rhs) noexcept;
    bitset& operator^=(const bitset& rhs) noexcept;
    bitset& operator<<=(size_t pos) noexcept;
    bitset& operator>>=(size_t pos) noexcept;
    bitset& set() noexcept;
}

```

```

bitset& set(size_t pos, bool val = true);
bitset& reset() noexcept;
bitset& reset(size_t pos);
bitset operator~() const noexcept;
bitset& flip() noexcept;
bitset& flip(size_t pos);

// element access
constexpr bool operator[](size_t pos) const;           // for b[i];
reference operator[](size_t pos);                     // for b[i];

unsigned long to_ulong() const;
unsigned long long to_ullong() const;
template<class charT = char,
        class traits = char_traits<charT>,
        class Allocator = allocator<charT>>
basic_string<charT, traits, Allocator>
to_string(charT zero = charT('0'), charT one = charT('1')) const;

size_t count() const noexcept;
constexpr size_t size() const noexcept;
bool operator==(const bitset& rhs) const noexcept;
bool test(size_t pos) const;
bool all() const noexcept;
bool any() const noexcept;
bool none() const noexcept;
bitset operator<<(size_t pos) const noexcept;
bitset operator>>(size_t pos) const noexcept;
};

// 22.9.3, hash support
template<class T> struct hash;
template<size_t N> struct hash<bitset<N>>;
}

```

- 1 The class template `bitset<N>` describes an object that can store a sequence consisting of a fixed number of bits, `N`.
- 2 Each bit represents either the value zero (reset) or one (set). To *toggle* a bit is to change the value zero to one, or the value one to zero. Each bit has a non-negative position `pos`. When converting between an object of class `bitset<N>` and a value of some integral type, bit position `pos` corresponds to the *bit value* `1 << pos`. The integral value corresponding to two or more bits is the sum of their bit values.
- 3 The functions described in 22.9.2 can report three kinds of errors, each associated with a distinct exception:
 - (3.1) — an *invalid-argument* error is associated with exceptions of type `invalid_argument` (19.2.5);
 - (3.2) — an *out-of-range* error is associated with exceptions of type `out_of_range` (19.2.7);
 - (3.3) — an *overflow* error is associated with exceptions of type `overflow_error` (19.2.10).

22.9.2.2 Constructors

[`bitset.cons`]

```
constexpr bitset() noexcept;
```

- 1 *Effects*: Initializes all bits in `*this` to zero.

```
constexpr bitset(unsigned long long val) noexcept;
```

- 2 *Effects*: Initializes the first `M` bit positions to the corresponding bit values in `val`. `M` is the smaller of `N` and the number of bits in the value representation (6.8.1) of `unsigned long long`. If `M < N`, the remaining bit positions are initialized to zero.

```
template<class charT, class traits, class Allocator>
explicit bitset(
    const basic_string<charT, traits, Allocator>& str,
    typename basic_string<charT, traits, Allocator>::size_type pos = 0,
    typename basic_string<charT, traits, Allocator>::size_type n
    = basic_string<charT, traits, Allocator>::npos,

```

```
charT zero = charT('0'),
charT one = charT('1');
```

3 *Effects:* Determines the effective length `rLen` of the initializing string as the smaller of `n` and `str.size() - pos`. Initializes the first `M` bit positions to values determined from the corresponding characters in the string `str`. `M` is the smaller of `N` and `rLen`.

4 An element of the constructed object has value zero if the corresponding character in `str`, beginning at position `pos`, is zero. Otherwise, the element has the value one. Character position `pos + M - 1` corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions.

5 If `M < N`, remaining bit positions are initialized to zero.

6 The function uses `traits::eq` to compare the character values.

7 *Throws:* `out_of_range` if `pos > str.size()` or `invalid_argument` if any of the `rLen` characters in `str` beginning at position `pos` is other than zero or one.

```
template<class charT>
explicit bitset(
    const charT* str,
    typename basic_string<charT>::size_type n = basic_string<charT>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));

```

8 *Effects:* As if by:

```
    bitset(n == basic_string<charT>::npos
          ? basic_string<charT>(str)
          : basic_string<charT>(str, n),
          0, n, zero, one)

```

22.9.2.3 Members

[bitset.members]

```
bitset& operator&=(const bitset& rhs) noexcept;
```

1 *Effects:* Clears each bit in `*this` for which the corresponding bit in `rhs` is clear, and leaves all other bits unchanged.

2 *Returns:* `*this`.

```
bitset& operator|=(const bitset& rhs) noexcept;
```

3 *Effects:* Sets each bit in `*this` for which the corresponding bit in `rhs` is set, and leaves all other bits unchanged.

4 *Returns:* `*this`.

```
bitset& operator^=(const bitset& rhs) noexcept;
```

5 *Effects:* Toggles each bit in `*this` for which the corresponding bit in `rhs` is set, and leaves all other bits unchanged.

6 *Returns:* `*this`.

```
bitset& operator<<=(size_t pos) noexcept;
```

7 *Effects:* Replaces each bit at position `I` in `*this` with a value determined as follows:

(7.1) — If `I < pos`, the new value is zero;

(7.2) — If `I >= pos`, the new value is the previous value of the bit at position `I - pos`.

8 *Returns:* `*this`.

```
bitset& operator>>=(size_t pos) noexcept;
```

9 *Effects:* Replaces each bit at position `I` in `*this` with a value determined as follows:

(9.1) — If `pos >= N - I`, the new value is zero;

(9.2) — If `pos < N - I`, the new value is the previous value of the bit at position `I + pos`.

10 *Returns:* `*this`.

```
bitset& set() noexcept;
```

11 *Effects:* Sets all bits in `*this`.

12 *Returns:* *this.

```
bitset& set(size_t pos, bool val = true);
```

13 *Effects:* Stores a new value in the bit at position pos in *this. If val is true, the stored value is one, otherwise it is zero.

14 *Returns:* *this.

15 *Throws:* out_of_range if pos does not correspond to a valid bit position.

```
bitset& reset() noexcept;
```

16 *Effects:* Resets all bits in *this.

17 *Returns:* *this.

```
bitset& reset(size_t pos);
```

18 *Effects:* Resets the bit at position pos in *this.

19 *Returns:* *this.

20 *Throws:* out_of_range if pos does not correspond to a valid bit position.

```
bitset operator~() const noexcept;
```

21 *Effects:* Constructs an object x of class bitset and initializes it with *this.

22 *Returns:* x.flip().

```
bitset& flip() noexcept;
```

23 *Effects:* Toggles all bits in *this.

24 *Returns:* *this.

```
bitset& flip(size_t pos);
```

25 *Effects:* Toggles the bit at position pos in *this.

26 *Returns:* *this.

27 *Throws:* out_of_range if pos does not correspond to a valid bit position.

```
unsigned long to_ulong() const;
```

28 *Returns:* x.

29 *Throws:* overflow_error if the integral value x corresponding to the bits in *this cannot be represented as type unsigned long.

```
unsigned long long to_ullong() const;
```

30 *Returns:* x.

31 *Throws:* overflow_error if the integral value x corresponding to the bits in *this cannot be represented as type unsigned long long.

```
template<class charT = char,
        class traits = char_traits<charT>,
        class Allocator = allocator<charT>>
basic_string<charT, traits, Allocator>
to_string(charT zero = charT('0'), charT one = charT('1')) const;
```

32 *Effects:* Constructs a string object of the appropriate type and initializes it to a string of length N characters. Each character is determined by the value of its corresponding bit position in *this. Character position N - 1 corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions. Bit value zero becomes the character zero, bit value one becomes the character one.

33 *Returns:* The created object.

```
size_t count() const noexcept;
```

34 *Returns:* A count of the number of bits set in *this.

```
constexpr size_t size() const noexcept;
35     Returns: N.

bool operator==(const bitset& rhs) const noexcept;
36     Returns: true if the value of each bit in *this equals the value of the corresponding bit in rhs.

bool test(size_t pos) const;
37     Returns: true if the bit at position pos in *this has the value one.
38     Throws: out_of_range if pos does not correspond to a valid bit position.

bool all() const noexcept;
39     Returns: count() == size().

bool any() const noexcept;
40     Returns: count() != 0.

bool none() const noexcept;
41     Returns: count() == 0.

bitset operator<<(size_t pos) const noexcept;
42     Returns: bitset(*this) <<= pos.

bitset operator>>(size_t pos) const noexcept;
43     Returns: bitset(*this) >>= pos.

constexpr bool operator[](size_t pos) const;
44     Preconditions: pos is valid.
45     Returns: true if the bit at position pos in *this has the value one, otherwise false.
46     Throws: Nothing.

bitset::reference operator[](size_t pos);
47     Preconditions: pos is valid.
48     Returns: An object of type bitset::reference such that (*this)[pos] == this->test(pos), and such that
(*this)[pos] = val is equivalent to this->set(pos, val).
49     Throws: Nothing.
50     Remarks: For the purpose of determining the presence of a data race (6.9.2), any access or update through the
resulting reference potentially accesses or modifies, respectively, the entire underlying bitset.
```

22.9.3 bitset hash support

[bitset.hash]

```
template<size_t N> struct hash<bitset<N>>;
```

1 The specialization is enabled (22.10.19).

22.9.4 bitset operators

[bitset.operators]

```
template<size_t N>
    bitset<N> operator&(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

1 *Returns:* bitset<N>(lhs) &= rhs.

```
template<size_t N>
    bitset<N> operator|(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

2 *Returns:* bitset<N>(lhs) |= rhs.

```
template<size_t N>
    bitset<N> operator^(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
```

3 *Returns:* bitset<N>(lhs) ^= rhs.

```
template<class charT, class traits, size_t N>
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, bitset<N>& x);
```

4 A formatted input function (31.7.4.3).

5 *Effects:* Extracts up to *N* characters from *is*. Stores these characters in a temporary object *str* of type `basic_string<charT, traits>`, then evaluates the expression `x = bitset<N>(str)`. Characters are extracted and stored until any of the following occurs:

(5.1) — *N* characters have been extracted and stored;

(5.2) — end-of-file occurs on the input sequence;

(5.3) — the next input character is neither `is.widen('0')` nor `is.widen('1')` (in which case the input character is not extracted).

6 If $N > 0$ and no characters are stored in *str*, calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (31.5.4.4)).

7 *Returns:* *is*.

```
template<class charT, class traits, size_t N>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);
```

8 *Returns:*

```
os << x.template to_string<charT, traits, allocator<charT>>>(
    use_facet<ctype<charT>>(os.getloc()).widen('0'),
    use_facet<ctype<charT>>(os.getloc()).widen('1'))
```

(see 31.7.5.3).

22.10 Function objects

[function.objects]

22.10.1 General

[function.objects.general]

¹ A *function object type* is an object type (6.8.1) that can be the type of the *postfix-expression* in a function call (7.6.1.3, 12.2.2.2).²⁰⁹ A *function object* is an object of a function object type. In the places where one would expect to pass a pointer to a function to an algorithmic template (Clause 27), the interface is specified to accept a function object. This not only makes algorithmic templates work with pointers to functions, but also enables them to work with arbitrary function objects.

22.10.2 Header <functional> synopsis

[functional.syn]

```
namespace std {
    // 22.10.5, invoke
    template<class F, class... Args>
        constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
            noexcept(is_nothrow_invocable_v<F, Args...>);

    template<class R, class F, class... Args>
        constexpr R invoke_r(F&& f, Args&&... args)
            noexcept(is_nothrow_invocable_r_v<R, F, Args...>);

    // 22.10.6, reference_wrapper
    template<class T> class reference_wrapper;

    template<class T> constexpr reference_wrapper<T> ref(T&) noexcept;
    template<class T> constexpr reference_wrapper<const T> cref(const T&) noexcept;
    template<class T> void ref(const T&&) = delete;
    template<class T> void cref(const T&&) = delete;

    template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T>) noexcept;
    template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T>) noexcept;
```

²⁰⁹ Such a type is a function pointer or a class type which has a member `operator()` or a class type which has a conversion to a pointer to function.

// 22.10.18, searchers
template<class ForwardIterator, class BinaryPredicate = equal_to<>>
    class default_searcher;

template<class RandomAccessIterator,
        class Hash = hash<typename iterator_traits<RandomAccessIterator>::value_type>,
        class BinaryPredicate = equal_to<>>
    class boyer_moore_searcher;

template<class RandomAccessIterator,
        class Hash = hash<typename iterator_traits<RandomAccessIterator>::value_type>,
        class BinaryPredicate = equal_to<>>
    class boyer_moore_horspool_searcher;

// 22.10.19, class template hash
template<class T>
    struct hash;

namespace ranges {
    // 22.10.9, concept-constrained comparisons
    struct equal_to;
    struct not_equal_to;
    struct greater;

```

```

    struct less;
    struct greater_equal;
    struct less_equal;
}
}

```

- ¹ [Example 1: If a C++ program wants to have a by-element addition of two vectors *a* and *b* containing `double` and put the result into *a*, it can do:

```

transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
—end example]

```

- ² [Example 2: To negate every element of *a*:

```

transform(a.begin(), a.end(), a.begin(), negate<double>());
—end example]

```

22.10.3 Definitions

[func.def]

- ¹ The following definitions apply to this Clause:
- ² A *call signature* is the name of a return type followed by a parenthesized comma-separated list of zero or more argument types.
- ³ A *callable type* is a function object type (22.10) or a pointer to member.
- ⁴ A *callable object* is an object of a callable type.
- ⁵ A *call wrapper type* is a type that holds a callable object and supports a call operation that forwards to that object.
- ⁶ A *call wrapper* is an object of a call wrapper type.
- ⁷ A *target object* is the callable object held by a call wrapper.
- ⁸ A call wrapper type may additionally hold a sequence of objects and references that may be passed as arguments to the target object. These entities are collectively referred to as *bound argument entities*.
- ⁹ The target object and bound argument entities of the call wrapper are collectively referred to as *state entities*.

22.10.4 Requirements

[func.require]

- ¹ Define *INVOKE*(*f*, *t*₁, *t*₂, ..., *t*_{*N*}) as follows:
- (1.1) — (*t*₁.**f*)(*t*₂, ..., *t*_{*N*}) when *f* is a pointer to a member function of a class *T* and `is_base_of_v<T, remove_reference_t<decltype(t1)>>` is true;
- (1.2) — (*t*₁.get().**f*)(*t*₂, ..., *t*_{*N*}) when *f* is a pointer to a member function of a class *T* and `remove_cvref_t<decltype(t1)>` is a specialization of `reference_wrapper`;
- (1.3) — ((**t*₁).**f*)(*t*₂, ..., *t*_{*N*}) when *f* is a pointer to a member function of a class *T* and *t*₁ does not satisfy the previous two items;
- (1.4) — *t*₁.**f* when *N* == 1 and *f* is a pointer to data member of a class *T* and `is_base_of_v<T, remove_reference_t<decltype(t1)>>` is true;
- (1.5) — *t*₁.get().**f* when *N* == 1 and *f* is a pointer to data member of a class *T* and `remove_cvref_t<decltype(t1)>` is a specialization of `reference_wrapper`;
- (1.6) — (**t*₁).**f* when *N* == 1 and *f* is a pointer to data member of a class *T* and *t*₁ does not satisfy the previous two items;
- (1.7) — *f*(*t*₁, *t*₂, ..., *t*_{*N*}) in all other cases.
- ² Define *INVOKE*<*R*>(f, *t*₁, *t*₂, ..., *t*_{*N*}) as `static_cast<void>(INVOKE(f, t1, t2, ..., tN))` if *R* is `cv void`, otherwise `INVOKE(f, t1, t2, ..., tN)` implicitly converted to *R*. If `reference_converts_from_temporary_v<R, decltype(INVOKE(f, t1, t2, ..., tN))>` is true, *INVOKE*<*R*>(f, *t*₁, *t*₂, ..., *t*_{*N*}) is ill-formed.
- ³ Every call wrapper (22.10.3) meets the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements. An *argument forwarding call wrapper* is a call wrapper that can be called with an arbitrary argument list and delivers the arguments to the target object as references. This forwarding step delivers rvalue arguments as rvalue references and lvalue arguments as lvalue references.

[Note 1: In a typical implementation, argument forwarding call wrappers have an overloaded function call operator of the form

```
template<class... UnBoundArgs>
constexpr R operator()(UnBoundArgs&&... unbound_args) cv-qual;
```

— end note]

- 4 A *perfect forwarding call wrapper* is an argument forwarding call wrapper that forwards its state entities to the underlying call expression. This forwarding step delivers a state entity of type T as $cv T\&$ when the call is performed on an lvalue of the call wrapper type and as $cv T\&\&$ otherwise, where cv represents the cv-qualifiers of the call wrapper and where cv shall be neither `volatile` nor `const volatile`.
- 5 A *call pattern* defines the semantics of invoking a perfect forwarding call wrapper. A postfix call performed on a perfect forwarding call wrapper is expression-equivalent (3.21) to an expression e determined from its call pattern cp by replacing all occurrences of the arguments of the call wrapper and its state entities with references as described in the corresponding forwarding steps.
- 6 A *simple call wrapper* is a perfect forwarding call wrapper that meets the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements and whose copy constructor, move constructor, and assignment operators are `constexpr` functions that do not throw exceptions.
- 7 The copy/move constructor of an argument forwarding call wrapper has the same apparent semantics as if memberwise copy/move of its state entities were performed (11.4.5.3).
[Note 2: This implies that each of the copy/move constructors has the same exception-specification as the corresponding implicit definition and is declared as `constexpr` if the corresponding implicit definition would be considered to be `constexpr`. — end note]
- 8 Argument forwarding call wrappers returned by a given standard library function template have the same type if the types of their corresponding state entities are the same.

22.10.5 invoke functions

[func.invoke]

```
template<class F, class... Args>
constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
noexcept(is_nothrow_invocable_v<F, Args...>);
```

1 *Constraints:* `is_invocable_v<F, Args...>` is true.

2 *Returns:* `INVOKE(std::forward<F>(f), std::forward<Args>(args)...) (22.10.4)`.

```
template<class R, class F, class... Args>
constexpr R invoke_r(F&& f, Args&&... args)
noexcept(is_nothrow_invocable_r_v<R, F, Args...>);
```

3 *Constraints:* `is_invocable_r_v<R, F, Args...>` is true.

4 *Returns:* `INVOKE<R>(std::forward<F>(f), std::forward<Args>(args)...) (22.10.4)`.

22.10.6 Class template reference_wrapper

[refwrap]

22.10.6.1 General

[refwrap.general]

```
namespace std {
template<class T> class reference_wrapper {
public:
// types
using type = T;

// 22.10.6.2, constructors
template<class U>
constexpr reference_wrapper(U&&) noexcept(see below);
constexpr reference_wrapper(const reference_wrapper& x) noexcept;

// 22.10.6.3, assignment
constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

// 22.10.6.4, access
constexpr operator T& () const noexcept;
constexpr T& get() const noexcept;
```

```

// 22.10.6.5, invocation
template<class... ArgTypes>
    constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&...) const;
};

template<class T>
    reference_wrapper(T&) -> reference_wrapper<T>;
}

```

- 1 `reference_wrapper<T>` is a *Cpp17CopyConstructible* and *Cpp17CopyAssignable* wrapper around a reference to an object or function of type `T`.
- 2 `reference_wrapper<T>` is a trivially copyable type (6.8.1).
- 3 The template parameter `T` of `reference_wrapper` may be an incomplete type.

22.10.6.2 Constructors

[refwrap.const]

```

template<class U>
    constexpr reference_wrapper(U&& u) noexcept(see below);

```

- 1 Let *FUN* denote the exposition-only functions

```

void FUN(T&) noexcept;
void FUN(T&&) = delete;

```
- 2 *Constraints:* The expression `FUN(declval<U>())` is well-formed and `is_same_v<remove_cvref_t<U>, reference_wrapper>` is false.
- 3 *Effects:* Creates a variable `r` as if by `T& r = std::forward<U>(u)`, then constructs a `reference_wrapper` object that stores a reference to `r`.
- 4 *Remarks:* The exception specification is equivalent to `noexcept(FUN(declval<U>()))`.

```

constexpr reference_wrapper(const reference_wrapper& x) noexcept;

```

- 5 *Effects:* Constructs a `reference_wrapper` object that stores a reference to `x.get()`.

22.10.6.3 Assignment

[refwrap.assign]

```

constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

```

- 1 *Postconditions:* `*this` stores a reference to `x.get()`.

22.10.6.4 Access

[refwrap.access]

```

constexpr operator T& () const noexcept;

```

- 1 *Returns:* The stored reference.

```

constexpr T& get() const noexcept;

```

- 2 *Returns:* The stored reference.

22.10.6.5 Invocation

[refwrap.invoke]

```

template<class... ArgTypes>
    constexpr invoke_result_t<T&, ArgTypes...>
    operator()(ArgTypes&&... args) const;

```

- 1 *Mandates:* `T` is a complete type.
- 2 *Returns:* `INVOKE(get(), std::forward<ArgTypes>(args)...) (22.10.4)`

22.10.6.6 Helper functions

[refwrap.helpers]

- 1 The template parameter `T` of the following `ref` and `cref` function templates may be an incomplete type.

```

template<class T> constexpr reference_wrapper<T> ref(T& t) noexcept;

```

- 2 *Returns:* `reference_wrapper<T>(t)`.

```

template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T> t) noexcept;

```

- 3 *Returns:* `t`.

```
template<class T> constexpr reference_wrapper<const T> cref(const T& t) noexcept;
```

4 *Returns:* reference_wrapper <const T>(t).

```
template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;
```

5 *Returns:* t.

22.10.7 Arithmetic operations

[arithmetic.operations]

22.10.7.1 General

[arithmetic.operations.general]

1 The library provides basic function object classes for all of the arithmetic operators in the language (7.6.5, 7.6.6).

22.10.7.2 Class template plus

[arithmetic.operations.plus]

```
template<class T = void> struct plus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns:* x + y.

```
template<> struct plus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) + std::forward<U>(u));
```

```
    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));
```

2 *Returns:* std::forward<T>(t) + std::forward<U>(u).

22.10.7.3 Class template minus

[arithmetic.operations.minus]

```
template<class T = void> struct minus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns:* x - y.

```
template<> struct minus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) - std::forward<U>(u));
```

```
    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));
```

2 *Returns:* std::forward<T>(t) - std::forward<U>(u).

22.10.7.4 Class template multiplies

[arithmetic.operations.multiplies]

```
template<class T = void> struct multiplies {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns:* x * y.

```
template<> struct multiplies<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) * std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));
```

2 *Returns:* `std::forward<T>(t) * std::forward<U>(u)`.

22.10.7.5 Class template divides

[arithmetic.operations.divides]

```
template<class T = void> struct divides {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns:* `x / y`.

```
template<> struct divides<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) / std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));
```

2 *Returns:* `std::forward<T>(t) / std::forward<U>(u)`.

22.10.7.6 Class template modulus

[arithmetic.operations.modulus]

```
template<class T = void> struct modulus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns:* `x % y`.

```
template<> struct modulus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) % std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) % std::forward<U>(u));
```

2 *Returns:* `std::forward<T>(t) % std::forward<U>(u)`.

22.10.7.7 Class template negate

[arithmetic.operations.negate]

```
template<class T = void> struct negate {
    constexpr T operator()(const T& x) const;
};
```

```
constexpr T operator()(const T& x) const;
```

1 *Returns:* `-x`.

```
template<> struct negate<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(-std::forward<T>(t));
```

```

    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));

```

2 *Returns:* `-std::forward<T>(t)`.

22.10.8 Comparisons

[comparisons]

22.10.8.1 General

[comparisons.general]

- 1 The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).
- 2 For templates `less`, `greater`, `less_equal`, and `greater_equal`, the specializations for any pointer type yield a result consistent with the implementation-defined strict total order over pointers (3.27).

[Note 1: If `a < b` is well-defined for pointers `a` and `b` of type `P`, then `(a < b) == less<P>(a, b)`, `(a > b) == greater<P>(a, b)`, and so forth. — end note]

For template specializations `less<void>`, `greater<void>`, `less_equal<void>`, and `greater_equal<void>`, if the call operator calls a built-in operator comparing pointers, the call operator yields a result consistent with the implementation-defined strict total order over pointers.

22.10.8.2 Class template `equal_to`

[comparisons.equal.to]

```

template<class T = void> struct equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns:* `x == y`.

```

template<> struct equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) == std::forward<U>(u));

    using is_transparent = unspecified;
};

```

```

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));

```

2 *Returns:* `std::forward<T>(t) == std::forward<U>(u)`.

22.10.8.3 Class template `not_equal_to`

[comparisons.not.equal.to]

```

template<class T = void> struct not_equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};

```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns:* `x != y`.

```

template<> struct not_equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) != std::forward<U>(u));

    using is_transparent = unspecified;
};

```

```

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) != std::forward<U>(u));

```

2 *Returns:* `std::forward<T>(t) != std::forward<U>(u)`.

22.10.8.4 Class template greater**[comparisons.greater]**

```
template<class T = void> struct greater {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns:* $x > y$.

```
template<> struct greater<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) > std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) > std::forward<U>(u));
```

2 *Returns:* $\text{std::forward<T>(t)} > \text{std::forward<U>(u)}$.

22.10.8.5 Class template less**[comparisons.less]**

```
template<class T = void> struct less {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns:* $x < y$.

```
template<> struct less<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) < std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) < std::forward<U>(u));
```

2 *Returns:* $\text{std::forward<T>(t)} < \text{std::forward<U>(u)}$.

22.10.8.6 Class template greater_equal**[comparisons.greater.equal]**

```
template<class T = void> struct greater_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns:* $x \geq y$.

```
template<> struct greater_equal<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) >= std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) >= std::forward<U>(u));
```

2 *Returns:* $\text{std::forward<T>(t)} \geq \text{std::forward<U>(u)}$.

22.10.8.7 Class template less_equal**[comparisons.less.equal]**

```
template<class T = void> struct less_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns:* $x \leq y$.

```
template<> struct less_equal<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) <= std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));
```

2 *Returns:* $\text{std::forward<T>(t)} \leq \text{std::forward<U>(u)}$.

22.10.8.8 Class compare_three_way**[comparisons.three.way]**

```
namespace std {
    struct compare_three_way {
        template<class T, class U>
            constexpr auto operator()(T&& t, U&& u) const;

        using is_transparent = unspecified;
    };
}
```

```
template<class T, class U>
    constexpr auto operator()(T&& t, U&& u) const;
```

1 *Constraints:* T and U satisfy `three_way_comparable_with`.

2 *Preconditions:* If the expression $\text{std::forward<T>(t)} \lt;=> \text{std::forward<U>(u)}$ results in a call to a built-in operator `<=>` comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2); otherwise, T and U model `three_way_comparable_with`.

3 *Effects:*

(3.1) — If the expression $\text{std::forward<T>(t)} \lt;=> \text{std::forward<U>(u)}$ results in a call to a built-in operator `<=>` comparing pointers of type P, returns `strong_ordering::less` if (the converted value of) t precedes u in the implementation-defined strict total order over pointers (3.27), `strong_ordering::greater` if u precedes t, and otherwise `strong_ordering::equal`.

(3.2) — Otherwise, equivalent to: return $\text{std::forward<T>(t)} \lt;=> \text{std::forward<U>(u)}$;

22.10.9 Concept-constrained comparisons**[range.cmp]**

```
struct ranges::equal_to {
    template<class T, class U>
        constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

```
template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;
```

1 *Constraints:* T and U satisfy `equality_comparable_with`.

2 *Preconditions:* If the expression $\text{std::forward<T>(t)} == \text{std::forward<U>(u)}$ results in a call to a built-in operator `==` comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2); otherwise, T and U model `equality_comparable_with`.

3 *Effects:*

(3.1) — If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers: returns `false` if either (the converted value of) `t` precedes `u` or `u` precedes `t` in the implementation-defined strict total order over pointers (3.27) and otherwise `true`.

(3.2) — Otherwise, equivalent to: `return std::forward<T>(t) == std::forward<U>(u);`

```
struct ranges::not_equal_to {
    template<class T, class U>
        constexpr bool operator()(T&& t, U&& u) const;
```

```
    using is_transparent = unspecified;
};
```

```
template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;
```

4 *Constraints:* `T` and `U` satisfy `equality_comparable_with`.

5 *Effects:* Equivalent to:

```
    return !ranges::equal_to{}(std::forward<T>(t), std::forward<U>(u));
```

```
struct ranges::greater {
    template<class T, class U>
        constexpr bool operator()(T&& t, U&& u) const;
```

```
    using is_transparent = unspecified;
};
```

```
template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;
```

6 *Constraints:* `T` and `U` satisfy `totally_ordered_with`.

7 *Effects:* Equivalent to:

```
    return ranges::less{}(std::forward<U>(u), std::forward<T>(t));
```

```
struct ranges::less {
    template<class T, class U>
        constexpr bool operator()(T&& t, U&& u) const;
```

```
    using is_transparent = unspecified;
};
```

```
template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;
```

8 *Constraints:* `T` and `U` satisfy `totally_ordered_with`.

9 *Preconditions:* If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` are equality-preserving (18.2); otherwise, `T` and `U` model `totally_ordered_with`. For any expressions `ET` and `EU` such that `decltype((ET))` is `T` and `decltype((EU))` is `U`, exactly one of `ranges::less{}(ET, EU)`, `ranges::less{}(EU, ET)`, or `ranges::equal_to{}(ET, EU)` is `true`.

10 *Effects:*

(10.1) — If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers: returns `true` if (the converted value of) `t` precedes `u` in the implementation-defined strict total order over pointers (3.27) and otherwise `false`.

(10.2) — Otherwise, equivalent to: `return std::forward<T>(t) < std::forward<U>(u);`

```
struct ranges::greater_equal {
    template<class T, class U>
        constexpr bool operator()(T&& t, U&& u) const;
```

```
    using is_transparent = unspecified;
};
```

```
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;
11     Constraints: T and U satisfy totally_ordered_with.
12     Effects: Equivalent to:
        return !ranges::less{}(std::forward<T>(t), std::forward<U>(u));
```

```
struct ranges::less_equal {
    template<class T, class U>
        constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

```
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;
13     Constraints: T and U satisfy totally_ordered_with.
14     Effects: Equivalent to:
        return !ranges::less{}(std::forward<U>(u), std::forward<T>(t));
```

22.10.10 Logical operations

[logical.operations]

22.10.10.1 General

[logical.operations.general]

- ¹ The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.2).

22.10.10.2 Class template `logical_and`

[logical.operations.and]

```
template<class T = void> struct logical_and {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
```

- ¹ *Returns:* $x \ \&\& \ y$.

```
template<> struct logical_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) && std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));
```

- ² *Returns:* $\text{std::forward<T>(t)} \ \&\& \ \text{std::forward<U>(u)}$.

22.10.10.3 Class template `logical_or`

[logical.operations.or]

```
template<class T = void> struct logical_or {
    constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
```

- ¹ *Returns:* $x \ || \ y$.

```
template<> struct logical_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) || std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) || std::forward<U>(u));
```

2 *Returns:* `std::forward<T>(t) || std::forward<U>(u)`.

22.10.10.4 Class template `logical_not`

[logical.operations.not]

```
template<class T = void> struct logical_not {
    constexpr bool operator()(const T& x) const;
};
```

```
constexpr bool operator()(const T& x) const;
```

1 *Returns:* `!x`.

```
template<> struct logical_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(!std::forward<T>(t));
```

```
    using is_transparent = unspecified;
};
```

```
template<class T> constexpr auto operator()(T&& t) const
    -> decltype(!std::forward<T>(t));
```

2 *Returns:* `!std::forward<T>(t)`.

22.10.11 Bitwise operations

[bitwise.operations]

22.10.11.1 General

[bitwise.operations.general]

1 The library provides basic function object classes for all of the bitwise operators in the language (7.6.11, 7.6.13, 7.6.12, 7.6.2.2).

22.10.11.2 Class template `bit_and`

[bitwise.operations.and]

```
template<class T = void> struct bit_and {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns:* `x & y`.

```
template<> struct bit_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) & std::forward<U>(u));
```

```
    using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));
```

2 *Returns:* `std::forward<T>(t) & std::forward<U>(u)`.

22.10.11.3 Class template `bit_or`

[bitwise.operations.or]

```
template<class T = void> struct bit_or {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns:* `x | y`.

```
template<> struct bit_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) | std::forward<U>(u));
```

```

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) | std::forward<U>(u));

```

2 *Returns:* std::forward<T>(t) | std::forward<U>(u).

22.10.11.4 Class template bit_xor

[bitwise.operations.xor]

```

template<class T = void> struct bit_xor {
    constexpr T operator()(const T& x, const T& y) const;
};

```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns:* x ^ y.

```

template<> struct bit_xor<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

```

```

    using is_transparent = unspecified;
};

```

```

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

```

2 *Returns:* std::forward<T>(t) ^ std::forward<U>(u).

22.10.11.5 Class template bit_not

[bitwise.operations.not]

```

template<class T = void> struct bit_not {
    constexpr T operator()(const T& x) const;
};

```

```
constexpr T operator()(const T& x) const;
```

1 *Returns:* ~x.

```

template<> struct bit_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(~std::forward<T>(t));

```

```

    using is_transparent = unspecified;
};

```

```

template<class T> constexpr auto operator()(T&& t) const
    -> decltype(~std::forward<T>(t));

```

2 *Returns:* ~std::forward<T>(t).

22.10.12 Class identity

[func.identity]

```

struct identity {
    template<class T>
        constexpr T&& operator()(T&& t) const noexcept;

```

```

    using is_transparent = unspecified;
};

```

```

template<class T>
    constexpr T&& operator()(T&& t) const noexcept;

```

1 *Effects:* Equivalent to: return std::forward<T>(t);

22.10.13 Function template not_fn**[func.not.fn]**

```
template<class F> constexpr unspecified not_fn(F&& f);
```

1 In the text that follows:

- (1.1) — g is a value of the result of a not_fn invocation,
 - (1.2) — FD is the type decay_t<F>,
 - (1.3) — fd is the target object of g (22.10.3) of type FD, direct-non-list-initialized with std::forward<F>(f),
 - (1.4) — call_args is an argument pack used in a function call expression (7.6.1.3) of g.
- 2 *Mandates:* is_constructible_v<FD, F> && is_move_constructible_v<FD> is true.
- 3 *Preconditions:* FD meets the *Cpp17MoveConstructible* requirements.
- 4 *Returns:* A perfect forwarding call wrapper (22.10.4) g with call pattern !invoke(fd, call_args...).
- 5 *Throws:* Any exception thrown by the initialization of fd.

22.10.14 Function templates bind_front and bind_back**[func.bind.partial]**

```
template<class F, class... Args>
constexpr unspecified bind_front(F&& f, Args&&... args);
template<class F, class... Args>
constexpr unspecified bind_back(F&& f, Args&&... args);
```

1 Within this subclause:

- (1.1) — g is a value of the result of a bind_front or bind_back invocation,
 - (1.2) — FD is the type decay_t<F>,
 - (1.3) — fd is the target object of g (22.10.3) of type FD, direct-non-list-initialized with std::forward<F>(f),
 - (1.4) — BoundArgs is a pack that denotes decay_t<Args>...,
 - (1.5) — bound_args is a pack of bound argument entities of g (22.10.3) of types BoundArgs..., direct-non-list-initialized with std::forward<Args>(args)..., respectively, and
 - (1.6) — call_args is an argument pack used in a function call expression (7.6.1.3) of g.
- 2 *Mandates:*
- ```
is_constructible_v<FD, F> &&
is_move_constructible_v<FD> &&
(is_constructible_v<BoundArgs, Args> && ...) &&
(is_move_constructible_v<BoundArgs> && ...)
```
- is true.
- 3 *Preconditions:* FD meets the *Cpp17MoveConstructible* requirements. For each  $T_i$  in BoundArgs, if  $T_i$  is an object type,  $T_i$  meets the *Cpp17MoveConstructible* requirements.
- 4 *Returns:* A perfect forwarding call wrapper (22.10.4) g with call pattern:
- (4.1) — invoke(fd, bound\_args..., call\_args...) for a bind\_front invocation, or
  - (4.2) — invoke(fd, call\_args..., bound\_args...) for a bind\_back invocation.
- 5 *Throws:* Any exception thrown by the initialization of the state entities of g (22.10.3).

**22.10.15 Function object binders****[func.bind]****22.10.15.1 General****[func.bind.general]**

1 Subclause 22.10.15 describes a uniform mechanism for binding arguments of callable objects.

**22.10.15.2 Class template is\_bind\_expression****[func.bind.isbind]**

```
namespace std {
 template<class T> struct is_bind_expression; // see below
}
```

1 The class template is\_bind\_expression can be used to detect function objects generated by bind. The function template bind uses is\_bind\_expression to detect subexpressions.

- 2 Specializations of the `is_bind_expression` template shall meet the *Cpp17UnaryTypeTrait* requirements (21.3.2). The implementation provides a definition that has a base characteristic of `true_type` if `T` is a type returned from `bind`, otherwise it has a base characteristic of `false_type`. A program may specialize this template for a program-defined type `T` to have a base characteristic of `true_type` to indicate that `T` should be treated as a subexpression in a `bind` call.

### 22.10.15.3 Class template `is_placeholder`

[func.bind.isplace]

```
namespace std {
 template<class T> struct is_placeholder; // see below
}
```

- 1 The class template `is_placeholder` can be used to detect the standard placeholders `_1`, `_2`, and so on. The function template `bind` uses `is_placeholder` to detect placeholders.
- 2 Specializations of the `is_placeholder` template shall meet the *Cpp17UnaryTypeTrait* requirements (21.3.2). The implementation provides a definition that has the base characteristic of `integral_constant<int, J>` if `T` is the type of `std::placeholders::_J`, otherwise it has a base characteristic of `integral_constant<int, 0>`. A program may specialize this template for a program-defined type `T` to have a base characteristic of `integral_constant<int, N>` with `N > 0` to indicate that `T` should be treated as a placeholder type.

### 22.10.15.4 Function template `bind`

[func.bind.bind]

- 1 In the text that follows:

- (1.1) — `g` is a value of the result of a `bind` invocation,
- (1.2) — `FD` is the type decay `_t<F>`,
- (1.3) — `fd` is an lvalue that is a target object of `g` (22.10.3) of type `FD` direct-non-list-initialized with `std::forward<F>(f)`,
- (1.4) — `Ti` is the *i*<sup>th</sup> type in the template parameter pack `BoundArgs`,
- (1.5) — `TDi` is the type decay `_t<Ti,`
- (1.6) — `ti` is the *i*<sup>th</sup> argument in the function parameter pack `bound_args`,
- (1.7) — `tdi` is a bound argument entity of `g` (22.10.3) of type `TDi` direct-non-list-initialized with `std::forward<Tii)`,
- (1.8) — `Uj` is the *j*<sup>th</sup> deduced type of the `UnBoundArgs&&...` parameter of the argument forwarding call wrapper, and
- (1.9) — `uj` is the *j*<sup>th</sup> argument associated with `Uj`.

```
template<class F, class... BoundArgs>
constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
template<class R, class F, class... BoundArgs>
constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
```

- 2 **Mandates:** `is_constructible_v<FD, F>` is true. For each `Ti` in `BoundArgs`, `is_constructible_v<TDi, Ti is true.`
- 3 **Preconditions:** `FD` and each `TDi` meet the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements. `INVOKE(fd, w1, w2, ..., wN)` (22.10.4) is a valid expression for some values `w1`, `w2`, ..., `wN`, where `N` has the value `sizeof...(bound_args)`.
- 4 **Returns:** An argument forwarding call wrapper `g` (22.10.4). A program that attempts to invoke a volatile-qualified `g` is ill-formed. When `g` is not volatile-qualified, invocation of `g(u1, u2, ..., uM)` is expression-equivalent (3.21) to
- ```
INVOKE(static_cast<Vfd>(vfd),
        static_cast<V1>(v1), static_cast<V2>(v2), ..., static_cast<VN>(vN))
```
- for the first overload, and
- ```
INVOKE<R>(static_cast<Vfd>(vfd),
 static_cast<V1>(v1), static_cast<V2>(v2), ..., static_cast<VN>(vN))
```
- for the second overload, where the values and types of the target argument `vfd` and of the bound arguments `v1`, `v2`, ..., `vN` are determined as specified below.
- 5 **Throws:** Any exception thrown by the initialization of the state entities of `g`.
- 6 [Note 1: If all of `FD` and `TDi` meet the requirements of *Cpp17CopyConstructible*, then the return type meets the requirements of *Cpp17CopyConstructible*. — end note]

<sup>7</sup> The values of the *bound arguments*  $v_1, v_2, \dots, v_N$  and their corresponding types  $V_1, V_2, \dots, V_N$  depend on the types  $TD_i$  derived from the call to `bind` and the cv-qualifiers  $cv$  of the call wrapper  $g$  as follows:

- (7.1) — if  $TD_i$  is `reference_wrapper<T>`, the argument is `tdi.get()` and its type  $V_i$  is  $T\&$ ;
  - (7.2) — if the value of `is_bind_expression_v<TDi>` is true, the argument is
 

```
static_cast<cv TDi&>(tdi)(std::forward<Uj>(uj)...)
```

 and its type  $V_i$  is `invoke_result_t<cv TDi&, Uj...>&&`;
  - (7.3) — if the value  $j$  of `is_placeholder_v<TDi>` is not zero, the argument is `std::forward<Uj>(uj)` and its type  $V_i$  is `Uj&&`;
  - (7.4) — otherwise, the value is `tdi` and its type  $V_i$  is `cv TDi&`.
- <sup>8</sup> The value of the target argument  $v_{fd}$  is `fd` and its corresponding type  $V_{fd}$  is `cv FD&`.

### 22.10.15.5 Placeholders

[func.bind.place]

```
namespace std::placeholders {
 // M is the implementation-defined number of placeholders
 see below _1;
 see below _2;
 .
 .
 .
 see below _M;
}
```

<sup>1</sup> All placeholder types meet the *Cpp17DefaultConstructible* and *Cpp17CopyConstructible* requirements, and their default constructors and copy/move constructors are `constexpr` functions that do not throw exceptions. It is implementation-defined whether placeholder types meet the *Cpp17CopyAssignable* requirements, but if so, their copy assignment operators are `constexpr` functions that do not throw exceptions.

<sup>2</sup> Placeholders should be defined as:

```
inline constexpr unspecified _1{};
```

If they are not, they are declared as:

```
extern unspecified _1;
```

### 22.10.16 Function template `mem_fn`

[func.memfn]

```
template<class R, class T> constexpr unspecified mem_fn(R T::* pm) noexcept;
```

<sup>1</sup> *Returns:* A simple call wrapper (22.10.4) `fn` with call pattern `invoke(pmd, call_args...)`, where `pmd` is the target object of `fn` of type `R T::*` direct-non-list-initialized with `pm`, and `call_args` is an argument pack used in a function call expression (7.6.1.3) of `fn`.

### 22.10.17 Polymorphic function wrappers

[func.wrap]

#### 22.10.17.1 General

[func.wrap.general]

<sup>1</sup> Subclause 22.10.17 describes polymorphic wrapper classes that encapsulate arbitrary callable objects.

#### 22.10.17.2 Class `bad_function_call`

[func.wrap.badcall]

<sup>1</sup> An exception of type `bad_function_call` is thrown by `function::operator()` (22.10.17.3.5) when the function wrapper object has no target.

```
namespace std {
 class bad_function_call : public exception {
 public:
 // see 17.9.3 for the specification of the special member functions
 const char* what() const noexcept override;
 };
}
```

```
const char* what() const noexcept override;
```

<sup>2</sup> *Returns:* An implementation-defined `ntbs`.

**22.10.17.3 Class template function****[func.wrap.func]****22.10.17.3.1 General****[func.wrap.func.general]**

```

namespace std {
 template<class> class function; // not defined

 template<class R, class... ArgTypes>
 class function<R(ArgTypes...)> {
 public:
 using result_type = R;

 // 22.10.17.3.2, construct/copy/destroy
 function() noexcept;
 function(nullptr_t) noexcept;
 function(const function&);
 function(function&&) noexcept;
 template<class F> function(F&&);

 function& operator=(const function&);
 function& operator=(function&&);
 function& operator=(nullptr_t) noexcept;
 template<class F> function& operator=(F&&);
 template<class F> function& operator=(reference_wrapper<F>) noexcept;

 ~function();

 // 22.10.17.3.3, function modifiers
 void swap(function&) noexcept;

 // 22.10.17.3.4, function capacity
 explicit operator bool() const noexcept;

 // 22.10.17.3.5, function invocation
 R operator()(ArgTypes...) const;

 // 22.10.17.3.6, function target access
 const type_info& target_type() const noexcept;
 template<class T> T* target() noexcept;
 template<class T> const T* target() const noexcept;
 };

 template<class R, class... ArgTypes>
 function(R*)(ArgTypes...) -> function<R(ArgTypes...)>;

 template<class F> function(F) -> function<see below>;
}

```

<sup>1</sup> The function class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (22.10.3), given a call signature (22.10.3).

<sup>2</sup> A callable type (22.10.3) *F* is *Lvalue-Callable* for argument types *ArgTypes* and return type *R* if the expression `INVOKE<R>(declval<F>(), declval<ArgTypes>()...)`, considered as an unevaluated operand (7.2.3), is well-formed (22.10.4).

<sup>3</sup> The function class template is a call wrapper (22.10.3) whose call signature (22.10.3) is `R(ArgTypes...)`.

<sup>4</sup> [Note 1: The types deduced by the deduction guides for `function` might change in future revisions of C++. — end note]

**22.10.17.3.2 Constructors and destructor****[func.wrap.func.con]**

```
function() noexcept;
```

<sup>1</sup> *Postconditions:* `!*this`.

```
function(nullptr_t) noexcept;
```

<sup>2</sup> *Postconditions:* `!*this`.

```
function(const function& f);
```

3 *Postconditions:* !\*this if !f; otherwise, the target object of \*this is a copy of f.target().

4 *Throws:* Nothing if f's target is a specialization of reference\_wrapper or a function pointer. Otherwise, may throw bad\_alloc or any exception thrown by the copy constructor of the stored callable object.

5 *Recommended practice:* Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f's target is an object holding only a pointer or reference to an object and a member function pointer.

```
function(function&& f) noexcept;
```

6 *Postconditions:* If !f, \*this has no target; otherwise, the target of \*this is equivalent to the target of f before the construction, and f is in a valid state with an unspecified value.

7 *Recommended practice:* Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f's target is an object holding only a pointer or reference to an object and a member function pointer.

```
template<class F> function(F&& f);
```

8 Let FD be decay\_t<F>.

9 *Constraints:*

(9.1) — is\_same\_v<remove\_cvref\_t<F>, function> is false, and

(9.2) — FD is Lvalue-Callable (22.10.17.3) for argument types ArgTypes... and return type R.

10 *Mandates:*

(10.1) — is\_copy\_constructible\_v<FD> is true, and

(10.2) — is\_constructible\_v<FD, F> is true.

11 *Preconditions:* FD meets the Cpp17CopyConstructible requirements.

12 *Postconditions:* !\*this is true if any of the following hold:

(12.1) — f is a null function pointer value.

(12.2) — f is a null member pointer value.

(12.3) — remove\_cvref\_t<F> is a specialization of the function class template, and !f is true.

13 Otherwise, \*this has a target object of type FD direct-non-list-initialized with std::forward<F>(f).

14 *Throws:* Nothing if FD is a specialization of reference\_wrapper or a function pointer type. Otherwise, may throw bad\_alloc or any exception thrown by the initialization of the target object.

15 *Recommended practice:* Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f refers to an object holding only a pointer or reference to an object and a member function pointer.

```
template<class F> function(F) -> function<see below>;
```

16 *Constraints:* ⚭F::operator() is well-formed when treated as an unevaluated operand and decltype(⚭F::operator()) is of the form R(G::\*)(A...) cv ⚭opt noexcept<sub>opt</sub> for a class type G.

17 *Remarks:* The deduced type is function<R(A...)>.

18 [Example 1:

```
void f() {
 int i{5};
 function g = [⚭](double) { return i; }; // deduces function<int(double)>
}
```

—end example]

```
function& operator=(const function& f);
```

19 *Effects:* As if by function(f).swap(\*this);

20 *Returns:* \*this.

```
function& operator=(function&& f);
```

21 *Effects:* Replaces the target of `*this` with the target of `f`.

22 *Returns:* `*this`.

```
function& operator=(nullptr_t) noexcept;
```

23 *Effects:* If `*this != nullptr`, destroys the target of `this`.

24 *Postconditions:* `!(*this)`.

25 *Returns:* `*this`.

```
template<class F> function& operator=(F&& f);
```

26 *Constraints:* `decay_t<F>` is Lvalue-Callable (22.10.17.3) for argument types `ArgTypes...` and return type `R`.

27 *Effects:* As if by: `function(std::forward<F>(f)).swap(*this)`;

28 *Returns:* `*this`.

```
template<class F> function& operator=(reference_wrapper<F> f) noexcept;
```

29 *Effects:* As if by: `function(f).swap(*this)`;

30 *Returns:* `*this`.

```
~function();
```

31 *Effects:* If `*this != nullptr`, destroys the target of `this`.

### 22.10.17.3.3 Modifiers

[func.wrap.func.mod]

```
void swap(function& other) noexcept;
```

1 *Effects:* Interchanges the target objects of `*this` and `other`.

### 22.10.17.3.4 Capacity

[func.wrap.func.cap]

```
explicit operator bool() const noexcept;
```

1 *Returns:* true if `*this` has a target, otherwise false.

### 22.10.17.3.5 Invocation

[func.wrap.func.inv]

```
R operator()(ArgTypes... args) const;
```

1 *Returns:* `INVOKE<R>(f, std::forward<ArgTypes>(args)...) (22.10.4)`, where `f` is the target object (22.10.3) of `*this`.

2 *Throws:* `bad_function_call` if `!*this`; otherwise, any exception thrown by the target object.

### 22.10.17.3.6 Target access

[func.wrap.func.targ]

```
const type_info& target_type() const noexcept;
```

1 *Returns:* If `*this` has a target of type `T`, `typeid(T)`; otherwise, `typeid(void)`.

```
template<class T> T* target() noexcept;
template<class T> const T* target() const noexcept;
```

2 *Returns:* If `target_type() == typeid(T)` a pointer to the stored function target; otherwise a null pointer.

### 22.10.17.3.7 Null pointer comparison operator functions

[func.wrap.func.nullptr]

```
template<class R, class... ArgTypes>
bool operator==(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;
```

1 *Returns:* `!f`.

### 22.10.17.3.8 Specialized algorithms

[func.wrap.func.alg]

```
template<class R, class... ArgTypes>
void swap(function<R(ArgTypes...)>& f1, function<R(ArgTypes...)>& f2) noexcept;
```

1 *Effects:* As if by: `f1.swap(f2)`;

**22.10.17.4 Move only wrapper****[func.wrap.move]****22.10.17.4.1 General****[func.wrap.move.general]**

- 1 The header provides partial specializations of `move_only_function` for each combination of the possible replacements of the placeholders `cv`, `ref`, and `noex` where
  - (1.1) — `cv` is either `const` or empty,
  - (1.2) — `ref` is either `&`, `&&`, or empty, and
  - (1.3) — `noex` is either `true` or `false`.
- 2 For each of the possible combinations of the placeholders mentioned above, there is a placeholder `inv-quals` defined as follows:
  - (2.1) — If `ref` is empty, let `inv-quals` be `cv&`,
  - (2.2) — otherwise, let `inv-quals` be `cv ref`.

**22.10.17.4.2 Class template `move_only_function`****[func.wrap.move.class]**

```

namespace std {
 template<class... S> class move_only_function; // not defined

 template<class R, class... ArgTypes>
 class move_only_function<R(ArgTypes...) cv ref noexcept(noex)> {
 public:
 using result_type = R;

 // 22.10.17.4.3, constructors, assignment, and destructor
 move_only_function() noexcept;
 move_only_function(nullptr_t) noexcept;
 move_only_function(move_only_function&&) noexcept;
 template<class F> move_only_function(F&&);
 template<class T, class... Args>
 explicit move_only_function(in_place_type_t<T>, Args&&...);
 template<class T, class U, class... Args>
 explicit move_only_function(in_place_type_t<T>, initializer_list<U>, Args&&...);

 move_only_function& operator=(move_only_function&&);
 move_only_function& operator=(nullptr_t) noexcept;
 template<class F> move_only_function& operator=(F&&);

 ~move_only_function();

 // 22.10.17.4.4, invocation
 explicit operator bool() const noexcept;
 R operator()(ArgTypes...) cv ref noexcept(noex);

 // 22.10.17.4.5, utility
 void swap(move_only_function&) noexcept;
 friend void swap(move_only_function&, move_only_function&) noexcept;
 friend bool operator==(const move_only_function&, nullptr_t) noexcept;

 private:
 template<class VT>
 static constexpr bool is-callable-from = see below; // exposition only
 };
}

```

- 1 The `move_only_function` class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, move, and call arbitrary callable objects, given a call signature.
- 2 *Recommended practice:* Implementations should avoid the use of dynamically allocated memory for a small contained value.

[Note 1: Such small-object optimization can only be applied to a type `T` for which `is_nothrow_move_constructible_v<T>` is `true`. — end note]

## 22.10.17.4.3 Constructors, assignment, and destructor

[func.wrap.move.ctor]

```
template<class VT>
 static constexpr bool is-callable-from = see below;
```

1 If *noex* is true, *is-callable-from*<VT> is equal to:

```
 is_nothrow_invocable_r_v<R, VT cv ref, ArgTypes...> &&
 is_nothrow_invocable_r_v<R, VT inv-quals, ArgTypes...>
```

Otherwise, *is-callable-from*<VT> is equal to:

```
 is_invocable_r_v<R, VT cv ref, ArgTypes...> &&
 is_invocable_r_v<R, VT inv-quals, ArgTypes...>
```

```
move_only_function() noexcept;
move_only_function(nullptr_t) noexcept;
```

2 **Postconditions:** *\*this* has no target object.

```
move_only_function(move_only_function&& f) noexcept;
```

3 **Postconditions:** The target object of *\*this* is the target object *f* had before construction, and *f* is in a valid state with an unspecified value.

```
template<class F> move_only_function(F&& f);
```

4 Let VT be `decay_t<F>`.

5 **Constraints:**

(5.1) — `remove_cvref_t<F>` is not the same type as `move_only_function`, and

(5.2) — `remove_cvref_t<F>` is not a specialization of `in_place_type_t`, and

(5.3) — *is-callable-from*<VT> is true.

6 **Mandates:** `is_constructible_v<VT, F>` is true.

7 **Preconditions:** VT meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is true, VT meets the *Cpp17MoveConstructible* requirements.

8 **Postconditions:** *\*this* has no target object if any of the following hold:

(8.1) — *f* is a null function pointer value, or

(8.2) — *f* is a null member pointer value, or

(8.3) — `remove_cvref_t<F>` is a specialization of the `move_only_function` class template, and *f* has no target object.

Otherwise, *\*this* has a target object of type VT direct-non-list-initialized with `std::forward<F>(f)`.

9 **Throws:** Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless VT is a function pointer or a specialization of `reference_wrapper`.

```
template<class T, class... Args>
 explicit move_only_function(in_place_type_t<T>, Args&&... args);
```

10 Let VT be `decay_t<T>`.

11 **Constraints:**

(11.1) — `is_constructible_v<VT, Args...>` is true, and

(11.2) — *is-callable-from*<VT> is true.

12 **Mandates:** VT is the same type as T.

13 **Preconditions:** VT meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is true, VT meets the *Cpp17MoveConstructible* requirements.

14 **Postconditions:** *\*this* has a target object of type VT direct-non-list-initialized with `std::forward<Args>(args)...`

15 **Throws:** Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless VT is a function pointer or a specialization of `reference_wrapper`.

```
template<class T, class U, class... Args>
explicit move_only_function(inplace_type_t<T>, initializer_list<U> ilist, Args&&... args);
```

16 Let VT be decay\_t<T>.

17 *Constraints:*

(17.1) — `is_constructible_v<VT, initializer_list<U>&, ArgTypes...>` is true, and

(17.2) — `is-callable-from<VT>` is true.

18 *Mandates:* VT is the same type as T.

19 *Preconditions:* VT meets the *Cpp17Destructible* requirements, and if `is_move_constructible_v<VT>` is true, VT meets the *Cpp17MoveConstructible* requirements.

20 *Postconditions:* \*this has a target object of type VT direct-non-list-initialized with `ilist`, `std::forward<ArgTypes>(args)...`

21 *Throws:* Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless VT is a function pointer or a specialization of `reference_wrapper`.

```
move_only_function& operator=(move_only_function&& f);
```

22 *Effects:* Equivalent to: `move_only_function(std::move(f)).swap(*this);`

23 *Returns:* \*this.

```
move_only_function& operator=(nullptr_t) noexcept;
```

24 *Effects:* Destroys the target object of \*this, if any.

25 *Returns:* \*this.

```
template<class F> move_only_function& operator=(F&& f);
```

26 *Effects:* Equivalent to: `move_only_function(std::forward<F>(f)).swap(*this);`

27 *Returns:* \*this.

```
~move_only_function();
```

28 *Effects:* Destroys the target object of \*this, if any.

#### 22.10.17.4.4 Invocation

[func.wrap.move.inv]

```
explicit operator bool() const noexcept;
```

1 *Returns:* true if \*this has a target object, otherwise false.

```
R operator()(ArgTypes... args) cv ref noexcept(noex);
```

2 *Preconditions:* \*this has a target object.

3 *Effects:* Equivalent to:

```
return INVOKE<R>(static_cast<F inv-quals>(f), std::forward<ArgTypes>(args)...);
```

where f is an lvalue designating the target object of \*this and F is the type of f.

#### 22.10.17.4.5 Utility

[func.wrap.move.util]

```
void swap(move_only_function& other) noexcept;
```

1 *Effects:* Exchanges the target objects of \*this and other.

```
friend void swap(move_only_function& f1, move_only_function& f2) noexcept;
```

2 *Effects:* Equivalent to `f1.swap(f2)`.

```
friend bool operator==(const move_only_function& f, nullptr_t) noexcept;
```

3 *Returns:* true if f has no target object, otherwise false.

**22.10.18 Searchers****[func.search]****22.10.18.1 General****[func.search.general]**

- <sup>1</sup> Subclause 22.10.18 provides function object types (22.10) for operations that search for a sequence [pat\_first, pat\_last) in another sequence [first, last) that is provided to the object's function call operator. The first sequence (the pattern to be searched for) is provided to the object's constructor, and the second (the sequence to be searched) is provided to the function call operator.
- <sup>2</sup> Each specialization of a class template specified in 22.10.18 shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. Template parameters named
- (2.1) — `ForwardIterator`,
  - (2.2) — `ForwardIterator1`,
  - (2.3) — `ForwardIterator2`,
  - (2.4) — `RandomAccessIterator`,
  - (2.5) — `RandomAccessIterator1`,
  - (2.6) — `RandomAccessIterator2`, and
  - (2.7) — `BinaryPredicate`

of templates specified in 22.10.18 shall meet the same requirements and semantics as specified in 27.1. Template parameters named `Hash` shall meet the *Cpp17Hash* requirements (Table 36).

- <sup>3</sup> The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.

**22.10.18.2 Class template `default_searcher`****[func.search.default]**

```
namespace std {
 template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
 class default_searcher {
 public:
 constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
 BinaryPredicate pred = BinaryPredicate());

 template<class ForwardIterator2>
 constexpr pair<ForwardIterator2, ForwardIterator2>
 operator()(ForwardIterator2 first, ForwardIterator2 last) const;

 private:
 ForwardIterator1 pat_first_; // exposition only
 ForwardIterator1 pat_last_; // exposition only
 BinaryPredicate pred_; // exposition only
 };
}
```

```
constexpr default_searcher(ForwardIterator pat_first, ForwardIterator pat_last,
 BinaryPredicate pred = BinaryPredicate());
```

- <sup>1</sup> *Effects:* Constructs a `default_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, and `pred_` with `pred`.
- <sup>2</sup> *Throws:* Any exception thrown by the copy constructor of `BinaryPredicate` or `ForwardIterator1`.

```
template<class ForwardIterator2>
constexpr pair<ForwardIterator2, ForwardIterator2>
operator()(ForwardIterator2 first, ForwardIterator2 last) const;
```

- <sup>3</sup> *Effects:* Returns a pair of iterators `i` and `j` such that

- (3.1) — `i == search(first, last, pat_first_, pat_last_, pred_)`, and
- (3.2) — if `i == last`, then `j == last`, otherwise `j == next(i, distance(pat_first_, pat_last_))`.

**22.10.18.3 Class template boyer\_moore\_searcher****[func.search.bm]**

```

namespace std {
 template<class RandomAccessIterator1,
 class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
 class BinaryPredicate = equal_to<>>
 class boyer_moore_searcher {
 public:
 boyer_moore_searcher(RandomAccessIterator1 pat_first,
 RandomAccessIterator1 pat_last,
 Hash hf = Hash(),
 BinaryPredicate pred = BinaryPredicate());

 template<class RandomAccessIterator2>
 pair<RandomAccessIterator2, RandomAccessIterator2>
 operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

 private:
 RandomAccessIterator1 pat_first_; // exposition only
 RandomAccessIterator1 pat_last_; // exposition only
 Hash hash_; // exposition only
 BinaryPredicate pred_; // exposition only
 };
}

```

```

boyer_moore_searcher(RandomAccessIterator1 pat_first,
 RandomAccessIterator1 pat_last,
 Hash hf = Hash(),
 BinaryPredicate pred = BinaryPredicate());

```

1 *Preconditions:* The value type of `RandomAccessIterator1` meets the *Cpp17DefaultConstructible*, the *Cpp17CopyConstructible*, and the *Cpp17CopyAssignable* requirements.

2 Let  $V$  be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values  $A$  and  $B$  of type  $V$ , if `pred(A, B) == true`, then `hf(A) == hf(B)` is true.

3 *Effects:* Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.

4 *Throws:* Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```

template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

```

5 *Mandates:* `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

6 *Effects:* Finds a subsequence of equal values in a sequence.

7 *Returns:* A pair of iterators  $i$  and  $j$  such that

(7.1) —  $i$  is the first iterator in the range  $[first, last - (pat\_last\_ - pat\_first\_))$  such that for every non-negative integer  $n$  less than `pat_last_ - pat_first_` the following condition holds: `pred(*(i + n), *(pat_first_ + n)) != false`, and

(7.2) —  $j == next(i, distance(pat\_first_, pat\_last\_))$ .

Returns `make_pair(first, first)` if  $[pat\_first_, pat\_last_)$  is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

8 *Complexity:* At most  $(last - first) * (pat\_last\_ - pat\_first_)$  applications of the predicate.

**22.10.18.4 Class template boyer\_moore\_horspool\_searcher****[func.search.bmh]**

```

namespace std {
 template<class RandomAccessIterator1,
 class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
 class BinaryPredicate = equal_to<>>

```

```

class boyer_moore_horspool_searcher {
public:
 boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
 RandomAccessIterator1 pat_last,
 Hash hf = Hash(),
 BinaryPredicate pred = BinaryPredicate());

 template<class RandomAccessIterator2>
 pair<RandomAccessIterator2, RandomAccessIterator2>
 operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

private:
 RandomAccessIterator1 pat_first_; // exposition only
 RandomAccessIterator1 pat_last_; // exposition only
 Hash hash_; // exposition only
 BinaryPredicate pred_; // exposition only
};
}

```

```

boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
 RandomAccessIterator1 pat_last,
 Hash hf = Hash(),
 BinaryPredicate pred = BinaryPredicate());

```

1 *Preconditions:* The value type of `RandomAccessIterator1` meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and *Cpp17CopyAssignable* requirements.

2 Let  $V$  be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values  $A$  and  $B$  of type  $V$ , if `pred(A, B) == true`, then `hf(A) == hf(B)` is true.

3 *Effects:* Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.

4 *Throws:* Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```

template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

```

5 *Mandates:* `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

6 *Effects:* Finds a subsequence of equal values in a sequence.

7 *Returns:* A pair of iterators  $i$  and  $j$  such that

(7.1) —  $i$  is the first iterator in the range  $[first, last - (pat\_last\_ - pat\_first\_))$  such that for every non-negative integer  $n$  less than `pat_last_ - pat_first_` the following condition holds: `pred(*(i + n), *(pat_first_ + n)) != false`, and

(7.2) — `j == next(i, distance(pat_first_, pat_last_))`.

Returns `make_pair(first, first)` if  $[pat\_first_, pat\_last_)$  is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

8 *Complexity:* At most  $(last - first) * (pat\_last_ - pat\_first_)$  applications of the predicate.

## 22.10.19 Class template hash

[unord.hash]

1 The unordered associative containers defined in 24.5 use specializations of the class template hash (22.10.2) as the default hash function.

2 Each specialization of hash is either enabled or disabled, as described below.

[Note 1: Enabled specializations meet the *Cpp17Hash* requirements, and disabled specializations do not. — end note]

Each header that declares the template hash provides enabled specializations of hash for `nullptr_t` and all cv-unqualified arithmetic, enumeration, and pointer types. For any type `Key` for which neither the library nor the user provides an explicit or partial specialization of the class template hash, `hash<Key>` is disabled.

- 3 If the library provides an explicit or partial specialization of `hash<Key>`, that specialization is enabled except as noted otherwise, and its member functions are `noexcept` except as noted otherwise.
- 4 If `H` is a disabled specialization of `hash`, these values are `false`: `is_default_constructible_v<H>`, `is_copy_constructible_v<H>`, `is_move_constructible_v<H>`, `is_copy_assignable_v<H>`, and `is_move_assignable_v<H>`. Disabled specializations of `hash` are not function object types (22.10).

[Note 2: This means that the specialization of `hash` exists, but any attempts to use it as a *Cpp17Hash* will be ill-formed. — end note]

- 5 An enabled specialization `hash<Key>` will:

- (5.1) — meet the *Cpp17Hash* requirements (Table 36), with `Key` as the function call argument type, the *Cpp17DefaultConstructible* requirements (Table 29), the *Cpp17CopyAssignable* requirements (Table 33),
- (5.2) — be swappable (16.4.4.3) for lvalues,
- (5.3) — meet the requirement that if `k1 == k2` is `true`, `h(k1) == h(k2)` is also `true`, where `h` is an object of type `hash<Key>` and `k1` and `k2` are objects of type `Key`;
- (5.4) — meet the requirement that the expression `h(k)`, where `h` is an object of type `hash<Key>` and `k` is an object of type `Key`, shall not throw an exception unless `hash<Key>` is a program-defined specialization.

## 22.11 Class `type_index`

[[type.index](#)]

### 22.11.1 Header `<type_index>` synopsis

[[type.index.synopsis](#)]

```
#include <compare> // see 17.11.1

namespace std {
 class type_index;
 template<class T> struct hash;
 template<> struct hash<type_index>;
}
```

### 22.11.2 `type_index` overview

[[type.index.overview](#)]

```
namespace std {
 class type_index {
 public:
 type_index(const type_info& rhs) noexcept;
 bool operator==(const type_index& rhs) const noexcept;
 bool operator< (const type_index& rhs) const noexcept;
 bool operator> (const type_index& rhs) const noexcept;
 bool operator<=(const type_index& rhs) const noexcept;
 bool operator>=(const type_index& rhs) const noexcept;
 strong_ordering operator<=>(const type_index& rhs) const noexcept;
 size_t hash_code() const noexcept;
 const char* name() const noexcept;

 private:
 const type_info* target; // exposition only
 // Note that the use of a pointer here, rather than a reference,
 // means that the default copy/move constructor and assignment
 // operators will be provided and work as expected.
 };
}
```

- 1 The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (24.4) and in unordered associative containers (24.5).

### 22.11.3 `type_index` members

[[type.index.members](#)]

```
type_index(const type_info& rhs) noexcept;
```

- 1 *Effects:* Constructs a `type_index` object, the equivalent of `target = &rhs`.

```
bool operator==(const type_index& rhs) const noexcept;
```

- 2 *Returns:* `*target == *rhs.target`.

```

bool operator<(const type_index& rhs) const noexcept;
3 Returns: target->before(*rhs.target).

bool operator>(const type_index& rhs) const noexcept;
4 Returns: rhs.target->before(*target).

bool operator<=(const type_index& rhs) const noexcept;
5 Returns: !rhs.target->before(*target).

bool operator>=(const type_index& rhs) const noexcept;
6 Returns: !target->before(*rhs.target).

strong_ordering operator<=>(const type_index& rhs) const noexcept;
7 Effects: Equivalent to:
 if (*target == *rhs.target) return strong_ordering::equal;
 if (target->before(*rhs.target)) return strong_ordering::less;
 return strong_ordering::greater;

size_t hash_code() const noexcept;
8 Returns: target->hash_code().

const char* name() const noexcept;
9 Returns: target->name().

```

#### 22.11.4 Hash support

[type.index.hash]

```
template<> struct hash<type_index>;
```

1 For an object `index` of type `type_index`, `hash<type_index>()(index)` shall evaluate to the same result as `index.hash_code()`.

### 22.12 Execution policies

[execpol]

#### 22.12.1 In general

[execpol.general]

1 Subclause 22.12 describes classes that are *execution policy* types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions.

[Example 1:

```

using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());

```

— end example]

[Note 1: Implementations can provide additional execution policies to those described in this standard as extensions to address parallel architectures that require idiosyncratic parameters for efficient execution. — end note]

#### 22.12.2 Header <execution> synopsis

[execution.syn]

```

namespace std {
 // 22.12.3, execution policy type trait
 template<class T> struct is_execution_policy;

```

```

 template<class T> inline constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}

namespace std::execution {
 // 22.12.4, sequenced execution policy
 class sequenced_policy;

 // 22.12.5, parallel execution policy
 class parallel_policy;

 // 22.12.6, parallel and unsequenced execution policy
 class parallel_unsequenced_policy;

 // 22.12.7, unsequenced execution policy
 class unsequenced_policy;

 // 22.12.8, execution policy objects
 inline constexpr sequenced_policy seq{ unspecified };
 inline constexpr parallel_policy par{ unspecified };
 inline constexpr parallel_unsequenced_policy par_unseq{ unspecified };
 inline constexpr unsequenced_policy unseq{ unspecified };
}

```

### 22.12.3 Execution policy type trait

[execpol.type]

```
template<class T> struct is_execution_policy { see below };
```

- 1 `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.
- 2 `is_execution_policy<T>` is a *Cpp17UnaryTypeTrait* with a base characteristic of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.  
[Note 1: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — end note]
- 3 The behavior of a program that adds specializations for `is_execution_policy` is undefined.

### 22.12.4 Sequenced execution policy

[execpol.seq]

```
class execution::sequenced_policy { unspecified };
```

- 1 The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.
- 2 During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

### 22.12.5 Parallel execution policy

[execpol.par]

```
class execution::parallel_policy { unspecified };
```

- 1 The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.
- 2 During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

### 22.12.6 Parallel and unsequenced execution policy

[execpol.parunseq]

```
class execution::parallel_unsequenced_policy { unspecified };
```

- 1 The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.
- 2 During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

**22.12.7 Unsequenced execution policy****[execpol.unseq]**

```
class execution::unsequenced_policy { unspecified };
```

- <sup>1</sup> The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items.
- <sup>2</sup> During the execution of a parallel algorithm with the `execution::unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

**22.12.8 Execution policy objects****[execpol.objects]**

```
inline constexpr execution::sequenced_policy execution::seq{ unspecified };
inline constexpr execution::parallel_policy execution::par{ unspecified };
inline constexpr execution::parallel_unsequenced_policy execution::par_unseq{ unspecified };
inline constexpr execution::unsequenced_policy execution::unseq{ unspecified };
```

- <sup>1</sup> The header `<execution>` declares global objects associated with each type of execution policy.

**22.13 Primitive numeric conversions****[charconv]****22.13.1 Header `<charconv>` synopsis****[charconv.syn]**

```
namespace std {
 // floating-point format for primitive numerical conversion
 enum class chars_format {
 scientific = unspecified,
 fixed = unspecified,
 hex = unspecified,
 general = fixed | scientific
 };

 // 22.13.2, primitive numerical output conversion
 struct to_chars_result {
 char* ptr;
 errc ec;
 friend bool operator==(const to_chars_result&, const to_chars_result&) = default;
 };

 to_chars_result to_chars(char* first, char* last, see below value, int base = 10);
 to_chars_result to_chars(char* first, char* last, bool value, int base = 10) = delete;

 to_chars_result to_chars(char* first, char* last, float value);
 to_chars_result to_chars(char* first, char* last, double value);
 to_chars_result to_chars(char* first, char* last, long double value);

 to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
 to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
 to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);

 to_chars_result to_chars(char* first, char* last, float value,
 chars_format fmt, int precision);
 to_chars_result to_chars(char* first, char* last, double value,
 chars_format fmt, int precision);
 to_chars_result to_chars(char* first, char* last, long double value,
 chars_format fmt, int precision);

 // 22.13.3, primitive numerical input conversion
 struct from_chars_result {
 const char* ptr;
 errc ec;
 friend bool operator==(const from_chars_result&, const from_chars_result&) = default;
 };

 from_chars_result from_chars(const char* first, const char* last,
 see below& value, int base = 10);
}
```

```

 from_chars_result from_chars(const char* first, const char* last, float& value,
 chars_format fmt = chars_format::general);
 from_chars_result from_chars(const char* first, const char* last, double& value,
 chars_format fmt = chars_format::general);
 from_chars_result from_chars(const char* first, const char* last, long double& value,
 chars_format fmt = chars_format::general);
}

```

- 1 The type `chars_format` is a bitmask type (16.3.3.3.4) with elements `scientific`, `fixed`, and `hex`.
- 2 The types `to_chars_result` and `from_chars_result` have the data members and special members specified above. They have no base classes or members other than those specified.

### 22.13.2 Primitive numeric output conversion

[charconv.to.chars]

- 1 All functions named `to_chars` convert `value` into a character string by successively filling the range `[first, last)`, where `[first, last)` is required to be a valid range. If the member `ec` of the return value is such that the value is equal to the value of a value-initialized `errc`, the conversion was successful and the member `ptr` is the one-past-the-end pointer of the characters written. Otherwise, the member `ec` has the value `errc::value_too_large`, the member `ptr` has the value `last`, and the contents of the range `[first, last)` are unspecified.
- 2 The functions that take a floating-point value but not a precision parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding `from_chars` function recovers `value` exactly.

[Note 1: This guarantee applies only if `to_chars` and `from_chars` are executed on the same implementation. — end note]

If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (17.3.4.1).

- 3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows: The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading `"0x"` in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

```
to_chars_result to_chars(char* first, char* last, see below value, int base = 10);
```

- 4 **Preconditions:** `base` has a value between 2 and 36 (inclusive).
- 5 **Effects:** The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a..z`. If `value` is less than zero, the representation starts with `'-'`.
- 6 **Throws:** Nothing.
- 7 **Remarks:** The implementation shall provide overloads for all signed and unsigned integer types and `char` as the type of the parameter `value`.

```

to_chars_result to_chars(char* first, char* last, float value);
to_chars_result to_chars(char* first, char* last, double value);
to_chars_result to_chars(char* first, char* last, long double value);

```

- 8 **Effects:** `value` is converted to a string in the style of `printf` in the "C" locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.

- 9 **Throws:** Nothing.

```

to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);

```

- 10 **Preconditions:** `fmt` has the value of one of the enumerators of `chars_format`.

- 11 **Effects:** `value` is converted to a string in the style of `printf` in the "C" locale.

- 12 **Throws:** Nothing.

```

to_chars_result to_chars(char* first, char* last, float value,
 chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, double value,
 chars_format fmt, int precision);

```

```
to_chars_result to_chars(char* first, char* last, long double value,
 chars_format fmt, int precision);
```

13 *Preconditions:* `fmt` has the value of one of the enumerators of `chars_format`.

14 *Effects:* `value` is converted to a string in the style of `printf` in the "C" locale with the given precision.

15 *Throws:* Nothing.

See also: ISO C 7.21.6.1

### 22.13.3 Primitive numeric input conversion

[**charconv.from.chars**]

1 All functions named `from_chars` analyze the string `[first, last)` for a pattern, where `[first, last)` is required to be a valid range. If no characters match the pattern, `value` is unmodified, the member `ptr` of the return value is `first` and the member `ec` is equal to `errc::invalid_argument`.

[*Note 1:* If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. — *end note*]

Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of `value`. The member `ptr` of the return value points to the first character not matching the pattern, or has the value `last` if all characters match. If the parsed value is not in the range representable by the type of `value`, `value` is unmodified and the member `ec` of the return value is equal to `errc::result_out_of_range`. Otherwise, `value` is set to the parsed value, after rounding according to `round_to_nearest` (17.3.4.1), and the member `ec` is value-initialized.

```
from_chars_result from_chars(const char* first, const char* last,
 see below& value, int base = 10);
```

2 *Preconditions:* `base` has a value between 2 and 36 (inclusive).

3 *Effects:* The pattern is the expected form of the subject sequence in the "C" locale for the given nonzero base, as described for `strtoul`, except that no "0x" or "0X" prefix shall appear if the value of `base` is 16, and except that '-' is the only sign that may appear, and only if `value` has a signed type.

4 *Throws:* Nothing.

5 *Remarks:* The implementation shall provide overloads for all signed and unsigned integer types and `char` as the referenced type of the parameter `value`.

```
from_chars_result from_chars(const char* first, const char* last, float& value,
 chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, double& value,
 chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, long double& value,
 chars_format fmt = chars_format::general);
```

6 *Preconditions:* `fmt` has the value of one of the enumerators of `chars_format`.

7 *Effects:* The pattern is the expected form of the subject sequence in the "C" locale, as described for `strtod`, except that

(7.1) — the sign '+' may only appear in the exponent part;

(7.2) — if `fmt` has `chars_format::scientific` set but not `chars_format::fixed`, the otherwise optional exponent part shall appear;

(7.3) — if `fmt` has `chars_format::fixed` set but not `chars_format::scientific`, the optional exponent part shall not appear; and

(7.4) — if `fmt` is `chars_format::hex`, the prefix "0x" or "0X" is assumed.

[*Example 1:* The string `0x123` is parsed to have the value `0` with remaining characters `x123`. — *end example*]

In any case, the resulting `value` is one of at most two floating-point values closest to the value of the string matching the pattern.

8 *Throws:* Nothing.

 make_wformat_args(Args&&... args);

// 22.14.8, class format_error
class format_error;
}

```

- <sup>1</sup> The class template `format_to_n_result` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

## 22.14.2 Format string

[format.string]

### 22.14.2.1 In general

[format.string.general]

- <sup>1</sup> A *format string* for arguments `args` is a (possibly empty) sequence of *replacement fields*, *escape sequences*, and characters other than `{` and `}`. Let `charT` be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape sequence is one of `{{` or `}}`. It is replaced with `{` or `}`, respectively, in the output. The syntax of replacement fields is as follows:

```

replacement-field:
 { arg-idopt format-specifieropt }
arg-id:
 0
 positive-integer
positive-integer:
 nonzero-digit
 positive-integer digit
nonnegative-integer:
 digit
 nonnegative-integer digit
nonzero-digit: one of
 1 2 3 4 5 6 7 8 9
digit: one of
 0 1 2 3 4 5 6 7 8 9
format-specifier:
 : format-spec
format-spec:
 as specified by the formatter specialization for the argument type

```

- <sup>2</sup> The *arg-id* field specifies the index of the argument in *args* whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index *arg-id* in *args*, the string is not a format string for *args*. The optional *format-specifier* field explicitly specifies a format for the replacement value.

<sup>3</sup> [Example 1:

```

string s = format("{0}-{}", 8); // value of s is "8-{"
—end example]

```

- <sup>4</sup> If all *arg-ids* in a format string are omitted (including those in the *format-spec*, as interpreted by the corresponding formatter specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some *arg-ids* are omitted and some are present, the string is not a format string.

[Note 1: A format string cannot contain a mixture of automatic and manual indexing. —end note]

[Example 2:

```

string s0 = format("{} to {}", "a", "b"); // OK, automatic indexing
string s1 = format("{1} to {0}", "a", "b"); // OK, manual indexing
string s2 = format("{0} to {}", "a", "b"); // not a format string (mixing automatic and manual indexing),
// ill-formed
string s3 = format("{} to {1}", "a", "b"); // not a format string (mixing automatic and manual indexing),
// ill-formed

```

—end example]

- <sup>5</sup> The *format-spec* field contains *format specifications* that define how the value should be presented. Each type can define its own interpretation of the *format-spec* field. If *format-spec* does not conform to the format specifications for the argument type referred to by *arg-id*, the string is not a format string for *args*.

[Example 3:

- (5.1) — For arithmetic, pointer, and string types the *format-spec* is interpreted as a *std-format-spec* as described in (22.14.2.2).
- (5.2) — For chrono types the *format-spec* is interpreted as a *chrono-format-spec* as described in (29.12).
- (5.3) — For user-defined formatter specializations, the behavior of the parse member function determines how the *format-spec* is interpreted.

—end example]

### 22.14.2.2 Standard format specifiers

[format.string.std]

- <sup>1</sup> Each formatter specializations described in 22.14.6.2 for fundamental and string types interprets *format-spec* as a *std-format-spec*.

[Note 1: The format specification can be used to specify such details as field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types. —end note]

The syntax of format specifications is as follows:

*std-format-spec*:  
*fill-and-align*<sub>opt</sub> *sign*<sub>opt</sub> *#*<sub>opt</sub> *0*<sub>opt</sub> *width*<sub>opt</sub> *precision*<sub>opt</sub> *L*<sub>opt</sub> *type*<sub>opt</sub>

*fill-and-align*:  
*fill*<sub>opt</sub> *align*

*fill*:  
any character other than { or }

*align*: one of  
< > ^

*sign*: one of  
+ - space

*width*:  
*positive-integer*  
{ *arg-id*<sub>opt</sub> }

*precision*:  
. *nonnegative-integer*  
. { *arg-id*<sub>opt</sub> }

*type*: one of  
a A b B c d e E f F g G o p s x X

- 2 [Note 2: The *fill* character can be any character other than { or }. The presence of a fill character is signaled by the character following it, which must be one of the alignment options. If the second character of *std-format-spec* is not a valid alignment option, then it is assumed that both the fill character and the alignment option are absent. — end note]
- 3 The *align* specifier applies to all argument types. The meaning of the various alignment options is as specified in Table 64.

[Example 1:

```
char c = 120;
string s0 = format("{:6}", 42); // value of s0 is " 42"
string s1 = format("{:6}", 'x'); // value of s1 is "x "
string s2 = format("{:*<6}", 'x'); // value of s2 is "x*****"
string s3 = format("{:*>6}", 'x'); // value of s3 is "*****x"
string s4 = format("{:*^6}", 'x'); // value of s4 is "***x***"
string s5 = format("{:6d}", c); // value of s5 is " 120"
string s6 = format("{:6}", true); // value of s6 is "true "
```

— end example]

[Note 3: Unless a minimum field width is defined, the field width is determined by the size of the content and the alignment option has no effect. — end note]

Table 64: Meaning of *align* options [tab:format.align]

| Option | Meaning                                                                                                                                                                                                                                         |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <      | Forces the field to be aligned to the start of the available space. This is the default for non-arithmetic non-pointer types, <code>charT</code> , and <code>bool</code> , unless an integer presentation type is specified.                    |
| >      | Forces the field to be aligned to the end of the available space. This is the default for arithmetic types other than <code>charT</code> and <code>bool</code> , pointer types, or when an integer presentation type is specified.              |
| ^      | Forces the field to be centered within the available space by inserting $\lfloor \frac{n}{2} \rfloor$ characters before and $\lceil \frac{n}{2} \rceil$ characters after the value, where $n$ is the total number of fill characters to insert. |

- 4 The *sign* option is only valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified. The meaning of the various options is as specified in Table 65.
- 5 The *sign* option applies to floating-point infinity and NaN.

[Example 2:

```
double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
string s0 = format("{0:},{0:+},{0:-},{0: }", 1); // value of s0 is "1,+1,1, 1"
string s1 = format("{0:},{0:+},{0:-},{0: }", -1); // value of s1 is "-1,-1,-1,-1"
string s2 = format("{0:},{0:+},{0:-},{0: }", inf); // value of s2 is "inf,+inf,inf, inf"
```

Table 65: Meaning of *sign* options [tab:format.sign]

| Option | Meaning                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| +      | Indicates that a sign should be used for both non-negative and negative numbers. The + sign is inserted before the output of <code>to_chars</code> for non-negative numbers other than negative zero.<br>[ <i>Note 4:</i> For negative numbers and negative zero the output of <code>to_chars</code> will already contain the sign so no additional transformation is performed. — <i>end note</i> ] |
| -      | Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior).                                                                                                                                                                                                                                                                                     |
| space  | Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero.                                                                                                                                                                                                                                            |

```
string s3 = format("{0:},{0:+},{0:-},{0: }", nan); // value of s3 is "nan,+nan,nan, nan"
```

— *end example*]

- 6 The # option causes the *alternate form* to be used for the conversion. This option is valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified, and not otherwise. For integral types, the alternate form inserts the base prefix (if any) specified in Table 67 into the output after the sign character (possibly space) if there is one, or before the output of `to_chars` otherwise. For floating-point types, the alternate form causes the result of the conversion of finite values to always contain a decimal-point character, even if no digits follow it. Normally, a decimal-point character appears in the result of these conversions only if a digit follows it. In addition, for `g` and `G` conversions, trailing zeros are not removed from the result.
- 7 If { *arg-id<sub>opt</sub>* } is used in a *width* or *precision*, the value of the corresponding formatting argument is used in its place. If the corresponding formatting argument is not of integral type, or its value is negative for *precision* or non-positive for *width*, an exception of type `format_error` is thrown.
- 8 The *positive-integer* in *width* is a decimal integer defining the minimum field width. If *width* is not specified, there is no minimum field width, and the field width is determined based on the content of the field.
- 9 The *width* of a string is defined as the estimated number of column positions appropriate for displaying it in a terminal.  
[*Note 5:* This is similar to the semantics of the POSIX `wcswidth` function. — *end note*]
- 10 For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use a Unicode encoding on platforms capable of displaying Unicode text in a terminal.  
[*Note 6:* This is the case for Windows<sup>210</sup>-based and many POSIX-based operating systems. — *end note*]
- 11 For a string in a Unicode encoding, implementations should estimate the width of a string as the sum of estimated widths of the first code points in its extended grapheme clusters. The extended grapheme clusters of a string are defined by UAX #29. The estimated width of the following code points is 2:

- (11.1) — u+1100 – u+115f
- (11.2) — u+2329 – u+232a
- (11.3) — u+2e80 – u+303e
- (11.4) — u+3040 – u+a4cf
- (11.5) — u+ac00 – u+d7a3
- (11.6) — u+f900 – u+faff
- (11.7) — u+fe10 – u+fe19
- (11.8) — u+fe30 – u+fe6f
- (11.9) — u+ff00 – u+ff60
- (11.10) — u+ffe0 – u+ffe6
- (11.11) — u+1f300 – u+1f64f
- (11.12) — u+1f900 – u+1f9ff

<sup>210</sup>) Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of this product.

(11.13) — u+20000 – u+2fffd

(11.14) — u+30000 – u+3ffff

The estimated width of other code points is 1.

- 12 For a string in a non-Unicode encoding, the width of a string is unspecified.
- 13 A zero (0) character preceding the *width* field pads the field with leading zeros (following any indication of sign or base) to the field width, except when applied to an infinity or NaN. This option is only valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified. If the 0 character and an *align* option both appear, the 0 character is ignored.

[Example 3:

```
char c = 120;
string s1 = format("{:+06d}", c); // value of s1 is "+00120"
string s2 = format("{:#06x}", 0xa); // value of s2 is "0x000a"
string s3 = format("{:<06}", -42); // value of s3 is "-42" (0 is ignored because of < alignment)
```

—end example]

- 14 The *nonnegative-integer* in *precision* is a decimal integer defining the precision or maximum field size. It can only be used with floating-point and string types. For floating-point types this field specifies the formatting precision. For string types, this field provides an upper bound for the estimated width of the prefix of the input string that is copied into the output. For a string in a Unicode encoding, the formatter copies to the output the longest prefix of whole extended grapheme clusters whose estimated width is no greater than the precision.
- 15 When the `L` option is used, the form used for the conversion is called the *locale-specific form*. The `L` option is only valid for arithmetic types, and its effect depends upon the type.
- (15.1) — For integral types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group separator characters.
- (15.2) — For floating-point types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group and radix separator characters.
- (15.3) — For the textual representation of `bool`, the locale-specific form causes the context's locale to be used to insert the appropriate string as if obtained with `numprint::truenam` or `numprint::falsenam`.
- 16 The *type* determines how the data should be presented.
- 17 The available string presentation types are specified in Table 66.

Table 66: Meaning of *type* options for strings [tab:format.type.string]

| Type    | Meaning                          |
|---------|----------------------------------|
| none, s | Copies the string to the output. |

- 18 The meaning of some non-string presentation types is defined in terms of a call to `to_chars`. In such cases, let `[first, last)` be a range large enough to hold the `to_chars` output and `value` be the formatting argument value. Formatting is done as if by calling `to_chars` as specified and copying the output through the output iterator of the format context.

[Note 7: Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers. —end note]

- 19 The available integer presentation types for integral types other than `bool` and `charT` are specified in Table 67.

[Example 4:

```
string s0 = format("{} ", 42); // value of s0 is "42"
string s1 = format("{0:b} {0:d} {0:o} {0:x}", 42); // value of s1 is "101010 42 52 2a"
string s2 = format("{0:#x} {0:#X}", 42); // value of s2 is "0x2a 0X2A"
string s3 = format("{:L}", 1234); // value of s3 can be "1,234"
 // (depending on the locale)
```

—end example]

- 20 The available `charT` presentation types are specified in Table 68.
- 21 The available `bool` presentation types are specified in Table 69.

Table 67: Meaning of *type* options for integer types [tab:format.type.int]

| Type | Meaning                                                                                                                                           |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| b    | to_chars(first, last, value, 2); the base prefix is 0b.                                                                                           |
| B    | The same as b, except that the base prefix is 0B.                                                                                                 |
| c    | Copies the character static_cast<charT>(value) to the output. Throws format_error if value is not in the range of representable values for charT. |
| d    | to_chars(first, last, value).                                                                                                                     |
| o    | to_chars(first, last, value, 8); the base prefix is 0 if value is nonzero and is empty otherwise.                                                 |
| x    | to_chars(first, last, value, 16); the base prefix is 0x.                                                                                          |
| X    | The same as x, except that it uses uppercase letters for digits above 9 and the base prefix is 0X.                                                |
| none | The same as d.<br>[Note 8: If the formatting argument type is charT or bool, the default is instead c or s, respectively. —end note]              |

Table 68: Meaning of *type* options for charT [tab:format.type.char]

| Type             | Meaning                             |
|------------------|-------------------------------------|
| none, c          | Copies the character to the output. |
| b, B, d, o, x, X | As specified in Table 67.           |

Table 69: Meaning of *type* options for bool [tab:format.type.bool]

| Type             | Meaning                                                                   |
|------------------|---------------------------------------------------------------------------|
| none, s          | Copies textual representation, either true or false, to the output.       |
| b, B, d, o, x, X | As specified in Table 67 for the value static_cast<unsigned char>(value). |

- <sup>22</sup> The available floating-point presentation types and their meanings for values other than infinity and NaN are specified in Table 70. For lower-case presentation types, infinity and NaN are formatted as inf and nan, respectively. For upper-case presentation types, infinity and NaN are formatted as INF and NAN, respectively.

[Note 9: In either case, a sign is included if indicated by the *sign* option. —end note]

- <sup>23</sup> The available pointer presentation types and their mapping to to\_chars are specified in Table 71.

[Note 10: Pointer presentation types also apply to nullptr\_t. —end note]

### 22.14.3 Error reporting

[format.err.report]

- <sup>1</sup> Formatting functions throw format\_error if an argument fmt is passed that is not a format string for args. They propagate exceptions thrown by operations of formatter specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

### 22.14.4 Class template *basic-format-string*

[format.fmt.string]

```
template<class charT, class... Args>
struct basic_format_string { // exposition only
private:
 basic_string_view<charT> str; // exposition only

public:
 template<class T> consteval basic_format_string(const T& s);
};
```

```
template<class T> consteval basic_format_string(const T& s);
```

- <sup>1</sup> *Constraints:* const T& models convertible\_to<basic\_string\_view<charT>>.

- <sup>2</sup> *Effects:* Direct-non-list-initializes str with s.

- <sup>3</sup> *Remarks:* A call to this function is not a core constant expression (7.7) unless there exist args of types Args such that str is a format string for args.

Table 70: Meaning of *type* options for floating-point types [tab:format.type.float]

| Type | Meaning                                                                                                                                                                                                                                                                                 |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a    | If <i>precision</i> is specified, equivalent to<br><code>to_chars(first, last, value, chars_format::hex, precision)</code><br>where <i>precision</i> is the specified formatting precision; equivalent to<br><code>to_chars(first, last, value, chars_format::hex)</code><br>otherwise. |
| A    | The same as a, except that it uses uppercase letters for digits above 9 and P to indicate the exponent.                                                                                                                                                                                 |
| e    | Equivalent to<br><code>to_chars(first, last, value, chars_format::scientific, precision)</code><br>where <i>precision</i> is the specified formatting precision, or 6 if <i>precision</i> is not specified.                                                                             |
| E    | The same as e, except that it uses E to indicate exponent.                                                                                                                                                                                                                              |
| f, F | Equivalent to<br><code>to_chars(first, last, value, chars_format::fixed, precision)</code><br>where <i>precision</i> is the specified formatting precision, or 6 if <i>precision</i> is not specified.                                                                                  |
| g    | Equivalent to<br><code>to_chars(first, last, value, chars_format::general, precision)</code><br>where <i>precision</i> is the specified formatting precision, or 6 if <i>precision</i> is not specified.                                                                                |
| G    | The same as g, except that it uses E to indicate exponent.                                                                                                                                                                                                                              |
| none | If <i>precision</i> is specified, equivalent to<br><code>to_chars(first, last, value, chars_format::general, precision)</code><br>where <i>precision</i> is the specified formatting precision; equivalent to<br><code>to_chars(first, last, value)</code><br>otherwise.                |

Table 71: Meaning of *type* options for pointer types [tab:format.type.ptr]

| Type    | Meaning                                                                                                                                                                                                              |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| none, p | If <code>uintptr_t</code> is defined,<br><code>to_chars(first, last, reinterpret_cast&lt;uintptr_t&gt;(value), 16)</code><br>with the prefix <code>0x</code> added to the output; otherwise, implementation-defined. |

### 22.14.5 Formatting functions

[format.functions]

- <sup>1</sup> In the description of the functions, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as in 27.2.

```
template<class... Args>
string format(format-string<Args...> fmt, Args&&... args);
```

- <sup>2</sup> *Effects:* Equivalent to:  
`return vformat(fmt.str, make_format_args(args...));`

```
template<class... Args>
wstring format(wformat-string<Args...> fmt, Args&&... args);
```

- <sup>3</sup> *Effects:* Equivalent to:  
`return vformat(fmt.str, make_wformat_args(args...));`

```
template<class... Args>
string format(const locale& loc, format-string<Args...> fmt, Args&&... args);
```

- <sup>4</sup> *Effects:* Equivalent to:  
`return vformat(loc, fmt.str, make_format_args(args...));`

```
template<class... Args>
wstring format(const locale& loc, wformat-string<Args...> fmt, Args&&... args);
```

- <sup>5</sup> *Effects:* Equivalent to:

```
return vformat(loc, fmt.str, make_wformat_args(args...));
```

```
string vformat(string_view fmt, format_args args);
wstring vformat(wstring_view fmt, wformat_args args);
string vformat(const locale& loc, string_view fmt, format_args args);
wstring vformat(const locale& loc, wstring_view fmt, wformat_args args);
```

6 *Returns:* A string object holding the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

7 *Throws:* As specified in 22.14.3.

```
template<class Out, class... Args>
Out format_to(Out out, format-string<Args...> fmt, Args&&... args);
```

8 *Effects:* Equivalent to:

```
return vformat_to(std::move(out), fmt.str, make_format_args(args...));
```

```
template<class Out, class... Args>
Out format_to(Out out, wformat-string<Args...> fmt, Args&&... args);
```

9 *Effects:* Equivalent to:

```
return vformat_to(std::move(out), fmt.str, make_wformat_args(args...));
```

```
template<class Out, class... Args>
Out format_to(Out out, const locale& loc, format-string<Args...> fmt, Args&&... args);
```

10 *Effects:* Equivalent to:

```
return vformat_to(std::move(out), loc, fmt.str, make_format_args(args...));
```

```
template<class Out, class... Args>
Out format_to(Out out, const locale& loc, wformat-string<Args...> fmt, Args&&... args);
```

11 *Effects:* Equivalent to:

```
return vformat_to(std::move(out), loc, fmt.str, make_wformat_args(args...));
```

```
template<class Out>
Out vformat_to(Out out, string_view fmt, format_args args);
template<class Out>
Out vformat_to(Out out, wstring_view fmt, wformat_args args);
template<class Out>
Out vformat_to(Out out, const locale& loc, string_view fmt, format_args args);
template<class Out>
Out vformat_to(Out out, const locale& loc, wstring_view fmt, wformat_args args);
```

12 Let `charT` be `decltype(fmt)::value_type`.

13 *Constraints:* `Out` satisfies `output_iterator<const charT&>`.

14 *Preconditions:* `Out` models `output_iterator<const charT&>`.

15 *Effects:* Places the character representation of formatting the arguments provided by `args`, formatted according to the specifications given in `fmt`, into the range `[out, out + N)`, where `N` is the number of characters in that character representation. If present, `loc` is used for locale-specific formatting.

16 *Returns:* `out + N`.

17 *Throws:* As specified in 22.14.3.

```
template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
format-string<Args...> fmt, Args&&... args);
template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
wformat-string<Args...> fmt, Args&&... args);
template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
const locale& loc, format-string<Args...> fmt,
Args&&... args);
```

```
template<class Out, class... Args>
 format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
 const locale& loc, wformat-string<Args...> fmt,
 Args&&... args);
```

18       Let

- (18.1)     — charT be `decltype(fmt.str)::value_type`,
- (18.2)     — N be `formatted_size(fmt, args...)` for the functions without a `loc` parameter and `formatted_size(loc, fmt, args...)` for the functions with a `loc` parameter, and
- (18.3)     — M be `clamp(n, 0, N)`.

19       *Constraints:* Out satisfies `output_iterator<const charT&>`.

20       *Preconditions:* Out models `output_iterator<const charT&>`, and `formatter<remove_cvref_t<Ti>, charT>` meets the *BasicFormatter* requirements (22.14.6.1) for each  $T_i$  in Args.

21       *Effects:* Places the first M characters of the character representation of formatting the arguments provided by args, formatted according to the specifications given in `fmt`, into the range `[out, out + M)`. If present, `loc` is used for locale-specific formatting.

22       *Returns:* `{out + M, N}`.

23       *Throws:* As specified in 22.14.3.

```
template<class... Args>
 size_t formatted_size(format-string<Args...> fmt, Args&&... args);
template<class... Args>
 size_t formatted_size(wformat-string<Args...> fmt, Args&&... args);
template<class... Args>
 size_t formatted_size(const locale& loc, format-string<Args...> fmt, Args&&... args);
template<class... Args>
 size_t formatted_size(const locale& loc, wformat-string<Args...> fmt, Args&&... args);
```

24       Let charT be `decltype(fmt.str)::value_type`.

25       *Preconditions:* `formatter<remove_cvref_t<Ti>, charT>` meets the *BasicFormatter* requirements (22.14.6.1) for each  $T_i$  in Args.

26       *Returns:* The number of characters in the character representation of formatting arguments args formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

27       *Throws:* As specified in 22.14.3.

## 22.14.6 Formatter

[format.formatter]

### 22.14.6.1 Formatter requirements

[formatter.requirements]

1 A type F meets the *BasicFormatter* requirements if:

- (1.1)     — it meets the
  - (1.1.1)    — *Cpp17DefaultConstructible* (Table 29),
  - (1.1.2)    — *Cpp17CopyConstructible* (Table 31),
  - (1.1.3)    — *Cpp17CopyAssignable* (Table 33), and
  - (1.1.4)    — *Cpp17Destructible* (Table 34)

requirements,

- (1.2)     — it is swappable (16.4.4.3) for lvalues, and
- (1.3)     — the expressions shown in Table 72 are valid and have the indicated semantics.

2 A type F meets the *Formatter* requirements if it meets the *BasicFormatter* requirements and the expressions shown in Table 73 are valid and have the indicated semantics.

3 Given character type charT, output iterator type Out, and formatting argument type T, in Table 72 and Table 73:

- (3.1)     — f is a value of type F,
- (3.2)     — u is an lvalue of type T,

- (3.3) — `t` is a value of a type convertible to (possibly `const`) `T`,
- (3.4) — `PC` is `basic_format_parse_context<charT>`,
- (3.5) — `FC` is `basic_format_context<Out, charT>`,
- (3.6) — `pc` is an lvalue of type `PC`, and
- (3.7) — `fc` is an lvalue of type `FC`.

`pc.begin()` points to the beginning of the *format-spec* (22.14.2) of the replacement field being formatted in the format string. If *format-spec* is empty then either `pc.begin() == pc.end()` or `*pc.begin() == '}'`.

Table 72: *BasicFormatter* requirements [tab:formatter.basic]

| Expression                   | Return type               | Requirement                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>f.parse(pc)</code>     | <code>PC::iterator</code> | Parses <i>format-spec</i> (22.14.2) for type <code>T</code> in the range <code>[pc.begin(), pc.end())</code> until the first unmatched character. Throws <code>format_error</code> unless the whole range is parsed or the unmatched character is <code>}</code> .<br>[Note 1: This allows formatters to emit meaningful error messages. — end note]<br>Stores the parsed format specifiers in <code>*this</code> and returns an iterator past the end of the parsed range. |
| <code>f.format(u, fc)</code> | <code>FC::iterator</code> | Formats <code>u</code> according to the specifiers stored in <code>*this</code> , writes the output to <code>fc.out()</code> , and returns an iterator past the end of the output range. The output shall only depend on <code>u</code> , <code>fc.locale()</code> , <code>fc.arg(n)</code> for any value <code>n</code> of type <code>size_t</code> , and the range <code>[pc.begin(), pc.end())</code> from the last call to <code>f.parse(pc)</code> .                   |

Table 73: *Formatter* requirements [tab:formatter]

| Expression                   | Return type               | Requirement                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>f.format(t, fc)</code> | <code>FC::iterator</code> | Formats <code>t</code> according to the specifiers stored in <code>*this</code> , writes the output to <code>fc.out()</code> , and returns an iterator past the end of the output range. The output shall only depend on <code>t</code> , <code>fc.locale()</code> , <code>fc.arg(n)</code> for any value <code>n</code> of type <code>size_t</code> , and the range <code>[pc.begin(), pc.end())</code> from the last call to <code>f.parse(pc)</code> . |
| <code>f.format(u, fc)</code> | <code>FC::iterator</code> | As above, but does not modify <code>u</code> .                                                                                                                                                                                                                                                                                                                                                                                                            |

### 22.14.6.2 Formatter specializations

[format.formatter.spec]

- 1 The functions defined in 22.14.5 use specializations of the class template `formatter` to format individual arguments.
- 2 Let `charT` be either `char` or `wchar_t`. Each specialization of `formatter` is either enabled or disabled, as described below. Each header that declares the template `formatter` provides the following enabled specializations:
  - (2.1) — The specializations
 

```
template<> struct formatter<char, char>;
template<> struct formatter<char, wchar_t>;
template<> struct formatter<wchar_t, wchar_t>;
```
  - (2.2) — For each `charT`, the string type specializations
 

```
template<> struct formatter<charT*, charT>;
template<> struct formatter<const charT*, charT>;
template<size_t N> struct formatter<const charT[N], charT>;
template<class traits, class Allocator>
 struct formatter<basic_string<charT, traits, Allocator>, charT>;
template<class traits>
 struct formatter<basic_string_view<charT, traits>, charT>;
```

- (2.3) — For each `charT`, for each cv-qualified arithmetic type `ArithmeticT` other than `char`, `wchar_t`, `char8_t`, `char16_t`, or `char32_t`, a specialization
- ```
template<> struct formatter<ArithmeticT, charT>;
```
- (2.4) — For each `charT`, the pointer type specializations
- ```
template<> struct formatter<nullptr_t, charT>;
template<> struct formatter<void*, charT>;
template<> struct formatter<const void*, charT>;
```

The parse member functions of these formatters interpret the format specification as a *std-format-spec* as described in 22.14.2.2.

[*Note 1:* Specializations such as `formatter<wchar_t, char>` and `formatter<const char*, wchar_t>` that would require implicit multibyte / wide string or character conversion are disabled. — *end note*]

- 3 For any types `T` and `charT` for which neither the library nor the user provides an explicit or partial specialization of the class template `formatter`, `formatter<T, charT>` is disabled.
- 4 If the library provides an explicit or partial specialization of `formatter<T, charT>`, that specialization is enabled and meets the *Formatter* requirements except as noted otherwise.
- 5 If `F` is a disabled specialization of `formatter`, these values are false:
- (5.1) — `is_default_constructible_v<F>`,
- (5.2) — `is_copy_constructible_v<F>`,
- (5.3) — `is_move_constructible_v<F>`,
- (5.4) — `is_copy_assignable_v<F>`, and
- (5.5) — `is_move_assignable_v<F>`.
- 6 An enabled specialization `formatter<T, charT>` meets the *BasicFormatter* requirements (22.14.6.1).

[*Example 1:*

```
#include <format>

enum color { red, green, blue };
const char* color_names[] = { "red", "green", "blue" };

template<> struct std::formatter<color> : std::formatter<const char*> {
 auto format(color c, format_context& ctx) {
 return formatter<const char*>::format(color_names[c], ctx);
 }
};

struct err {};

std::string s0 = std::format("{} ", 42); // OK, library-provided formatter
std::string s1 = std::format("{} ", L"foo"); // error: disabled formatter
std::string s2 = std::format("{} ", red); // OK, user-provided formatter
std::string s3 = std::format("{} ", err{}); // error: disabled formatter
```

— *end example*]

### 22.14.6.3 Class template `basic_format_parse_context`

[`format.parse.ctx`]

```
namespace std {
 template<class charT>
 class basic_format_parse_context {
 public:
 using char_type = charT;
 using const_iterator = typename basic_string_view<charT>::const_iterator;
 using iterator = const_iterator;

 private:
 iterator begin_; // exposition only
 iterator end_; // exposition only
 enum indexing { unknown, manual, automatic }; // exposition only
 };
};
```

```

 indexing indexing_; // exposition only
 size_t next_arg_id_; // exposition only
 size_t num_args_; // exposition only

public:
 constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
 size_t num_args = 0) noexcept;
 basic_format_parse_context(const basic_format_parse_context&) = delete;
 basic_format_parse_context& operator=(const basic_format_parse_context&) = delete;

 constexpr const_iterator begin() const noexcept;
 constexpr const_iterator end() const noexcept;
 constexpr void advance_to(const_iterator it);

 constexpr size_t next_arg_id();
 constexpr void check_arg_id(size_t id);
};
}

```

- <sup>1</sup> An instance of `basic_format_parse_context` holds the format string parsing state consisting of the format string range being parsed and the argument counter for automatic indexing.

```

constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
 size_t num_args = 0) noexcept;

```

- <sup>2</sup> *Effects:* Initializes `begin_` with `fmt.begin()`, `end_` with `fmt.end()`, `indexing_` with `unknown`, `next_arg_id_` with `0`, and `num_args_` with `num_args`.

```

constexpr const_iterator begin() const noexcept;

```

- <sup>3</sup> *Returns:* `begin_`.

```

constexpr const_iterator end() const noexcept;

```

- <sup>4</sup> *Returns:* `end_`.

```

constexpr void advance_to(const_iterator it);

```

- <sup>5</sup> *Preconditions:* `end()` is reachable from `it`.

- <sup>6</sup> *Effects:* Equivalent to: `begin_ = it;`

```

constexpr size_t next_arg_id();

```

- <sup>7</sup> *Effects:* If `indexing_ != manual`, equivalent to:

```

 if (indexing_ == unknown)
 indexing_ = automatic;
 return next_arg_id++;

```

- <sup>8</sup> *Throws:* `format_error` if `indexing_ == manual` which indicates mixing of automatic and manual argument indexing.

```

constexpr void check_arg_id(size_t id);

```

- <sup>9</sup> *Effects:* If `indexing_ != automatic`, equivalent to:

```

 if (indexing_ == unknown)
 indexing_ = manual;

```

- <sup>10</sup> *Throws:* `format_error` if `indexing_ == automatic` which indicates mixing of automatic and manual argument indexing.

- <sup>11</sup> *Remarks:* Call expressions where `id >= num_args_` are not core constant expressions (7.7).

#### 22.14.6.4 Class template `basic_format_context`

[format.context]

```

namespace std {
 template<class Out, class charT>
 class basic_format_context {
 basic_format_args<basic_format_context> args_; // exposition only
 Out out_; // exposition only
 };
}

```

```

public:
 using iterator = Out;
 using char_type = charT;
 template<class T> using formatter_type = formatter<T, charT>;

 basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
 std::locale locale();

 iterator out();
 void advance_to(iterator it);
};
}

```

- 1 An instance of `basic_format_context` holds formatting state consisting of the formatting arguments and the output iterator.
- 2 `Out` shall model `output_iterator<const charT&>`.
- 3 `format_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to string, such as `back_insert_iterator<string>`. Similarly, `wformat_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `wstring`.
- 4 *Recommended practice*: For a given type `charT`, implementations should provide a single instantiation of `basic_format_context` for appending to `basic_string<charT>`, `vector<charT>`, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a `span<charT>`) and polymorphic reallocation.

```
basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
```

- 5 *Returns*: `args_.get(id)`.

```
std::locale locale();
```

- 6 *Returns*: The locale passed to the formatting function if the latter takes one, and `std::locale()` otherwise.

```
iterator out();
```

- 7 *Effects*: Equivalent to: `return std::move(out_);`

```
void advance_to(iterator it);
```

- 8 *Effects*: Equivalent to: `out_ = std::move(it);`

[Example 1:

```

struct S { int value; };

template<> struct std::formatter<S> {
 size_t width_arg_id = 0;

 // Parses a width argument id in the format { digit }.
 constexpr auto parse(format_parse_context& ctx) {
 auto iter = ctx.begin();
 auto get_char = [&]() { return iter != ctx.end() ? *iter : 0; };
 if (get_char() != '{')
 return iter;
 ++iter;
 char c = get_char();
 if (!isdigit(c) || (++iter, get_char()) != '}')
 throw format_error("invalid format");
 width_arg_id = c - '0';
 ctx.check_arg_id(width_arg_id);
 return ++iter;
 }

 // Formats an S with width given by the argument width_arg_id.
 auto format(S s, format_context& ctx) {
 int width = visit_format_arg([](auto value) -> int {
 if constexpr (!is_integral_v<decltype(value)>)

```

```

 throw format_error("width is not integral");
 else if (value < 0 || value > numeric_limits<int>::max())
 throw format_error("invalid width");
 else
 return value;
 }, ctx.arg(width_arg_id));
return format_to(ctx.out(), "{0:x<{1}}", s.value, width);
}
};

```

```
std::string s = std::format("{0:{1}}", S{42}, 10); // value of s is "xxxxxxxx42"
—end example]
```

## 22.14.7 Arguments

[format.arguments]

### 22.14.7.1 Class template basic\_format\_arg

[format.arg]

```

namespace std {
 template<class Context>
 class basic_format_arg {
 public:
 class handle;

 private:
 using char_type = typename Context::char_type; // exposition only

 variant<monostate, bool, char_type,
 int, unsigned int, long long int, unsigned long long int,
 float, double, long double,
 const char_type*, basic_string_view<char_type>,
 const void*, handle> value; // exposition only

 template<class T> explicit basic_format_arg(T&& v) noexcept; // exposition only
 explicit basic_format_arg(float n) noexcept; // exposition only
 explicit basic_format_arg(double n) noexcept; // exposition only
 explicit basic_format_arg(long double n) noexcept; // exposition only
 explicit basic_format_arg(const char_type* s); // exposition only

 template<class traits>
 explicit basic_format_arg(
 basic_string_view<char_type, traits> s) noexcept; // exposition only

 template<class traits, class Allocator>
 explicit basic_format_arg(
 const basic_string<char_type, traits, Allocator>& s) noexcept; // exposition only

 explicit basic_format_arg(nullptr_t) noexcept; // exposition only

 template<class T>
 explicit basic_format_arg(T* p) noexcept; // exposition only

 public:
 basic_format_arg() noexcept;

 explicit operator bool() const noexcept;
 };
}

```

- <sup>1</sup> An instance of `basic_format_arg` provides access to a formatting argument for user-defined formatters.
- <sup>2</sup> The behavior of a program that adds specializations of `basic_format_arg` is undefined.

```
basic_format_arg() noexcept;
```

- <sup>3</sup> *Postconditions:* `!(*this)`.

```
template<class T> explicit basic_format_arg(T&& v) noexcept;
```

4 *Constraints:* The template specialization

```
typename Context::template formatter_type<remove_cvref_t<T>>
```

meets the *BasicFormatter* requirements (22.14.6.1). The extent to which an implementation determines that the specialization meets the *BasicFormatter* requirements is unspecified, except that as a minimum the expression

```
typename Context::template formatter_type<remove_cvref_t<T>>()
 .format(declval<T&&>(), declval<Context&&>())
```

shall be well-formed when treated as an unevaluated operand (7.2.3).

5 *Effects:*

- (5.1) — if  $T$  is `bool` or `char_type`, initializes value with  $v$ ;
- (5.2) — otherwise, if  $T$  is `char` and `char_type` is `wchar_t`, initializes value with `static_cast<wchar_t>(v)`;
- (5.3) — otherwise, if  $T$  is a signed integer type (6.8.2) and `sizeof(T) <= sizeof(int)`, initializes value with `static_cast<int>(v)`;
- (5.4) — otherwise, if  $T$  is an unsigned integer type and `sizeof(T) <= sizeof(unsigned int)`, initializes value with `static_cast<unsigned int>(v)`;
- (5.5) — otherwise, if  $T$  is a signed integer type and `sizeof(T) <= sizeof(long long int)`, initializes value with `static_cast<long long int>(v)`;
- (5.6) — otherwise, if  $T$  is an unsigned integer type and `sizeof(T) <= sizeof(unsigned long long int)`, initializes value with `static_cast<unsigned long long int>(v)`;
- (5.7) — otherwise, initializes value with `handle(v)`.

```
explicit basic_format_arg(float n) noexcept;
explicit basic_format_arg(double n) noexcept;
explicit basic_format_arg(long double n) noexcept;
```

6 *Effects:* Initializes value with  $n$ .

```
explicit basic_format_arg(const char_type* s);
```

7 *Preconditions:*  $s$  points to a NTCTS (3.37).

8 *Effects:* Initializes value with  $s$ .

```
template<class traits>
explicit basic_format_arg(basic_string_view<char_type, traits> s) noexcept;
```

9 *Effects:* Initializes value with `basic_string_view<char_type>(s.data(), s.size())`.

```
template<class traits, class Allocator>
explicit basic_format_arg(
 const basic_string<char_type, traits, Allocator>& s) noexcept;
```

10 *Effects:* Initializes value with `basic_string_view<char_type>(s.data(), s.size())`.

```
explicit basic_format_arg(nullptr_t) noexcept;
```

11 *Effects:* Initializes value with `static_cast<const void*>(nullptr)`.

```
template<class T> explicit basic_format_arg(T* p) noexcept;
```

12 *Constraints:* `is_void_v<T>` is true.

13 *Effects:* Initializes value with  $p$ .

14 [Note 1: Constructing `basic_format_arg` from a pointer to a member is ill-formed unless the user provides an enabled specialization of `formatter` for that pointer to member type. —end note]

```
explicit operator bool() const noexcept;
```

15 *Returns:* `!holds_alternative<monostate>(value)`.

16 The class `handle` allows formatting an object of a user-defined type.

```

namespace std {
 template<class Context>
 class basic_format_arg<Context>::handle {
 const void* ptr_; // exposition only
 void (*format_)(basic_format_parse_context<char_type>&,
 Context&, const void*); // exposition only

 template<class T> explicit handle(T&& val) noexcept; // exposition only

 friend class basic_format_arg<Context>; // exposition only

 public:
 void format(basic_format_parse_context<char_type>&, Context& ctx) const;
 };
}

```

```
template<class T> explicit handle(T&& val) noexcept;
```

17     Let

(17.1)     — TD be `remove_cvref_t<T>`,

(17.2)     — *const-formattable* be true if `typename Context::template formatter_type<TD>().format(declval<const TD&>(), declval<Context&>())` is well-formed, otherwise false,

(17.3)     — TQ be `const TD` if *const-formattable* is true and TD otherwise.

18     *Mandates:* *const-formattable* || `!is_const_v<remove_reference_t<T>>` is true.

19     *Effects:* Initializes `ptr_` with `addressof(val)` and `format_` with

```

 [](basic_format_parse_context<char_type>& parse_ctx,
 Context& format_ctx, const void* ptr) {
 typename Context::template formatter_type<TD> f;
 parse_ctx.advance_to(f.parse(parse_ctx));
 format_ctx.advance_to(f.format(*const_cast<TQ*>(static_cast<const TD*>(ptr)),
 format_ctx));
 }

```

void `format(basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx) const;`

20     *Effects:* Equivalent to: `format_(parse_ctx, format_ctx, ptr_);`

```

template<class Visitor, class Context>
 decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);

```

21     *Effects:* Equivalent to: `return visit(forward<Visitor>(vis), arg.value);`

### 22.14.7.2 Class template *format-arg-store*

[[format.arg.store](#)]

```

namespace std {
 template<class Context, class... Args>
 class format-arg-store { // exposition only
 array<basic_format_arg<Context>, sizeof...(Args)> args; // exposition only
 };
}

```

1 An instance of *format-arg-store* stores formatting arguments.

```

template<class Context = format_context, class... Args>
 format-arg-store<Context, Args...> make_format_args(Args&&... fmt_args);

```

2     *Preconditions:* The type `typename Context::template formatter_type<Ti>` meets the *BasicFormatter* requirements ([22.14.6.1](#)) for each `Ti` in `Args`.

3     *Returns:* An object of type `format-arg-store<Context, Args...>` whose `args` data member is initialized with `{basic_format_arg<Context>(fmt_args)...}`.

```

template<class... Args>
 format-arg-store<wformat_context, Args...> make_wformat_args(Args&&... args);

```

4     *Effects:* Equivalent to: `return make_format_args<wformat_context>(args...);`

**22.14.7.3 Class template `basic_format_args`****[format.args]**

```

namespace std {
 template<class Context>
 class basic_format_args {
 size_t size_; // exposition only
 const basic_format_arg<Context>* data_; // exposition only

 public:
 basic_format_args() noexcept;

 template<class... Args>
 basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;

 basic_format_arg<Context> get(size_t i) const noexcept;
 };
}

```

- <sup>1</sup> An instance of `basic_format_args` provides access to formatting arguments. Implementations should optimize the representation of `basic_format_args` for a small number of formatting arguments.

[*Note 1*: For example, by storing indices of type alternatives separately from values and packing the former. — *end note*]

```
basic_format_args() noexcept;
```

- <sup>2</sup> *Effects*: Initializes `size_` with 0.

```

template<class... Args>
basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;

```

- <sup>3</sup> *Effects*: Initializes `size_` with `sizeof...(Args)` and `data_` with `store.args.data()`.

```
basic_format_arg<Context> get(size_t i) const noexcept;
```

- <sup>4</sup> *Returns*: `i < size_ ? data_[i] : basic_format_arg<Context>()`.

**22.14.8 Class `format_error`****[format.error]**

```

namespace std {
 class format_error : public runtime_error {
 public:
 explicit format_error(const string& what_arg);
 explicit format_error(const char* what_arg);
 };
}

```

- <sup>1</sup> The class `format_error` defines the type of objects thrown as exceptions to report errors from the formatting library.

```
format_error(const string& what_arg);
```

- <sup>2</sup> *Postconditions*: `strcmp(what(), what_arg.c_str()) == 0`.

```
format_error(const char* what_arg);
```

- <sup>3</sup> *Postconditions*: `strcmp(what(), what_arg) == 0`.

**22.15 Bit manipulation****[bit]****22.15.1 General****[bit.general]**

- <sup>1</sup> The header `<bit>` provides components to access, manipulate and process both individual bits and bit sequences.

**22.15.2 Header `<bit>` synopsis****[bit.syn]**

```

namespace std {
 // 22.15.3, bit_cast
 template<class To, class From>
 constexpr To bit_cast(const From& from) noexcept;

 // 22.15.4, byteswap
 template<class T>
 constexpr T byteswap(T value) noexcept;
}

```

```

// 22.15.5, integral powers of 2
template<class T>
constexpr bool has_single_bit(T x) noexcept;
template<class T>
constexpr T bit_ceil(T x);
template<class T>
constexpr T bit_floor(T x) noexcept;
template<class T>
constexpr T bit_width(T x) noexcept;

// 22.15.6, rotating
template<class T>
[[nodiscard]] constexpr T rotl(T x, int s) noexcept;
template<class T>
[[nodiscard]] constexpr T rotr(T x, int s) noexcept;

// 22.15.7, counting
template<class T>
constexpr int countl_zero(T x) noexcept;
template<class T>
constexpr int countl_one(T x) noexcept;
template<class T>
constexpr int countr_zero(T x) noexcept;
template<class T>
constexpr int countr_one(T x) noexcept;
template<class T>
constexpr int popcount(T x) noexcept;

// 22.15.8, endian
enum class endian {
 little = see below,
 big = see below,
 native = see below
};
}

```

### 22.15.3 Function template `bit_cast`

[bit.cast]

```

template<class To, class From>
constexpr To bit_cast(const From& from) noexcept;

```

1 *Constraints:*

- (1.1) — `sizeof(To) == sizeof(From)` is true;
- (1.2) — `is_trivially_copyable_v<To>` is true; and
- (1.3) — `is_trivially_copyable_v<From>` is true.

2 *Returns:* An object of type `To`. Implicitly creates objects nested within the result (6.7.2). Each bit of the value representation of the result is equal to the corresponding bit in the object representation of `from`. Padding bits of the result are unspecified. For the result and each object created within it, if there is no value of the object's type corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified. A bit in the value representation of the result is indeterminate if it does not correspond to a bit in the value representation of `from` or corresponds to a bit of an object that is not within its lifetime or has an indeterminate value (6.7.4). For each bit in the value representation of the result that is indeterminate, the smallest object containing that bit has an indeterminate value; the behavior is undefined unless that object is of unsigned ordinary character type or `std::byte` type. The result does not otherwise contain any indeterminate values.

3 *Remarks:* This function is `constexpr` if and only if `To`, `From`, and the types of all subobjects of `To` and `From` are types `T` such that:

- (3.1) — `is_union_v<T>` is false;
- (3.2) — `is_pointer_v<T>` is false;
- (3.3) — `is_member_pointer_v<T>` is false;

- (3.4) — `is_volatile_v<T>` is false; and
- (3.5) — `T` has no non-static data members of reference type.

#### 22.15.4 `byteswap`

[bit.byteswap]

```
template<class T>
constexpr T byteswap(T value) noexcept;
```

- 1 *Constraints:* `T` models integral.
- 2 *Mandates:* `T` does not have padding bits (6.8.1).
- 3 Let the sequence  $R$  comprise the bytes of the object representation of `value` in reverse order.
- 4 *Returns:* An object `v` of type `T` such that each byte in the object representation of `v` is equal to the byte in the corresponding position in  $R$ .

#### 22.15.5 Integral powers of 2

[bit.pow.two]

```
template<class T>
constexpr bool has_single_bit(T x) noexcept;
```

- 1 *Constraints:* `T` is an unsigned integer type (6.8.2).
- 2 *Returns:* true if `x` is an integral power of two; false otherwise.

```
template<class T>
constexpr T bit_ceil(T x);
```

- 3 Let  $N$  be the smallest power of 2 greater than or equal to `x`.
- 4 *Constraints:* `T` is an unsigned integer type (6.8.2).
- 5 *Preconditions:*  $N$  is representable as a value of type `T`.
- 6 *Returns:*  $N$ .
- 7 *Throws:* Nothing.
- 8 *Remarks:* A function call expression that violates the precondition in the *Preconditions*: element is not a core constant expression (7.7).

```
template<class T>
constexpr T bit_floor(T x) noexcept;
```

- 9 *Constraints:* `T` is an unsigned integer type (6.8.2).
- 10 *Returns:* If `x == 0`, 0; otherwise the maximal value `y` such that `has_single_bit(y)` is true and `y <= x`.

```
template<class T>
constexpr T bit_width(T x) noexcept;
```

- 11 *Constraints:* `T` is an unsigned integer type (6.8.2).
- 12 *Returns:* If `x == 0`, 0; otherwise one plus the base-2 logarithm of `x`, with any fractional part discarded.

#### 22.15.6 Rotating

[bit.rotate]

- 1 In the following descriptions, let  $N$  denote `numeric_limits<T>::digits`.

```
template<class T>
[[nodiscard]] constexpr T rotl(T x, int s) noexcept;
```

- 2 *Constraints:* `T` is an unsigned integer type (6.8.2).
- 3 Let  $r$  be `s % N`.
- 4 *Returns:* If  $r$  is 0, `x`; if  $r$  is positive, `(x << r) | (x >> (N - r))`; if  $r$  is negative, `rotr(x, -r)`.

```
template<class T>
[[nodiscard]] constexpr T rotr(T x, int s) noexcept;
```

- 5 *Constraints:* `T` is an unsigned integer type (6.8.2).
- 6 Let  $r$  be `s % N`.

7 *Returns:* If  $r$  is 0,  $x$ ; if  $r$  is positive,  $(x \gg r) | (x \ll (N - r))$ ; if  $r$  is negative,  $\text{rotr}(x, -r)$ .

### 22.15.7 Counting

[bit.count]

1 In the following descriptions, let  $N$  denote `numeric_limits<T>::digits`.

```
template<class T>
constexpr int countl_zero(T x) noexcept;
```

2 *Constraints:*  $T$  is an unsigned integer type (6.8.2).

3 *Returns:* The number of consecutive 0 bits in the value of  $x$ , starting from the most significant bit.

[Note 1: Returns  $N$  if  $x == 0$ . — end note]

```
template<class T>
constexpr int countl_one(T x) noexcept;
```

4 *Constraints:*  $T$  is an unsigned integer type (6.8.2).

5 *Returns:* The number of consecutive 1 bits in the value of  $x$ , starting from the most significant bit.

[Note 2: Returns  $N$  if  $x == \text{numeric\_limits}<T>::\text{max}()$ . — end note]

```
template<class T>
constexpr int countr_zero(T x) noexcept;
```

6 *Constraints:*  $T$  is an unsigned integer type (6.8.2).

7 *Returns:* The number of consecutive 0 bits in the value of  $x$ , starting from the least significant bit.

[Note 3: Returns  $N$  if  $x == 0$ . — end note]

```
template<class T>
constexpr int countr_one(T x) noexcept;
```

8 *Constraints:*  $T$  is an unsigned integer type (6.8.2).

9 *Returns:* The number of consecutive 1 bits in the value of  $x$ , starting from the least significant bit.

[Note 4: Returns  $N$  if  $x == \text{numeric\_limits}<T>::\text{max}()$ . — end note]

```
template<class T>
constexpr int popcount(T x) noexcept;
```

10 *Constraints:*  $T$  is an unsigned integer type (6.8.2).

11 *Returns:* The number of 1 bits in the value of  $x$ .

### 22.15.8 Endian

[bit.endian]

1 Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```
enum class endian {
 little = see below,
 big = see below,
 native = see below
};
```

2 If all scalar types have size 1 byte, then all of `endian::little`, `endian::big`, and `endian::native` have the same value. Otherwise, `endian::little` is not equal to `endian::big`. If all scalar types are big-endian, `endian::native` is equal to `endian::big`. If all scalar types are little-endian, `endian::native` is equal to `endian::little`. Otherwise, `endian::native` is not equal to either `endian::big` or `endian::little`.

## 23 Strings library

[strings]

### 23.1 General

[strings.general]

- <sup>1</sup> This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.8.1) type. Such types are called *char-like types*, and objects of char-like types are called *char-like objects* or simply *characters*.
- <sup>2</sup> The following subclasses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 74.

Table 74: Strings library summary [tab:strings.summary]

| Subclause                               | Header                                                       |
|-----------------------------------------|--------------------------------------------------------------|
| 23.2 Character traits                   | <string>                                                     |
| 23.3 String view classes                | <string_view>                                                |
| 23.4 String classes                     |                                                              |
| 23.5 Null-terminated sequence utilities | <cctype>, <cstdlib>, <cstring>, <cuchar>, <wchar>, <cwctype> |

### 23.2 Character traits

[char.traits]

#### 23.2.1 General

[char.traits.general]

- <sup>1</sup> Subclause 23.2 defines requirements on classes representing *character traits*, and defines a class template `char_traits<charT>`, along with five specializations, `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that meet those requirements.
- <sup>2</sup> Most classes specified in 23.4, 23.3, and Clause 31 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member *typedef-names* and functions in the template parameter `traits` used by each such template. Subclause 23.2 defines the semantics of these members.
- <sup>3</sup> To specialize those templates to generate a string, string view, or istream class to handle a particular character container type (3.10) `C`, that and its related character traits class `X` are passed as a pair of parameters to the string, string view, or istream template as parameters `charT` and `traits`. If `X::char_type` is not the same type as `C`, the program is ill-formed.

#### 23.2.2 Character traits requirements

[char.traits.require]

- <sup>1</sup> In Table 75, `X` denotes a traits class defining types and functions for the character container type `C`; `c` and `d` denote values of type `C`; `p` and `q` denote values of type `const C*`; `s` denotes a value of type `C*`; `n`, `i` and `j` denote values of type `size_t`; `e` and `f` denote values of type `X::int_type`; `pos` denotes a value of type `X::pos_type`; and `r` denotes an lvalue of type `C`. No expression which is part of the character traits requirements specified in this subclause 23.2.2 shall exit via an exception.

Table 75: Character traits requirements [tab:char.traits.req]

| Expression                 | Return type       | Assertion/note pre-/post-condition                                             | Complexity   |
|----------------------------|-------------------|--------------------------------------------------------------------------------|--------------|
| <code>X::char_type</code>  | <code>C</code>    |                                                                                | compile-time |
| <code>X::int_type</code>   |                   | (described in 23.2.3)                                                          | compile-time |
| <code>X::off_type</code>   |                   | (described in 31.2.3 and 31.3)                                                 | compile-time |
| <code>X::pos_type</code>   |                   | (described in 31.2.3 and 31.3)                                                 | compile-time |
| <code>X::state_type</code> |                   | (described in 23.2.3)                                                          | compile-time |
| <code>X::eq(c,d)</code>    | <code>bool</code> | Returns: whether <code>c</code> is to be treated as equal to <code>d</code> .  | constant     |
| <code>X::lt(c,d)</code>    | <code>bool</code> | Returns: whether <code>c</code> is to be treated as less than <code>d</code> . | constant     |

Table 75: Character traits requirements (continued)

| Expression                       | Return type                      | Assertion/note<br>pre-/post-condition                                                                                                                                                                                                                                                                                              | Complexity |
|----------------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| <code>X::compare(p,q,n)</code>   | <code>int</code>                 | <i>Returns:</i> 0 if for each $i$ in $[0, n)$ , $X::eq(p[i],q[i])$ is true; else, a negative value if, for some $j$ in $[0, n)$ , $X::lt(p[j],q[j])$ is true and for each $i$ in $[0, j)$ $X::eq(p[i],q[i])$ is true; else a positive value.                                                                                       | linear     |
| <code>X::length(p)</code>        | <code>size_t</code>              | <i>Returns:</i> the smallest $i$ such that $X::eq(p[i],charT())$ is true.                                                                                                                                                                                                                                                          | linear     |
| <code>X::find(p,n,c)</code>      | <code>const X::char_type*</code> | <i>Returns:</i> the smallest $q$ in $[p,p+n)$ such that $X::eq(*q,c)$ is true, zero otherwise.                                                                                                                                                                                                                                     | linear     |

| <code>X::to_char_type(e)</code>  | <code>X::char_type</code>        | <i>Returns:</i> if for some $c$ , $X::eq\_int\_type(e,X::to\_int\_type(c))$ is true, $c$ ; else some unspecified value.                                                                                                                                                                                                            | constant   |
| <code>X::to_int_type(c)</code>   | <code>X::int_type</code>         | <i>Returns:</i> some value $e$ , constrained by the definitions of <code>to_char_type</code> and <code>eq_int_type</code> .                                                                                                                                                                                                        | constant   |
| <code>X::eq_int_type(e,f)</code> | <code>bool</code>                | <i>Returns:</i> for all $c$ and $d$ , $X::eq(c,d)$ is equal to $X::eq\_int\_type(X::to\_int\_type(c),X::to\_int\_type(d))$ ; otherwise, yields true if $e$ and $f$ are both copies of $X::eof()$ ; otherwise, yields false if one of $e$ and $f$ is a copy of $X::eof()$ and the other is not; otherwise the value is unspecified. | constant   |
| <code>X::eof()</code>            | <code>X::int_type</code>         | <i>Returns:</i> a value $e$ such that $X::eq\_int\_type(e,X::to\_int\_type(c))$ is false for all values $c$ .                                                                                                                                                                                                                      | constant   |

## 2 The class template

```
template<class charT> struct char_traits;
```

is provided in the header `<string>` as a basis for explicit specializations.

### 23.2.3 Traits typedefs

[char.traits.typedefs]

using int\_type = see below;

- 1 *Preconditions:* int\_type shall be able to represent all of the valid characters converted from the corresponding char\_type values, as well as an end-of-file value, eof().<sup>211</sup>

using state\_type = see below;

- 2 *Preconditions:* state\_type meets the Cpp17Destructible (Table 34), Cpp17CopyAssignable (Table 33), Cpp17CopyConstructible (Table 31), and Cpp17DefaultConstructible (Table 29) requirements.

### 23.2.4 char\_traits specializations

[char.traits.specializations]

#### 23.2.4.1 General

[char.traits.specializations.general]

```
namespace std {
 template<> struct char_traits<char>;
 template<> struct char_traits<char8_t>;
 template<> struct char_traits<char16_t>;
 template<> struct char_traits<char32_t>;
 template<> struct char_traits<wchar_t>;
}
```

- 1 The header `<string>` defines five specializations of the class template `char_traits`: `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`.

#### 23.2.4.2 struct char\_traits<char>

[char.traits.specializations.char]

```
namespace std {
 template<> struct char_traits<char> {
 using char_type = char;
 using int_type = int;
 using off_type = streamoff;
 using pos_type = streampos;
 using state_type = mbstate_t;
 using comparison_category = strong_ordering;

 static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
 static constexpr bool eq(char_type c1, char_type c2) noexcept;
 static constexpr bool lt(char_type c1, char_type c2) noexcept;

 static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
 static constexpr size_t length(const char_type* s);
 static constexpr const char_type* find(const char_type* s, size_t n,
 const char_type& a);
 static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* assign(char_type* s, size_t n, char_type a);

 static constexpr int_type not_eof(int_type c) noexcept;
 static constexpr char_type to_char_type(int_type c) noexcept;
 static constexpr int_type to_int_type(char_type c) noexcept;
 static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
 static constexpr int_type eof() noexcept;
 };
}
```

- 1 The type `mbstate_t` is defined in `<wchar>` and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.
- 2 The two-argument member `assign` is defined identically to the built-in operator `=`. The two-argument members `eq` and `lt` are defined identically to the built-in operators `==` and `<` for type `unsigned char`.
- 3 The member `eof()` returns `EOF`.

<sup>211</sup>) If `eof()` can be held in `char_type` then some `iostreams` operations can give surprising results.

**23.2.4.3 struct char\_traits<char8\_t>****[char.traits.specializations.char8.t]**

```

namespace std {
 template<> struct char_traits<char8_t> {
 using char_type = char8_t;
 using int_type = unsigned int;
 using off_type = streamoff;
 using pos_type = u8streampos;
 using state_type = mbstate_t;
 using comparison_category = strong_ordering;

 static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
 static constexpr bool eq(char_type c1, char_type c2) noexcept;
 static constexpr bool lt(char_type c1, char_type c2) noexcept;

 static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
 static constexpr size_t length(const char_type* s);
 static constexpr const char_type* find(const char_type* s, size_t n,
 const char_type& a);
 static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* assign(char_type* s, size_t n, char_type a);
 static constexpr int_type not_eof(int_type c) noexcept;
 static constexpr char_type to_char_type(int_type c) noexcept;
 static constexpr int_type to_int_type(char_type c) noexcept;
 static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
 static constexpr int_type eof() noexcept;
 };
}

```

- <sup>1</sup> The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<` respectively.
- <sup>2</sup> The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

**23.2.4.4 struct char\_traits<char16\_t>****[char.traits.specializations.char16.t]**

```

namespace std {
 template<> struct char_traits<char16_t> {
 using char_type = char16_t;
 using int_type = uint_least16_t;
 using off_type = streamoff;
 using pos_type = u16streampos;
 using state_type = mbstate_t;
 using comparison_category = strong_ordering;

 static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
 static constexpr bool eq(char_type c1, char_type c2) noexcept;
 static constexpr bool lt(char_type c1, char_type c2) noexcept;

 static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
 static constexpr size_t length(const char_type* s);
 static constexpr const char_type* find(const char_type* s, size_t n,
 const char_type& a);
 static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* assign(char_type* s, size_t n, char_type a);

 static constexpr int_type not_eof(int_type c) noexcept;
 static constexpr char_type to_char_type(int_type c) noexcept;
 static constexpr int_type to_int_type(char_type c) noexcept;
 static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
 static constexpr int_type eof() noexcept;
 };
}

```

- <sup>1</sup> The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

- <sup>2</sup> The member eof() returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

#### 23.2.4.5 struct char\_traits<char32\_t>

[char.traits.specializations.char32.t]

```
namespace std {
 template<> struct char_traits<char32_t> {
 using char_type = char32_t;
 using int_type = uint_least32_t;
 using off_type = streamoff;
 using pos_type = u32streampos;
 using state_type = mbstate_t;
 using comparison_category = strong_ordering;

 static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
 static constexpr bool eq(char_type c1, char_type c2) noexcept;
 static constexpr bool lt(char_type c1, char_type c2) noexcept;

 static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
 static constexpr size_t length(const char_type* s);
 static constexpr const char_type* find(const char_type* s, size_t n,
 const char_type& a);
 static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* assign(char_type* s, size_t n, char_type a);

 static constexpr int_type not_eof(int_type c) noexcept;
 static constexpr char_type to_char_type(int_type c) noexcept;
 static constexpr int_type to_int_type(char_type c) noexcept;
 static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
 static constexpr int_type eof() noexcept;
 };
}
```

- <sup>1</sup> The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and <, respectively.
- <sup>2</sup> The member eof() returns an implementation-defined constant that cannot appear as a Unicode code point.

#### 23.2.4.6 struct char\_traits<wchar\_t>

[char.traits.specializations.wchar.t]

```
namespace std {
 template<> struct char_traits<wchar_t> {
 using char_type = wchar_t;
 using int_type = wint_t;
 using off_type = streamoff;
 using pos_type = wstreampos;
 using state_type = mbstate_t;
 using comparison_category = strong_ordering;

 static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
 static constexpr bool eq(char_type c1, char_type c2) noexcept;
 static constexpr bool lt(char_type c1, char_type c2) noexcept;

 static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
 static constexpr size_t length(const char_type* s);
 static constexpr const char_type* find(const char_type* s, size_t n,
 const char_type& a);
 static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
 static constexpr char_type* assign(char_type* s, size_t n, char_type a);

 static constexpr int_type not_eof(int_type c) noexcept;
 static constexpr char_type to_char_type(int_type c) noexcept;
 static constexpr int_type to_int_type(char_type c) noexcept;
 static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
 static constexpr int_type eof() noexcept;
 };
}
```

- <sup>1</sup> The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.
- <sup>2</sup> The member `eof()` returns `WEOF`.

### 23.3 String view classes

[string.view]

#### 23.3.1 General

[string.view.general]

- <sup>1</sup> The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (23.1) objects with the first element of the sequence at position zero. In the rest of 23.3, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.
- <sup>2</sup> [Note 1: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types can define their own implicit conversions to `std::basic_string_view` in order to interoperate with these functions. — end note]

#### 23.3.2 Header <string\_view> synopsis

[string.view.synop]

```
#include <compare> // see 17.11.1

namespace std {
 // 23.3.3, class template basic_string_view
 template<class charT, class traits = char_traits<charT>>
 class basic_string_view;

 template<class charT, class traits>
 inline constexpr bool ranges::enable_view<basic_string_view<charT, traits>> = true;
 template<class charT, class traits>
 inline constexpr bool ranges::enable_borrowed_range<basic_string_view<charT, traits>> = true;

 // 23.3.5, non-member comparison functions
 template<class charT, class traits>
 constexpr bool operator==(basic_string_view<charT, traits> x,
 basic_string_view<charT, traits> y) noexcept;
 template<class charT, class traits>
 constexpr see below operator<=>(basic_string_view<charT, traits> x,
 basic_string_view<charT, traits> y) noexcept;

 // see 23.3.5, sufficient additional overloads of comparison functions

 // 23.3.6, inserters and extractors
 template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os,
 basic_string_view<charT, traits> str);

 // basic_string_view typedef-names
 using string_view = basic_string_view<char>;
 using u8string_view = basic_string_view<char8_t>;
 using u16string_view = basic_string_view<char16_t>;
 using u32string_view = basic_string_view<char32_t>;
 using wstring_view = basic_string_view<wchar_t>;

 // 23.3.7, hash support
 template<class T> struct hash;
 template<> struct hash<string_view>;
 template<> struct hash<u8string_view>;
 template<> struct hash<u16string_view>;
 template<> struct hash<u32string_view>;
 template<> struct hash<wstring_view>;

 inline namespace literals {
 inline namespace string_view_literals {
 // 23.3.8, suffix for basic_string_view literals
 constexpr string_view operator""sv(const char* str, size_t len) noexcept;
```

```

constexpr u8string_view operator""sv(const char8_t* str, size_t len) noexcept;
constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
}
}
}

```

- <sup>1</sup> The function templates defined in 22.2.2 and 25.7 are available when <string\_view> is included.

### 23.3.3 Class template `basic_string_view`

[string.view.template]

#### 23.3.3.1 General

[string.view.template.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_string_view {
 public:
 // types
 using traits_type = traits;

constexpr size_type find_last_not_of(basic_string_view s,
 size_type pos = npos) const noexcept;
constexpr size_type find_last_not_of(charT c, size_type pos = npos) const noexcept;
constexpr size_type find_last_not_of(const charT* s, size_type pos,
 size_type n) const;
constexpr size_type find_last_not_of(const charT* s, size_type pos = npos) const;

```

```

private:
 const_pointer data_; // exposition only
 size_type size_; // exposition only
};

// 23.3.4, deduction guides
template<class It, class End>
 basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
template<class R>
 basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;
}

```

- 1 In every specialization `basic_string_view<charT, traits>`, the type `traits` shall meet the character traits requirements (23.2).

[Note 1: The program is ill-formed if `traits::char_type` is not the same type as `charT`. — end note]

- 2 For a `basic_string_view str`, any operation that invalidates a pointer in the range `[str.data(), str.data() + str.size())` invalidates pointers, iterators, and references returned from `str`'s member functions.
- 3 The complexity of `basic_string_view` member functions is  $\mathcal{O}(1)$  unless otherwise specified.
- 4 `basic_string_view<charT, traits>` is a trivially copyable type (6.8.1).

### 23.3.3.2 Construction and assignment

[string.view.cons]

```
constexpr basic_string_view() noexcept;
```

- 1 *Postconditions:* `size_ == 0` and `data_ == nullptr`.

```
constexpr basic_string_view(const charT* str);
```

- 2 *Preconditions:* `[str, str + traits::length(str))` is a valid range.

- 3 *Effects:* Constructs a `basic_string_view`, initializing `data_` with `str` and initializing `size_` with `traits::length(str)`.

- 4 *Complexity:*  $\mathcal{O}(\text{traits::length}(str))$ .

```
constexpr basic_string_view(const charT* str, size_type len);
```

- 5 *Preconditions:* `[str, str + len)` is a valid range.

- 6 *Effects:* Constructs a `basic_string_view`, initializing `data_` with `str` and initializing `size_` with `len`.

```
template<class It, class End>
 constexpr basic_string_view(It begin, End end);
```

- 7 *Constraints:*

- (7.1) — It satisfies `contiguous_iterator`.
- (7.2) — End satisfies `sized_sentinel_for<It>`.
- (7.3) — `is_same_v<iter_value_t<It>, charT>` is true.
- (7.4) — `is_convertible_v<End, size_type>` is false.

- 8 *Preconditions:*

- (8.1) — `[begin, end)` is a valid range.
- (8.2) — It models `contiguous_iterator`.
- (8.3) — End models `sized_sentinel_for<It>`.

- 9 *Effects:* Initializes `data_` with `to_address(begin)` and initializes `size_` with `end - begin`.

- 10 *Throws:* When and what `end - begin` throws.

```
template<class R>
 constexpr basic_string_view(R&& r);
```

- 11 Let `d` be an lvalue of type `remove_cvref_t<R>`.

- 12 *Constraints:*

- (12.1) — `remove_cvref_t<R>` is not the same type as `basic_string_view`,
- (12.2) — `R` models `ranges::contiguous_range` and `ranges::sized_range`,
- (12.3) — `is_same_v<ranges::range_value_t<R>, charT>` is true,
- (12.4) — `is_convertible_v<R, const charT*>` is false,
- (12.5) — `d.operator ::std::basic_string_view<charT, traits>()` is not a valid expression, and
- (12.6) — if the *qualified-id* `remove_reference_t<R>::traits_type` is valid and denotes a type, `is_same_v<remove_reference_t<R>::traits_type, traits>` is true.

13 *Effects:* Initializes `data_` with `ranges::data(r)` and `size_` with `ranges::size(r)`.

14 *Throws:* Any exception thrown by `ranges::data(r)` and `ranges::size(r)`.

### 23.3.3.3 Iterator support

[string.view.iterators]

using `const_iterator = implementation-defined`;

1 A type that meets the requirements of a constant *Cpp17RandomAccessIterator* (25.3.5.7), models *contiguous\_iterator* (25.3.4.14), and meets the *constexpr iterator* requirements (25.3.1), whose `value_type` is the template parameter `charT`.

2 All requirements on container iterators (24.2) apply to `basic_string_view::const_iterator` as well.

`constexpr const_iterator begin() const noexcept;`  
`constexpr const_iterator cbegin() const noexcept;`

3 *Returns:* An iterator such that

(3.1) — if `!empty()`, `addressof(*begin()) == data_`,

(3.2) — otherwise, an unspecified value such that `[begin(), end())` is a valid range.

`constexpr const_iterator end() const noexcept;`  
`constexpr const_iterator cend() const noexcept;`

4 *Returns:* `begin() + size()`.

`constexpr const_reverse_iterator rbegin() const noexcept;`  
`constexpr const_reverse_iterator crbegin() const noexcept;`

5 *Returns:* `const_reverse_iterator(end())`.

`constexpr const_reverse_iterator rend() const noexcept;`  
`constexpr const_reverse_iterator crend() const noexcept;`

6 *Returns:* `const_reverse_iterator(begin())`.

### 23.3.3.4 Capacity

[string.view.capacity]

`constexpr size_type size() const noexcept;`  
`constexpr size_type length() const noexcept;`

1 *Returns:* `size_`.

`constexpr size_type max_size() const noexcept;`

2 *Returns:* The largest possible number of char-like objects that can be referred to by a `basic_string_view`.

`[[nodiscard]] constexpr bool empty() const noexcept;`

3 *Returns:* `size_ == 0`.

### 23.3.3.5 Element access

[string.view.access]

`constexpr const_reference operator[](size_type pos) const;`

1 *Preconditions:* `pos < size()`.

2 *Returns:* `data_[pos]`.

3 *Throws:* Nothing.

4 [Note 1: Unlike `basic_string::operator[]`, `basic_string_view::operator[](size())` has undefined behavior instead of returning `charT()`. — end note]

```
constexpr const_reference at(size_type pos) const;
```

5 *Returns:* `data_[pos]`.

6 *Throws:* `out_of_range` if `pos >= size()`.

```
constexpr const_reference front() const;
```

7 *Preconditions:* `!empty()`.

8 *Returns:* `data_[0]`.

9 *Throws:* Nothing.

```
constexpr const_reference back() const;
```

10 *Preconditions:* `!empty()`.

11 *Returns:* `data_[size() - 1]`.

12 *Throws:* Nothing.

```
constexpr const_pointer data() const noexcept;
```

13 *Returns:* `data_`.

14 [Note 2: Unlike `basic_string::data()` and *string-literals*, `data()` can return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass `data()` to a function that takes just a `const charT*` and expects a null-terminated string. — end note]

### 23.3.3.6 Modifiers

[string.view.modifiers]

```
constexpr void remove_prefix(size_type n);
```

1 *Preconditions:* `n <= size()`.

2 *Effects:* Equivalent to: `data_ += n; size_ -= n;`

```
constexpr void remove_suffix(size_type n);
```

3 *Preconditions:* `n <= size()`.

4 *Effects:* Equivalent to: `size_ -= n;`

```
constexpr void swap(basic_string_view& s) noexcept;
```

5 *Effects:* Exchanges the values of `*this` and `s`.

### 23.3.3.7 String operations

[string.view.ops]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 Let `rLen` be the smaller of `n` and `size() - pos`.

2 *Preconditions:* `[s, s + rLen)` is a valid range.

3 *Effects:* Equivalent to `traits::copy(s, data() + pos, rLen)`.

4 *Returns:* `rLen`.

5 *Throws:* `out_of_range` if `pos > size()`.

6 *Complexity:*  $\mathcal{O}(rLen)$ .

```
constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
```

7 Let `rLen` be the smaller of `n` and `size() - pos`.

8 *Effects:* Determines `rLen`, the effective length of the string to reference.

9 *Returns:* `basic_string_view(data() + pos, rLen)`.

10 *Throws:* `out_of_range` if `pos > size()`.

```
constexpr int compare(basic_string_view str) const noexcept;
```

11 Let `rlen` be the smaller of `size()` and `str.size()`.

12 *Effects:* Determines `rlen`, the effective length of the strings to compare. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`.

13 *Returns:* The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in [Table 76](#).

Table 76: `compare()` results [tab:string.view.compare]

| Condition                           | Return Value        |
|-------------------------------------|---------------------|
| <code>size() &lt; str.size()</code> | <code>&lt; 0</code> |
| <code>size() == str.size()</code>   | <code>0</code>      |
| <code>size() &gt; str.size()</code> | <code>&gt; 0</code> |

14 *Complexity:*  $\mathcal{O}(rlen)$ .

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
```

15 *Effects:* Equivalent to: `return substr(pos1, n1).compare(str);`

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
 size_type pos2, size_type n2) const;
```

16 *Effects:* Equivalent to: `return substr(pos1, n1).compare(str.substr(pos2, n2));`

```
constexpr int compare(const charT* s) const;
```

17 *Effects:* Equivalent to: `return compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
```

18 *Effects:* Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
```

19 *Effects:* Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s, n2));`

```
constexpr bool starts_with(basic_string_view x) const noexcept;
```

20 *Effects:* Equivalent to: `return substr(0, x.size()) == x;`

```
constexpr bool starts_with(charT x) const noexcept;
```

21 *Effects:* Equivalent to: `return !empty() && traits::eq(front(), x);`

```
constexpr bool starts_with(const charT* x) const;
```

22 *Effects:* Equivalent to: `return starts_with(basic_string_view(x));`

```
constexpr bool ends_with(basic_string_view x) const noexcept;
```

23 *Effects:* Equivalent to:

```
return size() >= x.size() && compare(size() - x.size(), npos, x) == 0;
```

```
constexpr bool ends_with(charT x) const noexcept;
```

24 *Effects:* Equivalent to: `return !empty() && traits::eq(back(), x);`

```
constexpr bool ends_with(const charT* x) const;
```

25 *Effects:* Equivalent to: `return ends_with(basic_string_view(x));`

```
constexpr bool contains(basic_string_view x) const noexcept;
```

```
constexpr bool contains(charT x) const noexcept;
```

```
constexpr bool contains(const charT* x) const;
```

26 *Effects:* Equivalent to: `return find(x) != npos;`

**23.3.3.8 Searching****[string.view.find]**

1 Member functions in this subclause have complexity  $\mathcal{O}(\text{size()} * \text{str.size}())$  at worst, although implementations should do better.

2 Let  $F$  be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

(2.1) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos) const;
```

has effects equivalent to: `return F(basic_string_view(s), pos);`

(2.2) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: `return F(basic_string_view(s, n), pos);`

(2.3) — Each member function of the form

```
constexpr return-type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to: `return F(basic_string_view(addressof(c), 1), pos);`

```
constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;
```

3 Let  $xpos$  be the lowest position, if possible, such that the following conditions hold:

(3.1) — `pos <= xpos`

(3.2) — `xpos + str.size() <= size()`

(3.3) — `traits::eq(at(xpos + I), str.at(I))` for all elements  $I$  of the string referenced by `str`.

4 *Effects:* Determines  $xpos$ .

5 *Returns:*  $xpos$  if the function can determine such a value for  $xpos$ . Otherwise, returns `npos`.

```
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;
```

6 Let  $xpos$  be the highest position, if possible, such that the following conditions hold:

(6.1) — `xpos <= pos`

(6.2) — `xpos + str.size() <= size()`

(6.3) — `traits::eq(at(xpos + I), str.at(I))` for all elements  $I$  of the string referenced by `str`.

7 *Effects:* Determines  $xpos$ .

8 *Returns:*  $xpos$  if the function can determine such a value for  $xpos$ . Otherwise, returns `npos`.

```
constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;
```

9 Let  $xpos$  be the lowest position, if possible, such that the following conditions hold:

(9.1) — `pos <= xpos`

(9.2) — `xpos < size()`

(9.3) — `traits::eq(at(xpos), str.at(I))` for some element  $I$  of the string referenced by `str`.

10 *Effects:* Determines  $xpos$ .

11 *Returns:*  $xpos$  if the function can determine such a value for  $xpos$ . Otherwise, returns `npos`.

```
constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
```

12 Let  $xpos$  be the highest position, if possible, such that the following conditions hold:

(12.1) — `xpos <= pos`

(12.2) — `xpos < size()`

(12.3) — `traits::eq(at(xpos), str.at(I))` for some element  $I$  of the string referenced by `str`.

13 *Effects:* Determines  $xpos$ .

14 *Returns:*  $xpos$  if the function can determine such a value for  $xpos$ . Otherwise, returns `npos`.

```
constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
```

15 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(15.1) — `pos <= xpos`

(15.2) — `xpos < size()`

(15.3) — `traits::eq(at(xpos), str.at(I))` for no element `I` of the string referenced by `str`.

16 *Effects:* Determines `xpos`.

17 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;
```

18 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(18.1) — `xpos <= pos`

(18.2) — `xpos < size()`

(18.3) — `traits::eq(at(xpos), str.at(I))` for no element `I` of the string referenced by `str`.

19 *Effects:* Determines `xpos`.

20 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

### 23.3.4 Deduction guides

[string.view.deduct]

```
template<class It, class End>
 basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
```

1 *Constraints:*

(1.1) — `It` satisfies `contiguous_iterator`.

(1.2) — `End` satisfies `sized_sentinel_for<It>`.

```
template<class R>
 basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;
```

2 *Constraints:* `R` satisfies `ranges::contiguous_range`.

### 23.3.5 Non-member comparison functions

[string.view.comparison]

1 Let `S` be `basic_string_view<charT, traits>`, and `sv` be an instance of `S`. Implementations shall provide sufficient additional overloads marked `constexpr` and `noexcept` so that an object `t` with an implicit conversion to `S` can be compared according to Table 77.

Table 77: Additional `basic_string_view` comparison overloads [tab:string.view.comparison.overloads]

| Expression                  | Equivalent to                  |
|-----------------------------|--------------------------------|
| <code>t == sv</code>        | <code>S(t) == sv</code>        |
| <code>sv == t</code>        | <code>sv == S(t)</code>        |
| <code>t != sv</code>        | <code>S(t) != sv</code>        |
| <code>sv != t</code>        | <code>sv != S(t)</code>        |
| <code>t &lt; sv</code>      | <code>S(t) &lt; sv</code>      |
| <code>sv &lt; t</code>      | <code>sv &lt; S(t)</code>      |
| <code>t &gt; sv</code>      | <code>S(t) &gt; sv</code>      |
| <code>sv &gt; t</code>      | <code>sv &gt; S(t)</code>      |
| <code>t &lt;= sv</code>     | <code>S(t) &lt;= sv</code>     |
| <code>sv &lt;= t</code>     | <code>sv &lt;= S(t)</code>     |
| <code>t &gt;= sv</code>     | <code>S(t) &gt;= sv</code>     |
| <code>sv &gt;= t</code>     | <code>sv &gt;= S(t)</code>     |
| <code>t &lt;=&gt; sv</code> | <code>S(t) &lt;=&gt; sv</code> |
| <code>sv &lt;=&gt; t</code> | <code>sv &lt;=&gt; S(t)</code> |

[Example 1: A sample conforming implementation for `operator==` would be:

```

template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept {
 return lhs.compare(rhs) == 0;
}
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
 type_identity_t<basic_string_view<charT, traits>> rhs) noexcept {
 return lhs.compare(rhs) == 0;
}

```

—end example]

```

template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept;

```

2 Returns: lhs.compare(rhs) == 0.

```

template<class charT, class traits>
constexpr see below operator<=>(basic_string_view<charT, traits> lhs,
 basic_string_view<charT, traits> rhs) noexcept;

```

3 Let R denote the type traits::comparison\_category if that *qualified-id* is valid and denotes a type (13.10.3), otherwise R is weak\_ordering.

4 Mandates: R denotes a comparison category type (17.11.2).

5 Returns: static\_cast<R>(lhs.compare(rhs) <=> 0).

### 23.3.6 Inserters and extractors

[string.view.io]

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);

```

1 Effects: Behaves as a formatted output function (31.7.5.3.1) of os. Forms a character sequence seq, initially consisting of the elements defined by the range [str.begin(), str.end()). Determines padding for seq as described in 31.7.5.3.1. Then inserts seq as if by calling os.rdbuf()->sputn(seq, n), where n is the larger of os.width() and str.size(); then calls os.width(0).

2 Returns: os

### 23.3.7 Hash support

[string.view.hash]

```

template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;

```

1 The specialization is enabled (22.10.19).

[Note 1: The hash value of a string view object is equal to the hash value of the corresponding string object (23.4.6). —end note]

### 23.3.8 Suffix for basic\_string\_view literals

[string.view.literals]

```

constexpr string_view operator"sv(const char* str, size_t len) noexcept;

```

1 Returns: string\_view{str, len}.

```

constexpr u8string_view operator"sv(const char8_t* str, size_t len) noexcept;

```

2 Returns: u8string\_view{str, len}.

```

constexpr u16string_view operator"sv(const char16_t* str, size_t len) noexcept;

```

3 Returns: u16string\_view{str, len}.

```
constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
```

4 *Returns:* u32string\_view{str, len}.

```
constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
```

5 *Returns:* wstring\_view{str, len}.

## 23.4 String classes

[string.classes]

### 23.4.1 General

[string.classes.general]

1 The header <string> defines the basic\_string class template for manipulating varying-length sequences of char-like objects and five *typedef-names*, string, u8string, u16string, u32string, and wstring, that name the specializations basic\_string<char>, basic\_string<char8\_t>, basic\_string<char16\_t>, basic\_string<char32\_t>, and basic\_string<wchar\_t>, respectively.

### 23.4.2 Header <string> synopsis

[string.syn]

```
#include <compare> // see 17.11.1

### 23.4.3 Class template `basic_string`

[basic.string]

#### 23.4.3.1 General

[basic.string.general]

- <sup>1</sup> The class template `basic_string` describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of 23.4.3, the type of the char-like objects held in a `basic_string` object is designated by `charT`.
- <sup>2</sup> A specialization of `basic_string` is a contiguous container (24.2.2.1).
- <sup>3</sup> In all cases, `[data(), data() + size())` is a valid range, `data() + size()` points at an object with value `charT()` (a “null terminator”), and `size() <= capacity()` is true.

```

namespace std {
 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>

}

```

- 4 A `size_type` parameter type in a `basic_string` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.
- 5 The types `iterator` and `const_iterator` meet the `constexpr` iterator requirements (25.3.1).

### 23.4.3.2 General requirements

[string.require]

- 1 If any operation would cause `size()` to exceed `max_size()`, that operation throws an exception object of type `length_error`.
- 2 If any member function or operator of `basic_string` throws an exception, that function or operator has no other effect on the `basic_string` object.
- 3 In every specialization `basic_string<charT, traits, Allocator>`, the type `allocator_traits<Allocator>::value_type` shall name the same type as `charT`. Every object of type `basic_string<charT, traits, Allocator>` uses an object of type `Allocator` to allocate and free storage for the contained `charT` objects as needed. The `Allocator` object used is obtained as described in 24.2.2.1. In every specialization `basic_string<charT, traits, Allocator>`, the type `traits` shall meet the character traits requirements (23.2).
 

[Note 1: Every specialization `basic_string<charT, traits, Allocator>` is an allocator-aware container, but does not use the allocator's `construct` and `destroy` member functions (24.2.2.1). — end note]

[Note 2: The program is ill-formed if `traits::char_type` is not the same type as `charT`. — end note]
- 4 References, pointers, and iterators referring to the elements of a `basic_string` sequence may be invalidated by the following uses of that `basic_string` object:
  - (4.1) — Passing as an argument to any standard library function taking a reference to non-const `basic_string` as an argument.<sup>213</sup>
  - (4.2) — Calling non-const member functions, except `operator[]`, `at`, `data`, `front`, `back`, `begin`, `rbegin`, `end`, and `rend`.

<sup>213</sup> For example, as an argument to non-member functions `swap()` (23.4.4.3), `operator>>()` (23.4.4.4), and `getline()` (23.4.4.4), or as an argument to `basic_string::swap()`.

**23.4.3.3 Constructors and assignment operators****[string.cons]**

```
constexpr explicit basic_string(const Allocator& a) noexcept;
```

1 *Postconditions:* `size()` is equal to 0.

```
constexpr basic_string(const basic_string& str);
constexpr basic_string(basic_string&& str) noexcept;
```

2 *Effects:* Constructs an object whose value is that of `str` prior to this call.

3 *Remarks:* In the second form, `str` is left in a valid but unspecified state.

```
constexpr basic_string(const basic_string& str, size_type pos,
 const Allocator& a = Allocator());
constexpr basic_string(const basic_string& str, size_type pos, size_type n,
 const Allocator& a = Allocator());
```

4 *Effects:* Let `n` be `npos` for the first overload. Equivalent to:

```
basic_string(basic_string_view<charT, traits>(str).substr(pos, n), a)
```

```
template<class T>
constexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());
```

5 *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

6 *Effects:* Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as:

```
basic_string(sv.substr(pos, n), a);
```

```
template<class T>
constexpr explicit basic_string(const T& t, const Allocator& a = Allocator());
```

7 *Constraints:*

(7.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(7.2) — `is_convertible_v<const T&, const charT*>` is false.

8 *Effects:* Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as `basic_string(sv.data(), sv.size(), a)`.

```
constexpr basic_string(const charT* s, size_type n, const Allocator& a = Allocator());
```

9 *Preconditions:* `[s, s + n)` is a valid range.

10 *Effects:* Constructs an object whose initial value is the range `[s, s + n)`.

11 *Postconditions:* `size()` is equal to `n`, and `traits::compare(data(), s, n)` is equal to 0.

```
constexpr basic_string(const charT* s, const Allocator& a = Allocator());
```

12 *Constraints:* `Allocator` is a type that qualifies as an allocator (24.2.2.1).

[Note 1: This affects class template argument deduction. — end note]

13 *Effects:* Equivalent to: `basic_string(s, traits::length(s), a)`.

```
constexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());
```

14 *Constraints:* `Allocator` is a type that qualifies as an allocator (24.2.2.1).

[Note 2: This affects class template argument deduction. — end note]

15 *Effects:* Constructs an object whose value consists of `n` copies of `c`.

```
template<class InputIterator>
constexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());
```

16 *Constraints:* `InputIterator` is a type that qualifies as an input iterator (24.2.2.1).

17 *Effects:* Constructs a string from the values in the range `[begin, end)`, as specified in 24.2.4.

```
template<container-compatible-range<charT> R>
constexpr basic_string(from_range_t, R&& rg, const Allocator& = Allocator());
```

18 *Effects:* Constructs a string from the values in the range `rg`, as specified in 24.2.4.

```
constexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());
```

19 *Effects:* Equivalent to `basic_string(il.begin(), il.end(), a)`.

```
constexpr basic_string(const basic_string& str, const Allocator& alloc);
constexpr basic_string(basic_string&& str, const Allocator& alloc);
```

20 *Effects:* Constructs an object whose value is that of `str` prior to this call. The stored allocator is constructed from `alloc`. In the second form, `str` is left in a valid but unspecified state.

21 *Throws:* The second form throws nothing if `alloc == str.get_allocator()`.

```
template<class InputIterator,
 class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
basic_string(InputIterator, InputIterator, Allocator = Allocator())
-> basic_string<typename iterator_traits<InputIterator>::value_type,
 char_traits<typename iterator_traits<InputIterator>::value_type>,
 Allocator>;
```

22 *Constraints:* `InputIterator` is a type that qualifies as an input iterator, and `Allocator` is a type that qualifies as an allocator (24.2.2.1).

```
template<class charT,
 class traits,
 class Allocator = allocator<charT>>
explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;
```

```
template<class charT,
 class traits,
 class Allocator = allocator<charT>>
basic_string(basic_string_view<charT, traits>,
 typename see below::size_type, typename see below::size_type,
 const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;
```

23 *Constraints:* `Allocator` is a type that qualifies as an allocator (24.2.2.1).

```
constexpr basic_string& operator=(const basic_string& str);
```

24 *Effects:* If `*this` and `str` are the same object, has no effect. Otherwise, replaces the value of `*this` with a copy of `str`.

25 *Returns:* `*this`.

```
constexpr basic_string& operator=(basic_string&& str)
noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
 allocator_traits<Allocator>::is_always_equal::value);
```

26 *Effects:* Move assigns as a sequence container (24.2), except that iterators, pointers and references may be invalidated.

27 *Returns:* `*this`.

```
template<class T>
constexpr basic_string& operator=(const T& t);
```

28 *Constraints:*

(28.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(28.2) — `is_convertible_v<const T&, const charT*>` is false.

29 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv);
```

```
constexpr basic_string& operator=(const charT* s);
```

30 *Effects:* Equivalent to: `return *this = basic_string_view<charT, traits>(s);`

```
constexpr basic_string& operator=(charT c);
```

31 *Effects:* Equivalent to:

```
return *this = basic_string_view<charT, traits>(addressof(c), 1);
```

```
constexpr basic_string& operator=(initializer_list<charT> il);
```

32 *Effects:* Equivalent to:

```
return *this = basic_string_view<charT, traits>(il.begin(), il.size());
```

#### 23.4.3.4 Iterator support

[string.iterators]

```
constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
```

1 *Returns:* An iterator referring to the first character in the string.

```
constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
```

2 *Returns:* An iterator which is the past-the-end value.

```
constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
```

3 *Returns:* An iterator which is semantically equivalent to `reverse_iterator(end())`.

```
constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;
```

4 *Returns:* An iterator which is semantically equivalent to `reverse_iterator(begin())`.

#### 23.4.3.5 Capacity

[string.capacity]

```
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

1 *Returns:* A count of the number of char-like objects currently in the string.

2 *Complexity:* Constant time.

```
constexpr size_type max_size() const noexcept;
```

3 *Returns:* The largest possible number of char-like objects that can be stored in a `basic_string`.

4 *Complexity:* Constant time.

```
constexpr void resize(size_type n, charT c);
```

5 *Effects:* Alters the value of `*this` as follows:

(5.1) — If `n <= size()`, erases the last `size() - n` elements.

(5.2) — If `n > size()`, appends `n - size()` copies of `c`.

```
constexpr void resize(size_type n);
```

6 *Effects:* Equivalent to `resize(n, charT())`.

```
template<class Operation> constexpr void resize_and_overwrite(size_type n, Operation op);
```

7 Let

(7.1) — `o = size()` before the call to `resize_and_overwrite`.

(7.2) — `k` be `min(o, n)`.

(7.3) —  $p$  be a `charT*`, such that the range  $[p, p + n]$  is valid and `this->compare(0, k, p, k) == 0` is true before the call. The values in the range  $[p + k, p + n]$  may be indeterminate (6.7.4).

(7.4) —  $OP$  be the expression `std::move(op)(p, n)`.

(7.5) —  $r = OP$ .

8 **Mandates:**  $OP$  has an integer-like type (25.3.4.4).

9 **Preconditions:**

(9.1) —  $OP$  does not throw an exception or modify  $p$  or  $n$ .

(9.2) —  $r \geq 0$ .

(9.3) —  $r \leq n$ .

(9.4) — After evaluating  $OP$  there are no indeterminate values in the range  $[p, p + r)$ .

10 **Effects:** Evaluates  $OP$ , replaces the contents of `*this` with  $[p, p + r)$ , and invalidates all pointers and references to the range  $[p, p + n]$ .

11 **Recommended practice:** Implementations should avoid unnecessary copies and allocations by, for example, making  $p$  a pointer into internal storage and by restoring `*(p + r)` to `charT()` after evaluating  $OP$ .

```
constexpr size_type capacity() const noexcept;
```

12 **Returns:** The size of the allocated storage in the string.

13 **Complexity:** Constant time.

```
constexpr void reserve(size_type res_arg);
```

14 **Effects:** A directive that informs a `basic_string` of a planned change in size, so that the storage allocation can be managed accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`.

15 **Throws:** `length_error` if `res_arg > max_size()` or any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr void shrink_to_fit();
```

16 **Effects:** `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[Note 1: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation.

17 **Complexity:** If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

18 **Remarks:** Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[Note 2: If no reallocation happens, they remain valid. — end note]

```
constexpr void clear() noexcept;
```

19 **Effects:** Equivalent to: `erase(begin(), end());`

```
[[nodiscard]] constexpr bool empty() const noexcept;
```

20 **Effects:** Equivalent to: `return size() == 0;`

### 23.4.3.6 Element access

[string.access]

```
constexpr const_reference operator[](size_type pos) const;
constexpr reference operator[](size_type pos);
```

1 **Preconditions:** `pos <= size()`.

2 **Returns:** `*(begin() + pos)` if `pos < size()`. Otherwise, returns a reference to an object of type `charT` with value `charT()`, where modifying the object to any value other than `charT()` leads to undefined behavior.

3 **Throws:** Nothing.

4 **Complexity:** Constant time.

```
constexpr const_reference at(size_type pos) const;
constexpr reference at(size_type pos);
```

5 *Returns:* operator[](pos).

6 *Throws:* out\_of\_range if pos >= size().

```
constexpr const charT& front() const;
constexpr charT& front();
```

7 *Preconditions:* !empty().

8 *Effects:* Equivalent to: return operator[](0);

```
constexpr const charT& back() const;
constexpr charT& back();
```

9 *Preconditions:* !empty().

10 *Effects:* Equivalent to: return operator[](size() - 1);

### 23.4.3.7 Modifiers

[string.modifiers]

#### 23.4.3.7.1 basic\_string::operator+=

[string.op.append]

```
constexpr basic_string& operator+=(const basic_string& str);
```

1 *Effects:* Equivalent to: return append(str);

```
template<class T>
constexpr basic_string& operator+=(const T& t);
```

2 *Constraints:*

(2.1) — is\_convertible\_v<const T&, basic\_string\_view<charT, traits>> is true and

(2.2) — is\_convertible\_v<const T&, const charT\*> is false.

3 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv);
```

```
constexpr basic_string& operator+=(const charT* s);
```

4 *Effects:* Equivalent to: return append(s);

```
constexpr basic_string& operator+=(charT c);
```

5 *Effects:* Equivalent to: return append(size\_type{1}, c);

```
constexpr basic_string& operator+=(initializer_list<charT> il);
```

6 *Effects:* Equivalent to: return append(il);

#### 23.4.3.7.2 basic\_string::append

[string.append]

```
constexpr basic_string& append(const basic_string& str);
```

1 *Effects:* Equivalent to: return append(str.data(), str.size());

```
constexpr basic_string& append(const basic_string& str, size_type pos, size_type n = npos);
```

2 *Effects:* Equivalent to:

```
return append(basic_string_view<charT, traits>(str).substr(pos, n));
```

```
template<class T>
constexpr basic_string& append(const T& t);
```

3 *Constraints:*

(3.1) — is\_convertible\_v<const T&, basic\_string\_view<charT, traits>> is true and

(3.2) — is\_convertible\_v<const T&, const charT\*> is false.

4 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.data(), sv.size());
```

```
template<class T>
constexpr basic_string& append(const T& t, size_type pos, size_type n = npos);
```

5 *Constraints:*

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(5.2) — `is_convertible_v<const T&, const charT*>` is false.

6 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.substr(pos, n));
```

```
constexpr basic_string& append(const charT* s, size_type n);
```

7 *Preconditions:* `[s, s + n)` is a valid range.

8 *Effects:* Appends a copy of the range `[s, s + n)` to the string.

9 *Returns:* `*this`.

```
constexpr basic_string& append(const charT* s);
```

10 *Effects:* Equivalent to: `return append(s, traits::length(s));`

```
constexpr basic_string& append(size_type n, charT c);
```

11 *Effects:* Appends `n` copies of `c` to the string.

12 *Returns:* `*this`.

```
template<class InputIterator>
constexpr basic_string& append(InputIterator first, InputIterator last);
```

13 *Constraints:* `InputIterator` is a type that qualifies as an input iterator (24.2.2.1).

14 *Effects:* Equivalent to: `return append(basic_string(first, last, get_allocator()));`

```
template<container-compatible-range<charT> R>
constexpr basic_string& append_range(R&& rg);
```

15 *Effects:* Equivalent to: `return append(basic_string(from_range, std::forward<R>(rg), get_allocator()));`

```
constexpr basic_string& append(initializer_list<charT> il);
```

16 *Effects:* Equivalent to: `return append(il.begin(), il.size());`

```
constexpr void push_back(charT c);
```

17 *Effects:* Equivalent to `append(size_type{1}, c)`.

### 23.4.3.7.3 `basic_string::assign`

[string.assign]

```
constexpr basic_string& assign(const basic_string& str);
```

1 *Effects:* Equivalent to: `return *this = str;`

```
constexpr basic_string& assign(basic_string&& str)
noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
allocator_traits<Allocator>::is_always_equal::value);
```

2 *Effects:* Equivalent to: `return *this = std::move(str);`

```
constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);
```

3 *Effects:* Equivalent to:

```
return assign(basic_string_view<charT, traits>(str).substr(pos, n));
```

```
template<class T>
constexpr basic_string& assign(const T& t);
```

4 *Constraints:*

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(4.2) — `is_convertible_v<const T&, const charT*>` is false.

5 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv.data(), sv.size());
```

```
template<class T>
constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);
```

6 *Constraints:*

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(6.2) — `is_convertible_v<const T&, const charT*>` is false.

7 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv.substr(pos, n));
```

```
constexpr basic_string& assign(const charT* s, size_type n);
```

8 *Preconditions:* `[s, s + n)` is a valid range.

9 *Effects:* Replaces the string controlled by `*this` with a copy of the range `[s, s + n)`.

10 *Returns:* `*this`.

```
constexpr basic_string& assign(const charT* s);
```

11 *Effects:* Equivalent to: `return assign(s, traits::length(s));`

```
constexpr basic_string& assign(initializer_list<charT> il);
```

12 *Effects:* Equivalent to: `return assign(il.begin(), il.size());`

```
constexpr basic_string& assign(size_type n, charT c);
```

13 *Effects:* Equivalent to:

```
clear();
resize(n, c);
return *this;
```

```
template<class InputIterator>
constexpr basic_string& assign(InputIterator first, InputIterator last);
```

14 *Constraints:* `InputIterator` is a type that qualifies as an input iterator (24.2.2.1).

15 *Effects:* Equivalent to: `return assign(basic_string(first, last, get_allocator()));`

```
template<container-compatible-range<charT> R>
constexpr basic_string& assign_range(R&& rg);
```

16 *Effects:* Equivalent to: `return assign(basic_string(from_range, std::forward<R>(rg), get_allocator()));`

#### 23.4.3.7.4 `basic_string::insert`

[string.insert]

```
constexpr basic_string& insert(size_type pos, const basic_string& str);
```

1 *Effects:* Equivalent to: `return insert(pos, str.data(), str.size());`

```
constexpr basic_string& insert(size_type pos1, const basic_string& str,
 size_type pos2, size_type n = npos);
```

2 *Effects:* Equivalent to:

```
return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);
```

```
template<class T>
constexpr basic_string& insert(size_type pos, const T& t);
```

3 *Constraints:*

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(3.2) — `is_convertible_v<const T&, const charT*>` is false.

4 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return insert(pos, sv.data(), sv.size());
```

```
template<class T>
constexpr basic_string& insert(size_type pos1, const T& t,
 size_type pos2, size_type n = npos);
```

5 *Constraints:*

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(5.2) — `is_convertible_v<const T&, const charT*>` is false.

6 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return insert(pos1, sv.substr(pos2, n));
```

```
constexpr basic_string& insert(size_type pos, const charT* s, size_type n);
```

7 *Preconditions:* `[s, s + n)` is a valid range.

8 *Effects:* Inserts a copy of the range `[s, s + n)` immediately before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

9 *Returns:* `*this`.

10 *Throws:*

(10.1) — `out_of_range` if `pos > size()`,

(10.2) — `length_error` if `n > max_size() - size()`, or

(10.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& insert(size_type pos, const charT* s);
```

11 *Effects:* Equivalent to: `return insert(pos, s, traits::length(s));`

```
constexpr basic_string& insert(size_type pos, size_type n, charT c);
```

12 *Effects:* Inserts `n` copies of `c` before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

13 *Returns:* `*this`

14 *Throws:*

(14.1) — `out_of_range` if `pos > size()`,

(14.2) — `length_error` if `n > max_size() - size()`, or

(14.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr iterator insert(const_iterator p, charT c);
```

15 *Preconditions:* `p` is a valid iterator on `*this`.

16 *Effects:* Inserts a copy of `c` at the position `p`.

17 *Returns:* An iterator which refers to the inserted character.

```
constexpr iterator insert(const_iterator p, size_type n, charT c);
```

18 *Preconditions:* `p` is a valid iterator on `*this`.

19 *Effects:* Inserts `n` copies of `c` at the position `p`.

20 *Returns:* An iterator which refers to the first inserted character, or `p` if `n == 0`.

```
template<class InputIterator>
constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);
```

21 *Constraints:* InputIterator is a type that qualifies as an input iterator (24.2.2.1).

22 *Preconditions:* p is a valid iterator on \*this.

23 *Effects:* Equivalent to insert(p - begin(), basic\_string(first, last, get\_allocator())).

24 *Returns:* An iterator which refers to the first inserted character, or p if first == last.

```
template<container-compatible-range<charT> R>
constexpr iterator insert_range(const_iterator p, R&& rg);
```

25 *Preconditions:* p is a valid iterator on \*this.

26 *Effects:* Equivalent to insert(p - begin(), basic\_string(from\_range, std::forward<R>(rg), get\_allocator())).

27 *Returns:* An iterator which refers to the first inserted character, or p if rg is empty.

```
constexpr iterator insert(const_iterator p, initializer_list<charT> il);
```

28 *Effects:* Equivalent to: return insert(p, il.begin(), il.end());

#### 23.4.3.7.5 basic\_string::erase

[string.erase]

```
constexpr basic_string& erase(size_type pos = 0, size_type n = npos);
```

1 *Effects:* Determines the effective length xlen of the string to be removed as the smaller of n and size() - pos. Removes the characters in the range [begin() + pos, begin() + pos + xlen).

2 *Returns:* \*this.

3 *Throws:* out\_of\_range if pos > size().

```
constexpr iterator erase(const_iterator p);
```

4 *Preconditions:* p is a valid dereferenceable iterator on \*this.

5 *Effects:* Removes the character referred to by p.

6 *Returns:* An iterator which points to the element immediately following p prior to the element being erased. If no such element exists, end() is returned.

7 *Throws:* Nothing.

```
constexpr iterator erase(const_iterator first, const_iterator last);
```

8 *Preconditions:* first and last are valid iterators on \*this. [first, last) is a valid range.

9 *Effects:* Removes the characters in the range [first, last).

10 *Returns:* An iterator which points to the element pointed to by last prior to the other elements being erased. If no such element exists, end() is returned.

11 *Throws:* Nothing.

```
constexpr void pop_back();
```

12 *Preconditions:* !empty().

13 *Effects:* Equivalent to erase(end() - 1).

14 *Throws:* Nothing.

#### 23.4.3.7.6 basic\_string::replace

[string.replace]

```
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);
```

1 *Effects:* Equivalent to: return replace(pos1, n1, str.data(), str.size());

```
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
 size_type pos2, size_type n2 = npos);
```

2 *Effects:* Equivalent to:

```
return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));
```

```

template<class T>
constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);
3 Constraints:
(3.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(3.2) — is_convertible_v<const T&, const charT*> is false.
4 Effects: Equivalent to:
 basic_string_view<charT, traits> sv = t;
 return replace(pos1, n1, sv.data(), sv.size());

template<class T>
constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
 size_type pos2, size_type n2 = npos);
5 Constraints:
(5.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(5.2) — is_convertible_v<const T&, const charT*> is false.
6 Effects: Equivalent to:
 basic_string_view<charT, traits> sv = t;
 return replace(pos1, n1, sv.substr(pos2, n2));

constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);
7 Preconditions: [s, s + n2) is a valid range.
8 Effects: Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1.
 If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters
 in the range [begin() + pos1, begin() + pos1 + xlen) with a copy of the range [s, s + n2).
9 Returns: *this.
10 Throws:
(10.1) — out_of_range if pos1 > size(),
(10.2) — length_error if the length of the resulting string would exceed max_size(), or
(10.3) — any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr basic_string& replace(size_type pos, size_type n, const charT* s);
11 Effects: Equivalent to: return replace(pos, n, s, traits::length(s));

constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);
12 Effects: Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1.
 If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters
 in the range [begin() + pos1, begin() + pos1 + xlen) with n2 copies of c.
13 Returns: *this.
14 Throws:
(14.1) — out_of_range if pos1 > size(),
(14.2) — length_error if the length of the resulting string would exceed max_size(), or
(14.3) — any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);
15 Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(str));

template<class T>
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);
16 Constraints:
(16.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

```

(16.2) — `is_convertible_v<const T&, const charT*>` is false.

17 *Preconditions:* `[begin(), i1)` and `[i1, i2)` are valid ranges.

18 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());
```

`constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);`

19 *Effects:* Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s, n));`

`constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);`

20 *Effects:* Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s));`

`constexpr basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);`

21 *Preconditions:* `[begin(), i1)` and `[i1, i2)` are valid ranges.

22 *Effects:* Equivalent to: `return replace(i1 - begin(), i2 - i1, n, c);`

```
template<class InputIterator>
constexpr basic_string& replace(const_iterator i1, const_iterator i2,
 InputIterator j1, InputIterator j2);
```

23 *Constraints:* `InputIterator` is a type that qualifies as an input iterator (24.2.2.1).

24 *Effects:* Equivalent to: `return replace(i1, i2, basic_string(j1, j2, get_allocator()));`

```
template<container-compatible-range<charT> R>
constexpr basic_string& replace_with_range(const_iterator i1, const_iterator i2, R&& rg);
```

25 *Effects:* Equivalent to:

```
return replace(i1, i2, basic_string(from_range, std::forward<R>(rg), get_allocator()));
```

`constexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);`

26 *Effects:* Equivalent to: `return replace(i1, i2, il.begin(), il.size());`

#### 23.4.3.7.7 `basic_string::copy` [string.copy]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 *Effects:* Equivalent to: `return basic_string_view<charT, traits>(*this).copy(s, n, pos);`

[Note 1: This does not terminate `s` with a null object. — end note]

#### 23.4.3.7.8 `basic_string::swap` [string.swap]

```
constexpr void swap(basic_string& s)
noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
 allocator_traits<Allocator>::is_always_equal::value);
```

1 *Preconditions:* `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `get_allocator() == s.get_allocator()`.

2 *Postconditions:* `*this` contains the same sequence of characters that was in `s`, `s` contains the same sequence of characters that was in `*this`.

3 *Throws:* Nothing.

4 *Complexity:* Constant time.

### 23.4.3.8 String operations [string.ops]

#### 23.4.3.8.1 Accessors [string.accessors]

```
constexpr const charT* c_str() const noexcept;
constexpr const charT* data() const noexcept;
```

1 *Returns:* A pointer `p` such that `p + i == addressof(operator[](i))` for each `i` in `[0, size())`.

2 *Complexity:* Constant time.

- 3 *Remarks:* The program shall not modify any of the values stored in the character array; otherwise, the behavior is undefined.

```
constexpr charT* data() noexcept;
```

- 4 *Returns:* A pointer  $p$  such that  $p + i == \text{addressof}(\text{operator}[])(i)$  for each  $i$  in  $[0, \text{size}())$ .

- 5 *Complexity:* Constant time.

- 6 *Remarks:* The program shall not modify the value stored at  $p + \text{size}()$  to any value other than  $\text{charT}()$ ; otherwise, the behavior is undefined.

```
constexpr operator basic_string_view<charT, traits>() const noexcept;
```

- 7 *Effects:* Equivalent to: `return basic_string_view<charT, traits>(data(), size());`

```
constexpr allocator_type get_allocator() const noexcept;
```

- 8 *Returns:* A copy of the Allocator object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.

### 23.4.3.8.2 Searching

[string.find]

- 1 Let  $F$  be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

- (1.1) — Each member function of the form

```
constexpr size_type F(const basic_string& str, size_type pos) const noexcept;
has effects equivalent to: return F(basic_string_view<charT, traits>(str), pos);
```

- (1.2) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos) const;
has effects equivalent to: return F(basic_string_view<charT, traits>(s), pos);
```

- (1.3) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos, size_type n) const;
has effects equivalent to: return F(basic_string_view<charT, traits>(s, n), pos);
```

- (1.4) — Each member function of the form

```
constexpr size_type F(charT c, size_type pos) const noexcept;
has effects equivalent to:
return F(basic_string_view<charT, traits>(addressof(c), 1), pos);
```

```
template<class T>
constexpr size_type find(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
constexpr size_type rfind(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
constexpr size_type find_first_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
constexpr size_type find_last_of(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
constexpr size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
constexpr size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept(see below);
```

- 2 *Constraints:*

- (2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and  
 (2.2) — `is_convertible_v<const T&, const charT*>` is false.

- 3 *Effects:* Let  $G$  be the name of the function. Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.G(sv, pos);
```

- 4 *Remarks:* The exception specification is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

**23.4.3.8.3 basic\_string::substr****[string.substr]**

```
constexpr basic_string substr(size_type pos = 0, size_type n = npos) const;
```

1 *Effects:* Determines the effective length *rlen* of the string to copy as the smaller of *n* and `size() - pos`.

2 *Returns:* `basic_string(data()+pos, rlen)`.

3 *Throws:* `out_of_range` if `pos > size()`.

**23.4.3.8.4 basic\_string::compare****[string.compare]**

```
template<class T>
constexpr int compare(const T& t) const noexcept(see below);
```

1 *Constraints:*

(1.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(1.2) — `is_convertible_v<const T&, const charT*>` is false.

2 *Effects:* Equivalent to: `return basic_string_view<charT, traits>(*this).compare(t);`

3 *Remarks:* The exception specification is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

```
template<class T>
constexpr int compare(size_type pos1, size_type n1, const T& t) const;
```

4 *Constraints:*

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(4.2) — `is_convertible_v<const T&, const charT*>` is false.

5 *Effects:* Equivalent to:

```
return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);
```

```
template<class T>
constexpr int compare(size_type pos1, size_type n1, const T& t,
 size_type pos2, size_type n2 = npos) const;
```

6 *Constraints:*

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(6.2) — `is_convertible_v<const T&, const charT*>` is false.

7 *Effects:* Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.substr(pos1, n1).compare(sv.substr(pos2, n2));
```

```
constexpr int compare(const basic_string& str) const noexcept;
```

8 *Effects:* Equivalent to: `return compare(basic_string_view<charT, traits>(str));`

```
constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;
```

9 *Effects:* Equivalent to: `return compare(pos1, n1, basic_string_view<charT, traits>(str));`

```
constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
 size_type pos2, size_type n2 = npos) const;
```

10 *Effects:* Equivalent to:

```
return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);
```

```
constexpr int compare(const charT* s) const;
```

11 *Effects:* Equivalent to: `return compare(basic_string_view<charT, traits>(s));`

```
constexpr int compare(size_type pos, size_type n1, const charT* s) const;
```

12 *Effects:* Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s));`

```
constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;
```

13 *Effects:* Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s, n2));`

#### 23.4.3.8.5 `basic_string::starts_with`

[string.starts.with]

```
constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;
```

1 *Effects:* Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).starts_with(x);
```

#### 23.4.3.8.6 `basic_string::ends_with`

[string.ends.with]

```
constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;
```

1 *Effects:* Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).ends_with(x);
```

#### 23.4.3.8.7 `basic_string::contains`

[string.contains]

```
constexpr bool contains(basic_string_view<charT, traits> x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;
```

1 *Effects:* Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).contains(x);
```

### 23.4.4 Non-member functions

[string.nonmembers]

#### 23.4.4.1 `operator+`

[string.op.plus]

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
 const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);
```

1 *Effects:* Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
 const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, const charT* rhs);
```

2 *Effects:* Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
 basic_string<charT, traits, Allocator>&& rhs);
```

3 *Effects:* Equivalent to:

```
lhs.append(rhs);
```

```
return std::move(lhs);
```

except that both lhs and rhs are left in valid but unspecified states.

[*Note 1:* If lhs and rhs have equal allocators, the implementation can move from either. — *end note*]

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
 basic_string<charT, traits, Allocator>&& rhs);
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const charT* lhs, basic_string<charT, traits, Allocator>&& rhs);
```

4 *Effects:* Equivalent to:

```
rhs.insert(0, lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
```

5 *Effects:* Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);
```

6 *Effects:* Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(r.begin(), lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, basic_string<charT, traits, Allocator>&& rhs);
```

7 *Effects:* Equivalent to:

```
rhs.insert(rhs.begin(), lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);
```

8 *Effects:* Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.push_back(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);
```

9 *Effects:* Equivalent to:

```
lhs.push_back(rhs);
return std::move(lhs);
```

#### 23.4.4.2 Non-member comparison operator functions

[string.cmp]

```
template<class charT, class traits, class Allocator>
constexpr bool
operator==(const basic_string<charT, traits, Allocator>& lhs,
 const basic_string<charT, traits, Allocator>& rhs) noexcept;
```

```

template<class charT, class traits, class Allocator>
constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
 const charT* rhs);

template<class charT, class traits, class Allocator>
constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
 const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
 const charT* rhs);

```

1 *Effects:* Let *op* be the operator. Equivalent to:

```
return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);
```

### 23.4.4.3 swap

[string.special]

```

template<class charT, class traits, class Allocator>
constexpr void
swap(basic_string<charT, traits, Allocator>& lhs,
 basic_string<charT, traits, Allocator>& rhs)
noexcept(noexcept(lhs.swap(rhs)));

```

1 *Effects:* Equivalent to `lhs.swap(rhs)`.

### 23.4.4.4 Inserters and extractors

[string.io]

```

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, basic_string<charT, traits, Allocator>& str);

```

1 *Effects:* Behaves as a formatted input function (31.7.4.3.1). After constructing a sentry object, if the sentry object returns true when converted to a value of type bool, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)`. If `is.width()` is greater than zero, the maximum number *n* of characters appended is `is.width()`; otherwise *n* is `str.max_size()`. Characters are extracted and appended until any of the following occurs:

- (1.1) — *n* characters are stored;
- (1.2) — end-of-file occurs on the input sequence;
- (1.3) — `isspace(c, is.getloc())` is true for the next available input character *c*.

2 After the last character (if any) is extracted, `is.width(0)` is called and the sentry object is destroyed.

3 If the function extracts no characters, it calls `is.setstate(ios_base::failbit)`, which may throw `ios_base::failure` (31.5.4.4).

4 *Returns:* `is`.

```

template<class charT, class traits, class Allocator>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
 const basic_string<charT, traits, Allocator>& str);

```

5 *Effects:* Equivalent to: `return os << basic_string_view<charT, traits>(str);`

```

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
 basic_string<charT, traits, Allocator>& str,
 charT delim);
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
 basic_string<charT, traits, Allocator>& str,
 charT delim);

```

6 *Effects:* Behaves as an unformatted input function (31.7.4.4), except that it does not affect the value returned by subsequent calls to `basic_istream<>::gcount()`. After constructing a sentry object, if the sentry object

returns true when converted to a value of type bool, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)` until any of the following occurs:

- (6.1) — end-of-file occurs on the input sequence (in which case, the `getline` function calls `is.setstate(ios_base::eofbit)`).
- (6.2) — `traits::eq(c, delim)` for the next available input character `c` (in which case, `c` is extracted but not appended) (31.5.4.4)
- (6.3) — `str.max_size()` characters are stored (in which case, the function calls `is.setstate(ios_base::failbit)`) (31.5.4.4)

7 The conditions are tested in the order shown. In any case, after the last character is extracted, the sentry object is destroyed.

8 If the function extracts no characters, it calls `is.setstate(ios_base::failbit)` which may throw `ios_base::failure` (31.5.4.4).

9 *Returns:* `is`.

```
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
 basic_string<charT, traits, Allocator>& str);
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
 basic_string<charT, traits, Allocator>& str);
```

10 *Returns:* `getline(is, str, is.widen('\n'))`.

#### 23.4.4.5 Erasure

[string.erasure]

```
template<class charT, class traits, class Allocator, class U>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase(basic_string<charT, traits, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class charT, class traits, class Allocator, class Predicate>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);
```

2 *Effects:* Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

#### 23.4.5 Numeric conversions

[string.conversions]

```
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

1 *Effects:* The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

2 *Returns:* The converted result.

- 3 *Throws:* `invalid_argument` if `strtol`, `strtoul`, `strtoll`, or `strtoull` reports that no conversion can be performed. *Throws* `out_of_range` if `strtol`, `strtoul`, `strtoll` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
long double stold(const string& str, size_t* idx = nullptr);
```

- 4 *Effects:* These functions call `strtof(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

- 5 *Returns:* The converted result.

- 6 *Throws:* `invalid_argument` if `strtof`, `strtod`, or `strtold` reports that no conversion can be performed. *Throws* `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

- 7 *Returns:* Each function returns a string object holding the character representation of the value of its argument that would be generated by calling `sprintf(buf, fmt, val)` with a format specifier of `"%d"`, `"%u"`, `"%ld"`, `"%lu"`, `"%lld"`, `"%llu"`, `"%f"`, `"%F"`, or `"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size.

```
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

- 8 *Effects:* The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

- 9 *Returns:* The converted result.

- 10 *Throws:* `invalid_argument` if `wcstol`, `wcstoul`, `wcstoll`, or `wcstoull` reports that no conversion can be performed. *Throws* `out_of_range` if the converted value is outside the range of representable values for the return type.

```
float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);
```

- 11 *Effects:* These functions call `wcstof(str.c_str(), ptr)`, `wcstod(str.c_str(), ptr)`, and `wcstold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

- 12 *Returns:* The converted result.

- 13 *Throws:* `invalid_argument` if `wcstof`, `wcstod`, or `wcstold` reports that no conversion can be performed. *Throws* `out_of_range` if `wcstof`, `wcstod`, or `wcstold` sets `errno` to `ERANGE`.

```
wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);
```

- 14 *Returns:* Each function returns a `wstring` object holding the character representation of the value of its argument that would be generated by calling `swprintf(buf, buffersz, fmt, val)` with a format specifier of `L"%d"`, `L"%u"`, `L"%ld"`, `L"%lu"`, `L"%lld"`, `L"%llu"`, `L"%f"`, `L"%F"`, or `L"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size `buffersz`.

### 23.4.6 Hash support

[basic.string.hash]

```
template<> struct hash<string>;
template<> struct hash<u8string>;
template<> struct hash<u16string>;
template<> struct hash<u32string>;
template<> struct hash<wstring>;
template<> struct hash<pmr::string>;
template<> struct hash<pmr::u8string>;
template<> struct hash<pmr::u16string>;
template<> struct hash<pmr::u32string>;
template<> struct hash<pmr::wstring>;
```

- 1 If `S` is one of these string types, `SV` is the corresponding string view type, and `s` is an object of type `S`, then `hash<S>()(s) == hash<SV>()(SV(s))`.

### 23.4.7 Suffix for `basic_string` literals

[basic.string.literals]

```
constexpr string operator"s(const char* str, size_t len);
```

- 1 *Returns:* `string{str, len}`.

```
constexpr u8string operator"s(const char8_t* str, size_t len);
```

- 2 *Returns:* `u8string{str, len}`.

```
constexpr u16string operator"s(const char16_t* str, size_t len);
```

- 3 *Returns:* `u16string{str, len}`.

```
constexpr u32string operator"s(const char32_t* str, size_t len);
```

- 4 *Returns:* `u32string{str, len}`.

```
constexpr wstring operator"s(const wchar_t* str, size_t len);
```

- 5 *Returns:* `wstring{str, len}`.

- 6 [Note 1: The same suffix `s` is used for `chrono::duration` literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

## 23.5 Null-terminated sequence utilities

[c.strings]

### 23.5.1 Header `<cctype>` synopsis

[cctype.syn]

```
namespace std {
 int isalnum(int c);
 int isalpha(int c);
 int isblank(int c);
 int iscntrl(int c);
 int isdigit(int c);
 int isgraph(int c);
 int islower(int c);
 int isprint(int c);
 int ispunct(int c);
```

```

int isspace(int c);
int isupper(int c);
int isxdigit(int c);
int tolower(int c);
int toupper(int c);
}

```

- <sup>1</sup> The contents and meaning of the header <cctype> are the same as the C standard library header <ctype.h>.

See also: ISO C 7.4

### 23.5.2 Header <cwctype> synopsis

[cwctype.syn]

```

namespace std {
 using wint_t = see below;
 using wctrans_t = see below;
 using wctype_t = see below;

 int iswalnum(wint_t wc);
 int iswalphabetic(wint_t wc);
 int iswblank(wint_t wc);
 int iswcntrl(wint_t wc);
 int iswdigit(wint_t wc);
 int iswgraph(wint_t wc);
 int iswlower(wint_t wc);
 int iswprint(wint_t wc);
 int iswpunct(wint_t wc);
 int iswspace(wint_t wc);
 int iswupper(wint_t wc);
 int iswxdigit(wint_t wc);
 int iswctype(wint_t wc, wctype_t desc);
 wctype_t wctype(const char* property);
 wint_t towlower(wint_t wc);
 wint_t towupper(wint_t wc);
 wint_t towctrans(wint_t wc, wctrans_t desc);
 wctrans_t wctrans(const char* property);
}

#define WEOF see below

```

- <sup>1</sup> The contents and meaning of the header <cwctype> are the same as the C standard library header <wctype.h>.

See also: ISO C 7.30

### 23.5.3 Header <cstring> synopsis

[cstring.syn]

```

namespace std {
 using size_t = see 17.2.4;

 void* memcpy(void* s1, const void* s2, size_t n);
 void* memmove(void* s1, const void* s2, size_t n);
 char* strcpy(char* s1, const char* s2);
 char* strncpy(char* s1, const char* s2, size_t n);
 char* strcat(char* s1, const char* s2);
 char* strncat(char* s1, const char* s2, size_t n);
 int memcmp(const void* s1, const void* s2, size_t n);
 int strcmp(const char* s1, const char* s2);
 int strcoll(const char* s1, const char* s2);
 int strncmp(const char* s1, const char* s2, size_t n);
 size_t strxfrm(char* s1, const char* s2, size_t n);
 const void* memchr(const void* s, int c, size_t n); // see 16.2
 void* memchr(void* s, int c, size_t n); // see 16.2
 const char* strchr(const char* s, int c); // see 16.2
 char* strchr(char* s, int c); // see 16.2
 size_t strcspn(const char* s1, const char* s2);
 const char* strpbrk(const char* s1, const char* s2); // see 16.2
 char* strpbrk(char* s1, const char* s2); // see 16.2
}

```

```

const char* strrchr(const char* s, int c); // see 16.2
char* strrchr(char* s, int c); // see 16.2
size_t strspn(const char* s1, const char* s2);
const char* strstr(const char* s1, const char* s2); // see 16.2
char* strstr(char* s1, const char* s2); // see 16.2
char* strtok(char* s1, const char* s2);
void* memset(void* s, int c, size_t n);
char* strerror(int errnum);
size_t strlen(const char* s);
}

```

```
#define NULL see 17.2.3
```

- 1 The contents and meaning of the header `<cstring>` are the same as the C standard library header `<string.h>`.
- 2 The functions `strerror` and `strtok` are not required to avoid data races (16.4.6.10).
- 3 The functions `memcpy` and `memmove` are signal-safe (17.13.5). Both functions implicitly create objects (6.7.2) in the destination region of storage immediately prior to copying the sequence of characters to the destination.
- 4 [Note 1: The functions `strchr`, `strpbrk`, `strrchr`, `strstr`, and `memchr`, have different signatures in this document, but they have the same behavior as in the C standard library (16.2). —end note]

```

// 23.5.6, multibyte / wide string and character conversion functions

```

int mbsinit(const mbstate_t* ps);
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wctomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbsrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
}

```

```

#define NULL see 17.2.3
#define WCHAR_MAX see below
#define WCHAR_MIN see below
#define WEOF see below

```

- 1 The contents and meaning of the header <wchar.h> are the same as the C standard library header <wchar.h>, except that it does not declare a type `wchar_t`.
- 2 [Note 1: The functions `wcschr`, `wcsncpy`, `wcsrchr`, `wcsstr`, and `wmemchr` have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — end note]

See also: ISO C 7.29

### 23.5.5 Header <cuchar> synopsis

[`cuchar.syn`]

```

namespace std {
 using mbstate_t = see below;
 using size_t = see 17.2.4;

 size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
 size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
 size_t mbrtoc16(char16_t* pc16, const char* s, size_t n, mbstate_t* ps);
 size_t c16rtomb(char* s, char16_t c16, mbstate_t* ps);
 size_t mbrtoc32(char32_t* pc32, const char* s, size_t n, mbstate_t* ps);
 size_t c32rtomb(char* s, char32_t c32, mbstate_t* ps);
}

```

- 1 The contents and meaning of the header <cuchar> are the same as the C standard library header <uchar.h>, except that it declares the additional `mbrtoc8` and `c8rtomb` functions and does not declare types `char16_t` nor `char32_t`.

See also: ISO C 7.28

### 23.5.6 Multibyte / wide string and character conversion functions

[c.mb.wcs]

- <sup>1</sup> [Note 1: The headers `<csdlib>` (17.2.2), `<cuchar>` (23.5.5), and `<cwchar>` (23.5.4) declare the functions described in this subclause. — end note]

```
int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);
```

- <sup>2</sup> *Effects:* These functions have the semantics specified in the C standard library.

See also: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

```
int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);
```

- <sup>3</sup> *Effects:* These functions have the semantics specified in the C standard library.

- <sup>4</sup> *Remarks:* Calls to these functions may introduce a data race (16.4.6.10) with other calls to the same function.

See also: ISO C 7.22.7

```
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrctomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbsrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
```

- <sup>5</sup> *Effects:* These functions have the semantics specified in the C standard library.

- <sup>6</sup> *Remarks:* Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.

See also: ISO C 7.29.6.3

```
size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
```

- <sup>7</sup> *Effects:* If `s` is a null pointer, equivalent to `mbrtoc8(nullptr, "", 1, ps)`. Otherwise, the function inspects at most `n` bytes beginning with the byte pointed to by `s` to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if `pc8` is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by `pc8`. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is `u+0000` null, the resulting state described is the initial conversion state.

- <sup>8</sup> *Returns:* The first of the following that applies (given the current conversion state):

- (8.1) — 0, if the next `n` or fewer bytes complete the multibyte character that corresponds to the `u+0000` null Unicode character (which is the value stored).
- (8.2) — between 1 and `n` (inclusive), if the next `n` or fewer bytes complete a valid multibyte character (whose first (or only) code unit is stored); the value returned is the number of bytes that complete the multibyte character.
- (8.3) — `(size_t)(-3)`, if the next code unit resulting from a previous call has been stored (no bytes from the input have been consumed by this call).
- (8.4) — `(size_t)(-2)`, if the next `n` bytes contribute to an incomplete (but potentially valid) multibyte character, and all `n` bytes have been processed (no value is stored).
- (8.5) — `(size_t)(-1)`, if an encoding error occurs, in which case the next `n` or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro `EILSEQ` is stored in `errno`, and the conversion state is unspecified.

```
size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
```

- <sup>9</sup> *Effects:* If `s` is a null pointer, equivalent to `c8rtomb(buf, u8'\0', ps)` where `buf` is an internal buffer. Otherwise, if `c8` completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by `s`. At most `MB_CUR_MAX` bytes are stored. If the multibyte character is a null

character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

<sup>10</sup> *Returns:* The number of bytes stored in the array object (including any shift sequences). If `c8` does not contribute to a sequence of `char8_t` corresponding to a valid multibyte character, the value of the macro `EILSEQ` is stored in `errno`, `(size_t) (-1)` is returned, and the conversion state is unspecified.

<sup>11</sup> *Remarks:* Calls to `c8rtomb` with a null pointer argument for `s` may introduce a data race (16.4.6.10) with other calls to `c8rtomb` with a null pointer argument for `s`.

## 24 Containers library

## [containers]

### 24.1 General

[containers.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to organize collections of information.
- <sup>2</sup> The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in [Table 78](#).

Table 78: Containers library summary [tab:containers.summary]

| Subclause                                             | Header                                                                                                                                                |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">24.2</a> Requirements                     |                                                                                                                                                       |

### 24.2 Requirements

[container.requirements]

#### 24.2.1 Preamble

[container.requirements.preamble]

- <sup>1</sup> Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.
- <sup>2</sup> All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects.

[*Example 1*: The copy constructor of type `vector<vector<int>>` has linear complexity, even though the complexity of copying each contained `vector<int>` is itself linear. — *end example*]

- <sup>3</sup> Allocator-aware containers ([24.2.2.5](#)) other than `basic_string` construct elements using the function `allocator_traits<allocator_type>::rebind_traits<U>::construct` and destroy elements using the function `allocator_traits<allocator_type>::rebind_traits<U>::destroy` ([20.2.8.3](#)), where `U` is either `allocator_type::value_type` or an internal type used by the container. These functions are called only for the container's element type, not for internal types used by the container.

[*Note 1*: This means, for example, that a node-based container would need to construct nodes containing aligned buffers and call `construct` to place the element into the buffer. — *end note*]

#### 24.2.2 General containers

[container.gen.reqmts]

##### 24.2.2.1 General

[container.requirements.general]

- <sup>1</sup> In subclause [24.2.2](#),
  - (1.1) — `X` denotes a container class containing objects of type `T`,
  - (1.2) — `a` and `b` denote values of type `X`,
  - (1.3) — `i` and `j` denote values of type (possibly `const`) `X::iterator`,
  - (1.4) — `u` denotes an identifier,
  - (1.5) — `r` denotes a non-const value of type `X`, and
  - (1.6) — `rv` denotes a non-const rvalue of type `X`.

##### 24.2.2.2 Containers

[container.reqmts]

- <sup>1</sup> A type `X` meets the *container* requirements if the following types, statements, and expressions are well-formed and have the specified semantics.

typename `X::value_type`

- <sup>2</sup> *Result*: `T`

3        *Preconditions:*  $T$  is *Cpp17Erasable* from  $X$  (see 24.2.2.5, below).

typename  $X::$ reference

4        *Result:*  $T\&$

typename  $X::$ const\_reference

5        *Result:* const  $T\&$

typename  $X::$ iterator

6        *Result:* A type that meets the forward iterator requirements (25.3.5.5) with value type  $T$ . The type  $X::$ iterator is convertible to  $X::$ const\_iterator.

typename  $X::$ const\_iterator

7        *Result:* A type that meets the requirements of a constant iterator and those of a forward iterator with value type  $T$ .

typename  $X::$ difference\_type

8        *Result:* A signed integer type, identical to the difference type of  $X::$ iterator and  $X::$ const\_iterator.

typename  $X::$ size\_type

9        *Result:* An unsigned integer type that can represent any non-negative value of  $X::$ difference\_type.

$X$  u;

$X$  u = X();

10       *Postconditions:* u.empty()

11       *Complexity:* Constant.

$X$  u(a);

$X$  u = a;

12       *Preconditions:*  $T$  is *Cpp17CopyInsertable* into  $X$  (see below).

13       *Postconditions:* u == a

14       *Complexity:* Linear.

$X$  u(rv);

$X$  u = rv;

15       *Postconditions:* u is equal to the value that rv had before this construction.

16       *Complexity:* Linear for array and constant for all other standard containers.

a = rv

17       *Result:*  $X\&$ .

18       *Effects:* All existing elements of a are either move assigned to or destroyed.

19       *Postconditions:* If a and rv do not refer to the same object, a is equal to the value that rv had before this assignment.

20       *Complexity:* Linear.

a.~X()

21       *Result:* void

22       *Effects:* Destroys every element of a; any memory obtained is deallocated.

23       *Complexity:* Linear.

a.begin()

24       *Result:* iterator; const\_iterator for constant a.

25       *Returns:* An iterator referring to the first element in the container.

26       *Complexity:* Constant.

`a.end()`

- 27 *Result:* iterator; `const_iterator` for constant `a`.  
 28 *Returns:* An iterator which is the past-the-end value for the container.  
 29 *Complexity:* Constant.

`a.cbegin()`

- 30 *Result:* `const_iterator`.  
 31 *Returns:* `const_cast<X const&>(a).begin()`  
 32 *Complexity:* Constant.

`a.cend()`

- 33 *Result:* `const_iterator`.  
 34 *Returns:* `const_cast<X const&>(a).end()`  
 35 *Complexity:* Constant.

`i <=> j`

- 36 *Result:* `strong_ordering`.  
 37 *Constraints:* `X::iterator` meets the random access iterator requirements.  
 38 *Complexity:* Constant.

`a == b`

- 39 *Preconditions:* `T` meets the *Cpp17EqualityComparable* requirements.  
 40 *Result:* Convertible to `bool`.  
 41 *Returns:* `equal(a.begin(), a.end(), b.begin(), b.end())`  
 [Note 1: The algorithm `equal` is defined in 27.6.11. — end note]  
 42 *Complexity:* Constant if `a.size() != b.size()`, linear otherwise.  
 43 *Remarks:* `==` is an equivalence relation.

`a != b`

- 44 *Effects:* Equivalent to `!(a == b)`.

`a.swap(b)`

- 45 *Result:* `void`  
 46 *Effects:* Exchanges the contents of `a` and `b`.  
 47 *Complexity:* Linear for array and constant for all other standard containers.

`swap(a, b)`

- 48 *Effects:* Equivalent to `a.swap(b)`.

`r = a`

- 49 *Result:* `x&`.  
 50 *Postconditions:* `r == a`.  
 51 *Complexity:* Linear.

`a.size()`

- 52 *Result:* `size_type`.  
 53 *Returns:* `distance(a.begin(), a.end())`, i.e. the number of elements in the container.  
 54 *Complexity:* Constant.  
 55 *Remarks:* The number of elements is defined by the rules of constructors, inserts, and erases.

a.max\_size()

56 *Result:* size\_type.

57 *Returns:* distance(begin(), end()) for the largest possible container.

58 *Complexity:* Constant.

a.empty()

59 *Result:* Convertible to bool.

60 *Returns:* a.begin() == a.end()

61 *Complexity:* Constant.

62 *Remarks:* If the container is empty, then a.empty() is true.

63 In the expressions

```
i == j
i != j
i < j
i <= j
i >= j
i > j
i <=> j
i - j
```

where *i* and *j* denote objects of a container's iterator type, either or both may be replaced by an object of the container's const\_iterator type referring to the same element with no change in semantics.

64 Unless otherwise specified, all containers defined in this Clause obtain memory using an allocator (see 16.4.4.6).

[Note 2: In particular, containers and iterators do not store references to allocated elements other than through the allocator's pointer type, i.e., as objects of type `P` or `pointer_traits<P>::template rebind<unspecified>`, where `P` is `allocator_traits<allocator_type>::pointer`. — end note]

Copy constructors for these container types obtain an allocator by calling `allocator_traits<allocator_type>::select_on_container_copy_construction` on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a `const allocator_type&` argument.

[Note 3: If an invocation of a constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization. — end note]

A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or `swap()`. Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if

(64.1) — `allocator_traits<allocator_type>::propagate_on_container_copy_assignment::value`,

(64.2) — `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value`, or

(64.3) — `allocator_traits<allocator_type>::propagate_on_container_swap::value`

is true within the implementation of the corresponding container operation. In all container types defined in this Clause, the member `get_allocator()` returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

65 The expression `a.swap(b)`, for containers *a* and *b* of a standard container type other than `array`, shall exchange the values of *a* and *b* without invoking any move, copy, or swap operations on the individual container elements. Lvalues of any `Compare`, `Pred`, or `Hash` types belonging to *a* and *b* shall be swappable and shall be exchanged by calling `swap` as described in 16.4.4.3. If `allocator_traits<allocator_type>::propagate_on_container_swap::value` is true, then lvalues of type `allocator_type` shall be swappable and the allocators of *a* and *b* shall also be exchanged by calling `swap` as described in 16.4.4.3. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless `a.get_allocator() == b.get_allocator()`. Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value `a.end()` before the swap will have value `b.end()` after the swap.

**24.2.2.3 Reversible container requirements****[container.rev.reqmts]**

- 1 A type *X* meets the *reversible container* requirements if *X* meets the container requirements, the iterator type of *X* belongs to the bidirectional or random access iterator categories (25.3), and the following types and expressions are well-formed and have the specified semantics.

typename *X*::reverse\_iterator

- 2 *Result*: The type reverse\_iterator<*X*::iterator>, an iterator type whose value type is *T*.

typename *X*::const\_reverse\_iterator

- 3 *Result*: The type reverse\_iterator<*X*::const\_iterator>, a constant iterator type whose value type is *T*.

*a*.rbegin()

- 4 *Result*: reverse\_iterator; const\_reverse\_iterator for constant *a*.

5 *Returns*: reverse\_iterator(end())

6 *Complexity*: Constant.

*a*.rend()

- 7 *Result*: reverse\_iterator; const\_reverse\_iterator for constant *a*.

8 *Returns*: reverse\_iterator(begin())

9 *Complexity*: Constant.

*a*.crbegin()

- 10 *Result*: const\_reverse\_iterator.

11 *Returns*: const\_cast<*X* const&>(a).rbegin()

12 *Complexity*: Constant.

*a*.crend()

- 13 *Result*: const\_reverse\_iterator.

14 *Returns*: const\_cast<*X* const&>(a).rend()

15 *Complexity*: Constant.

- 16 Unless otherwise specified (see 24.2.7.2, 24.2.8.2, 24.3.8.4, and 24.3.11.5) all container types defined in this Clause meet the following additional requirements:

- (16.1) — if an exception is thrown by an insert() or emplace() function while inserting a single element, that function has no effects.
- (16.2) — if an exception is thrown by a push\_back(), push\_front(), emplace\_back(), or emplace\_front() function, that function has no effects.
- (16.3) — no erase(), clear(), pop\_back() or pop\_front() function throws an exception.
- (16.4) — no copy constructor or assignment operator of a returned iterator throws an exception.
- (16.5) — no swap() function throws an exception.
- (16.6) — no swap() function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped.

[Note 1: The end() iterator does not refer to any element, so it can be invalidated. — end note]

- 17 Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

- 18 A *contiguous container* is a container whose member types iterator and const\_iterator meet the Cpp17RandomAccessIterator requirements (25.3.5.7) and model contiguous\_iterator (25.3.4.14).

**24.2.2.4 Optional container requirements****[container.opt.reqmts]**

- 1 The following operations are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics as described unless otherwise stated. If the iterators passed to

`lexicographical_compare_three_way` meet the `constexpr` iterator requirements (25.3.1) then the operations described below are implemented by `constexpr` functions.

a <=> b

2 *Result:* `synth-three-way-result<X::value_type>`.

3 *Preconditions:* Either <=> is defined for values of type (possibly `const`) `T`, or < is defined for values of type (possibly `const`) `T` and < is a total ordering relationship.

4 *Returns:* `lexicographical_compare_three_way(a.begin(), a.end(), b.begin(), b.end(), synth-three-way)`

[Note 1: The algorithm `lexicographical_compare_three_way` is defined in Clause 27. — end note]

5 *Complexity:* Linear.

#### 24.2.2.5 Allocator-aware containers

[**container.alloc.reqmts**]

1 All of the containers defined in Clause 24 and in 23.4.3 except `array` meet the additional requirements of an *allocator-aware container*, as described below.

2 Given an allocator type `A` and given a container type `X` having a `value_type` identical to `T` and an `allocator_type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue `m` of type `A`, a pointer `p` of type `T*`, an expression `v` of type (possibly `const`) `T`, and an rvalue `rv` of type `T`, the following terms are defined. If `X` is not allocator-aware or is a specialization of `basic_string`, the terms below are defined as if `A` were `allocator<T>` — no allocator object needs to be created and user specializations of `allocator<T>` are not instantiated:

(2.1) — `T` is *Cpp17DefaultInsertable into X* means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p)
```

(2.2) — An element of `X` is *default-inserted* if it is initialized by evaluation of the expression

```
allocator_traits<A>::construct(m, p)
```

where `p` is the address of the uninitialized storage for the element allocated within `X`.

(2.3) — `T` is *Cpp17MoveInsertable into X* means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, rv)
```

and its evaluation causes the following postcondition to hold: The value of `*p` is equivalent to the value of `rv` before the evaluation.

[Note 1: `rv` remains a valid object. Its state is unspecified — end note]

(2.4) — `T` is *Cpp17CopyInsertable into X* means that, in addition to `T` being *Cpp17MoveInsertable into X*, the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, v)
```

and its evaluation causes the following postcondition to hold: The value of `v` is unchanged and is equivalent to `*p`.

(2.5) — `T` is *Cpp17EmplaceConstructible into X from args*, for zero or more arguments `args`, means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, args)
```

(2.6) — `T` is *Cpp17Erasable from X* means that the following expression is well-formed:

```
allocator_traits<A>::destroy(m, p)
```

[Note 2: A container calls `allocator_traits<A>::construct(m, p, args)` to construct an element at `p` using `args`, with `m == get_allocator()`. The default `construct` in `allocator` will call `::new((void*)p) T(args)`, but specialized allocators can choose a different definition. — end note]

3 The following exposition-only concept is used in the definition of containers:

```
template<class R, class T>
concept container-compatible-range = // exposition only
 ranges::input_range<R> && convertible_to<ranges::range_reference_t<R>, T>;
```

4 In this subclause,

(4.1) — `X` denotes an allocator-aware container class with a `value_type` of `T` using an allocator of type `A`,

(4.2) — `u` denotes a variable,

- (4.3) — a and b denote non-const lvalues of type X,
- (4.4) — c denotes an lvalue of type const X,
- (4.5) — t denotes an lvalue or a const rvalue of type X,
- (4.6) — rv denotes a non-const rvalue of type X, and
- (4.7) — m is a value of type A.

A type X meets the allocator-aware container requirements if X meets the container requirements and the following types, statements, and expressions are well-formed and have the specified semantics.

```
typename X::allocator_type
```

5       *Result:* A

6       *Preconditions:* allocator\_type::value\_type is the same as X::value\_type.

```
c.get_allocator()
```

7       *Result:* A

8       *Complexity:* Constant.

```
X u;
```

```
X u = X();
```

9       *Preconditions:* A meets the *Cpp17DefaultConstructible* requirements.

10      *Postconditions:* u.empty() returns true, u.get\_allocator() == A().

11      *Complexity:* Constant.

```
X u(m);
```

12      *Postconditions:* u.empty() returns true, u.get\_allocator() == m.

13      *Complexity:* Constant.

```
X u(t, m);
```

14      *Preconditions:* T is *Cpp17CopyInsertable* into X.

15      *Postconditions:* u == t, u.get\_allocator() == m

16      *Complexity:* Linear.

```
X u(rv);
```

17      *Postconditions:* u has the same elements as rv had before this construction; the value of u.get\_allocator() is the same as the value of rv.get\_allocator() before this construction.

18      *Complexity:* Constant.

```
X u(rv, m);
```

19      *Preconditions:* T is *Cpp17MoveInsertable* into X.

20      *Postconditions:* u has the same elements, or copies of the elements, that rv had before this construction, u.get\_allocator() == m.

21      *Complexity:* Constant if m == rv.get\_allocator(), otherwise linear.

```
a = t
```

22      *Result:* X&.

23      *Preconditions:* T is *Cpp17CopyInsertable* into X and *Cpp17CopyAssignable*.

24      *Postconditions:* a == t is true.

25      *Complexity:* Linear.

```
a = rv
```

26      *Result:* X&.

27 *Preconditions:* If `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value` is `false`,  $T$  is *Cpp17MoveInsertable* into  $X$  and *Cpp17MoveAssignable*.

28 *Effects:* All existing elements of  $a$  are either move assigned to or destroyed.

29 *Postconditions:* If  $a$  and  $rv$  do not refer to the same object,  $a$  is equal to the value that  $rv$  had before this assignment.

30 *Complexity:* Linear.

`a.swap(b)`

31 *Result:* `void`

32 *Effects:* Exchanges the contents of  $a$  and  $b$ .

33 *Complexity:* Constant.

34 The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type  $A$  shall not qualify as an allocator unless it meets both of the following conditions:

(34.1) — The *qualified-id* `A::value_type` is valid and denotes a type (13.10.3).

(34.2) — The expression `declval<A&>().allocate(size_t{})` is well-formed when treated as an unevaluated operand.

### 24.2.3 Container data races

[container.requirements.dataraces]

1 For purposes of avoiding data races (16.4.6.10), implementations shall consider the following functions to be `const`: `begin`, `end`, `rbegin`, `rend`, `front`, `back`, `data`, `find`, `lower_bound`, `upper_bound`, `equal_range`, `at` and, except in associative or unordered associative containers, `operator[]`.

2 Notwithstanding 16.4.6.10, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting `vector<bool>`, are modified concurrently.

3 [Note 1: For a `vector<int> x` with a size greater than one, `x[1] = 5` and `*x.begin() = 10` can be executed concurrently without a data race, but `x[0] = 5` and `*x.begin() = 10` executed concurrently can result in a data race. As an exception to the general rule, for a `vector<bool> y`, `y[0] = true` can race with `y[1] = true`. — end note]

### 24.2.4 Sequence containers

[sequence.reqmts]

1 A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: `vector`, `forward_list`, `list`, and `deque`. In addition, `array` is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as `stacks` or `queues`, out of the basic sequence container kinds (or out of other kinds of sequence containers that the user defines).

2 [Note 1: The sequence containers offer the programmer different complexity trade-offs. `vector` is appropriate in most circumstances. `array` has a fixed size known during translation. `list` or `forward_list` support frequent insertions and deletions from the middle of the sequence. `deque` supports efficient insertions and deletions taking place at the beginning or at the end of the sequence. When choosing a container, remember `vector` is best; leave a comment to explain if you choose from the rest! — end note]

3 In this subclause,

(3.1) —  $X$  denotes a sequence container class,

(3.2) —  $a$  denotes a value of type  $X$  containing elements of type  $T$ ,

(3.3) —  $u$  denotes the name of a variable being declared,

(3.4) —  $A$  denotes `X::allocator_type` if the *qualified-id* `X::allocator_type` is valid and denotes a type (13.10.3) and `allocator<T>` if it doesn't,

(3.5) —  $i$  and  $j$  denote iterators that meet the *Cpp17InputIterator* requirements and refer to elements implicitly convertible to `value_type`,

(3.6) —  $[i, j)$  denotes a valid range,

(3.7) —  $rg$  denotes a value of a type  $R$  that models *container-compatible-range<T>*,

(3.8) —  $il$  designates an object of type `initializer_list<value_type>`,

(3.9) —  $n$  denotes a value of type `X::size_type`,

- (3.10) —  $p$  denotes a valid constant iterator to  $a$ ,
- (3.11) —  $q$  denotes a valid dereferenceable constant iterator to  $a$ ,
- (3.12) —  $[q_1, q_2)$  denotes a valid range of constant iterators in  $a$ ,
- (3.13) —  $t$  denotes an lvalue or a const rvalue of  $X::\text{value\_type}$ , and
- (3.14) —  $rv$  denotes a non-const rvalue of  $X::\text{value\_type}$ .
- (3.15) —  $\text{Args}$  denotes a template parameter pack;
- (3.16) —  $\text{args}$  denotes a function parameter pack with the pattern  $\text{Args}\&\&$ .

4 The complexities of the expressions are sequence dependent.

5 A type  $X$  meets the *sequence container* requirements if  $X$  meets the container requirements and the following statements and expressions are well-formed and have the specified semantics.

$X(u(n, t));$

6 *Preconditions:*  $T$  is *Cpp17CopyInsertable* into  $X$ .

7 *Effects:* Constructs a sequence container with  $n$  copies of  $t$ .

8 *Postconditions:*  $\text{distance}(u.\text{begin}(), u.\text{end}()) == n$  is true.

$X(u(i, j));$

9 *Preconditions:*  $T$  is *Cpp17EmplaceConstructible* into  $X$  from  $*i$ . For *vector*, if the iterator does not meet the *Cpp17ForwardIterator* requirements (25.3.5.5),  $T$  is also *Cpp17MoveInsertable* into  $X$ .

10 *Effects:* Constructs a sequence container equal to the range  $[i, j)$ . Each iterator in the range  $[i, j)$  is dereferenced exactly once.

11 *Postconditions:*  $\text{distance}(u.\text{begin}(), u.\text{end}()) == \text{distance}(i, j)$  is true.

$X(\text{from\_range}, rg)$

12 *Preconditions:*  $T$  is *Cpp17EmplaceConstructible* into  $X$  from  $*\text{ranges}::\text{begin}(rg)$ . For *vector*, if  $R$  models neither *sized\_range* nor *forward\_range*,  $T$  is also *Cpp17MoveInsertable* into  $X$ .

13 *Effects:* Constructs a sequence container equal to the range  $rg$ . Each iterator in the range  $rg$  is dereferenced exactly once.

14 *Postconditions:*  $\text{distance}(\text{begin}(), \text{end}()) == \text{ranges}::\text{distance}(rg)$  is true.

$X(il)$

15 *Effects:* Equivalent to  $X(il.\text{begin}(), il.\text{end}())$ .

$a = il$

16 *Result:*  $X\&$ .

17 *Preconditions:*  $T$  is *Cpp17CopyInsertable* into  $X$  and *Cpp17CopyAssignable*.

18 *Effects:* Assigns the range  $[il.\text{begin}(), il.\text{end}())$  into  $a$ . All existing elements of  $a$  are either assigned to or destroyed.

19 *Returns:*  $*\text{this}$ .

$a.\text{emplace}(p, \text{args})$

20 *Result:* iterator.

21 *Preconditions:*  $T$  is *Cpp17EmplaceConstructible* into  $X$  from  $\text{args}$ . For *vector* and *deque*,  $T$  is also *Cpp17MoveInsertable* into  $X$  and *Cpp17MoveAssignable*.

22 *Effects:* Inserts an object of type  $T$  constructed with  $\text{std}::\text{forward}\langle\text{Args}\rangle(\text{args})\dots$  before  $p$ .

[Note 2:  $\text{args}$  can directly or indirectly refer to a value in  $a$ . — end note]

23 *Returns:* An iterator that points to the new element constructed from  $\text{args}$  into  $a$ .

$a.\text{insert}(p, t)$

24 *Result:* iterator.

25 *Preconditions:*  $T$  is *Cpp17CopyInsertable* into  $X$ . For *vector* and *deque*,  $T$  is also *Cpp17CopyAssignable*.

26 *Effects:* Inserts a copy of  $t$  before  $p$ .

27 *Returns:* An iterator that points to the copy of  $t$  inserted into  $a$ .

`a.insert(p, rv)`

28 *Result:* iterator.

29 *Preconditions:*  $T$  is *Cpp17MoveInsertable* into  $X$ . For *vector* and *deque*,  $T$  is also *Cpp17MoveAssignable*.

30 *Effects:* Inserts a copy of  $rv$  before  $p$ .

31 *Returns:* An iterator that points to the copy of  $rv$  inserted into  $a$ .

`a.insert(p, n, t)`

32 *Result:* iterator.

33 *Preconditions:*  $T$  is *Cpp17CopyInsertable* into  $X$  and *Cpp17CopyAssignable*.

34 *Effects:* Inserts  $n$  copies of  $t$  before  $p$ .

35 *Returns:* An iterator that points to the copy of the first element inserted into  $a$ , or  $p$  if  $n == 0$ .

`a.insert(p, i, j)`

36 *Result:* iterator.

37 *Preconditions:*  $T$  is *Cpp17EmplaceConstructible* into  $X$  from  $*i$ . For *vector* and *deque*,  $T$  is also *Cpp17MoveInsertable* into  $X$ , *Cpp17MoveConstructible*, *Cpp17MoveAssignable*, and swappable (16.4.4.3). Neither  $i$  nor  $j$  are iterators into  $a$ .

38 *Effects:* Inserts copies of elements in  $[i, j)$  before  $p$ . Each iterator in the range  $[i, j)$  shall be dereferenced exactly once.

39 *Returns:* An iterator that points to the copy of the first element inserted into  $a$ , or  $p$  if  $i == j$ .

`a.insert_range(p, rg)`

40 *Result:* iterator.

41 *Preconditions:*  $T$  is *Cpp17EmplaceConstructible* into  $X$  from  $*ranges::begin(rg)$ . For *vector* and *deque*,  $T$  is also *Cpp17MoveInsertable* into  $X$ , *Cpp17MoveConstructible*, *Cpp17MoveAssignable*, and swappable (16.4.4.3).  $rg$  and  $a$  do not overlap.

42 *Effects:* Inserts copies of elements in  $rg$  before  $p$ . Each iterator in the range  $rg$  is dereferenced exactly once.

43 *Returns:* An iterator that points to the copy of the first element inserted into  $a$ , or  $p$  if  $rg$  is empty.

`a.insert(p, il)`

44 *Effects:* Equivalent to `a.insert(p, il.begin(), il.end())`.

`a.erase(q)`

45 *Result:* iterator.

46 *Preconditions:* For *vector* and *deque*,  $T$  is *Cpp17MoveAssignable*.

47 *Effects:* Erases the element pointed to by  $q$ .

48 *Returns:* An iterator that points to the element immediately following  $q$  prior to the element being erased. If no such element exists, `a.end()` is returned.

`a.erase(q1, q2)`

49 *Result:* iterator.

50 *Preconditions:* For *vector* and *deque*,  $T$  is *Cpp17MoveAssignable*.

51 *Effects:* Erases the elements in the range  $[q1, q2)$ .

52 *Returns:* An iterator that points to the element pointed to by  $q2$  prior to any elements being erased. If no such element exists, `a.end()` is returned.

a.clear()

53 *Result:* void

54 *Effects:* Destroys all elements in a. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

55 *Postconditions:* a.empty() is true.

56 *Complexity:* Linear.

a.assign(i, j)

57 *Result:* void

58 *Preconditions:* T is *Cpp17EmplaceConstructible* into X from \*i and assignable from \*i. For vector, if the iterator does not meet the forward iterator requirements (25.3.5.5), T is also *Cpp17MoveInsertable* into X. Neither i nor j are iterators into a.

59 *Effects:* Replaces elements in a with a copy of [i, j). Invalidates all references, pointers and iterators referring to the elements of a. For vector and deque, also invalidates the past-the-end iterator. Each iterator in the range [i, j) is dereferenced exactly once.

a.assign\_range(rg)

60 *Result:* void

61 *Mandates:* assignable\_from<T&, ranges::range\_reference\_t<R>> is modeled.

62 *Preconditions:* T is *Cpp17EmplaceConstructible* into X from \*ranges::begin(rg). For vector, if R models neither sized\_range nor forward\_range, T is also *Cpp17MoveInsertable* into X. rg and a do not overlap.

63 *Effects:* Replaces elements in a with a copy of each element in rg. Invalidates all references, pointers, and iterators referring to the elements of a. For vector and deque, also invalidates the past-the-end iterator. Each iterator in the range rg is dereferenced exactly once.

a.assign(il)

64 *Effects:* Equivalent to a.assign(il.begin(), il.end()).

a.assign(n, t)

65 *Result:* void

66 *Preconditions:* T is *Cpp17CopyInsertable* into X and *Cpp17CopyAssignable*. t is not a reference into a.

67 *Effects:* Replaces elements in a with n copies of t. Invalidates all references, pointers and iterators referring to the elements of a. For vector and deque, also invalidates the past-the-end iterator.

68 For every sequence container defined in this Clause and in [Clause 23](#):

(68.1) — If the constructor

```
template<class InputIterator>
 X(InputIterator first, InputIterator last,
 const allocator_type& alloc = allocator_type());
```

is called with a type InputIterator that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(68.2) — If the member functions of the forms:

```
template<class InputIterator>
 return-type F(const_iterator p,
 InputIterator first, InputIterator last); // such as insert
```

```
template<class InputIterator>
 return-type F(InputIterator first, InputIterator last); // such as append, assign
```

```
template<class InputIterator>
 return-type F(const_iterator i1, const_iterator i2,
 InputIterator first, InputIterator last); // such as replace
```

are called with a type `InputIterator` that does not qualify as an input iterator, then these functions shall not participate in overload resolution.

- (68.3) — A deduction guide for a sequence container shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter, or if it has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

69 The following operations are provided for some types of sequence containers but not others. An implementation shall implement them so as to take amortized constant time.

`a.front()`

70 *Result:* reference; `const_reference` for constant `a`.

71 *Returns:* `*a.begin()`

72 *Remarks:* Required for `basic_string`, `array`, `deque`, `forward_list`, `list`, and `vector`.

`a.back()`

73 *Result:* reference; `const_reference` for constant `a`.

74 *Effects:* Equivalent to:

```
auto tmp = a.end();
--tmp;
return *tmp;
```

75 *Remarks:* Required for `basic_string`, `array`, `deque`, `list`, and `vector`.

`a.emplace_front(args)`

76 *Result:* reference

77 *Preconditions:*  $T$  is `Cpp17EmplaceConstructible` into  $X$  from `args`.

78 *Effects:* Prepends an object of type  $T$  constructed with `std::forward<Args>(args)...`

79 *Returns:* `a.front()`.

80 *Remarks:* Required for `deque`, `forward_list`, and `list`.

`a.emplace_back(args)`

81 *Result:* reference

82 *Preconditions:*  $T$  is `Cpp17EmplaceConstructible` into  $X$  from `args`. For `vector`,  $T$  is also `Cpp17MoveInsertable` into  $X$ .

83 *Effects:* Appends an object of type  $T$  constructed with `std::forward<Args>(args)...`

84 *Returns:* `a.back()`.

85 *Remarks:* Required for `deque`, `list`, and `vector`.

`a.push_front(t)`

86 *Result:* `void`

87 *Preconditions:*  $T$  is `Cpp17CopyInsertable` into  $X$ .

88 *Effects:* Prepends a copy of `t`.

89 *Remarks:* Required for `deque`, `forward_list`, and `list`.

`a.push_front(rv)`

90 *Result:* `void`

91 *Preconditions:*  $T$  is `Cpp17MoveInsertable` into  $X$ .

92 *Effects:* Prepends a copy of `rv`.

93 *Remarks:* Required for `deque`, `forward_list`, and `list`.

`a.prepend_range(rg)`

94 *Result:* `void`

95        *Preconditions:*  $T$  is *Cpp17EmplaceConstructible* into  $X$  from  $*ranges::begin(rg)$ .

96        *Effects:* Inserts copies of elements in  $rg$  before  $begin()$ . Each iterator in the range  $rg$  is dereferenced exactly once.

          [*Note 3:* The order of elements in  $rg$  is not reversed. — *end note*]

97        *Remarks:* Required for `deque`, `forward_list`, and `list`.

      a.push\_back(t)

98        *Result:* void

99        *Preconditions:*  $T$  is *Cpp17CopyInsertable* into  $X$ .

100       *Effects:* Appends a copy of  $t$ .

101       *Remarks:* Required for `basic_string`, `deque`, `list`, and `vector`.

      a.push\_back(rv)

102       *Result:* void

103       *Preconditions:*  $T$  is *Cpp17MoveInsertable* into  $X$ .

104       *Effects:* Appends a copy of  $rv$ .

105       *Remarks:* Required for `basic_string`, `deque`, `list`, and `vector`.

      a.append\_range(rg)

106       *Result:* void

107       *Preconditions:*  $T$  is *Cpp17EmplaceConstructible* into  $X$  from  $*ranges::begin(rg)$ . For `vector`,  $T$  is also *Cpp17MoveInsertable* into  $X$ .

108       *Effects:* Inserts copies of elements in  $rg$  before  $end()$ . Each iterator in the range  $rg$  is dereferenced exactly once.

109       *Remarks:* Required for `deque`, `list`, and `vector`.

      a.pop\_front()

110       *Result:* void

111       *Preconditions:*  $a.empty()$  is false.

112       *Effects:* Destroys the first element.

113       *Remarks:* Required for `deque`, `forward_list`, and `list`.

      a.pop\_back()

114       *Result:* void

115       *Preconditions:*  $a.empty()$  is false.

116       *Effects:* Destroys the last element.

117       *Remarks:* Required for `basic_string`, `deque`, `list`, and `vector`.

      a[n]

118       *Result:* reference; `const_reference` for constant  $a$

119       *Returns:*  $*(a.begin() + n)$

120       *Remarks:* Required for `basic_string`, `array`, `deque`, and `vector`.

      a.at(n)

121       *Result:* reference; `const_reference` for constant  $a$

122       *Returns:*  $*(a.begin() + n)$

123       *Throws:* `out_of_range` if  $n \geq a.size()$ .

124       *Remarks:* Required for `basic_string`, `array`, `deque`, and `vector`.

## 24.2.5 Node handles

[container.node]

### 24.2.5.1 Overview

[container.node.overview]

- <sup>1</sup> A *node handle* is an object that accepts ownership of a single element from an associative container (24.2.7) or an unordered associative container (24.2.8). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 79.

Table 79: Container types with compatible nodes [tab:container.node.compat]

|                                |                                     |
|--------------------------------|-------------------------------------|
| map<K, T, C1, A>               | map<K, T, C2, A>                    |
| map<K, T, C1, A>               | multimap<K, T, C2, A>               |
| set<K, C1, A>                  | set<K, C2, A>                       |
| set<K, C1, A>                  | multiset<K, C2, A>                  |
| unordered_map<K, T, H1, E1, A> | unordered_map<K, T, H2, E2, A>      |
| unordered_map<K, T, H1, E1, A> | unordered_multimap<K, T, H2, E2, A> |
| unordered_set<K, H1, E1, A>    | unordered_set<K, H2, E2, A>         |
| unordered_set<K, H1, E1, A>    | unordered_multiset<K, H2, E2, A>    |

- <sup>2</sup> If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.
- <sup>3</sup> Class *node-handle* is for exposition only.
- <sup>4</sup> If a user-defined specialization of pair exists for pair<const Key, T> or pair<Key, T>, where Key is the container's key\_type and T is the container's mapped\_type, the behavior of operations involving node handles is undefined.

```
template<unspecified>
class node-handle {
public:
 // These type declarations are described in 24.2.7 and 24.2.8.
 using value_type = see below; // not present for map containers
 using key_type = see below; // not present for set containers
 using mapped_type = see below; // not present for set containers
 using allocator_type = see below;

private:
 using container_node_type = unspecified; // exposition only
 using ator_traits = allocator_traits<allocator_type>; // exposition only

 typename ator_traits::template
 rebind_traits<container_node_type>::pointer ptr_; // exposition only
 optional<allocator_type> alloc_; // exposition only

public:
 // 24.2.5.2, constructors, copy, and assignment
 constexpr node-handle() noexcept : ptr_(), alloc_() {}
 node-handle(node-handle&&) noexcept;
 node-handle& operator=(node-handle&&);

 // 24.2.5.3, destructor
 ~node-handle();

 // 24.2.5.4, observers
 value_type& value() const; // not present for map containers
 key_type& key() const; // not present for set containers
 mapped_type& mapped() const; // not present for set containers

 allocator_type get_allocator() const;
 explicit operator bool() const noexcept;
 [[nodiscard]] bool empty() const noexcept;

```

```

// 24.2.5.5, modifiers
void swap(node-handle&)
 noexcept(ator_traits::propagate_on_container_swap::value ||
 ator_traits::is_always_equal::value);

friend void swap(node-handle& x, node-handle& y) noexcept(noexcept(x.swap(y))) {
 x.swap(y);
}
};

```

### 24.2.5.2 Constructors, copy, and assignment

[container.node.cons]

```
node-handle(node-handle&& nh) noexcept;
```

- 1 *Effects:* Constructs a *node-handle* object initializing *ptr\_* with *nh.ptr\_*. Move constructs *alloc\_* with *nh.alloc\_*. Assigns *nullptr* to *nh.ptr\_* and assigns *nullopt* to *nh.alloc\_*.

```
node-handle& operator=(node-handle&& nh);
```

- 2 *Preconditions:* Either *!alloc\_*, or *ator\_traits::propagate\_on\_container\_move\_assignment::value* is true, or *alloc\_ == nh.alloc\_*.

3 *Effects:*

- (3.1) — If *ptr\_ != nullptr*, destroys the *value\_type* subobject in the *container\_node\_type* object pointed to by *ptr\_* by calling *ator\_traits::destroy*, then deallocates *ptr\_* by calling *ator\_traits::template rebind\_traits<container\_node\_type>::deallocate*.
- (3.2) — Assigns *nh.ptr\_* to *ptr\_*.
- (3.3) — If *!alloc\_* or *ator\_traits::propagate\_on\_container\_move\_assignment::value* is true, move assigns *nh.alloc\_* to *alloc\_*.
- (3.4) — Assigns *nullptr* to *nh.ptr\_* and assigns *nullopt* to *nh.alloc\_*.

4 *Returns:* *\*this*.

5 *Throws:* Nothing.

### 24.2.5.3 Destructor

[container.node.dtor]

```
~node-handle();
```

- 1 *Effects:* If *ptr\_ != nullptr*, destroys the *value\_type* subobject in the *container\_node\_type* object pointed to by *ptr\_* by calling *ator\_traits::destroy*, then deallocates *ptr\_* by calling *ator\_traits::template rebind\_traits<container\_node\_type>::deallocate*.

### 24.2.5.4 Observers

[container.node.observers]

```
value_type& value() const;
```

- 1 *Preconditions:* *empty() == false*.

2 *Returns:* A reference to the *value\_type* subobject in the *container\_node\_type* object pointed to by *ptr\_*.

3 *Throws:* Nothing.

```
key_type& key() const;
```

- 4 *Preconditions:* *empty() == false*.

5 *Returns:* A non-const reference to the *key\_type* member of the *value\_type* subobject in the *container\_node\_type* object pointed to by *ptr\_*.

6 *Throws:* Nothing.

7 *Remarks:* Modifying the key through the returned reference is permitted.

```
mapped_type& mapped() const;
```

- 8 *Preconditions:* *empty() == false*.

9 *Returns:* A reference to the *mapped\_type* member of the *value\_type* subobject in the *container\_node\_type* object pointed to by *ptr\_*.

10 *Throws:* Nothing.

```
allocator_type get_allocator() const;
```

11 *Preconditions:* `empty() == false`.

12 *Returns:* `*alloc_`.

13 *Throws:* Nothing.

```
explicit operator bool() const noexcept;
```

14 *Returns:* `ptr_ != nullptr`.

```
[[nodiscard]] bool empty() const noexcept;
```

15 *Returns:* `ptr_ == nullptr`.

### 24.2.5.5 Modifiers

[container.node.modifiers]

```
void swap(node-handle& nh)
 noexcept(ator_traits::propagate_on_container_swap::value ||
 ator_traits::is_always_equal::value);
```

1 *Preconditions:* `!alloc_`, or `!nh.alloc_`, or `ator_traits::propagate_on_container_swap::value` is true, or `alloc_ == nh.alloc_`.

2 *Effects:* Calls `swap(ptr_, nh.ptr_)`. If `!alloc_`, or `!nh.alloc_`, or `ator_traits::propagate_on_container_swap::value` is true calls `swap(alloc_, nh.alloc_)`.

### 24.2.6 Insert return type

[container.insert.return]

1 The associative containers with unique keys and the unordered containers with unique keys have a member function `insert` that returns a nested type `insert_return_type`. That return type is a specialization of the template specified in this subclause.

```
template<class Iterator, class NodeType>
struct insert-return-type
{
 Iterator position;
 bool inserted;
 NodeType node;
};
```

2 The name `insert-return-type` is exposition only. `insert-return-type` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

### 24.2.7 Associative containers

[associative.reqmts]

#### 24.2.7.1 General

[associative.reqmts.general]

1 Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: `set`, `multiset`, `map` and `multimap`.

2 Each associative container is parameterized on `Key` and an ordering relation `Compare` that induces a strict weak ordering (27.8) on elements of `Key`. In addition, `map` and `multimap` associate an arbitrary *mapped type* `T` with the `Key`. The object of type `Compare` is called the *comparison object* of a container.

3 The phrase “equivalence of keys” means the equivalence relation imposed by the comparison object. That is, two keys `k1` and `k2` are considered to be equivalent if for the comparison object `comp`, `comp(k1, k2) == false && comp(k2, k1) == false`.

[Note 1: This is not necessarily the same as the result of `k1 == k2`. — end note]

For any two keys `k1` and `k2` in the same container, calling `comp(k1, k2)` shall always return the same value.

4 An associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. The `set` and `map` classes support unique keys; the `multiset` and `multimap` classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.

5 For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`.

- 6 iterator of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

[Note 2: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — end note]

- 7 In this subclause,

- (7.1) — `X` denotes an associative container class,
- (7.2) — `a` denotes a value of type `X`,
- (7.3) — `a2` denotes a value of a type with nodes compatible with type `X` (Table 79),
- (7.4) — `b` denotes a possibly `const` value of type `X`,
- (7.5) — `u` denotes the name of a variable being declared,
- (7.6) — `a_uniq` denotes a value of type `X` when `X` supports unique keys,
- (7.7) — `a_eq` denotes a value of type `X` when `X` supports multiple keys,
- (7.8) — `a_tran` denotes a possibly `const` value of type `X` when the *qualified-id* `X::key_compare::is_transparent` is valid and denotes a type (13.10.3),
- (7.9) — `i` and `j` meet the *Cpp17InputIterator* requirements and refer to elements implicitly convertible to `value_type`,
- (7.10) — `[i, j)` denotes a valid range,
- (7.11) — `rg` denotes a value of a type `R` that models *container-compatible-range*<`value_type`>,
- (7.12) — `p` denotes a valid constant iterator to `a`,
- (7.13) — `q` denotes a valid dereferenceable constant iterator to `a`,
- (7.14) — `r` denotes a valid dereferenceable iterator to `a`,
- (7.15) — `[q1, q2)` denotes a valid range of constant iterators in `a`,
- (7.16) — `il` designates an object of type `initializer_list<value_type>`,
- (7.17) — `t` denotes a value of type `X::value_type`,
- (7.18) — `k` denotes a value of type `X::key_type`, and
- (7.19) — `c` denotes a possibly `const` value of type `X::key_compare`;
- (7.20) — `kl` is a value such that `a` is partitioned (27.8) with respect to `c(x, kl)`, with `x` the key value of `e` and `e` in `a`;
- (7.21) — `ku` is a value such that `a` is partitioned with respect to `!c(ku, x)`, with `x` the key value of `e` and `e` in `a`;
- (7.22) — `ke` is a value such that `a` is partitioned with respect to `c(x, ke)` and `!c(ke, x)`, with `c(x, ke)` implying `!c(ke, x)` and with `x` the key value of `e` and `e` in `a`;
- (7.23) — `kx` is a value such that
  - (7.23.1) — `a` is partitioned with respect to `c(x, kx)` and `!c(kx, x)`, with `c(x, kx)` implying `!c(kx, x)` and with `x` the key value of `e` and `e` in `a`, and
  - (7.23.2) — `kx` is not convertible to either `iterator` or `const_iterator`; and
- (7.24) — `A` denotes the storage allocator used by `X`, if any, or `allocator<X::value_type>` otherwise,
- (7.25) — `m` denotes an allocator of a type convertible to `A`, and `nh` denotes a non-const rvalue of type `X::node_type`.

- 8 A type `X` meets the *associative container* requirements if `X` meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for `map` and `multimap`, the requirements placed on `value_type` in 24.2.2.5 apply instead to `key_type` and `mapped_type`.

[Note 3: For example, in some cases `key_type` and `mapped_type` are required to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*. — end note]

```
typename X::key_type
```

- 9 **Result:** `Key`.

typename X::mapped\_type

10     *Result:* T.

11     *Remarks:* For map and multimap only.

typename X::value\_type

12     *Result:* Key for set and multiset only; pair<const Key, T> for map and multimap only.

13     *Preconditions:* X::value\_type is *Cpp17Erasable* from X.

typename X::key\_compare

14     *Result:* Compare.

15     *Preconditions:* key\_compare is *Cpp17CopyConstructible*.

typename X::value\_compare

16     *Result:* A binary predicate type. It is the same as key\_compare for set and multiset; is an ordering relation on pairs induced by the first component (i.e., Key) for map and multimap.

typename X::node\_type

17     *Result:* A specialization of the *node-handle* class template (24.2.5), such that the public nested types are the same types as the corresponding types in X.

X(c)

18     *Effects:* Constructs an empty container. Uses a copy of c as a comparison object.

19     *Complexity:* Constant.

X u = X();

X u;

20     *Preconditions:* key\_compare meets the *Cpp17DefaultConstructible* requirements.

21     *Effects:* Constructs an empty container. Uses Compare() as a comparison object.

22     *Complexity:* Constant.

X(i, j, c)

23     *Preconditions:* value\_type is *Cpp17EplaceConstructible* into X from \*i.

24     *Effects:* Constructs an empty container and inserts elements from the range [i, j) into it; uses c as a comparison object.

25     *Complexity:*  $N \log N$  in general, where  $N$  has the value distance(i, j); linear if [i, j) is sorted with value\_comp().

X(i, j)

26     *Preconditions:* key\_compare meets the *Cpp17DefaultConstructible* requirements. value\_type is *Cpp17EplaceConstructible* into X from \*i.

27     *Effects:* Constructs an empty container and inserts elements from the range [i, j) into it; uses Compare() as a comparison object.

28     *Complexity:*  $N \log N$  in general, where  $N$  has the value distance(i, j); linear if [i, j) is sorted with value\_comp().

X(from\_range, rg, c)

29     *Preconditions:* value\_type is *Cpp17EplaceConstructible* into X from \*range::begin(rg).

30     *Effects:* Constructs an empty container and inserts each element from rg into it. Uses c as the comparison object.

31     *Complexity:*  $N \log N$  in general, where  $N$  has the value ranges::distance(rg); linear if rg is sorted with value\_comp().

`X(from_range, rg)`

32 *Preconditions:* `key_compare` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

33 *Effects:* Constructs an empty container and inserts each element from `rg` into it. Uses `Compare()` as the comparison object.

34 *Complexity:* Same as `X(from_range, rg, c)`.

`X(il, c)`

35 *Effects:* Equivalent to `X(il.begin(), il.end(), c)`.

`X(il)`

36 *Effects:* Equivalent to `X(il.begin(), il.end())`.

`a = il`

37 *Result:* `X&`

38 *Preconditions:* `value_type` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

39 *Effects:* Assigns the range `[il.begin(), il.end())` into `a`. All existing elements of `a` are either assigned to or destroyed.

40 *Complexity:*  $N \log N$  in general, where  $N$  has the value `il.size() + a.size()`; linear if `[il.begin(), il.end())` is sorted with `value_comp()`.

`b.key_comp()`

41 *Result:* `X::key_compare`

42 *Returns:* The comparison object out of which `b` was constructed.

43 *Complexity:* Constant.

`b.value_comp()`

44 *Result:* `X::value_compare`

45 *Returns:* An object of `value_compare` constructed out of the comparison object.

46 *Complexity:* Constant.

`a_uniq.emplace(args)`

47 *Result:* `pair<iterator, bool>`

48 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

49 *Effects:* Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` if and only if there is no element in the container with key equivalent to the key of `t`.

50 *Returns:* The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of `t`.

51 *Complexity:* Logarithmic.

`a_eq.emplace(args)`

52 *Result:* `iterator`

53 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

54 *Effects:* Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.

55 *Returns:* An iterator pointing to the newly inserted element.

56 *Complexity:* Logarithmic.

`a.emplace_hint(p, args)`

57 *Result:* `iterator`

58 *Effects:* Equivalent to `a.emplace(std::forward<Args>(args)...) ,` except that the element is inserted as close as possible to the position just prior to `p`.

59 *Returns:* An iterator pointing to the element with the key equivalent to the newly inserted element.

60 *Complexity:* Logarithmic in general, but amortized constant if the element is inserted right before `p`.

`a_uniq.insert(t)`

61 *Result:* `pair<iterator, bool>`

62 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

63 *Effects:* Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.

64 *Returns:* The `bool` component of the returned `pair` is `true` if and only if the insertion takes place, and the `iterator` component of the `pair` points to the element with key equivalent to the key of `t`.

65 *Complexity:* Logarithmic.

`a_eq.insert(t)`

66 *Result:* `iterator`

67 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

68 *Effects:* Inserts `t` and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.

69 *Complexity:* Logarithmic.

`a.insert(p, t)`

70 *Result:* `iterator`

71 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`.

72 *Effects:* Inserts `t` if and only if there is no element with key equivalent to the key of `t` in containers with unique keys; always inserts `t` in containers with equivalent keys. `t` is inserted as close as possible to the position just prior to `p`.

73 *Returns:* An iterator pointing to the element with key equivalent to the key of `t`.

74 *Complexity:* Logarithmic in general, but amortized constant if `t` is inserted right before `p`.

`a.insert(i, j)`

75 *Result:* `void`

76 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. Neither `i` nor `j` are iterators into `a`.

77 *Effects:* Inserts each element from the range `[i, j)` if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

78 *Complexity:*  $N \log(a.size() + N)$ , where  $N$  has the value `distance(i, j)`.

`a.insert_range(rg)`

79 *Result:* `void`

80 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`. `rg` and `a` do not overlap.

81 *Effects:* Inserts each element from `rg` if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

82 *Complexity:*  $N \log(a.size() + N)$ , where  $N$  has the value `ranges::distance(rg)`.

`a.insert(il)`

83 *Effects:* Equivalent to `a.insert(il.begin(), il.end())`.

`a_uniq.insert(nh)`

84 *Result:* `insert_return_type`

85 *Preconditions:* `nh` is empty or `a_uniq.get_allocator() == nh.get_allocator()` is true.

86 *Effects:* If `nh` is empty, has no effect. Otherwise, inserts the element owned by `nh` if and only if there is no element in the container with a key equivalent to `nh.key()`.

87 *Returns:* If `nh` is empty, `inserted` is false, `position` is `end()`, and `node` is empty. Otherwise if the insertion took place, `inserted` is true, `position` points to the inserted element, and `node` is empty; if the insertion failed, `inserted` is false, `node` has the previous value of `nh`, and `position` points to an element with a key equivalent to `nh.key()`.

88 *Complexity:* Logarithmic.

`a_eq.insert(nh)`

89 *Result:* `iterator`

90 *Preconditions:* `nh` is empty or `a_eq.get_allocator() == nh.get_allocator()` is true.

91 *Effects:* If `nh` is empty, has no effect and returns `a_eq.end()`. Otherwise, inserts the element owned by `nh` and returns an iterator pointing to the newly inserted element. If a range containing elements with keys equivalent to `nh.key()` exists in `a_eq`, the element is inserted at the end of that range.

92 *Postconditions:* `nh` is empty.

93 *Complexity:* Logarithmic.

`a.insert(p, nh)`

94 *Result:* `iterator`

95 *Preconditions:* `nh` is empty or `a.get_allocator() == nh.get_allocator()` is true.

96 *Effects:* If `nh` is empty, has no effect and returns `a.end()`. Otherwise, inserts the element owned by `nh` if and only if there is no element with key equivalent to `nh.key()` in containers with unique keys; always inserts the element owned by `nh` in containers with equivalent keys. The element is inserted as close as possible to the position just prior to `p`.

97 *Postconditions:* `nh` is empty if insertion succeeds, unchanged if insertion fails.

98 *Returns:* An iterator pointing to the element with key equivalent to `nh.key()`.

99 *Complexity:* Logarithmic in general, but amortized constant if the element is inserted right before `p`.

`a.extract(k)`

100 *Result:* `node_type`

101 *Effects:* Removes the first element in the container with key equivalent to `k`.

102 *Returns:* A `node_type` owning the element if found, otherwise an empty `node_type`.

103 *Complexity:*  $\log(a.size())$

`a_tran.extract(kx)`

104 *Result:* `node_type`

105 *Effects:* Removes the first element in the container with key `r` such that `!c(r, kx) && !c(kx, r)` is true.

106 *Returns:* A `node_type` owning the element if found, otherwise an empty `node_type`.

107 *Complexity:*  $\log(a\_tran.size())$

`a.extract(q)`

108 *Result:* `node_type`

109 *Effects:* Removes the element pointed to by `q`.

110 *Returns:* A `node_type` owning that element.

111 *Complexity:* Amortized constant.

`a.merge(a2)`

112 *Result:* void

113 *Preconditions:* `a.get_allocator() == a2.get_allocator()`.

114 *Effects:* Attempts to extract each element in `a2` and insert it into `a` using the comparison object of `a`. In containers with unique keys, if there is an element in `a` with key equivalent to the key of an element from `a2`, then that element is not extracted from `a2`.

115 *Postconditions:* Pointers and references to the transferred elements of `a2` refer to those same elements but as members of `a`. Iterators referring to the transferred elements will continue to refer to their elements, but they now behave as iterators into `a`, not into `a2`.

116 *Throws:* Nothing unless the comparison object throws.

117 *Complexity:*  $N \log(a.size() + N)$ , where  $N$  has the value `a2.size()`.

`a.erase(k)`

118 *Result:* `size_type`

119 *Effects:* Erases all elements in the container with key equivalent to `k`.

120 *Returns:* The number of erased elements.

121 *Complexity:*  $\log(a.size()) + a.count(k)$

`a_tran.erase(kx)`

122 *Result:* `size_type`

123 *Effects:* Erases all elements in the container with key `r` such that `!c(r, kx) && !c(kx, r)` is true.

124 *Returns:* The number of erased elements.

125 *Complexity:*  $\log(a\_tran.size()) + a\_tran.count(kx)$

`a.erase(q)`

126 *Result:* iterator

127 *Effects:* Erases the element pointed to by `q`.

128 *Returns:* An iterator pointing to the element immediately following `q` prior to the element being erased. If no such element exists, returns `a.end()`.

129 *Complexity:* Amortized constant.

`a.erase(r)`

130 *Result:* iterator

131 *Effects:* Erases the element pointed to by `r`.

132 *Returns:* An iterator pointing to the element immediately following `r` prior to the element being erased. If no such element exists, returns `a.end()`.

133 *Complexity:* Amortized constant.

`a.erase(q1, q2)`

134 *Result:* iterator

135 *Effects:* Erases all the elements in the range `[q1, q2)`.

136 *Returns:* An iterator pointing to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.

137 *Complexity:*  $\log(a.size()) + N$ , where  $N$  has the value `distance(q1, q2)`.

`a.clear()`

138 *Effects:* Equivalent to `a.erase(a.begin(), a.end())`.

139 *Postconditions:* `a.empty()` is true.

140 *Complexity:* Linear in `a.size()`.

`b.find(k)`

141 *Result:* iterator; const\_iterator for constant b.

142 *Returns:* An iterator pointing to an element with the key equivalent to k, or `b.end()` if such an element is not found.

143 *Complexity:* Logarithmic.

`a_tran.find(ke)`

144 *Result:* iterator; const\_iterator for constant a\_tran.

145 *Returns:* An iterator pointing to an element with key r such that  $!c(r, ke) \ \&\& \ !c(ke, r)$  is true, or `a_tran.end()` if such an element is not found.

146 *Complexity:* Logarithmic.

`b.count(k)`

147 *Result:* size\_type

148 *Returns:* The number of elements with key equivalent to k.

149 *Complexity:*  $\log(b.size()) + b.count(k)$

`a_tran.count(ke)`

150 *Result:* size\_type

151 *Returns:* The number of elements with key r such that  $!c(r, ke) \ \&\& \ !c(ke, r)$ .

152 *Complexity:*  $\log(a\_tran.size()) + a\_tran.count(ke)$

`b.contains(k)`

153 *Result:* bool

154 *Effects:* Equivalent to: `return b.find(k) != b.end();`

`a_tran.contains(ke)`

155 *Result:* bool

156 *Effects:* Equivalent to: `return a_tran.find(ke) != a_tran.end();`

`b.lower_bound(k)`

157 *Result:* iterator; const\_iterator for constant b.

158 *Returns:* An iterator pointing to the first element with key not less than k, or `b.end()` if such an element is not found.

159 *Complexity:* Logarithmic.

`a_tran.lower_bound(kl)`

160 *Result:* iterator; const\_iterator for constant a\_tran.

161 *Returns:* An iterator pointing to the first element with key r such that  $!c(r, kl)$ , or `a_tran.end()` if such an element is not found.

162 *Complexity:* Logarithmic.

`b.upper_bound(k)`

163 *Result:* iterator; const\_iterator for constant b.

164 *Returns:* An iterator pointing to the first element with key greater than k, or `b.end()` if such an element is not found.

165 *Complexity:* Logarithmic,

`a_tran.upper_bound(ku)`

166 *Result:* iterator; const\_iterator for constant a\_tran.

167 *Returns:* An iterator pointing to the first element with key *r* such that `c(ku, r)`, or `a_tran.end()` if such an element is not found.

168 *Complexity:* Logarithmic.

`b.equal_range(k)`

169 *Result:* `pair<iterator, iterator>`; `pair<const_iterator, const_iterator>` for constant *b*.

170 *Effects:* Equivalent to: `return make_pair(b.lower_bound(k), b.upper_bound(k));`

171 *Complexity:* Logarithmic.

`a_tran.equal_range(ke)`

172 *Result:* `pair<iterator, iterator>`; `pair<const_iterator, const_iterator>` for constant *a\_tran*.

173 *Effects:* Equivalent to: `return make_pair(a_tran.lower_bound(ke), a_tran.upper_bound(ke));`

174 *Complexity:* Logarithmic.

175 The `insert`, `insert_range`, and `emplace` members shall not affect the validity of iterators and references to the container, and the `erase` members shall invalidate only iterators and references to the erased elements.

176 The `extract` members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is undefined behavior. References and pointers to an element obtained while it is owned by a `node_type` are invalidated if the element is successfully inserted.

177 The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators *i* and *j* such that distance from *i* to *j* is positive, the following condition holds:

`value_comp(*j, *i) == false`

178 For associative containers with unique keys the stronger condition holds:

`value_comp(*i, *j) != false`

179 When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, through either a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.

180 The member function templates `find`, `count`, `contains`, `lower_bound`, `upper_bound`, `equal_range`, `erase`, and `extract` shall not participate in overload resolution unless the *qualified-id* `Compare::is_transparent` is valid and denotes a type (13.10.3). Additionally, the member function templates `extract` and `erase` shall not participate in overload resolution if `is_convertible_v<K&&, iterator> || is_convertible_v<K&&, const_iterator>` is true, where *K* is the type substituted as the first template argument.

181 A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

(181.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(181.2) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(181.3) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

### 24.2.7.2 Exception safety guarantees

[**associative.reqmts.except**]

1 For associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Compare` object (if any).

2 For associative containers, if an exception is thrown by any operation from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.

3 For associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Compare` object (if any).

## 24.2.8 Unordered associative containers

[unord.req]

### 24.2.8.1 General

[unord.req.general]

- 1 Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: `unordered_set`, `unordered_map`, `unordered_multiset`, and `unordered_multimap`.
- 2 Unordered associative containers conform to the requirements for Containers (24.2), except that the expressions `a == b` and `a != b` have different semantics than for the other container types.
- 3 Each unordered associative container is parameterized by `Key`, by a function object type `Hash` that meets the *Cpp17Hash* requirements (16.4.4.5) and acts as a hash function for argument values of type `Key`, and by a binary predicate `Pred` that induces an equivalence relation on values of type `Key`. Additionally, `unordered_map` and `unordered_multimap` associate an arbitrary *mapped type* `T` with the `Key`.
- 4 The container's object of type `Hash` — denoted by `hash` — is called the *hash function* of the container. The container's object of type `Pred` — denoted by `pred` — is called the *key equality predicate* of the container.
- 5 Two values `k1` and `k2` are considered equivalent if the container's key equality predicate `pred(k1, k2)` is valid and returns `true` when passed those values. If `k1` and `k2` are equivalent, the container's hash function shall return the same value for both.

[Note 1: Thus, when an unordered associative container is instantiated with a non-default `Pred` parameter it usually needs a non-default `Hash` parameter as well. — end note]

For any two keys `k1` and `k2` in the same container, calling `pred(k1, k2)` shall always return the same value. For any key `k` in a container, calling `hash(k)` shall always return the same value.

- 6 An unordered associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. `unordered_set` and `unordered_map` support unique keys. `unordered_multiset` and `unordered_multimap` support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into *equivalent-key groups* such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.
  - 7 For `unordered_set` and `unordered_multiset` the value type is the same as the key type. For `unordered_map` and `unordered_multimap` it is `pair<const Key, T>`.
  - 8 For unordered containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.
- [Note 2: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — end note]
- 9 The elements of an unordered associative container are organized into *buckets*. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For `unordered_multiset` and `unordered_multimap`, rehashing preserves the relative ordering of equivalent elements.

10 In this subclause,

- (10.1) — `X` denotes an unordered associative container class,
- (10.2) — `a` denotes a value of type `X`,
- (10.3) — `a2` denotes a value of a type with nodes compatible with type `X` (Table 79),
- (10.4) — `b` denotes a possibly const value of type `X`,
- (10.5) — `a_uniq` denotes a value of type `X` when `X` supports unique keys,
- (10.6) — `a_eq` denotes a value of type `X` when `X` supports equivalent keys,
- (10.7) — `a_tran` denotes a possibly const value of type `X` when the *qualified-ids* `X::key_equal::is_transparent` and `X::hasher::is_transparent` are both valid and denote types (13.10.3),
- (10.8) — `i` and `j` denote input iterators that refer to `value_type`,
- (10.9) — `[i, j)` denotes a valid range,

- (10.10) — `rg` denotes a value of a type `R` that models *container-compatible-range*`<value_type>`,
- (10.11) — `p` and `q2` denote valid constant iterators to `a`,
- (10.12) — `q` and `q1` denote valid dereferenceable constant iterators to `a`,
- (10.13) — `r` denotes a valid dereferenceable iterator to `a`,
- (10.14) — `[q1, q2)` denotes a valid range in `a`,
- (10.15) — `il` denotes a value of type `initializer_list<value_type>`,
- (10.16) — `t` denotes a value of type `X::value_type`,
- (10.17) — `k` denotes a value of type `key_type`,
- (10.18) — `hf` denotes a possibly const value of type hasher,
- (10.19) — `eq` denotes a possibly const value of type `key_equal`,
- (10.20) — `ke` is a value such that
- (10.20.1) — `eq(r1, ke) == eq(ke, r1)`,
- (10.20.2) — `hf(r1) == hf(ke)` if `eq(r1, ke)` is true, and
- (10.20.3) — `(eq(r1, ke) && eq(r1, r2)) == eq(r2, ke)`,  
 where `r1` and `r2` are keys of elements in `a_tran`,
- (10.21) — `kx` is a value such that
- (10.21.1) — `eq(r1, kx) == eq(kx, r1)`,
- (10.21.2) — `hf(r1) == hf(kx)` if `eq(r1, kx)` is true,
- (10.21.3) — `(eq(r1, kx) && eq(r1, r2)) == eq(r2, kx)`, and
- (10.21.4) — `kx` is not convertible to either iterator or `const_iterator`,  
 where `r1` and `r2` are keys of elements in `a_tran`,
- (10.22) — `n` denotes a value of type `size_type`,
- (10.23) — `z` denotes a value of type `float`, and
- (10.24) — `nh` denotes a non-const rvalue of type `X::node_type`.

- 11 A type `X` meets the *unordered associative container* requirements if `X` meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for `unordered_map` and `unordered_multimap`, the requirements placed on `value_type` in 24.2.2.5 apply instead to `key_type` and `mapped_type`.

[Note 3: For example, `key_type` and `mapped_type` are sometimes required to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*. — end note]

typename `X::key_type`

- 12 **Result:** `Key`.

typename `X::mapped_type`

- 13 **Result:** `T`.

- 14 **Remarks:** For `unordered_map` and `unordered_multimap` only.

typename `X::value_type`

- 15 **Result:** `Key` for `unordered_set` and `unordered_multiset` only; `pair<const Key, T>` for `unordered_map` and `unordered_multimap` only.

- 16 **Preconditions:** `value_type` is *Cpp17Erasable* from `X`.

typename `X::hasher`

- 17 **Result:** `Hash`.

- 18 **Preconditions:** `Hash` is a unary function object type such that the expression `hf(k)` has type `size_t`.

typename X::key\_equal

19 *Result:* Pred.

20 *Preconditions:* Pred meets the *Cpp17CopyConstructible* requirements. Pred is a binary predicate that takes two arguments of type Key. Pred is an equivalence relation.

typename X::local\_iterator

21 *Result:* An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::iterator's.

[*Note 4:* A local\_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — end note]

typename X::const\_local\_iterator

22 *Result:* An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::const\_iterator's.

[*Note 5:* A const\_local\_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — end note]

typename X::node\_type

23 *Result:* A specialization of a *node-handle* class template (24.2.5), such that the public nested types are the same types as the corresponding types in X.

X(n, hf, eq)

24 *Effects:* Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate.

25 *Complexity:*  $\mathcal{O}(n)$

X(n, hf)

26 *Preconditions:* key\_equal meets the *Cpp17DefaultConstructible* requirements.

27 *Effects:* Constructs an empty container with at least n buckets, using hf as the hash function and key\_equal() as the key equality predicate.

28 *Complexity:*  $\mathcal{O}(n)$

X(n)

29 *Preconditions:* hasher and key\_equal meet the *Cpp17DefaultConstructible* requirements.

30 *Effects:* Constructs an empty container with at least n buckets, using hasher() as the hash function and key\_equal() as the key equality predicate.

31 *Complexity:*  $\mathcal{O}(n)$

X a = X();

X a;

32 *Preconditions:* hasher and key\_equal meet the *Cpp17DefaultConstructible* requirements.

33 *Effects:* Constructs an empty container with an unspecified number of buckets, using hasher() as the hash function and key\_equal() as the key equality predicate.

34 *Complexity:* Constant.

X(i, j, n, hf, eq)

35 *Preconditions:* value\_type is *Cpp17EmplaceConstructible* into X from \*i.

36 *Effects:* Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate, and inserts elements from [i, j) into it.

37 *Complexity:* Average case  $\mathcal{O}(N)$  ( $N$  is distance(i, j)), worst case  $\mathcal{O}(N^2)$ .

`X(i, j, n, hf)`

38 *Preconditions:* `key_equal` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

39 *Effects:* Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.

40 *Complexity:* Average case  $\mathcal{O}(N)$  ( $N$  is `distance(i, j)`), worst case  $\mathcal{O}(N^2)$ .

`X(i, j, n)`

41 *Preconditions:* `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

42 *Effects:* Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.

43 *Complexity:* Average case  $\mathcal{O}(N)$  ( $N$  is `distance(i, j)`), worst case  $\mathcal{O}(N^2)$ .

`X(i, j)`

44 *Preconditions:* `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`.

45 *Effects:* Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.

46 *Complexity:* Average case  $\mathcal{O}(N)$  ( $N$  is `distance(i, j)`), worst case  $\mathcal{O}(N^2)$ .

`X(from_range, rg, n, hf, eq)`

47 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

48 *Effects:* Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `eq` as the key equality predicate, and inserts elements from `rg` into it.

49 *Complexity:* Average case  $\mathcal{O}(N)$  ( $N$  is `ranges::distance(rg)`), worst case  $\mathcal{O}(N^2)$ .

`X(from_range, rg, n, hf)`

50 *Preconditions:* `key_equal` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

51 *Effects:* Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

52 *Complexity:* Average case  $\mathcal{O}(N)$  ( $N$  is `ranges::distance(rg)`), worst case  $\mathcal{O}(N^2)$ .

`X(from_range, rg, n)`

53 *Preconditions:* `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

54 *Effects:* Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

55 *Complexity:* Average case  $\mathcal{O}(N)$  ( $N$  is `ranges::distance(rg)`), worst case  $\mathcal{O}(N^2)$ .

`X(from_range, rg)`

56 *Preconditions:* `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*ranges::begin(rg)`.

57 *Effects:* Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `rg` into it.

58 *Complexity:* Average case  $\mathcal{O}(N)$  ( $N$  is `ranges::distance(rg)`), worst case  $\mathcal{O}(N^2)$ .

`X(il)`

59 *Effects:* Equivalent to `X(il.begin(), il.end())`.

`X(il, n)`

60 *Effects:* Equivalent to `X(il.begin(), il.end(), n)`.

`X(il, n, hf)`

61 *Effects:* Equivalent to `X(il.begin(), il.end(), n, hf)`.

`X(il, n, hf, eq)`

62 *Effects:* Equivalent to `X(il.begin(), il.end(), n, hf, eq)`.

`X(b)`

63 *Effects:* In addition to the container requirements (24.2.2.1), copies the hash function, predicate, and maximum load factor.

64 *Complexity:* Average case linear in `b.size()`, worst case quadratic.

`a = b`

65 *Result:* `X&`

66 *Effects:* In addition to the container requirements, copies the hash function, predicate, and maximum load factor.

67 *Complexity:* Average case linear in `b.size()`, worst case quadratic.

`a = il`

68 *Result:* `X&`

69 *Preconditions:* `value_type` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*.

70 *Effects:* Assigns the range `[il.begin(), il.end())` into `a`. All existing elements of `a` are either assigned to or destroyed.

71 *Complexity:* Average case linear in `il.size()`, worst case quadratic.

`b.hash_function()`

72 *Result:* hasher

73 *Returns:* `b`'s hash function.

74 *Complexity:* Constant.

`b.key_eq()`

75 *Result:* `key_equal`

76 *Returns:* `b`'s key equality predicate.

77 *Complexity:* Constant.

`a_uniq.emplace(args)`

78 *Result:* `pair<iterator, bool>`

79 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

80 *Effects:* Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` if and only if there is no element in the container with key equivalent to the key of `t`.

81 *Returns:* The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of `t`.

82 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_uniq.size())$ .

`a_eq.emplace(args)`

83 *Result:* iterator

84 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`.

85 *Effects:* Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` and

86 *Returns:* An iterator pointing to the newly inserted element.

87 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_eq.size())$ .

`a.emplace_hint(p, args)`

88 *Result:* iterator

89 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into  $X$  from `args`.

90 *Effects:* Equivalent to `a.emplace(std::forward<Args>(args)...) .`

91 *Returns:* An iterator pointing to the element with the key equivalent to the newly inserted element. The `const_iterator` `p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

92 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a.size())$ .

`a_uniq.insert(t)`

93 *Result:* `pair<iterator, bool>`

94 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into  $X$ ; otherwise, `value_type` is *Cpp17CopyInsertable* into  $X$ .

95 *Effects:* Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.

96 *Returns:* The `bool` component of the returned pair indicates whether the insertion takes place, and the `iterator` component points to the element with key equivalent to the key of `t`.

97 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_uniq.size())$ .

`a_eq.insert(t)`

98 *Result:* iterator

99 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into  $X$ ; otherwise, `value_type` is *Cpp17CopyInsertable* into  $X$ .

100 *Effects:* Inserts `t`.

101 *Returns:* An iterator pointing to the newly inserted element.

102 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_eq.size())$ .

`a.insert(p, t)`

103 *Result:* iterator

104 *Preconditions:* If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into  $X$ ; otherwise, `value_type` is *Cpp17CopyInsertable* into  $X$ .

105 *Effects:* Equivalent to `a.insert(t)`. The iterator `p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

106 *Returns:* An iterator pointing to the element with the key equivalent to that of `t`.

107 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a.size())$ .

`a.insert(i, j)`

108 *Result:* void

109 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into  $X$  from `*i`. Neither `i` nor `j` are iterators into `a`.

110 *Effects:* Equivalent to `a.insert(t)` for each element in `[i, j)`.

111 *Complexity:* Average case  $\mathcal{O}(N)$ , where  $N$  is `distance(i, j)`, worst case  $\mathcal{O}(N(a.size() + 1))$ .

`a.insert_range(rg)`

112 *Result:* void

113 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into  $X$  from `*ranges::begin(rg)`. `rg` and `a` do not overlap.

114 *Effects:* Equivalent to `a.insert(t)` for each element `t` in `rg`.

115 *Complexity:* Average case  $\mathcal{O}(N)$ , where  $N$  is `ranges::distance(rg)`, worst case  $\mathcal{O}(N(a.size() + 1))$ .

`a.insert(il)`

116 *Effects:* Equivalent to `a.insert(il.begin(), il.end())`.

`a_uniq.insert(nh)`

117 *Result:* `insert_return_type`

118 *Preconditions:* `nh` is empty or `a_uniq.get_allocator() == nh.get_allocator()` is true.

119 *Effects:* If `nh` is empty, has no effect. Otherwise, inserts the element owned by `nh` if and only if there is no element in the container with a key equivalent to `nh.key()`.

120 *Postconditions:* If `nh` is empty, `inserted` is false, `position` is `end()`, and `node` is empty. Otherwise if the insertion took place, `inserted` is true, `position` points to the inserted element, and `node` is empty; if the insertion failed, `inserted` is false, `node` has the previous value of `nh`, and `position` points to an element with a key equivalent to `nh.key()`.

121 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_uniq.size())$ .

`a_eq.insert(nh)`

122 *Result:* `iterator`

123 *Preconditions:* `nh` is empty or `a_eq.get_allocator() == nh.get_allocator()` is true.

124 *Effects:* If `nh` is empty, has no effect and returns `a_eq.end()`. Otherwise, inserts the element owned by `nh` and returns an iterator pointing to the newly inserted element.

125 *Postconditions:* `nh` is empty.

126 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_eq.size())$ .

`a.insert(q, nh)`

127 *Result:* `iterator`

128 *Preconditions:* `nh` is empty or `a.get_allocator() == nh.get_allocator()` is true.

129 *Effects:* If `nh` is empty, has no effect and returns `a.end()`. Otherwise, inserts the element owned by `nh` if and only if there is no element with key equivalent to `nh.key()` in containers with unique keys; always inserts the element owned by `nh` in containers with equivalent keys. The iterator `q` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

130 *Postconditions:* `nh` is empty if insertion succeeds, unchanged if insertion fails.

131 *Returns:* An iterator pointing to the element with key equivalent to `nh.key()`.

132 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a.size())$ .

`a.extract(k)`

133 *Result:* `node_type`

134 *Effects:* Removes an element in the container with key equivalent to `k`.

135 *Returns:* A `node_type` owning the element if found, otherwise an empty `node_type`.

136 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a.size())$ .

`a_tran.extract(kx)`

137 *Result:* `node_type`

138 *Effects:* Removes an element in the container with key equivalent to `kx`.

139 *Returns:* A `node_type` owning the element if found, otherwise an empty `node_type`.

140 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_tran.size())$ .

`a.extract(q)`

141 *Result:* `node_type`

142 *Effects:* Removes the element pointed to by `q`.

143 *Returns:* A `node_type` owning that element.

144 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a.size())$ .

`a.merge(a2)`

145 *Result:* void

146 *Preconditions:* `a.get_allocator() == a2.get_allocator()`.

147 *Effects:* Attempts to extract each element in `a2` and insert it into `a` using the hash function and key equality predicate of `a`. In containers with unique keys, if there is an element in `a` with key equivalent to the key of an element from `a2`, then that element is not extracted from `a2`.

148 *Postconditions:* Pointers and references to the transferred elements of `a2` refer to those same elements but as members of `a`. Iterators referring to the transferred elements and all iterators referring to `a` will be invalidated, but iterators to elements remaining in `a2` will remain valid.

149 *Complexity:* Average case  $\mathcal{O}(N)$ , where  $N$  is `a2.size()`, worst case  $\mathcal{O}(N*a.size() + N)$ .

`a.erase(k)`

150 *Result:* `size_type`

151 *Effects:* Erases all elements with key equivalent to `k`.

152 *Returns:* The number of elements erased.

153 *Complexity:* Average case  $\mathcal{O}(a.count(k))$ , worst case  $\mathcal{O}(a.size())$ .

`a_tran.erase(kx)`

154 *Result:* `size_type`

155 *Effects:* Erases all elements with key equivalent to `kx`.

156 *Returns:* The number of elements erased.

157 *Complexity:* Average case  $\mathcal{O}(a\_tran.count(kx))$ , worst case  $\mathcal{O}(a\_tran.size())$ .

`a.erase(q)`

158 *Result:* iterator

159 *Effects:* Erases the element pointed to by `q`.

160 *Returns:* The iterator immediately following `q` prior to the erasure.

161 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a.size())$ .

`a.erase(r)`

162 *Result:* iterator

163 *Effects:* Erases the element pointed to by `r`.

164 *Returns:* The iterator immediately following `r` prior to the erasure.

165 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a.size())$ .

`a.erase(q1, q2)`

166 *Result:* iterator

167 *Effects:* Erases all elements in the range `[q1, q2)`.

168 *Returns:* The iterator immediately following the erased elements prior to the erasure.

169 *Complexity:* Average case linear in `distance(q1, q2)`, worst case  $\mathcal{O}(a.size())$ .

`a.clear()`

170 *Result:* void

171 *Effects:* Erases all elements in the container.

172 *Postconditions:* `a.empty()` is true.

173 *Complexity:* Linear in `a.size()`.

`b.find(k)`

174 *Result:* iterator; const\_iterator for const b.

175 *Returns:* An iterator pointing to an element with key equivalent to k, or `b.end()` if no such element exists.

176 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(b.size())$ .

`a_tran.find(ke)`

177 *Result:* iterator; const\_iterator for const a\_tran.

178 *Returns:* An iterator pointing to an element with key equivalent to ke, or `a_tran.end()` if no such element exists.

179 *Complexity:* Average case  $\mathcal{O}(1)$ , worst case  $\mathcal{O}(a\_tran.size())$ .

`b.count(k)`

180 *Result:* size\_type

181 *Returns:* The number of elements with key equivalent to k.

182 *Complexity:* Average case  $\mathcal{O}(b.count(k))$ , worst case  $\mathcal{O}(b.size())$ .

`a_tran.count(ke)`

183 *Result:* size\_type

184 *Returns:* The number of elements with key equivalent to ke.

185 *Complexity:* Average case  $\mathcal{O}(a\_tran.count(ke))$ , worst case  $\mathcal{O}(a\_tran.size())$ .

`b.contains(k)`

186 *Effects:* Equivalent to `b.find(k) != b.end()`.

`a_tran.contains(ke)`

187 *Effects:* Equivalent to `a_tran.find(ke) != a_tran.end()`.

`b.equal_range(k)`

188 *Result:* pair<iterator, iterator>; pair<const\_iterator, const\_iterator> for const b.

189 *Returns:* A range containing all elements with keys equivalent to k. Returns `make_pair(b.end(), b.end())` if no such elements exist.

190 *Complexity:* Average case  $\mathcal{O}(b.count(k))$ , worst case  $\mathcal{O}(b.size())$ .

`a_tran.equal_range(ke)`

191 *Result:* pair<iterator, iterator>; pair<const\_iterator, const\_iterator> for const a\_tran.

192 *Returns:* A range containing all elements with keys equivalent to ke. Returns `make_pair(a_tran.end(), a_tran.end())` if no such elements exist.

193 *Complexity:* Average case  $\mathcal{O}(a\_tran.count(ke))$ , worst case  $\mathcal{O}(a\_tran.size())$ .

`b.bucket_count()`

194 *Result:* size\_type

195 *Returns:* The number of buckets that b contains.

196 *Complexity:* Constant.

`b.max_bucket_count()`

197 *Result:* size\_type

198 *Returns:* An upper bound on the number of buckets that b can ever contain.

199 *Complexity:* Constant.

`b.bucket(k)`

200 *Result:* size\_type

201 *Preconditions:* `b.bucket_count() > 0`.

202 *Returns:* The index of the bucket in which elements with keys equivalent to *k* would be found, if any such element existed. The return value is in the range  $[0, b.bucket\_count())$ .

203 *Complexity:* Constant.

`b.bucket_size(n)`

204 *Result:* `size_type`

205 *Preconditions:* *n* shall be in the range  $[0, b.bucket\_count())$ .

206 *Returns:* The number of elements in the *n*<sup>th</sup> bucket.

207 *Complexity:*  $\mathcal{O}(b.bucket\_size(n))$

`b.begin(n)`

208 *Result:* `local_iterator`; `const_local_iterator` for `const b`.

209 *Preconditions:* *n* is in the range  $[0, b.bucket\_count())$ .

210 *Returns:* An iterator referring to the first element in the bucket. If the bucket is empty, then `b.begin(n) == b.end(n)`.

211 *Complexity:* Constant.

`b.end(n)`

212 *Result:* `local_iterator`; `const_local_iterator` for `const b`.

213 *Preconditions:* *n* is in the range  $[0, b.bucket\_count())$ .

214 *Returns:* An iterator which is the past-the-end value for the bucket.

215 *Complexity:* Constant.

`b.cbegin(n)`

216 *Result:* `const_local_iterator`

217 *Preconditions:* *n* shall be in the range  $[0, b.bucket\_count())$ .

218 *Returns:* An iterator referring to the first element in the bucket. If the bucket is empty, then `b.cbegin(n) == b.cend(n)`.

219 *Complexity:* Constant.

`b.cend(n)`

220 *Result:* `const_local_iterator`

221 *Preconditions:* *n* is in the range  $[0, b.bucket\_count())$ .

222 *Returns:* An iterator which is the past-the-end value for the bucket.

223 *Complexity:* Constant.

`b.load_factor()`

224 *Result:* `float`

225 *Returns:* The average number of elements per bucket.

226 *Complexity:* Constant.

`b.max_load_factor()`

227 *Result:* `float`

228 *Returns:* A positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number.

229 *Complexity:* Constant.

`a.max_load_factor(z)`

230 *Result:* `void`

231 *Preconditions:* *z* is positive. May change the container's maximum load factor, using *z* as a hint.

232 *Complexity*: Constant.

a.rehash(n)

233 *Result*: void

234 *Postconditions*: a.bucket\_count() >= a.size() / a.max\_load\_factor() and a.bucket\_count() >= n.

235 *Complexity*: Average case linear in a.size(), worst case quadratic.

a.reserve(n)

236 *Effects*: Equivalent to a.rehash(ceil(n / a.max\_load\_factor())).

237 Two unordered containers a and b compare equal if a.size() == b.size() and, for every equivalent-key group [Ea1, Ea2) obtained from a.equal\_range(Ea1), there exists an equivalent-key group [Eb1, Eb2) obtained from b.equal\_range(Ea1), such that is\_permutation(Ea1, Ea2, Eb1, Eb2) returns true. For unordered\_set and unordered\_map, the complexity of operator== (i.e., the number of calls to the == operator of the value\_type, to the predicate returned by key\_eq(), and to the hasher returned by hash\_function()) is proportional to  $N$  in the average case and to  $N^2$  in the worst case, where  $N$  is a.size(). For unordered\_multiset and unordered\_multimap, the complexity of operator== is proportional to  $\sum E_i^2$  in the average case and to  $N^2$  in the worst case, where  $N$  is a.size(), and  $E_i$  is the size of the  $i^{\text{th}}$  equivalent-key group in a. However, if the respective elements of each corresponding pair of equivalent-key groups  $Ea_i$  and  $Eb_i$  are arranged in the same order (as is commonly the case, e.g., if a and b are unmodified copies of the same container), then the average-case complexity for unordered\_multiset and unordered\_multimap becomes proportional to  $N$  (but worst-case complexity remains  $\mathcal{O}(N^2)$ , e.g., for a pathologically bad hash function). The behavior of a program that uses operator== or operator!= on unordered containers is undefined unless the Pred function object has the same behavior for both containers and the equality comparison function for Key is a refinement<sup>214</sup> of the partition into equivalent-key groups produced by Pred.

238 The iterator types iterator and const\_iterator of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both iterator and const\_iterator are constant iterators.

239 The insert, insert\_range, and emplace members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The erase members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.

240 The insert, insert\_range, and emplace members shall not affect the validity of iterators if  $(N+n) \leq z * B$ , where  $N$  is the number of elements in the container prior to the insert operation,  $n$  is the number of elements inserted,  $B$  is the container's bucket count, and  $z$  is the container's maximum load factor.

241 The extract members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a node\_type is undefined behavior. References and pointers to an element obtained while it is owned by a node\_type are invalidated if the element is successfully inserted.

242 The member function templates find, count, equal\_range, contains, extract, and erase shall not participate in overload resolution unless the qualified-ids Pred::is\_transparent and Hash::is\_transparent are both valid and denote types (13.10.3). Additionally, the member function templates extract and erase shall not participate in overload resolution if is\_convertible\_v<K&&, iterator> || is\_convertible\_v<K&&, const\_iterator> is true, where K is the type substituted as the first template argument.

243 A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

- (243.1) — It has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
- (243.2) — It has an Allocator template parameter and a type that does not qualify as an allocator is deduced for that parameter.
- (243.3) — It has a Hash template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.
- (243.4) — It has a Pred template parameter and a type that qualifies as an allocator is deduced for that parameter.

<sup>214</sup> Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.

**24.2.8.2 Exception safety guarantees****[unord.req.except]**

- 1 For unordered associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's Hash or Pred object (if any).
- 2 For unordered associative containers, if an exception is thrown by any operation other than the container's hash function from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.
- 3 For unordered associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's Hash or Pred object (if any).
- 4 For unordered associative containers, if an exception is thrown from within a `rehash()` function other than by the container's hash function or comparison function, the `rehash()` function has no effect.

**24.3 Sequence containers****[sequences]****24.3.1 In general****[sequences.general]**

- 1 The headers `<array>` (24.3.2), `<deque>` (24.3.3), `<forward_list>` (24.3.4), `<list>` (24.3.5), and `<vector>` (24.3.6) define class templates that meet the requirements for sequence containers.
- 2 The following exposition-only alias template may appear in deduction guides for sequence containers:

```
template<class InputIterator>
 using iter-value-type = typename iterator_traits<InputIterator>::value_type; // exposition only
```

**24.3.2 Header `<array>` synopsis****[array.syn]**

```
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {
 // 24.3.7, class template array
 template<class T, size_t N> struct array;

 template<class T, size_t N>
 constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);
 template<class T, size_t N>
 constexpr synth-three-way-result<T>
 operator<=>(const array<T, N>& x, const array<T, N>& y);

 // 24.3.7.4, specialized algorithms
 template<class T, size_t N>
 constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

 // 24.3.7.6, array creation functions
 template<class T, size_t N>
 constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
 template<class T, size_t N>
 constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);

 // 24.3.7.7, tuple interface
 template<class T> struct tuple_size;
 template<size_t I, class T> struct tuple_element;
 template<class T, size_t N>
 struct tuple_size<array<T, N>>;
 template<size_t I, class T, size_t N>
 struct tuple_element<I, array<T, N>>;
 template<size_t I, class T, size_t N>
 constexpr T& get(array<T, N>&) noexcept;
 template<size_t I, class T, size_t N>
 constexpr T&& get(array<T, N>&&) noexcept;
 template<size_t I, class T, size_t N>

### 24.3.7 Class template array

[array]

#### 24.3.7.1 Overview

[array.overview]

- <sup>1</sup> The header <array> defines a class template for storing fixed-size sequences of objects. An array is a contiguous container (24.2.2.1). An instance of array<T, N> stores N elements of type T, so that size() == N is an invariant.
- <sup>2</sup> An array is an aggregate (9.4.2) that can be list-initialized with up to N elements whose types are convertible to T.
- <sup>3</sup> An array meets all of the requirements of a container (24.2.2.2) and of a reversible container (24.2.2.3), except that a default constructed array object is not empty if N > 0. An array meets some of the requirements of a sequence container (24.2.4). Descriptions are provided here only for operations on array that are not described in one of these tables and for operations where there is additional semantic information.
- <sup>4</sup> array<T, N> is a structural type (13.2) if T is a structural type. Two values a1 and a2 of type array<T, N> are template-argument-equivalent (13.6) if and only if each pair of corresponding elements in a1 and a2 are template-argument-equivalent.
- <sup>5</sup> The types iterator and const\_iterator meet the constexpr iterator requirements (25.3.1).

```

namespace std {
 template<class T, size_t N>
 struct array {
 // types
 using value_type = T;
 using pointer = T*;
 using const_pointer = const T*;
 using reference = T&;
 using const_reference = const T&;
 using size_type = size_t;
 using difference_type = ptrdiff_t;
 using iterator = implementation-defined; // see 24.2
 using const_iterator = implementation-defined; // see 24.2
 using reverse_iterator = std::reverse_iterator<iterator>;
 using const_reverse_iterator = std::reverse_iterator<const_iterator>;

 // no explicit construct/copy/destroy for aggregate type

 constexpr void fill(const T& u);
 constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);

 // iterators
 constexpr iterator begin() noexcept;
 constexpr const_iterator begin() const noexcept;
 constexpr iterator end() noexcept;
 constexpr const_iterator end() const noexcept;

 constexpr reverse_iterator rbegin() noexcept;
 constexpr const_reverse_iterator rbegin() const noexcept;
 constexpr reverse_iterator rend() noexcept;
 constexpr const_reverse_iterator rend() const noexcept;

 constexpr const_iterator cbegin() const noexcept;
 constexpr const_iterator cend() const noexcept;
 constexpr const_reverse_iterator crbegin() const noexcept;
 constexpr const_reverse_iterator crend() const noexcept;

 // capacity
 [[nodiscard]] constexpr bool empty() const noexcept;
 constexpr size_type size() const noexcept;
 constexpr size_type max_size() const noexcept;
 };
}

```

```

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr reference at(size_type n);
constexpr const_reference at(size_type n) const;
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

constexpr T * data() noexcept;
constexpr const T * data() const noexcept;
};

template<class T, class... U>
 array(T, U...) -> array<T, 1 + sizeof...(U)>;
}

```

### 24.3.7.2 Constructors, copy, and assignment

[array.cons]

- 1 The conditions for an aggregate (9.4.2) shall be met. Class `array` relies on the implicitly-declared special member functions (11.4.5.2, 11.4.7, 11.4.5.3) to conform to the container requirements table in 24.2. In addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for `array` require that `T` be *Cpp17MoveConstructible* or *Cpp17MoveAssignable*, respectively.

```

template<class T, class... U>
 array(T, U...) -> array<T, 1 + sizeof...(U)>;

```

- 2 *Mandates:* (`is_same_v<T, U> && ...`) is true.

### 24.3.7.3 Member functions

[array.members]

```

constexpr size_type size() const noexcept;

```

- 1 *Returns:* `N`.

```

constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

```

- 2 *Returns:* A pointer such that `[data(), data() + size())` is a valid range. For a non-empty array, `data() == addressof(front())`.

```

constexpr void fill(const T& u);

```

- 3 *Effects:* As if by `fill_n(begin(), N, u)`.

```

constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);

```

- 4 *Effects:* Equivalent to `swap_ranges(begin(), end(), y.begin())`.

- 5 [Note 1: Unlike the swap function for other containers, `array::swap` takes linear time, can exit via an exception, and does not cause iterators to become associated with the other container. — end note]

### 24.3.7.4 Specialized algorithms

[array.special]

```

template<class T, size_t N>
 constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

```

- 1 *Constraints:* `N == 0` or `is_swappable_v<T>` is true.

- 2 *Effects:* As if by `x.swap(y)`.

- 3 *Complexity:* Linear in `N`.

### 24.3.7.5 Zero-sized arrays

[array.zero]

- 1 `array` shall provide support for the special case `N == 0`.
- 2 In the case that `N == 0`, `begin() == end() == unique value`. The return value of `data()` is unspecified.
- 3 The effect of calling `front()` or `back()` for a zero-sized array is undefined.
- 4 Member function `swap()` shall have a non-throwing exception specification.

**24.3.7.6 Array creation functions****[array.creation]**

```
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
```

1 *Mandates:* `is_array_v<T>` is false and `is_constructible_v<T, T&>` is true.

2 *Preconditions:* `T` meets the *Cpp17CopyConstructible* requirements.

3 *Returns:* `{{ a[0], ..., a[N - 1] }}`.

```
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
```

4 *Mandates:* `is_array_v<T>` is false and `is_move_constructible_v<T>` is true.

5 *Preconditions:* `T` meets the *Cpp17MoveConstructible* requirements.

6 *Returns:* `{{ std::move(a[0]), ..., std::move(a[N - 1]) }}`.

**24.3.7.7 Tuple interface****[array.tuple]**

```
template<class T, size_t N>
struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };
```

```
template<size_t I, class T, size_t N>
struct tuple_element<I, array<T, N>> {
 using type = T;
};
```

1 *Mandates:* `I < N` is true.

```
template<size_t I, class T, size_t N>
constexpr T& get(array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
constexpr T&& get(array<T, N>&& a) noexcept;
template<size_t I, class T, size_t N>
constexpr const T& get(const array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
constexpr const T&& get(const array<T, N>&& a) noexcept;
```

2 *Mandates:* `I < N` is true.

3 *Returns:* A reference to the  $I^{\text{th}}$  element of `a`, where indexing is zero-based.

**24.3.8 Class template deque****[deque]****24.3.8.1 Overview****[deque.overview]**

- 1 A deque is a sequence container that supports random access iterators (25.3.5.7). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.
- 2 A deque meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on deque that are not described in one of these tables or for operations where there is additional semantic information.

```
namespace std {
 template<class T, class Allocator = allocator<T>>
 class deque {
 public:
 // types
 using value_type = T;
 using allocator_type = Allocator;
 using pointer = typename allocator_traits<Allocator>::pointer;
 using const_pointer = typename allocator_traits<Allocator>::const_pointer;
 using reference = value_type&;
 using const_reference = const value_type&;
 using size_type = implementation-defined; // see 24.2
```

```

using difference_type = implementation-defined; // see 24.2
using iterator = implementation-defined; // see 24.2
using const_iterator = implementation-defined; // see 24.2
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// 24.3.8.2, construct/copy/destroy
deque() : deque(Allocator()) { }
explicit deque(const Allocator&);
explicit deque(size_type n, const Allocator& = Allocator());
deque(size_type n, const T& value, const Allocator& = Allocator());
template<class InputIterator>
 deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
template<container-compatible-range<T> R>
 deque(from_range_t, R&& rg, const Allocator& = Allocator());
deque(const deque& x);
deque(deque&&);
deque(const deque&, const type_identity_t<Allocator>&);
deque(deque&&, const type_identity_t<Allocator>&);
deque(initializer_list<T>, const Allocator& = Allocator());

~deque();
deque& operator=(const deque& x);
deque& operator=(deque&& x)
 noexcept(allocator_traits<Allocator>::is_always_equal::value);
deque& operator=(initializer_list<T>);
template<class InputIterator>
 void assign(InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
 void assign_range(R&& rg);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// iterators
iterator begin() noexcept;
const_iterator begin() const noexcept;
iterator end() noexcept;
const_iterator end() const noexcept;
reverse_iterator rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
reverse_iterator rend() noexcept;
const_reverse_iterator rend() const noexcept;

const_iterator cbegin() const noexcept;
const_iterator cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// 24.3.8.3, capacity
[[nodiscard]] bool empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
void resize(size_type sz);
void resize(size_type sz, const T& c);
void shrink_to_fit();

// element access
reference operator[](size_type n);
const_reference operator[](size_type n) const;
reference at(size_type n);
const_reference at(size_type n) const;
reference front();
const_reference front() const;

```

```

reference back();
const_reference back() const;

// 24.3.8.4, modifiers
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);

void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
 void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
 void append_range(R&& rg);

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
 iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
 iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);

void pop_front();
void pop_back();

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(deque&)
 noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
 deque(InputIterator, InputIterator, Allocator = Allocator())
 -> deque<iter-value-type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
 deque(from_range_t, R&&, Allocator = Allocator())
 -> deque<ranges::range_value_t<R>, Allocator>;
}

```

### 24.3.8.2 Constructors, copy, and assignment

[deque.cons]

```
explicit deque(const Allocator&);
```

1     *Effects:* Constructs an empty deque, using the specified allocator.

2     *Complexity:* Constant.

```
explicit deque(size_type n, const Allocator& = Allocator());
```

3     *Preconditions:* T is *Cpp17DefaultInsertable* into \*this.

4     *Effects:* Constructs a deque with n default-inserted elements using the specified allocator.

5     *Complexity:* Linear in n.

```
deque(size_type n, const T& value, const Allocator& = Allocator());
```

6     *Preconditions:* T is *Cpp17CopyInsertable* into \*this.

7     *Effects:* Constructs a deque with n copies of value, using the specified allocator.

8     *Complexity:* Linear in n.

```
template<class InputIterator>
deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects:* Constructs a deque equal to the range [first, last), using the specified allocator.

10 *Complexity:* Linear in distance(first, last).

```
template<container-compatible-range<T> R>
deque(from_range_t, R&& rg, const Allocator& = Allocator());
```

11 *Effects:* Constructs a deque with the elements of the range rg, using the specified allocator.

12 *Complexity:* Linear in ranges::distance(rg).

### 24.3.8.3 Capacity

[deque.capacity]

```
void resize(size_type sz);
```

1 *Preconditions:* T is Cpp17MoveInsertable and Cpp17DefaultInsertable into \*this.

2 *Effects:* If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

```
void resize(size_type sz, const T& c);
```

3 *Preconditions:* T is Cpp17CopyInsertable into \*this.

4 *Effects:* If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

```
void shrink_to_fit();
```

5 *Preconditions:* T is Cpp17MoveInsertable into \*this.

6 *Effects:* shrink\_to\_fit is a non-binding request to reduce memory use but does not change the size of the sequence.

[Note 1: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

If the size is equal to the old capacity, or if an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T, then there are no effects.

7 *Complexity:* If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

8 *Remarks:* If the size is not equal to the old capacity, then invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

### 24.3.8.4 Modifiers

[deque.modifiers]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
```

```
 iterator insert(const_iterator position,
 InputIterator first, InputIterator last);
```

```
template<container-compatible-range<T> R>
```

```
 iterator insert_range(const_iterator position, R&& rg);
 iterator insert(const_iterator position, initializer_list<T>);
```

```
template<class... Args> reference emplace_front(Args&&... args);
```

```
template<class... Args> reference emplace_back(Args&&... args);
```

```
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
```

```
void push_front(const T& x);
```

```
void push_front(T&& x);
```

```
template<container-compatible-range<T> R>
```

```
 void prepend_range(R&& rg);
```

```
void push_back(const T& x);
```

```
void push_back(T&& x);
```

```
template<container-compatible-range<T> R>
void append_range(R&& rg);
```

1 *Effects:* An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

2 *Complexity:* The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element at either the beginning or end of a deque always takes constant time and causes a single call to a constructor of  $T$ .

3 *Remarks:* If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of  $T$  there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-*Cpp17CopyInsertable*  $T$ , the effects are unspecified.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();
```

4 *Effects:* An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.

[*Note 1:* `pop_front` and `pop_back` are erase operations. — *end note*]

5 *Throws:* Nothing unless an exception is thrown by the assignment operator of  $T$ .

6 *Complexity:* The number of calls to the destructor of  $T$  is the same as the number of elements erased, but the number of calls to the assignment operator of  $T$  is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

### 24.3.8.5 Erasure

[`deque.erasure`]

```
template<class T, class Allocator, class U>
typename deque<T, Allocator>::size_type
erase(deque<T, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class T, class Allocator, class Predicate>
typename deque<T, Allocator>::size_type
erase_if(deque<T, Allocator>& c, Predicate pred);
```

2 *Effects:* Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

## 24.3.9 Class template `forward_list`

[`forward.list`]

### 24.3.9.1 Overview

[`forward.list.overview`]

1 A `forward_list` is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported.

[*Note 1:* It is intended that `forward_list` have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — *end note*]

- <sup>2</sup> A `forward_list` meets all of the requirements of a container (24.2.2.2), except that the `size()` member function is not provided and `operator==` has linear complexity, A `forward_list` also meets all of the requirements for an allocator-aware container (24.2.2.5). In addition, a `forward_list` provides the `assign` member functions and several of the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on `forward_list` that are not described in that table or for operations where there is additional semantic information.
- <sup>3</sup> [Note 2: Modifying any list requires access to the element preceding the first element of interest, but in a `forward_list` there is no constant-time way to access a preceding element. For this reason, `erase_after` and `splice_after` take fully-open ranges, not semi-open ranges. — *end note*]

```
namespace std {
 template<class T, class Allocator = allocator<T>>
 class forward_list {
 public:
 // types
 using value_type = T;
 using allocator_type = Allocator;

```

```

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
 forward_list(InputIterator, InputIterator, Allocator = Allocator())
 -> forward_list<iter-value-type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
 forward_list(from_range_t, R&&, Allocator = Allocator())
 -> forward_list<ranges::range_value_t<R>, Allocator>;
}

```

- 4 An incomplete type  $T$  may be used when instantiating `forward_list` if the allocator meets the allocator completeness requirements (16.4.4.6.2).  $T$  shall be complete before any member of the resulting specialization of `forward_list` is referenced.

### 24.3.9.2 Constructors, copy, and assignment

[forward.list.cons]

```
explicit forward_list(const Allocator&);
```

- 1 *Effects:* Constructs an empty `forward_list` object using the specified allocator.

- 2 *Complexity:* Constant.

```
explicit forward_list(size_type n, const Allocator& = Allocator());
```

- 3 *Preconditions:*  $T$  is *Cpp17DefaultInsertable* into  $*this$ .

- 4 *Effects:* Constructs a `forward_list` object with  $n$  default-inserted elements using the specified allocator.

- 5 *Complexity:* Linear in  $n$ .

```
forward_list(size_type n, const T& value, const Allocator& = Allocator());
```

- 6 *Preconditions:*  $T$  is *Cpp17CopyInsertable* into  $*this$ .

- 7 *Effects:* Constructs a `forward_list` object with  $n$  copies of `value` using the specified allocator.

- 8 *Complexity:* Linear in  $n$ .

```
template<class InputIterator>
 forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

- 9 *Effects:* Constructs a `forward_list` object equal to the range `[first, last)`.

- 10 *Complexity:* Linear in `distance(first, last)`.

```
template<container-compatible-range<T> R>
 forward_list(from_range_t, R&& rg, const Allocator& = Allocator());
```

- 11 *Effects:* Constructs a `forward_list` object with the elements of the range `rg`.

- 12 *Complexity:* Linear in `ranges::distance(rg)`.

### 24.3.9.3 Iterators

[forward.list.iter]

```
iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
const_iterator cbefore_begin() const noexcept;
```

- 1 *Effects:* `cbefore_begin()` is equivalent to `const_cast<forward_list const&>(*this).before_begin()`.

- 2 *Returns:* A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by `begin()`.

- 3 *Remarks:* `before_begin() == end()` shall equal `false`.

### 24.3.9.4 Element access

[forward.list.access]

```
reference front();
const_reference front() const;
```

- 1 *Returns:* `*begin()`

### 24.3.9.5 Modifiers

[forward.list.modifiers]

- 1 None of the overloads of `insert_after` shall affect the validity of iterators and references, and `erase_after` shall invalidate only iterators and references to the erased elements. If an exception is thrown during `insert_after` there

shall be no effect. Inserting  $n$  elements into a `forward_list` is linear in  $n$ , and the number of calls to the copy or move constructor of  $T$  is exactly equal to  $n$ . Erasing  $n$  elements from a `forward_list` is linear in  $n$  and the number of calls to the destructor of type  $T$  is exactly equal to  $n$ .

```
template<class... Args> reference emplace_front(Args&&... args);
```

- 2        *Effects:* Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args)...) at the beginning of the list.`

```
void push_front(const T& x);
void push_front(T&& x);
```

- 3        *Effects:* Inserts a copy of  $x$  at the beginning of the list.

```
template<container-compatible-range<T> R>
void prepend_range(R&& rg);
```

- 4        *Effects:* Inserts a copy of each element of  $rg$  at the beginning of the list.

[*Note 1:* The order of elements is not reversed. — *end note*]

```
void pop_front();
```

- 5        *Effects:* As if by `erase_after(before_begin())`.

```
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
```

- 6        *Preconditions:*  $position$  is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

- 7        *Effects:* Inserts a copy of  $x$  after  $position$ .

- 8        *Returns:* An iterator pointing to the copy of  $x$ .

```
iterator insert_after(const_iterator position, size_type n, const T& x);
```

- 9        *Preconditions:*  $position$  is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

- 10       *Effects:* Inserts  $n$  copies of  $x$  after  $position$ .

- 11       *Returns:* An iterator pointing to the last inserted copy of  $x$  or  $position$  if  $n == 0$ .

```
template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
```

- 12       *Preconditions:*  $position$  is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. Neither  $first$  nor  $last$  are iterators in `*this`.

- 13       *Effects:* Inserts copies of elements in `[first, last)` after  $position$ .

- 14       *Returns:* An iterator pointing to the last inserted element or  $position$  if  $first == last$ .

```
template<container-compatible-range<T> R>
iterator insert_range_after(const_iterator position, R&& rg);
```

- 15       *Preconditions:*  $position$  is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.  $rg$  and `*this` do not overlap.

- 16       *Effects:* Inserts copies of elements in the range  $rg$  after  $position$ .

- 17       *Returns:* An iterator pointing to the last inserted element, or  $position$  if  $rg$  is empty.

```
iterator insert_after(const_iterator position, initializer_list<T> il);
```

- 18       *Effects:* `insert_after(p, il.begin(), il.end())`.

- 19       *Returns:* An iterator pointing to the last inserted element or  $position$  if  $il$  is empty.

```
template<class... Args>
iterator emplace_after(const_iterator position, Args&&... args);
```

- 20       *Preconditions:*  $position$  is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

- 21       *Effects:* Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args)...) after position.`

22 *Returns:* An iterator pointing to the new object.

```
iterator erase_after(const_iterator position);
```

23 *Preconditions:* The iterator following `position` is dereferenceable.

24 *Effects:* Erases the element pointed to by the iterator following `position`.

25 *Returns:* An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

26 *Throws:* Nothing.

```
iterator erase_after(const_iterator position, const_iterator last);
```

27 *Preconditions:* All iterators in the range `(position, last)` are dereferenceable.

28 *Effects:* Erases the elements in the range `(position, last)`.

29 *Returns:* `last`.

30 *Throws:* Nothing.

```
void resize(size_type sz);
```

31 *Preconditions:*  $T$  is *Cpp17DefaultInsertable* into `*this`.

32 *Effects:* If  $sz < \text{distance}(\text{begin}(), \text{end}())$ , erases the last  $\text{distance}(\text{begin}(), \text{end}()) - sz$  elements from the list. Otherwise, inserts  $sz - \text{distance}(\text{begin}(), \text{end}())$  default-inserted elements at the end of the list.

```
void resize(size_type sz, const value_type& c);
```

33 *Preconditions:*  $T$  is *Cpp17CopyInsertable* into `*this`.

34 *Effects:* If  $sz < \text{distance}(\text{begin}(), \text{end}())$ , erases the last  $\text{distance}(\text{begin}(), \text{end}()) - sz$  elements from the list. Otherwise, inserts  $sz - \text{distance}(\text{begin}(), \text{end}())$  copies of `c` at the end of the list.

```
void clear() noexcept;
```

35 *Effects:* Erases all elements in the range `[begin(), end())`.

36 *Remarks:* Does not invalidate past-the-end iterators.

### 24.3.9.6 Operations

[forward.list.ops]

1 In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 27.2. The semantics of `i + n`, where `i` is an iterator into the list and `n` is an integer, are the same as those of `next(i, n)`. The expression `i - n`, where `i` is an iterator into the list and `n` is an integer, means an iterator `j` such that `j + n == i` is true. For `merge` and `sort`, the definitions and requirements in 27.8 apply.

```
void splice_after(const_iterator position, forward_list& x);
```

```
void splice_after(const_iterator position, forward_list&& x);
```

2 *Preconditions:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. `get_allocator() == x.get_allocator()` is true. `addressof(x) != this` is true.

3 *Effects:* Inserts the contents of `x` after `position`, and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

4 *Throws:* Nothing.

5 *Complexity:*  $\mathcal{O}(\text{distance}(x.\text{begin}(), x.\text{end}()))$

```
void splice_after(const_iterator position, forward_list& x, const_iterator i);
```

```
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
```

6 *Preconditions:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. The iterator following `i` is a dereferenceable iterator in `x`. `get_allocator() == x.get_allocator()` is true.

7 *Effects:* Inserts the element following `i` into `*this`, following `position`, and removes it from `x`. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `++i` continue to refer to the same element but as a member of `*this`. Iterators to `++i` continue to refer to the same element, but now behave as iterators into `*this`, not into `x`.

8 *Throws:* Nothing.

9 *Complexity:*  $\mathcal{O}(1)$

```
void splice_after(const_iterator position, forward_list& x,
 const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
 const_iterator first, const_iterator last);
```

10 *Preconditions:* position is before\_begin() or is a dereferenceable iterator in the range [begin(), end()). (first, last) is a valid range in x, and all iterators in the range (first, last) are dereferenceable. position is not an iterator in the range (first, last). get\_allocator() == x.get\_allocator() is true.

11 *Effects:* Inserts elements in the range (first, last) after position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements but as members of \*this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into \*this, not into x.

12 *Complexity:*  $\mathcal{O}(\text{distance}(\text{first}, \text{last}))$

```
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

13 *Effects:* Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: \*i == value (for remove()), pred(\*i) is true (for remove\_if()). Invalidates only the iterators and references to the erased elements.

14 *Returns:* The number of elements erased.

15 *Throws:* Nothing unless an exception is thrown by the equality comparison or the predicate.

16 *Complexity:* Exactly distance(begin(), end()) applications of the corresponding predicate.

17 *Remarks:* Stable (16.4.6.8).

```
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);
```

18 Let binary\_pred be equal\_to<>{} for the first overload.

19 *Preconditions:* binary\_pred is an equivalence relation.

20 *Effects:* Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator i in the range [begin() + 1, end()) for which binary\_pred(\*i, \*(i - 1)) is true. Invalidates only the iterators and references to the erased elements.

21 *Returns:* The number of elements erased.

22 *Throws:* Nothing unless an exception is thrown by the predicate.

23 *Complexity:* If empty() is false, exactly distance(begin(), end()) - 1 applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);
```

24 Let comp be less<> for the first two overloads.

25 *Preconditions:* \*this and x are both sorted with respect to the comparator comp, and get\_allocator() == x.get\_allocator() is true.

26 *Effects:* If addressof(x) == this, there are no effects. Otherwise, merges the two sorted ranges [begin(), end()) and [x.begin(), x.end()). The result is a range that is sorted with respect to the comparator comp. Pointers and references to the moved elements of x now refer to those same elements but as members of \*this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into \*this, not into x.

27 *Complexity:* At most distance(begin(), end()) + distance(x.begin(), x.end()) - 1 comparisons if addressof(x) != this; otherwise, no comparisons are performed.

28 *Remarks:* Stable (16.4.6.8). If addressof(x) != this, x is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison, there are no effects.

```
void sort();
template<class Compare> void sort(Compare comp);
```

29 *Effects:* Sorts the list according to the operator< or the comp function object. If an exception is thrown, the order of the elements in \*this is unspecified. Does not affect the validity of iterators and references.

30 *Complexity:* Approximately  $N \log N$  comparisons, where  $N$  is distance(begin(), end()).

31 *Remarks:* Stable (16.4.6.8).

```
void reverse() noexcept;
```

32 *Effects:* Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

33 *Complexity:* Linear time.

### 24.3.9.7 Erasure

[forward.list.erasure]

```
template<class T, class Allocator, class U>
 typename forward_list<T, Allocator>::size_type
 erase(forward_list<T, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to: return erase\_if(c, [&](auto& elem) { return elem == value; });

```
template<class T, class Allocator, class Predicate>
 typename forward_list<T, Allocator>::size_type
 erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

2 *Effects:* Equivalent to: return c.remove\_if(pred);

## 24.3.10 Class template list

[list]

### 24.3.10.1 Overview

[list.overview]

- 1 A list is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (24.3.11) and deques (24.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.
- 2 A list meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including most of the optional sequence container requirements (24.2.4). The exceptions are the operator[] and at member functions, which are not provided.<sup>215</sup> Descriptions are provided here only for operations on list that are not described in one of these tables or for operations where there is additional semantic information.

```
namespace std {
 template<class T, class Allocator = allocator<T>>
 class list {
 public:
 // types
 using value_type = T;
 using allocator_type = Allocator;
 using pointer = typename allocator_traits<Allocator>::pointer;
 using const_pointer = typename allocator_traits<Allocator>::const_pointer;
 using reference = value_type&;
 using const_reference = const value_type&;
 using size_type = implementation-defined; // see 24.2
 using difference_type = implementation-defined; // see 24.2
 using iterator = implementation-defined; // see 24.2
 using const_iterator = implementation-defined; // see 24.2
 using reverse_iterator = std::reverse_iterator<iterator>;
 using const_reverse_iterator = std::reverse_iterator<const_iterator>;

 // 24.3.10.2, construct/copy/destroy
 list() : list(Allocator()) { }
 explicit list(const Allocator&);
 explicit list(size_type n, const Allocator& = Allocator());
 list(size_type n, const T& value, const Allocator& = Allocator());
```

<sup>215</sup> These member functions are only provided by containers whose iterators are random access iterators.

```

template<class InputIterator>
 list(InputIterator first, InputIterator last, const Allocator& = Allocator());

 list(InputIterator, InputIterator, Allocator = Allocator())
 -> list<iter-value-type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
 list(from_range_t, R&&, Allocator = Allocator())
 -> list<ranges::range_value_t<R>, Allocator>;
}

```

- <sup>3</sup> An incomplete type  $T$  may be used when instantiating `list` if the allocator meets the allocator completeness requirements (16.4.4.6.2).  $T$  shall be complete before any member of the resulting specialization of `list` is referenced.

### 24.3.10.2 Constructors, copy, and assignment

[list.cons]

```
explicit list(const Allocator&);
```

- 1 *Effects:* Constructs an empty list, using the specified allocator.

- 2 *Complexity:* Constant.

```
explicit list(size_type n, const Allocator& = Allocator());
```

- 3 *Preconditions:*  $T$  is `Cpp17DefaultInsertable` into `*this`.

- 4 *Effects:* Constructs a list with  $n$  default-inserted elements using the specified allocator.

5 *Complexity*: Linear in  $n$ .

```
list(size_type n, const T& value, const Allocator& = Allocator());
```

6 *Preconditions*:  $T$  is *Cpp17CopyInsertable* into  $*this$ .

7 *Effects*: Constructs a list with  $n$  copies of  $value$ , using the specified allocator.

8 *Complexity*: Linear in  $n$ .

```
template<class InputIterator>
list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects*: Constructs a list equal to the range  $[first, last)$ .

10 *Complexity*: Linear in  $distance(first, last)$ .

```
template<container-compatible-range<T> R>
list(from_range_t, R&& rg, const Allocator& = Allocator());
```

11 *Effects*: Constructs a list object with the elements of the range  $rg$ .

12 *Complexity*: Linear in  $ranges::distance(rg)$ .

### 24.3.10.3 Capacity

[list.capacity]

```
void resize(size_type sz);
```

1 *Preconditions*:  $T$  is *Cpp17DefaultInsertable* into  $*this$ .

2 *Effects*: If  $size() < sz$ , appends  $sz - size()$  default-inserted elements to the sequence. If  $sz \leq size()$ , equivalent to:

```
list<T>::iterator it = begin();
advance(it, sz);
erase(it, end());
```

```
void resize(size_type sz, const T& c);
```

3 *Preconditions*:  $T$  is *Cpp17CopyInsertable* into  $*this$ .

4 *Effects*: As if by:

```
if (sz > size())
 insert(end(), sz-size(), c);
else if (sz < size()) {
 iterator i = begin();
 advance(i, sz);
 erase(i, end());
}
else
 ; // do nothing
```

### 24.3.10.4 Modifiers

[list.modifiers]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
```

```
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first,
 InputIterator last);
```

```
template<container-compatible-range<T> R>
iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);
```

```
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
void prepend_range(R&& rg);
```

```
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
void append_range(R&& rg);
```

1 *Complexity:* Insertion of a single element into a list takes constant time and exactly one call to a constructor of  $T$ . Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of  $T$  is exactly equal to the number of elements inserted.

2 *Remarks:* Does not affect the validity of iterators and references. If an exception is thrown there are no effects.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
```

```
void pop_front();
void pop_back();
void clear() noexcept;
```

3 *Effects:* Invalidates only the iterators and references to the erased elements.

4 *Throws:* Nothing.

5 *Complexity:* Erasing a single element is a constant time operation with a single call to the destructor of  $T$ . Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type  $T$  is exactly equal to the size of the range.

### 24.3.10.5 Operations

[list.ops]

1 Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them.<sup>216</sup> In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 27.2. The semantics of  $i + n$  and  $i - n$ , where  $i$  is an iterator into the list and  $n$  is an integer, are the same as those of `next(i, n)` and `prev(i, n)`, respectively. For `merge` and `sort`, the definitions and requirements in 27.8 apply.

2 `list` provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if `get_allocator() != x.get_allocator()`.

```
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
```

3 *Preconditions:* `addressof(x) != this` is true.

4 *Effects:* Inserts the contents of  $x$  before `position` and  $x$  becomes empty. Pointers and references to the moved elements of  $x$  now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into  $x$ .

5 *Throws:* Nothing.

6 *Complexity:* Constant time.

```
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
```

7 *Preconditions:*  $i$  is a valid dereferenceable iterator of  $x$ .

8 *Effects:* Inserts an element pointed to by  $i$  from list  $x$  before `position` and removes the element from  $x$ . The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*i` continue to refer to this same element but as a member of `*this`. Iterators to `*i` (including  $i$  itself) continue to refer to the same element, but now behave as iterators into `*this`, not into  $x$ .

9 *Throws:* Nothing.

10 *Complexity:* Constant time.

```
void splice(const_iterator position, list& x, const_iterator first,
 const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first,
 const_iterator last);
```

11 *Preconditions:* `[first, last)` is a valid range in  $x$ . `position` is not an iterator in the range `[first, last)`.

<sup>216</sup>As specified in 16.4.4.6, the requirements in this Clause apply only to lists whose allocators compare equal.

12 *Effects:* Inserts elements in the range `[first, last)` before `position` and removes the elements from `x`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

13 *Throws:* Nothing.

14 *Complexity:* Constant time if `addressof(x) == this`; otherwise, linear time.

```
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

15 *Effects:* Erases all the elements in the list referred to by a list iterator `i` for which the following conditions hold: `*i == value`, `pred(*i) != false`. Invalidates only the iterators and references to the erased elements.

16 *Returns:* The number of elements erased.

17 *Throws:* Nothing unless an exception is thrown by `*i == value` or `pred(*i) != false`.

18 *Complexity:* Exactly `size()` applications of the corresponding predicate.

19 *Remarks:* Stable (16.4.6.8).

```
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);
```

20 Let `binary_pred` be `equal_to<>{} for the first overload.`

21 *Preconditions:* `binary_pred` is an equivalence relation.

22 *Effects:* Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator `i` in the range `[begin() + 1, end())` for which `binary_pred(*i, *(i - 1))` is true. Invalidates only the iterators and references to the erased elements.

23 *Returns:* The number of elements erased.

24 *Throws:* Nothing unless an exception is thrown by the predicate.

25 *Complexity:* If `empty()` is false, exactly `size() - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);
```

26 Let `comp` be `less<>` for the first two overloads.

27 *Preconditions:* `*this` and `x` are both sorted with respect to the comparator `comp`, and `get_allocator() == x.get_allocator()` is true.

28 *Effects:* If `addressof(x) == this`, there are no effects. Otherwise, merges the two sorted ranges `[begin(), end())` and `[x.begin(), x.end())`. The result is a range that is sorted with respect to the comparator `comp`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

29 *Complexity:* At most `size() + x.size() - 1` comparisons if `addressof(x) != this`; otherwise, no comparisons are performed.

30 *Remarks:* Stable (16.4.6.8). If `addressof(x) != this`, `x` is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison there are no effects.

```
void reverse() noexcept;
```

31 *Effects:* Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

32 *Complexity:* Linear time.

```
void sort();
template<class Compare> void sort(Compare comp);
```

33 *Effects:* Sorts the list according to the operator`<` or a `Compare` function object. If an exception is thrown, the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.

34 *Complexity:* Approximately  $N \log N$  comparisons, where  $N == \text{size}()$ .

35 *Remarks:* Stable (16.4.6.8).

### 24.3.10.6 Erasure

[list.erasure]

```
template<class T, class Allocator, class U>
 typename list<T, Allocator>::size_type
 erase(list<T, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to: `return erase_if(c, [&](auto& elem) { return elem == value; });`

```
template<class T, class Allocator, class Predicate>
 typename list<T, Allocator>::size_type
 erase_if(list<T, Allocator>& c, Predicate pred);
```

2 *Effects:* Equivalent to: `return c.remove_if(pred);`

## 24.3.11 Class template vector

[vector]

### 24.3.11.1 Overview

[vector.overview]

- 1 A vector is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.
- 2 A vector meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), of a sequence container, including most of the optional sequence container requirements (24.2.4), and, for an element type other than `bool`, of a contiguous container (24.2.2.1). The exceptions are the `push_front`, `prepend_range`, `pop_front`, and `emplace_front` member functions, which are not provided. Descriptions are provided here only for operations on vector that are not described in one of these tables or for operations where there is additional semantic information.
- 3 The types `iterator` and `const_iterator` meet the `constexpr` iterator requirements (25.3.1).

```
namespace std {
 template<class T, class Allocator = allocator<T>>
 class vector {
 public:
 // types
 using value_type = T;
 using allocator_type = Allocator;
 using pointer = typename allocator_traits<Allocator>::pointer;
 using const_pointer = typename allocator_traits<Allocator>::const_pointer;
 using reference = value_type&;
 using const_reference = const value_type&;
 using size_type = implementation-defined; // see 24.2
 using difference_type = implementation-defined; // see 24.2
 using iterator = implementation-defined; // see 24.2
 using const_iterator = implementation-defined; // see 24.2
 using reverse_iterator = std::reverse_iterator<iterator>;
 using const_reverse_iterator = std::reverse_iterator<const_iterator>;

 // 24.3.11.2, construct/copy/destroy
 constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { }
 constexpr explicit vector(const Allocator&) noexcept;
 constexpr explicit vector(size_type n, const Allocator& = Allocator());
 constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
 template<class InputIterator>
 constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
 template<container-compatible-range<T> R>
 constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
 constexpr vector(const vector& x);
 constexpr vector(vector&&) noexcept;
 constexpr vector(const vector&, const type_identity_t<Allocator>&);
 constexpr vector(vector&&, const type_identity_t<Allocator>&);
 constexpr vector(initializer_list<T>, const Allocator& = Allocator());
 constexpr ~vector();
```

```

constexpr vector& operator=(const vector& x);
constexpr vector& operator=(vector&& x)
 noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
 allocator_traits<Allocator>::is_always_equal::value);
constexpr vector& operator=(initializer_list<T>);
template<class InputIterator>
 constexpr void assign(InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
 constexpr void assign_range(R&& rg);
constexpr void assign(size_type n, const T& u);
constexpr void assign(initializer_list<T>);
constexpr allocator_type get_allocator() const noexcept;

// iterators

constexpr size_type capacity() const noexcept;
constexpr void resize(size_type sz);
constexpr void resize(size_type sz, const T& c);
constexpr void reserve(size_type n);
constexpr void shrink_to_fit();

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr const_reference at(size_type n) const;
constexpr reference at(size_type n);
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

// 24.3.11.4, data access
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

// 24.3.11.5, modifiers
template<class... Args> constexpr reference emplace_back(Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
template<container-compatible-range<T> R>
 constexpr void append_range(R&& rg);
constexpr void pop_back();

template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);

```

```

template<class InputIterator>
 constexpr iterator insert(const_iterator position,
 InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
 constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T> il);
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&)
 noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
 allocator_traits<Allocator>::is_always_equal::value);
constexpr void clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
 vector(InputIterator, InputIterator, Allocator = Allocator())
 -> vector<iter-value-type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
 vector(from_range_t, R&&, Allocator = Allocator())
 -> vector<ranges::range_value_t<R>, Allocator>;
}

```

- 4 An incomplete type  $T$  may be used when instantiating `vector` if the allocator meets the allocator completeness requirements (16.4.4.6.2).  $T$  shall be complete before any member of the resulting specialization of `vector` is referenced.

#### 24.3.11.2 Constructors

[vector.cons]

```
constexpr explicit vector(const Allocator&) noexcept;
```

- 1 *Effects:* Constructs an empty vector, using the specified allocator.

- 2 *Complexity:* Constant.

```
constexpr explicit vector(size_type n, const Allocator& = Allocator());
```

- 3 *Preconditions:*  $T$  is *Cpp17DefaultInsertable* into  $*this$ .

- 4 *Effects:* Constructs a vector with  $n$  default-inserted elements using the specified allocator.

- 5 *Complexity:* Linear in  $n$ .

```
constexpr vector(size_type n, const T& value,
 const Allocator& = Allocator());
```

- 6 *Preconditions:*  $T$  is *Cpp17CopyInsertable* into  $*this$ .

- 7 *Effects:* Constructs a vector with  $n$  copies of `value`, using the specified allocator.

- 8 *Complexity:* Linear in  $n$ .

```
template<class InputIterator>
 constexpr vector(InputIterator first, InputIterator last,
 const Allocator& = Allocator());
```

- 9 *Effects:* Constructs a vector equal to the range `[first, last)`, using the specified allocator.

- 10 *Complexity:* Makes only  $N$  calls to the copy constructor of  $T$  (where  $N$  is the distance between `first` and `last`) and no reallocations if iterators `first` and `last` are of forward, bidirectional, or random access categories. It makes order  $N$  calls to the copy constructor of  $T$  and order  $\log N$  reallocations if they are just input iterators.

```
template<container-compatible-range<T> R>
 constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
```

- 11 *Effects:* Constructs a vector object with the elements of the range `rg`, using the specified allocator.

- 12 *Complexity:* Initializes exactly  $N$  elements from the results of dereferencing successive iterators of `rg`, where  $N$  is `ranges::distance(rg)`. Performs no reallocations if  $R$  models `ranges::forward_range` or `ranges::sized_range`; otherwise, performs order  $\log N$  reallocations and order  $N$  calls to the copy or move constructor of  $T$ .

**24.3.11.3 Capacity****[vector.capacity]**

```
constexpr size_type capacity() const noexcept;
```

1 *Returns:* The total number of elements that the vector can hold without requiring reallocation.

2 *Complexity:* Constant time.

```
constexpr void reserve(size_type n);
```

3 *Preconditions:*  $T$  is *Cpp17MoveInsertable* into *\*this*.

4 *Effects:* A directive that informs a vector of a planned change in size, so that it can manage the storage allocation accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`. If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* type, there are no effects.

5 *Throws:* `length_error` if  $n > \text{max\_size}()$ .<sup>217</sup>

6 *Complexity:* It does not change the size of the sequence and takes at most linear time in the size of the sequence.

7 *Remarks:* Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[Note 1: If no reallocation happens, they remain valid. — end note]

No reallocation shall take place during insertions that happen after a call to `reserve()` until an insertion would make the size of the vector greater than the value of `capacity()`.

```
constexpr void shrink_to_fit();
```

8 *Preconditions:*  $T$  is *Cpp17MoveInsertable* into *\*this*.

9 *Effects:* `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[Note 2: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation. If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable*  $T$  there are no effects.

10 *Complexity:* If reallocation happens, linear in the size of the sequence.

11 *Remarks:* Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator.

[Note 3: If no reallocation happens, they remain valid. — end note]

```
constexpr void swap(vector& x)
noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
 allocator_traits<Allocator>::is_always_equal::value);
```

12 *Effects:* Exchanges the contents and `capacity()` of *\*this* with that of  $x$ .

13 *Complexity:* Constant time.

```
constexpr void resize(size_type sz);
```

14 *Preconditions:*  $T$  is *Cpp17MoveInsertable* and *Cpp17DefaultInsertable* into *\*this*.

15 *Effects:* If  $sz < \text{size}()$ , erases the last  $\text{size}() - sz$  elements from the sequence. Otherwise, appends  $sz - \text{size}()$  default-inserted elements to the sequence.

16 *Remarks:* If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable*  $T$  there are no effects.

```
constexpr void resize(size_type sz, const T& c);
```

17 *Preconditions:*  $T$  is *Cpp17CopyInsertable* into *\*this*.

18 *Effects:* If  $sz < \text{size}()$ , erases the last  $\text{size}() - sz$  elements from the sequence. Otherwise, appends  $sz - \text{size}()$  copies of  $c$  to the sequence.

19 *Remarks:* If an exception is thrown there are no effects.

<sup>217</sup> `reserve()` uses `Allocator::allocate()` which can throw an appropriate exception.

**24.3.11.4 Data****[vector.data]**

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

1 *Returns:* A pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == addressof(front())`.

2 *Complexity:* Constant time.

**24.3.11.5 Modifiers****[vector.modifiers]**

```
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
 constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
 constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> constexpr reference emplace_back(Args&&... args);
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
template<container-compatible-range<T> R>
 constexpr void append_range(R&& rg);
```

1 *Complexity:* If reallocation happens, linear in the number of elements of the resulting vector; otherwise, linear in the number of elements inserted plus the distance to the end of the vector.

2 *Remarks:* Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. If no reallocation happens, then references, pointers, and iterators before the insertion point remain valid but those at or after the insertion point, including the past-the-end iterator, are invalidated. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of `T` or by any `InputIterator` operation there are no effects. If an exception is thrown while inserting a single element at the end and `T` is `Cpp17CopyInsertable` or `is_nothrow_move_constructible_v<T>` is true, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-`Cpp17CopyInsertable` `T`, the effects are unspecified.

```
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();
```

3 *Effects:* Invalidates iterators and references at or after the point of the erase.

4 *Throws:* Nothing unless an exception is thrown by the assignment operator or move assignment operator of `T`.

5 *Complexity:* The destructor of `T` is called the number of times equal to the number of the elements erased, but the assignment operator of `T` is called the number of times equal to the number of elements in the vector after the erased elements.

**24.3.11.6 Erasure****[vector.erasure]**

```
template<class T, class Allocator, class U>
 constexpr typename vector<T, Allocator>::size_type
 erase(vector<T, Allocator>& c, const U& value);
```

1 *Effects:* Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class T, class Allocator, class Predicate>
constexpr typename vector<T, Allocator>::size_type
erase_if(vector<T, Allocator>& c, Predicate pred);
```

<sup>2</sup> *Effects:* Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

### 24.3.12 Class vector<bool>

[vector.bool]

<sup>1</sup> To optimize space allocation, a specialization of vector for bool elements is provided:

```
namespace std {
template<class Allocator>
class vector<bool, Allocator> {
public:
 // types
 using value_type = bool;
 using allocator_type = Allocator;
 using pointer = implementation-defined;
 using const_pointer = implementation-defined;
 using const_reference = bool;
 using size_type = implementation-defined; // see 24.2
 using difference_type = implementation-defined; // see 24.2
 using iterator = implementation-defined; // see 24.2
 using const_iterator = implementation-defined; // see 24.2
 using reverse_iterator = std::reverse_iterator<iterator>;
 using const_reverse_iterator = std::reverse_iterator<const_iterator>;

 // bit reference
 class reference {
 friend class vector;
 constexpr reference() noexcept;
 public:
 constexpr reference(const reference&) = default;
 constexpr ~reference();
 constexpr operator bool() const noexcept;

constexpr void swap(vector&);
constexpr static void swap(reference x, reference y) noexcept;
constexpr void flip() noexcept; // flips all bits
constexpr void clear() noexcept;
};
}

```

- 2 Unless described below, all operations have the same requirements and semantics as the primary `vector` template, except that operations dealing with the `bool` value type map to bit values in the container storage and `allocator_traits::construct` (20.2.8.3) is not used to construct these values.
- 3 There is no requirement that the data be stored as a contiguous allocation of `bool` values. A space-optimized representation of bits is recommended instead.
- 4 `reference` is a class that simulates the behavior of references of a single bit in `vector<bool>`. The conversion function returns `true` when the bit is set, and `false` otherwise. The assignment operators set the bit when the argument is (convertible to) `true` and clear it otherwise. `flip` reverses the state of the bit.

```
constexpr void flip() noexcept;
```

- 5 *Effects:* Replaces each element in the container with its complement.

```
constexpr static void swap(reference x, reference y) noexcept;
```

- 6 *Effects:* Exchanges the contents of `x` and `y` as if by:

```
bool b = x;
x = y;
y = b;
```

```
template<class Allocator> struct hash<vector<bool, Allocator>>;
```

- 7 The specialization is enabled (22.10.19).

## 24.4 Associative containers

[associative]

### 24.4.1 In general

[associative.general]

- 1 The header `<map>` defines the class templates `map` and `multimap`; the header `<set>` defines the class templates `set` and `multiset`.
- 2 The following exposition-only alias templates may appear in deduction guides for associative containers:

```
template<class InputIterator>
using iter-value-type =
 typename iterator_traits<InputIterator>::value_type; // exposition only
template<class InputIterator>
using iter-key-type = remove_const_t<
 typename iterator_traits<InputIterator>::value_type::first_type>; // exposition only
template<class InputIterator>
using iter-mapped-type =
 typename iterator_traits<InputIterator>::value_type::second_type; // exposition only
template<class InputIterator>
using iter-to-alloc-type = pair<
 add_const_t<typename iterator_traits<InputIterator>::value_type::first_type>,
 typename iterator_traits<InputIterator>::value_type::second_type>; // exposition only
template<ranges::input_range Range>
using range-key-type =
 remove_const_t<typename ranges::range_value_t<Range>::first_type>; // exposition only
template<ranges::input_range Range>
using range-mapped-type = typename ranges::range_value_t<Range>::second_type; // exposition only
template<ranges::input_range Range>
using range-to-alloc-type =
 pair<add_const_t<typename ranges::range_value_t<Range>::first_type>,
 typename ranges::range_value_t<Range>::second_type>; // exposition only
```

### 24.4.2 Header `<map>` synopsis

[associative.map.syn]

```
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {
// 24.4.4, class template map
template<class Key, class T, class Compare = less<Key>,
 class Allocator = allocator<pair<const Key, T>>>
class map;
```

```

template<class Key, class T, class Compare, class Allocator>
 bool operator==(const map<Key, T, Compare, Allocator>& x,
 const map<Key, T, Compare, Allocator>& y);
template<class Key, class T, class Compare, class Allocator>
 synth-three-way-result<pair<const Key, T>>
 operator<=>(const map<Key, T, Compare, Allocator>& x,
 const map<Key, T, Compare, Allocator>& y);

template<class Key, class T, class Compare, class Allocator>

 polymorphic_allocator<pair<const Key, T>>>;

 template<class Key, class T, class Compare = less<Key>>
 using multimap = std::multimap<Key, T, Compare,
 polymorphic_allocator<pair<const Key, T>>>;
}
}

```

### 24.4.3 Header <set> synopsis

[associative.set.syn]

```

#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {
 // 24.4.6, class template set
 template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
 class set;

 template<class Key, class Compare, class Allocator>
 bool operator==(const set<Key, Compare, Allocator>& x,
 const set<Key, Compare, Allocator>& y);
}

```

```

template<class Key, class Compare, class Allocator>
 synth-three-way-result<Key> operator<=>(const set<Key, Compare, Allocator>& x,
 const set<Key, Compare, Allocator>& y);

template<class Key, class Compare, class Allocator>
 void swap(set<Key, Compare, Allocator>& x,
 set<Key, Compare, Allocator>& y)
 noexcept(noexcept(x.swap(y)));

template<class Key, class Compare, class Allocator, class Predicate>
 typename set<Key, Compare, Allocator>::size_type
 erase_if(set<Key, Compare, Allocator>& c, Predicate pred);

// 24.4.7, class template multiset
template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
 class multiset;

template<class Key, class Compare, class Allocator>
 bool operator==(const multiset<Key, Compare, Allocator>& x,
 const multiset<Key, Compare, Allocator>& y);
template<class Key, class Compare, class Allocator>
 synth-three-way-result<Key> operator<=>(const multiset<Key, Compare, Allocator>& x,
 const multiset<Key, Compare, Allocator>& y);

template<class Key, class Compare, class Allocator>
 void swap(multiset<Key, Compare, Allocator>& x,
 multiset<Key, Compare, Allocator>& y)
 noexcept(noexcept(x.swap(y)));

template<class Key, class Compare, class Allocator, class Predicate>
 typename multiset<Key, Compare, Allocator>::size_type
 erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

namespace pmr {
 template<class Key, class Compare = less<Key>>
 using set = std::set<Key, Compare, polymorphic_allocator<Key>>;

 template<class Key, class Compare = less<Key>>
 using multiset = std::multiset<Key, Compare, polymorphic_allocator<Key>>;
}
}

```

## 24.4.4 Class template map

[map]

### 24.4.4.1 Overview

[map.overview]

- 1 A map is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of values of another type T based on the keys. The map class supports bidirectional iterators.
- 2 A map meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A map also provides most operations described in 24.2.7 for unique keys. This means that a map supports the a\_uniq operations in 24.2.7 but not the a\_eq operations. For a map<Key, T> the key\_type is Key and the value\_type is pair<const Key, T>. Descriptions are provided here only for operations on map that are not described in one of those tables or for operations where there is additional semantic information.

```

namespace std {
 template<class Key, class T, class Compare = less<Key>,
 class Allocator = allocator<pair<const Key, T>>>
 class map {
 public:
 // types
 using key_type = Key;
 using mapped_type = T;
 using value_type = pair<const Key, T>;

}

```

#### 24.4.4.2 Constructors, copy, and assignment

[map.cons]

```
explicit map(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects:* Constructs an empty map using the specified comparison object and allocator.

2 *Complexity:* Constant.

```

template<class InputIterator>
map(InputIterator first, InputIterator last,
 const Compare& comp = Compare(), const Allocator& = Allocator());

```

3 *Effects:* Constructs an empty map using the specified comparison object and allocator, and inserts elements from the range [first, last).

4 *Complexity:* Linear in  $N$  if the range [first, last) is already sorted using comp and otherwise  $N \log N$ , where  $N$  is last - first.

```

template<container-compatible-range<value_type> R>
map(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

```

5 *Effects:* Constructs an empty map using the specified comparison object and allocator, and inserts elements from the range rg.

6 *Complexity:* Linear in  $N$  if rg is already sorted using comp and otherwise  $N \log N$ , where  $N$  is ranges::distance(rg).

#### 24.4.4.3 Element access

[map.access]

```
mapped_type& operator[](const key_type& x);
```

1 *Effects:* Equivalent to: return try\_emplace(x).first->second;

```
mapped_type& operator[](key_type&& x);
```

2 *Effects:* Equivalent to: return try\_emplace(move(x)).first->second;

```

mapped_type& at(const key_type& x);
const mapped_type& at(const key_type& x) const;

```

3 *Returns:* A reference to the mapped\_type corresponding to x in \*this.

4 *Throws:* An exception object of type out\_of\_range if no such element is present.

5 *Complexity:* Logarithmic.

#### 24.4.4.4 Modifiers

[map.modifiers]

```

template<class P>
pair<iterator, bool> insert(P&& x);
template<class P>
iterator insert(const_iterator position, P&& x);

```

1 *Constraints:* is\_constructible\_v<value\_type, P&&> is true.

2 *Effects:* The first form is equivalent to return emplace(std::forward<P>(x)). The second form is equivalent to return emplace\_hint(position, std::forward<P>(x)).

```

template<class... Args>
 pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
 iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);

```

3     *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into map from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)...`.

4     *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)...`.

5     *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

6     *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```

template<class... Args>
 pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
 iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);

```

7     *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into map from `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)...`.

8     *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)...`.

9     *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

10    *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```

template<class M>
 pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
 iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);

```

11    *Mandates:* `is_assignable_v<mapped_type&, M&&>` is `true`.

12    *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into map from `k`, `forward<M>(obj)`.

13    *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `std::forward<M>(obj)`.

14    *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

15    *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```

template<class M>
 pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
 iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);

```

16    *Mandates:* `is_assignable_v<mapped_type&, M&&>` is `true`.

17    *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into map from `move(k)`, `forward<M>(obj)`.

18    *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

19    *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

20    *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

#### 24.4.4.5 Erasure

[map.erasure]

```

template<class Key, class T, class Compare, class Allocator, class Predicate>
 typename map<Key, T, Compare, Allocator>::size_type

```

```
erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);
```

<sup>1</sup> *Effects:* Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last;) {
 if (pred(*i)) {
 i = c.erase(i);
 } else {
 ++i;
 }
}
return original_size - c.size();
```

## 24.4.5 Class template `multimap`

[[multimap](#)]

### 24.4.5.1 Overview

[[multimap.overview](#)]

- <sup>1</sup> A `multimap` is an associative container that supports equivalent keys (possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type `T` based on the keys. The `multimap` class supports bidirectional iterators.
- <sup>2</sup> A `multimap` meets all of the requirements of a container ([24.2.2.2](#)), of a reversible container ([24.2.2.3](#)), of an allocator-aware container ([24.2.2.5](#)), and of an associative container ([24.2.7](#)). A `multimap` also provides most operations described in [24.2.7](#) for equal keys. This means that a `multimap` supports the `a_eq` operations in [24.2.7](#) but not the `a_uniq` operations. For a `multimap<Key, T>` the `key_type` is `Key` and the `value_type` is `pair<const Key, T>`. Descriptions are provided here only for operations on `multimap` that are not described in one of those tables or for operations where there is additional semantic information.

```
namespace std {
 template<class Key, class T, class Compare = less<Key>,
 class Allocator = allocator<pair<const Key, T>>>
 class multimap {
 public:
 // types
 using key_type = Key;
 using mapped_type = T;
 using value_type = pair<const Key, T>;
 using key_compare = Compare;

 multimap(initializer_list<pair<Key, T>>, Allocator)
 -> multimap<Key, T, less<Key>, Allocator>;
}

```

#### 24.4.5.2 Constructors

[multimap.cons]

```
explicit multimap(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects:* Constructs an empty multimap using the specified comparison object and allocator.

2 *Complexity:* Constant.

```
template<class InputIterator>
 multimap(InputIterator first, InputIterator last,
 const Compare& comp = Compare(),
 const Allocator& = Allocator());
```

3 *Effects:* Constructs an empty multimap using the specified comparison object and allocator, and inserts elements from the range [first, last).

4 *Complexity:* Linear in  $N$  if the range [first, last) is already sorted using comp and otherwise  $N \log N$ , where  $N$  is last - first.

```
template<container-compatible-range<value_type> R>
 multimap(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());
```

5 *Effects:* Constructs an empty multimap using the specified comparison object and allocator, and inserts elements from the range rg.

6 *Complexity:* Linear in  $N$  if rg is already sorted using comp and otherwise  $N \log N$ , where  $N$  is ranges::distance(rg).

#### 24.4.5.3 Modifiers

[multimap.modifiers]

```
template<class P> iterator insert(P&& x);
template<class P> iterator insert(const_iterator position, P&& x);
```

1 *Constraints:* is\_constructible\_v<value\_type, P&&> is true.

2 *Effects:* The first form is equivalent to return `emplace(std::forward<P>(x))`. The second form is equivalent to return `emplace_hint(position, std::forward<P>(x))`.

**24.4.5.4 Erasure****[multimap.erasure]**

```
template<class Key, class T, class Compare, class Allocator, class Predicate>
typename multimap<Key, T, Compare, Allocator>::size_type
erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);
```

<sup>1</sup> *Effects:* Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last;) {
 if (pred(*i)) {
 i = c.erase(i);
 } else {
 ++i;
 }
}
return original_size - c.size();
```

**24.4.6 Class template set****[set]****24.4.6.1 Overview****[set.overview]**

- <sup>1</sup> A set is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of the keys themselves. The set class supports bidirectional iterators.
- <sup>2</sup> A set meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A set also provides most operations described in 24.2.7 for unique keys. This means that a set supports the `a_uniq` operations in 24.2.7 but not the `a_eq` operations. For a `set<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on set that are not described in one of these tables and for operations where there is additional semantic information.

```
namespace std {
 template<class Key, class Compare = less<Key>,
 class Allocator = allocator<Key>>

#### 24.4.6.2 Constructors, copy, and assignment

[set.cons]

```
explicit set(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects:* Constructs an empty set using the specified comparison objects and allocator.

2 *Complexity:* Constant.

```

template<class InputIterator>
set(InputIterator first, InputIterator last,
 const Compare& comp = Compare(), const Allocator& = Allocator());

```

3 *Effects:* Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range [first, last).

4 *Complexity:* Linear in  $N$  if the range [first, last) is already sorted using comp and otherwise  $N \log N$ , where  $N$  is last - first.

```

template<container-compatible-range<value_type> R>
set(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

```

5 *Effects:* Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range rg.

6 *Complexity:* Linear in  $N$  if rg is already sorted using comp and otherwise  $N \log N$ , where  $N$  is ranges::distance(rg).

#### 24.4.6.3 Erasure

[set.erasure]

```

template<class Key, class Compare, class Allocator, class Predicate>
typename set<Key, Compare, Allocator>::size_type
erase_if(set<Key, Compare, Allocator>& c, Predicate pred);

```

1 *Effects:* Equivalent to:

```

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last;) {
 if (pred(*i)) {
 i = c.erase(i);
 } else {
 ++i;
 }
}
return original_size - c.size();

```

### 24.4.7 Class template multiset

[multiset]

#### 24.4.7.1 Overview

[multiset.overview]

1 A multiset is an associative container that supports equivalent keys (possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The multiset class supports bidirectional iterators.

2 A multiset meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), of an associative container (24.2.7). multiset also provides most operations described in 24.2.7 for duplicate keys. This means that a multiset supports the a\_eq operations in 24.2.7 but not the a\_uniq operations. For a multiset<Key> both the key\_type and value\_type are Key. Descriptions are provided here only for operations on multiset that are not described in one of these tables and for operations where there is additional semantic information.

```

namespace std {
 template<class Key, class Compare = less<Key>,

template<class Key, class Allocator>
multiset(initializer_list<Key>, Allocator) -> multiset<Key, less<Key>, Allocator>;
}

```

#### 24.4.7.2 Constructors

[multiset.cons]

```
explicit multiset(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects:* Constructs an empty multiset using the specified comparison object and allocator.

2 *Complexity:* Constant.

```
template<class InputIterator>
multiset(InputIterator first, InputIterator last,
 const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects:* Constructs an empty multiset using the specified comparison object and allocator, and inserts elements from the range [first, last).

- 4 *Complexity*: Linear in  $N$  if the range  $[first, last)$  is already sorted using `comp` and otherwise  $N \log N$ , where  $N$  is `last - first`.

```
template<container-compatible-range<value_type> R>
multiset(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());
```

- 5 *Effects*: Constructs an empty multiset using the specified comparison object and allocator, and inserts elements from the range `rg`.

- 6 *Complexity*: Linear in  $N$  if `rg` is already sorted using `comp` and otherwise  $N \log N$ , where  $N$  is `ranges::distance(rg)`.

### 24.4.7.3 Erasure

[multiset.erasure]

```
template<class Key, class Compare, class Allocator, class Predicate>
typename multiset<Key, Compare, Allocator>::size_type
erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);
```

- 1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last;) {
 if (pred(*i)) {
 i = c.erase(i);
 } else {
 ++i;
 }
}
return original_size - c.size();
```

## 24.5 Unordered associative containers

[unord]

### 24.5.1 In general

[unord.general]

- 1 The header `<unordered_map>` defines the class templates `unordered_map` and `unordered_multimap`; the header `<unordered_set>` defines the class templates `unordered_set` and `unordered_multiset`.
- 2 The exposition-only alias templates *iter-value-type*, *iter-key-type*, *iter-mapped-type*, and *iter-to-alloc-type* defined in 24.4.1 may appear in deduction guides for unordered containers.

### 24.5.2 Header `<unordered_map>` synopsis

[unord.map.syn]

```
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

 polymorphic_allocator<Key>>;
}
}

```

## 24.5.4 Class template `unordered_map`

[unord.map]

### 24.5.4.1 Overview

[unord.map.overview]

- <sup>1</sup> An `unordered_map` is an unordered associative container that supports unique keys (an `unordered_map` contains at most one of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_map` class supports forward iterators.
- <sup>2</sup> An `unordered_map` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_map` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_map<Key, T>` the key type is `Key`, the mapped type is `T`, and the value type is `pair<const Key, T>`.
- <sup>3</sup> Subclause 24.5.4 only describes operations on `unordered_map` that are not described in one of the requirement tables, or for which there is additional semantic information.

```

namespace std {
 template<class Key,
 class T,
 class Hash = hash<Key>,
 class Pred = equal_to<Key>,
 class Allocator = allocator<pair<const Key, T>>
 class unordered_map {
 public:
 // types
 using key_type = Key;
 using mapped_type = T;
 using value_type = pair<const Key, T>;

 -> unordered_map<Key, T, hash<Key>, equal_to<Key>, Allocator>;

template<class Key, class T, class Hash, class Allocator>
 unordered_map(initializer_list<pair<Key, T>>, typename see below::size_type, Hash,
 Allocator)
 -> unordered_map<Key, T, Hash, equal_to<Key>, Allocator>;
}

```

- 4 A `size_type` parameter type in an `unordered_map` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

#### 24.5.4.2 Constructors

[unord.map.cnstr]

```

unordered_map() : unordered_map(size_type(see below)) { }
explicit unordered_map(size_type n,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());

```

- 1 *Effects:* Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

- 2 *Complexity:* Constant.

```

template<class InputIterator>
 unordered_map(InputIterator f, InputIterator l,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
 unordered_map(from_range_t, R&& rg,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
unordered_map(initializer_list<value_type> il,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());

```

- 3 *Effects:* Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)`, `rg`, or `il`, respectively. `max_load_factor()` returns 1.0.

- 4 *Complexity:* Average case linear, worst case quadratic.

#### 24.5.4.3 Element access

[unord.map.elem]

```
mapped_type& operator[](const key_type& k);
```

- 1 *Effects:* Equivalent to: `return try_emplace(k).first->second;`

```
mapped_type& operator[](key_type&& k);
```

- 2 *Effects:* Equivalent to: `return try_emplace(move(k)).first->second;`

```
mapped_type& at(const key_type& k);
const mapped_type& at(const key_type& k) const;
```

- 3 *Returns:* A reference to `x.second`, where `x` is the (unique) element whose key is equivalent to `k`.

- 4 *Throws:* An exception object of type `out_of_range` if no such element is present.

## 24.5.4.4 Modifiers

[unord.map.modifiers]

```
template<class P>
 pair<iterator, bool> insert(P&& obj);
```

1       *Constraints:* `is_constructible_v<value_type, P&&>` is true.

2       *Effects:* Equivalent to: `return emplace(std::forward<P>(obj));`

```
template<class P>
 iterator insert(const_iterator hint, P&& obj);
```

3       *Constraints:* `is_constructible_v<value_type, P&&>` is true.

4       *Effects:* Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

```
template<class... Args>
 pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
```

```
template<class... Args>
 iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

5       *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)...`.

6       *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)...`.

7       *Returns:* In the first overload, the `bool` component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

8       *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class... Args>
 pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
```

```
template<class... Args>
 iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

9       *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)...`.

10       *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)...`.

11       *Returns:* In the first overload, the `bool` component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

12       *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
 pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
```

```
template<class M>
 iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

13       *Mandates:* `is_assignable_v<mapped_type&, M&&>` is true.

14       *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `k`, `std::forward<M>(obj)`.

15       *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `std::forward<M>(obj)`.

16       *Returns:* In the first overload, the `bool` component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

17       *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
 pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
```

```
template<class M>
 iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

18       *Mandates:* `is_assignable_v<mapped_type&, M&&>` is true.

- 19 *Preconditions:* `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `std::move(k)`, `std::forward<M>(obj)`.
- 20 *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.
- 21 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.
- 22 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

#### 24.5.4.5 Erasure

[unord.map.erasure]

```
template<class K, class T, class H, class P, class A, class Predicate>
 typename unordered_map<K, T, H, P, A>::size_type
 erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

- 1 *Effects:* Equivalent to:

```
 auto original_size = c.size();
 for (auto i = c.begin(), last = c.end(); i != last;) {
 if (pred(*i)) {
 i = c.erase(i);
 } else {
 ++i;
 }
 }
 return original_size - c.size();
```

#### 24.5.5 Class template `unordered_multimap`

[unord.multimap]

##### 24.5.5.1 Overview

[unord.multimap.overview]

- 1 An `unordered_multimap` is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.
- 2 An `unordered_multimap` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the key type is `Key`, the mapped type is `T`, and the value type is `pair<const Key, T>`.
- 3 Subclause 24.5.5 only describes operations on `unordered_multimap` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
 template<class Key,
 class T,
 class Hash = hash<Key>,
 class Pred = equal_to<Key>,
 class Allocator = allocator<pair<const Key, T>>>

template<class Key, class T, class Hash, class Allocator>
 unordered_multimap(initializer_list<pair<Key, T>>, typename see below::size_type,
 Hash, Allocator)
 -> unordered_multimap<Key, T, Hash, equal_to<Key>, Allocator>;
}

```

- <sup>4</sup> A `size_type` parameter type in an `unordered_multimap` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

### 24.5.5.2 Constructors

[unord.multimap.cnstr]

```

unordered_multimap() : unordered_multimap(size_type(see below)) { }
explicit unordered_multimap(size_type n,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());

```

- <sup>1</sup> *Effects:* Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.
- <sup>2</sup> *Complexity:* Constant.

```

template<class InputIterator>
 unordered_multimap(InputIterator f, InputIterator l,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
 unordered_multimap(from_range_t, R&& rg,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
unordered_multimap(initializer_list<value_type> il,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());

```

3 *Effects:* Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)`, `rg`, or `il`, respectively. `max_load_factor()` returns `1.0`.

4 *Complexity:* Average case linear, worst case quadratic.

### 24.5.5.3 Modifiers

[unord.multimap.modifiers]

```

template<class P>
 iterator insert(P&& obj);

```

1 *Constraints:* `is_constructible_v<value_type, P&&>` is true.

2 *Effects:* Equivalent to: `return emplace(std::forward<P>(obj));`

```

template<class P>
 iterator insert(const_iterator hint, P&& obj);

```

3 *Constraints:* `is_constructible_v<value_type, P&&>` is true.

4 *Effects:* Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

### 24.5.5.4 Erasure

[unord.multimap.erasure]

```

template<class K, class T, class H, class P, class A, class Predicate>
 typename unordered_multimap<K, T, H, P, A>::size_type
 erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);

```

1 *Effects:* Equivalent to:

```

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last;) {
 if (pred(*i)) {
 i = c.erase(i);
 } else {
 ++i;
 }
}
return original_size - c.size();

```

## 24.5.6 Class template `unordered_set`

[unord.set]

### 24.5.6.1 Overview

[unord.set.overview]

1 An `unordered_set` is an unordered associative container that supports unique keys (an `unordered_set` contains at most one of each key value) and in which the elements' keys are the elements themselves. The `unordered_set` class supports forward iterators.

2 An `unordered_set` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_set` supports the `a_uniq` operations in that table, not the `a_eq` operations. For

an `unordered_set<Key>` the `key` type and the value type are both `Key`. The iterator and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.

- <sup>3</sup> Subclause 24.5.6 only describes operations on `unordered_set` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
 template<class Key,
 class Hash = hash<Key>,
 class Pred = equal_to<Key>,
 class Allocator = allocator<Key>>

}

```

- 4 A `size_type` parameter type in an `unordered_set` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

### 24.5.6.2 Constructors

[unord.set.cnstr]

```
unordered_set() : unordered_set(size_type(see below)) { }
```

```
explicit unordered_set(size_type n,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
```

- 1 *Effects:* Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

- 2 *Complexity:* Constant.

```
template<class InputIterator>
 unordered_set(InputIterator f, InputIterator l,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
 unordered_multiset(from_range_t, R&& rg,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
unordered_set(initializer_list<value_type> il,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
```

- 3 *Effects:* Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)`, `rg`, or `il`, respectively. `max_load_factor()` returns 1.0.

- 4 *Complexity:* Average case linear, worst case quadratic.

### 24.5.6.3 Erasure

[unord.set.erasure]

```
template<class K, class H, class P, class A, class Predicate>
 typename unordered_set<K, H, P, A>::size_type
 erase_if(unordered_set<K, H, P, A>& c, Predicate pred);
```

- 1 *Effects:* Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last;) {
 if (pred(*i)) {
 i = c.erase(i);
 } else {
 ++i;
 }
}
return original_size - c.size();
```

## 24.5.7 Class template `unordered_multiset`

[unord.multiset]

### 24.5.7.1 Overview

[unord.multiset.overview]

- 1 An `unordered_multiset` is an unordered associative container that supports equivalent keys (an instance of `unordered_multiset` may contain multiple copies of the same key value) and in which each element's key is the element itself. The `unordered_multiset` class supports forward iterators.
- 2 An `unordered_multiset` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multiset` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multiset<Key>` the key type and the value type are both `Key`. The iterator and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.
- 3 Subclause 24.5.7 only describes operations on `unordered_multiset` that are not described in one of the requirement tables, or for which there is additional semantic information.

```

}

```

- <sup>4</sup> A `size_type` parameter type in an `unordered_multiset` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

### 24.5.7.2 Constructors

[unord.multiset.cnstr]

```

unordered_multiset() : unordered_multiset(size_type(see below)) { }
explicit unordered_multiset(size_type n,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());

```

- <sup>1</sup> *Effects:* Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined.

`max_load_factor()` returns 1.0.

2 **Complexity:** Constant.

```
template<class InputIterator>
 unordered_multiset(InputIterator f, InputIterator l,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
template<container-compatible-range<value_type> R>
 unordered_multiset(from_range_t, R&& rg,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
 size_type n = see below,
 const hasher& hf = hasher(),
 const key_equal& eql = key_equal(),
 const allocator_type& a = allocator_type());
```

3 **Effects:** Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)`, `rg`, or `il`, respectively. `max_load_factor()` returns 1.0.

4 **Complexity:** Average case linear, worst case quadratic.

### 24.5.7.3 Erasure

[unord.multiset.erasure]

```
template<class K, class H, class P, class A, class Predicate>
 typename unordered_multiset<K, H, P, A>::size_type
 erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);
```

1 **Effects:** Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last;) {
 if (pred(*i)) {
 i = c.erase(i);
 } else {
 ++i;
 }
}
return original_size - c.size();
```

## 24.6 Container adaptors

[container.adaptors]

### 24.6.1 In general

[container.adaptors.general]

- 1 The headers `<queue>` and `<stack>` define the container adaptors `queue`, `priority_queue`, and `stack`.
- 2 The container adaptors each take a Container template parameter, and each constructor takes a Container reference argument. This container is copied into the Container member of each adaptor. If the container takes an allocator, then a compatible allocator may be passed in to the adaptor's constructor. Otherwise, normal copy or move construction is used for the container argument. The first template parameter `T` of the container adaptors shall denote the same type as `Container::value_type`.
- 3 For container adaptors, no swap function throws an exception unless that exception is thrown by the swap of the adaptor's Container or Compare object (if any).
- 4 A constructor template of a container adaptor shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
- 5 A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:
  - (5.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
  - (5.2) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

- (5.3) — It has a Container template parameter and a type that qualifies as an allocator is deduced for that parameter.
- (5.4) — It has no Container template parameter, and it has an Allocator template parameter, and a type that does not qualify as an allocator is deduced for that parameter.
- (5.5) — It has both Container and Allocator template parameters, and `uses_allocator_v<Container, Allocator>` is false.
- <sup>6</sup> The exposition-only alias template *iter-value-type* defined in 24.3.1 may appear in deduction guides for container adaptors.

### 24.6.2 Header <queue> synopsis

[queue.syn]

```
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

template<class T, class Container, class Alloc>
 struct uses_allocator<stack<T, Container>, Alloc>;
}

```

## 24.6.4 Class template queue

[queue]

### 24.6.4.1 Definition

[queue.defn]

- <sup>1</sup> Any sequence container supporting operations `front()`, `back()`, `push_back()` and `pop_front()` can be used to instantiate queue. In particular, `list` (24.3.10) and `deque` (24.3.8) can be used.

```

namespace std {
 template<class T, class Container = deque<T>>
 class queue {
 public:
 using value_type = typename Container::value_type;
 using reference = typename Container::reference;
 using const_reference = typename Container::const_reference;
 using size_type = typename Container::size_type;

#### 24.6.4.2 Constructors

[queue.cons]

```
explicit queue(const Container& cont);
```

1 *Effects:* Initializes *c* with *cont*.

```
explicit queue(Container&& cont);
```

2 *Effects:* Initializes *c* with `std::move(cont)`.

```
template<class InputIterator>
queue(InputIterator first, InputIterator last);
```

3 *Effects:* Initializes *c* with *first* as the first argument and *last* as the second argument.

```
template<container-compatible-range<T> R>
queue(from_range_t, R&& rg);
```

4 *Effects:* Initializes *c* with `ranges::to<Container>(std::forward<R>(rg))`.

#### 24.6.4.3 Constructors with allocators

[queue.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is false the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit queue(const Alloc& a);
```

2 *Effects:* Initializes *c* with *a*.

```
template<class Alloc> queue(const container_type& cont, const Alloc& a);
```

3 *Effects:* Initializes *c* with *cont* as the first argument and *a* as the second argument.

```
template<class Alloc> queue(container_type&& cont, const Alloc& a);
```

4 *Effects:* Initializes *c* with `std::move(cont)` as the first argument and *a* as the second argument.

```
template<class Alloc> queue(const queue& q, const Alloc& a);
```

5 *Effects:* Initializes *c* with *q.c* as the first argument and *a* as the second argument.

```
template<class Alloc> queue(queue&& q, const Alloc& a);
```

6 *Effects:* Initializes `c` with `std::move(q.c)` as the first argument and `a` as the second argument.

```
template<class InputIterator, class Alloc>
queue(InputIterator first, InputIterator last, const Alloc& alloc);
```

7 *Effects:* Initializes `c` with `first` as the first argument, `last` as the second argument, and `alloc` as the third argument.

```
template<container-compatible-range<T> R, class Alloc>
queue(from_range_t, R&& rg, const Alloc& a);
```

8 *Effects:* Initializes `c` with `ranges::to<Container>(std::forward<R>(rg), a)`.

#### 24.6.4.4 Modifiers

[queue.mod]

```
template<container-compatible-range<T> R>
void push_range(R&& rg);
```

1 *Effects:* Equivalent to `c.append_range(std::forward<R>(rg))` if that is a valid expression, otherwise `ranges::copy(rg, back_inserter(c))`.

#### 24.6.4.5 Operators

[queue.ops]

```
template<class T, class Container>
bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
```

1 *Returns:* `x.c == y.c`.

```
template<class T, class Container>
bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
```

2 *Returns:* `x.c != y.c`.

```
template<class T, class Container>
bool operator<(const queue<T, Container>& x, const queue<T, Container>& y);
```

3 *Returns:* `x.c < y.c`.

```
template<class T, class Container>

```

6 *Returns:* `x.c >= y.c`.

```
template<class T, three_way_comparable Container>
compare_three_way_result_t<Container>
operator<=>(const queue<T, Container>& x, const queue<T, Container>& y);
```

7 *Returns:* `x.c <=> y.c`.

#### 24.6.4.6 Specialized algorithms

[queue.special]

```
template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints:* `is_swappable_v<Container>` is true.

2 *Effects:* As if by `x.swap(y)`.

## 24.6.5 Class template `priority_queue`

[priority.queue]

### 24.6.5.1 Overview

[priqueue.overview]

- <sup>1</sup> Any sequence container with random access iterator and supporting operations `front()`, `push_back()` and `pop_back()` can be used to instantiate `priority_queue`. In particular, `vector` (24.3.11) and `deque` (24.3.8) can be used. Instantiating `priority_queue` also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (27.8).

```

namespace std {
 template<class T, class Container = vector<T>,
 class Compare = less<typename Container::value_type>>
 class priority_queue {
 public:
 using value_type = typename Container::value_type;
 using reference = typename Container::reference;
 using const_reference = typename Container::const_reference;
 using size_type = typename Container::size_type;
 using container_type = Container;
 using value_compare = Compare;

 protected:
 Container c;
 Compare comp;

 public:
 priority_queue() : priority_queue(Compare()) {}
 explicit priority_queue(const Compare& x) : priority_queue(x, Container()) {}
 priority_queue(const Compare& x, const Container&);
 priority_queue(const Compare& x, Container&&);
 template<class InputIterator>
 priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());
 template<class InputIterator>
 priority_queue(InputIterator first, InputIterator last, const Compare& x,
 const Container&);
 template<class InputIterator>
 priority_queue(InputIterator first, InputIterator last, const Compare& x,
 Container&&);
 template<container-compatible-range<T> R>
 priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
 template<class Alloc> explicit priority_queue(const Alloc&);
 template<class Alloc> priority_queue(const Compare&, const Alloc&);
 template<class Alloc> priority_queue(const Compare&, const Container&, const Alloc&);
 template<class Alloc> priority_queue(const Compare&, Container&&, const Alloc&);
 template<class Alloc> priority_queue(const priority_queue&, const Alloc&);
 template<class Alloc> priority_queue(priority_queue&&, const Alloc&);
 template<class InputIterator, class Alloc>
 priority_queue(InputIterator, InputIterator, const Alloc&);
 template<class InputIterator, class Alloc>
 priority_queue(InputIterator, InputIterator, const Compare&, const Alloc&);

// no equality is provided

template<class T, class Container, class Compare, class Alloc>
 struct uses_allocator<priority_queue<T, Container, Compare>, Alloc>
 : uses_allocator<Container, Alloc>::type { };
}

```

### 24.6.5.2 Constructors

[priority\_queue.cons]

```

priority_queue(const Compare& x, const Container& y);
priority_queue(const Compare& x, Container&& y);

```

<sup>1</sup> *Preconditions:* x defines a strict weak ordering (27.8).

- 2 *Effects:* Initializes `comp` with `x` and `c` with `y` (copy constructing or move constructing as appropriate); calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());
```

- 3 *Preconditions:* `x` defines a strict weak ordering (27.8).

- 4 *Effects:* Initializes `c` with `first` as the first argument and `last` as the second argument, and initializes `comp` with `x`; then calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x, const Container& y);
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x, Container&& y);
```

- 5 *Preconditions:* `x` defines a strict weak ordering (27.8).

- 6 *Effects:* Initializes `comp` with `x` and `c` with `y` (copy constructing or move constructing as appropriate); calls `c.insert(c.end(), first, last)`; and finally calls `make_heap(c.begin(), c.end(), comp)`.

```
template<container-compatible-range<T> R>
priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
```

- 7 *Preconditions:* `x` defines a strict weak ordering (27.8).

- 8 *Effects:* Initializes `comp` with `x` and `c` with `ranges::to<Container>(std::forward<R>(rg))` and finally calls `make_heap(c.begin(), c.end(), comp)`.

### 24.6.5.3 Constructors with allocators

[priority\_queue.cons.alloc]

- 1 If `uses_allocator_v<container_type, Alloc>` is false the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit priority_queue(const Alloc& a);
```

- 2 *Effects:* Initializes `c` with `a` and value-initializes `comp`.

```
template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);
```

- 3 *Effects:* Initializes `c` with `a` and initializes `comp` with `compare`.

```
template<class Alloc>
priority_queue(const Compare& compare, const Container& cont, const Alloc& a);
```

- 4 *Effects:* Initializes `c` with `cont` as the first argument and `a` as the second argument, and initializes `comp` with `compare`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class Alloc>
priority_queue(const Compare& compare, Container&& cont, const Alloc& a);
```

- 5 *Effects:* Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument, and initializes `comp` with `compare`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class Alloc> priority_queue(const priority_queue& q, const Alloc& a);
```

- 6 *Effects:* Initializes `c` with `q.c` as the first argument and `a` as the second argument, and initializes `comp` with `q.comp`.

```
template<class Alloc> priority_queue(priority_queue&& q, const Alloc& a);
```

- 7 *Effects:* Initializes `c` with `std::move(q.c)` as the first argument and `a` as the second argument, and initializes `comp` with `std::move(q.comp)`.

```
template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Alloc& a);
```

- 8 *Effects:* Initializes `c` with `first` as the first argument, `last` as the second argument, and `a` as the third argument, and value-initializes `comp`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Compare& compare, const Alloc& a);
```

- 9 *Effects:* Initializes *c* with *first* as the first argument, *last* as the second argument, and *a* as the third argument, and initializes *comp* with *compare*; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Compare& compare,
 const Container& cont, const Alloc& a);
```

- 10 *Effects:* Initializes *c* with *cont* as the first argument and *a* as the second argument, and initializes *comp* with *compare*; calls `c.insert(c.end(), first, last)`; and finally calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Compare& compare, Container&& cont,
 const Alloc& a);
```

- 11 *Effects:* Initializes *c* with `std::move(cont)` as the first argument and *a* as the second argument, and initializes *comp* with *compare*; calls `c.insert(c.end(), first, last)`; and finally calls `make_heap(c.begin(), c.end(), comp)`.

```
template<container-compatible-range<T> R, class Alloc>
priority_queue(from_range_t, R&& rg, const Compare& compare, const Alloc& a);
```

- 12 *Effects:* Initializes *comp* with *compare* and *c* with `ranges::to<Container>(std::forward<R>(rg), a)`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<container-compatible-range<T> R, class Alloc>
priority_queue(from_range_t, R&& rg, const Alloc& a);
```

- 13 *Effects:* Initializes *c* with `ranges::to<Container>(std::forward<R>(rg), a)`; calls `make_heap(c.begin(), c.end(), comp)`.

#### 24.6.5.4 Members

[[priority\\_queue.members](#)]

```
void push(const value_type& x);
```

- 1 *Effects:* As if by:  
`c.push_back(x);`  
`push_heap(c.begin(), c.end(), comp);`

```
void push(value_type&& x);
```

- 2 *Effects:* As if by:  
`c.push_back(std::move(x));`  
`push_heap(c.begin(), c.end(), comp);`

```
template<container-compatible-range<T> R>
void push_range(R&& rg);
```

- 3 *Effects:* Insert all elements of *rg* in *c*.  
4 *Postconditions:* `is_heap(c.begin(), c.end(), comp)` is true.

```
template<class... Args> void emplace(Args&&... args);
```

- 5 *Effects:* As if by:  
`c.emplace_back(std::forward<Args>(args)...);`  
`push_heap(c.begin(), c.end(), comp);`

```
void pop();
```

- 6 *Effects:* As if by:  
`pop_heap(c.begin(), c.end(), comp);`  
`c.pop_back();`

**24.6.5.5 Specialized algorithms****[priority\_queue.special]**

```
template<class T, class Container, class Compare>
void swap(priority_queue<T, Container, Compare>& x,
 priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints:* `is_swappable_v<Container>` is true and `is_swappable_v<Compare>` is true.

2 *Effects:* As if by `x.swap(y)`.

**24.6.6 Class template stack****[stack]****24.6.6.1 General****[stack.general]**

1 Any sequence container supporting operations `back()`, `push_back()` and `pop_back()` can be used to instantiate `stack`. In particular, `vector` (24.3.11), `list` (24.3.10) and `deque` (24.3.8) can be used.

```

4 *Effects:* Initializes *c* with `ranges::to<Container>(std::forward<R>(rg))`.

### 24.6.6.4 Constructors with allocators

[stack.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is false the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit stack(const Alloc& a);
```

2 *Effects:* Initializes *c* with *a*.

```
template<class Alloc> stack(const container_type& cont, const Alloc& a);
```

3 *Effects:* Initializes *c* with *cont* as the first argument and *a* as the second argument.

```
template<class Alloc> stack(container_type&& cont, const Alloc& a);
```

4 *Effects:* Initializes *c* with `std::move(cont)` as the first argument and *a* as the second argument.

```
template<class Alloc> stack(const stack& s, const Alloc& a);
```

5 *Effects:* Initializes *c* with *s.c* as the first argument and *a* as the second argument.

```
template<class Alloc> stack(stack&& s, const Alloc& a);
```

6 *Effects:* Initializes *c* with `std::move(s.c)` as the first argument and *a* as the second argument.

```
template<class InputIterator, class Alloc>
stack(InputIterator first, InputIterator last, const Alloc& alloc);
```

- 7 *Effects:* Initializes `c` with `first` as the first argument, `last` as the second argument, and `alloc` as the third argument.

```
template<container-compatible-range<T> R, class Alloc>
stack(from_range_t, R&& rg, const Alloc& a);
```

- 8 *Effects:* Initializes `c` with `ranges::to<Container>(std::forward<R>(rg), a)`.

#### 24.6.6.5 Modifiers

[stack.mod]

```
template<container-compatible-range<T> R>
void push_range(R&& rg);
```

- 1 *Effects:* Equivalent to `c.append_range(std::forward<R>(rg))` if that is a valid expression, otherwise `ranges::copy(rg, back_inserter(c))`.

#### 24.6.6.6 Operators

[stack.ops]

```
template<class T, class Container>
bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
```

- 1 *Returns:* `x.c == y.c`.

```

bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
```

- 2 *Returns:* `x.c != y.c`.

```
template<class T, class Container>
bool operator<(const stack<T, Container>& x, const stack<T, Container>& y);
```

- 3 *Returns:* `x.c < y.c`.

```
template<class T, class Container>
bool operator>(const stack<T, Container>& x, const stack<T, Container>& y);
```

- 4 *Returns:* `x.c > y.c`.

```
template<class T, class Container>
bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
```

- 5 *Returns:* `x.c <= y.c`.

```
template<class T, class Container>
bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
```

- 6 *Returns:* `x.c >= y.c`.

```
template<class T, three_way_comparable Container>
compare_three_way_result_t<Container>
operator<=>(const stack<T, Container>& x, const stack<T, Container>& y);
```

- 7 *Returns:* `x.c <=> y.c`.

#### 24.6.6.7 Specialized algorithms

[stack.special]

```
template<class T, class Container>
void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
```

- 1 *Constraints:* `is_swappable_v<Container>` is true.

- 2 *Effects:* As if by `x.swap(y)`.

### 24.7 Views

[views]

#### 24.7.1 General

[views.general]

- 1 The header `<span>` defines the view `span`.

**24.7.2 Header `<span>` synopsis****[span.syn]**

```

namespace std {
 // constants
 inline constexpr size_t dynamic_extent = numeric_limits<size_t>::max();

 // 24.7.3, class template span
 template<class ElementType, size_t Extent = dynamic_extent>
 class span;

 template<class ElementType, size_t Extent>
 inline constexpr bool ranges::enable_view<span<ElementType, Extent>> = true;
 template<class ElementType, size_t Extent>
 inline constexpr bool ranges::enable_borrowed_range<span<ElementType, Extent>> = true;

 // 24.7.3.8, views of object representation
 template<class ElementType, size_t Extent>
 span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
 as_bytes(span<ElementType, Extent> s) noexcept;

 template<class ElementType, size_t Extent>
 span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
 as_writable_bytes(span<ElementType, Extent> s) noexcept;
}

```

**24.7.3 Class template span****[views.span]****24.7.3.1 Overview****[span.overview]**

- 1 A span is a view over a contiguous sequence of objects, the storage of which is owned by some other object.
- 2 All member functions of span have constant time complexity.

```

namespace std {
 template<class ElementType, size_t Extent = dynamic_extent>
 class span {
 public:
 // constants and types
 using element_type = ElementType;
 using value_type = remove_cv_t<ElementType>;
 using size_type = size_t;
 using difference_type = ptrdiff_t;
 using pointer = element_type*;
 using const_pointer = const element_type*;
 using reference = element_type&;
 using const_reference = const element_type&;
 using iterator = implementation-defined; // see 24.7.3.7
 using reverse_iterator = std::reverse_iterator<iterator>;
 static constexpr size_type extent = Extent;

 // 24.7.3.2, constructors, copy, and assignment
 constexpr span() noexcept;
 template<class It>
 constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
 template<class It, class End>
 constexpr explicit(extent != dynamic_extent) span(It first, End last);
 template<size_t N>
 constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
 template<class T, size_t N>
 constexpr span(array<T, N>& arr) noexcept;
 template<class T, size_t N>
 constexpr span(const array<T, N>& arr) noexcept;
 template<class R>
 constexpr explicit(extent != dynamic_extent) span(R&& r);
 constexpr span(const span& other) noexcept = default;
 template<class OtherElementType, size_t OtherExtent>
 constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;

```

```

~span() noexcept = default;

constexpr span& operator=(const span& other) noexcept = default;

// 24.7.3.4, subviews
template<size_t Count>
 constexpr span<element_type, Count> first() const;
template<size_t Count>
 constexpr span<element_type, Count> last() const;
template<size_t Offset, size_t Count = dynamic_extent>
 constexpr span<element_type, see below> subspan() const;

constexpr span<element_type, dynamic_extent> first(size_type count) const;
constexpr span<element_type, dynamic_extent> last(size_type count) const;
constexpr span<element_type, dynamic_extent> subspan(
 size_type offset, size_type count = dynamic_extent) const;

// 24.7.3.5, observers
constexpr size_type size() const noexcept;
constexpr size_type size_bytes() const noexcept;
[[nodiscard]] constexpr bool empty() const noexcept;

// 24.7.3.6, element access
constexpr reference operator[](size_type idx) const;
constexpr reference front() const;
constexpr reference back() const;
constexpr pointer data() const noexcept;

// 24.7.3.7, iterator support
constexpr iterator begin() const noexcept;
constexpr iterator end() const noexcept;
constexpr reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() const noexcept;

private:
 pointer data_; // exposition only
 size_type size_; // exposition only
};

template<class It, class EndOrSize>
 span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;
template<class T, size_t N>
 span(T (&)[N]) -> span<T, N>;
template<class T, size_t N>
 span(array<T, N>&) -> span<T, N>;
template<class T, size_t N>
 span(const array<T, N>&) -> span<const T, N>;
template<class R>
 span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
}

```

<sup>3</sup> span<ElementType, Extent> is a trivially copyable type (6.8.1).

<sup>4</sup> ElementType is required to be a complete object type that is not an abstract class type.

### 24.7.3.2 Constructors, copy, and assignment

[span.cons]

```
constexpr span() noexcept;
```

<sup>1</sup> *Constraints:* Extent == dynamic\_extent || Extent == 0 is true.

<sup>2</sup> *Postconditions:* size() == 0 && data() == nullptr.

```
template<class It>
 constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
```

<sup>3</sup> *Constraints:* Let U be remove\_reference\_t<iter\_reference\_t<It>>.

- (3.1) — It satisfies `contiguous_iterator`.
- (3.2) — `is_convertible_v<U(*)[], element_type(*)[]>` is true.  
 [Note 1: The intent is to allow only qualification conversions of the iterator reference type to `element_type`. — *end note*]

4 **Preconditions:**

- (4.1) — `[first, first + count)` is a valid range.
- (4.2) — It models `contiguous_iterator`.
- (4.3) — If `extent` is not equal to `dynamic_extent`, then `count` is equal to `extent`.

5 **Effects:** Initializes `data_` with `to_address(first)` and `size_` with `count`.

6 **Throws:** Nothing.

```
template<class It, class End>
constexpr explicit(extent != dynamic_extent) span(It first, End last);
```

7 **Constraints:** Let `U` be `remove_reference_t<iter_reference_t<It>>`.

- (7.1) — `is_convertible_v<U(*)[], element_type(*)[]>` is true.  
 [Note 2: The intent is to allow only qualification conversions of the iterator reference type to `element_type`. — *end note*]
- (7.2) — It satisfies `contiguous_iterator`.
- (7.3) — `End` satisfies `sized_sentinel_for<It>`.
- (7.4) — `is_convertible_v<End, size_t>` is false.

8 **Preconditions:**

- (8.1) — If `extent` is not equal to `dynamic_extent`, then `last - first` is equal to `extent`.
- (8.2) — `[first, last)` is a valid range.
- (8.3) — It models `contiguous_iterator`.
- (8.4) — `End` models `sized_sentinel_for<It>`.

9 **Effects:** Initializes `data_` with `to_address(first)` and `size_` with `last - first`.

10 **Throws:** When and what `last - first` throws.

```
template<size_t N> constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
template<class T, size_t N> constexpr span(array<T, N>& arr) noexcept;
template<class T, size_t N> constexpr span(const array<T, N>& arr) noexcept;
```

11 **Constraints:** Let `U` be `remove_pointer_t<decltype(data(arr))>`.

- (11.1) — `extent == dynamic_extent || N == extent` is true, and
- (11.2) — `is_convertible_v<U(*)[], element_type(*)[]>` is true.  
 [Note 3: The intent is to allow only qualification conversions of the array element type to `element_type`. — *end note*]

12 **Effects:** Constructs a span that is a view over the supplied array.

[Note 4: `type_identity_t` affects class template argument deduction. — *end note*]

13 **Postconditions:** `size() == N && data() == data(arr)` is true.

```
template<class R> constexpr explicit(extent != dynamic_extent) span(R&& r);
```

14 **Constraints:** Let `U` be `remove_reference_t<ranges::range_reference_t<R>>`.

- (14.1) — `R` satisfies `ranges::contiguous_range` and `ranges::sized_range`.
- (14.2) — Either `R` satisfies `ranges::borrowed_range` or `is_const_v<element_type>` is true.
- (14.3) — `remove_cvref_t<R>` is not a specialization of `span`.
- (14.4) — `remove_cvref_t<R>` is not a specialization of `array`.
- (14.5) — `is_array_v<remove_cvref_t<R>>` is false.
- (14.6) — `is_convertible_v<U(*)[], element_type(*)[]>` is true.

[Note 5: The intent is to allow only qualification conversions of the range reference type to `element_type`. — *end note*]

- 15 *Preconditions:*
- (15.1) — If `extent` is not equal to `dynamic_extent`, then `ranges::size(r)` is equal to `extent`.
- (15.2) — R models `ranges::contiguous_range` and `ranges::sized_range`.
- (15.3) — If `is_const_v<element_type>` is false, R models `ranges::borrowed_range`.
- 16 *Effects:* Initializes `data_` with `ranges::data(r)` and `size_` with `ranges::size(r)`.
- 17 *Throws:* What and when `ranges::data(r)` and `ranges::size(r)` throw.

```
constexpr span(const span& other) noexcept = default;
```

- 18 *Postconditions:* `other.size() == size() && other.data() == data()`.

```
template<class OtherElementType, size_t OtherExtent>
constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;
```

- 19 *Constraints:*
- (19.1) — `extent == dynamic_extent || OtherExtent == dynamic_extent || extent == OtherExtent` is true, and
- (19.2) — `is_convertible_v<OtherElementType(*)[], element_type(*)[]>` is true.

[Note 6: The intent is to allow only qualification conversions of the `OtherElementType` to `element_type`. — *end note*]

- 20 *Preconditions:* If `extent` is not equal to `dynamic_extent`, then `s.size()` is equal to `extent`.
- 21 *Effects:* Constructs a span that is a view over the range `[s.data(), s.data() + s.size())`.
- 22 *Postconditions:* `size() == s.size() && data() == s.data()`.
- 23 *Remarks:* The expression inside `explicit` is equivalent to:

```
extent != dynamic_extent && OtherExtent == dynamic_extent
```

```
constexpr span& operator=(const span& other) noexcept = default;
```

- 24 *Postconditions:* `size() == other.size() && data() == other.data()`.

### 24.7.3.3 Deduction guides

[`span.deduct`]

```
template<class It, class EndOrSize>
span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;
```

- 1 *Constraints:* It satisfies `contiguous_iterator`.

```
template<class R>
span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
```

- 2 *Constraints:* R satisfies `ranges::contiguous_range`.

### 24.7.3.4 Subviews

[`span.sub`]

```
template<size_t Count> constexpr span<element_type, Count> first() const;
```

- 1 *Mandates:* `Count <= Extent` is true.
- 2 *Preconditions:* `Count <= size()` is true.
- 3 *Effects:* Equivalent to: `return R{data(), Count};` where R is the return type.

```
template<size_t Count> constexpr span<element_type, Count> last() const;
```

- 4 *Mandates:* `Count <= Extent` is true.
- 5 *Preconditions:* `Count <= size()` is true.
- 6 *Effects:* Equivalent to: `return R{data() + (size() - Count), Count};` where R is the return type.

```
template<size_t Offset, size_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;
```

- 7 *Mandates:*

Offset <= Extent && (Count == dynamic\_extent || Count <= Extent - Offset)  
is true.

8 *Preconditions:*

Offset <= size() && (Count == dynamic\_extent || Count <= size() - Offset)  
is true.

9 *Effects:* Equivalent to:

```
return span<ElementType, see below>(
 data() + Offset, Count != dynamic_extent ? Count : size() - Offset);
```

10 *Remarks:* The second template argument of the returned span type is:

```
Count != dynamic_extent ? Count
 : (Extent != dynamic_extent ? Extent - Offset
 : dynamic_extent)
```

```
constexpr span<element_type, dynamic_extent> first(size_type count) const;
```

11 *Preconditions:* count <= size() is true.

12 *Effects:* Equivalent to: return {data(), count};

```
constexpr span<element_type, dynamic_extent> last(size_type count) const;
```

13 *Preconditions:* count <= size() is true.

14 *Effects:* Equivalent to: return {data() + (size() - count), count};

```
constexpr span<element_type, dynamic_extent> subspan(
 size_type offset, size_type count = dynamic_extent) const;
```

15 *Preconditions:*

offset <= size() && (count == dynamic\_extent || count <= size() - offset)  
is true.

16 *Effects:* Equivalent to:

```
return {data() + offset, count == dynamic_extent ? size() - offset : count};
```

### 24.7.3.5 Observers

[span.obs]

```
constexpr size_type size() const noexcept;
```

1 *Effects:* Equivalent to: return size\_;

```
constexpr size_type size_bytes() const noexcept;
```

2 *Effects:* Equivalent to: return size() \* sizeof(element\_type);

```
[[nodiscard]] constexpr bool empty() const noexcept;
```

3 *Effects:* Equivalent to: return size() == 0;

### 24.7.3.6 Element access

[span.elem]

```
constexpr reference operator[](size_type idx) const;
```

1 *Preconditions:* idx < size() is true.

2 *Effects:* Equivalent to: return \*(data() + idx);

```
constexpr reference front() const;
```

3 *Preconditions:* empty() is false.

4 *Effects:* Equivalent to: return \*data();

```
constexpr reference back() const;
```

5 *Preconditions:* empty() is false.

6 *Effects:* Equivalent to: return \*(data() + (size() - 1));

```
constexpr pointer data() const noexcept;
```

7 *Effects:* Equivalent to: return data\_;

### 24.7.3.7 Iterator support

[span.iterators]

```
using iterator = implementation-defined;
```

1 The type models contiguous\_iterator (25.3.4.14), meets the Cpp17RandomAccessIterator requirements (25.3.5.7), and meets the requirements for constexpr iterators (25.3.1), whose value type is value\_type and whose reference type is reference.

2 All requirements on container iterators (24.2) apply to span::iterator as well.

```
constexpr iterator begin() const noexcept;
```

3 *Returns:* An iterator referring to the first element in the span. If empty() is true, then it returns the same value as end().

```
constexpr iterator end() const noexcept;
```

4 *Returns:* An iterator which is the past-the-end value.

```
constexpr reverse_iterator rbegin() const noexcept;
```

5 *Effects:* Equivalent to: return reverse\_iterator(end());

```
constexpr reverse_iterator rend() const noexcept;
```

6 *Effects:* Equivalent to: return reverse\_iterator(begin());

### 24.7.3.8 Views of object representation

[span.objectrep]

```
template<class ElementType, size_t Extent>
```

```
span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
```

```
as_bytes(span<ElementType, Extent> s) noexcept;
```

1 *Effects:* Equivalent to: return R{reinterpret\_cast<const byte\*>(s.data()), s.size\_bytes()}; where R is the return type.

```
template<class ElementType, size_t Extent>
```

```
span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
```

```
as_writable_bytes(span<ElementType, Extent> s) noexcept;
```

2 *Constraints:* is\_const\_v<ElementType> is false.

3 *Effects:* Equivalent to: return R{reinterpret\_cast<byte\*>(s.data()), s.size\_bytes()}; where R is the return type.

## 25 Iterators library

## [iterators]

### 25.1 General

[iterators.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform iterations over containers (Clause 24), streams (31.7), stream buffers (31.6), and other ranges (Clause 26).
- <sup>2</sup> The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 80.

Table 80: Iterators library summary [tab:iterators.summary]

| Subclause | Header                           |
|-----------|----------------------------------|
| 25.3      | Iterator requirements <iterator> |
| 25.4      | Iterator primitives              |
| 25.5      | Iterator adaptors                |
| 25.6      | Stream iterators                 |
| 25.7      | Range access                     |

### 25.2 Header <iterator> synopsis

[iterator.synopsis]

```
#include <compare> // see 17.11.1
#include <concepts> // see 18.3

```

## 25.3 Iterator requirements

[iterator.requirements]

### 25.3.1 In general

[iterator.requirements.general]

- <sup>1</sup> Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator *i* supports the expression *\*i*, resulting in a value of some object type *T*, called the *value type* of the iterator. An output iterator *i* has a non-empty set of types that are indirectly-writable to the iterator; for each such type *T*, the expression *\*i = o* is valid where *o* is a value of type *T*. For every iterator type *X*, there is a corresponding signed integer-like type (25.3.4.4) called the *difference type* of the iterator.
- <sup>2</sup> Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: *input iterators*, *output iterators*, *forward iterators*, *bidirectional iterators*, *random access iterators*, and *contiguous iterators*, as shown in Table 81.

Table 81: Relations among iterator categories [tab:iterators.relations]

- <sup>3</sup> The six categories of iterators correspond to the iterator concepts

- (3.1) — `input_iterator` (25.3.4.9),
- (3.2) — `output_iterator` (25.3.4.10),
- (3.3) — `forward_iterator` (25.3.4.11),
- (3.4) — `bidirectional_iterator` (25.3.4.12),
- (3.5) — `random_access_iterator` (25.3.4.13), and
- (3.6) — `contiguous_iterator` (25.3.4.14),

respectively. The generic term *iterator* refers to any type that models the `input_or_output_iterator` concept (25.3.4.6).

- <sup>4</sup> Forward iterators meet all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also meet all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also meet all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also meet all the requirements of random access iterators and can be used whenever a random access iterator is specified.
- <sup>5</sup> Iterators that further meet the requirements of output iterators are called *mutable iterators*. Nonmutable iterators are referred to as *constant iterators*.
- <sup>6</sup> In addition to the requirements in this subclause, the nested *typedef-names* specified in 25.3.2.3 shall be provided for the iterator type.

[Note 1: Either the iterator type must provide the *typedef-names* directly (in which case `iterator_traits` pick them up automatically), or an `iterator_traits` specialization must provide them. — end note]

- <sup>7</sup> Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a *past-the-end value*. Values of an iterator *i* for which the expression *\*i* is defined are called *dereferenceable*. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the *Cpp17DefaultConstructible* requirements, using a value-initialized iterator as the source of a copy or move operation.

[Note 2: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — end note]

In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

- 8 Most of the library’s algorithmic templates that operate on data structures have interfaces that use ranges. A *range* is an iterator and a *sentinel* that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.<sup>218</sup>
- 9 An iterator and a sentinel denoting a range are comparable. A range  $[i, s)$  is empty if  $i == s$ ; otherwise,  $[i, s)$  refers to the elements in the data structure starting with the element pointed to by  $i$  and up to but not including the element, if any, pointed to by the first iterator  $j$  such that  $j == s$ .
- 10 A sentinel  $s$  is called *reachable from* an iterator  $i$  if and only if there is a finite sequence of applications of the expression  $++i$  that makes  $i == s$ . If  $s$  is reachable from  $i$ ,  $[i, s)$  denotes a *valid range*.
- 11 A *counted range*  $i + [0, n)$  is empty if  $n == 0$ ; otherwise,  $i + [0, n)$  refers to the  $n$  elements in the data structure starting with the element pointed to by  $i$  and up to but not including the element, if any, pointed to by the result of  $n$  applications of  $++i$ . A counted range  $i + [0, n)$  is *valid* if and only if  $n == 0$ ; or  $n$  is positive,  $i$  is dereferenceable, and  $++i + [0, --n)$  is valid.
- 12 The result of the application of library functions to invalid ranges is undefined.
- 13 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.
- 14 Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.
- 15 An *invalid iterator* is an iterator that may be singular.<sup>219</sup>
- 16 Iterators are called *constexpr iterators* if all operations provided to meet iterator category requirements are constexpr functions.

[Note 3: For example, the types “pointer to int” and `reverse_iterator<int*` are constexpr iterators. — end note]

## 25.3.2 Associated types

[iterator.assoc.types]

### 25.3.2.1 Incrementable traits

[incrementable.traits]

- 1 To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if `WI` is the name of a type that models the `weakly_incrementable` concept (25.3.4.4), the type

```
iter_difference_t<WI>
```

be defined as the incrementable type’s difference type.

```
namespace std {
 template<class> struct incrementable_traits { };

 template<class T>
 requires is_object_v<T>
 struct incrementable_traits<T*> {
 using difference_type = ptrdiff_t;
 };

 template<class I>
 struct incrementable_traits<const I>
 : incrementable_traits<I> { };

 template<class T>
 requires { typename T::difference_type; }
 struct incrementable_traits<T> {
 using difference_type = typename T::difference_type;
 };

 template<class T>
 requires (!requires { typename T::difference_type; } &&
 requires(const T& a, const T& b) { { a - b } -> integral; })
 struct incrementable_traits<T> {
 using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
 };
}
```

218) The sentinel denoting the end of a range can have the same type as the iterator denoting the beginning of the range, or a different type.

219) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.

```

 template<class T>
 using iter_difference_t = see below;
}

```

- <sup>2</sup> Let  $R_I$  be `remove_cvref_t<I>`. The type `iter_difference_t<I>` denotes
- (2.1) — `incrementable_traits<R_I>::difference_type` if `iterator_traits<R_I>` names a specialization generated from the primary template, and
- (2.2) — `iterator_traits<R_I>::difference_type` otherwise.
- <sup>3</sup> Users may specialize `incrementable_traits` on program-defined types.

### 25.3.2.2 Indirectly readable traits

[readable.traits]

- <sup>1</sup> To implement algorithms only in terms of indirectly readable types, it is often necessary to determine the value type that corresponds to a particular indirectly readable type. Accordingly, it is required that if  $R$  is the name of a type that models the `indirectly_readable` concept (25.3.4.2), the type

```
iter_value_t<R>
```

be defined as the indirectly readable type's value type.

```

template<class> struct cond-value-type { }; // exposition only
template<class T>
 requires is_object_v<T>
struct cond-value-type<T> {
 using value_type = remove_cv_t<T>;
};

template<class T>
 concept has-member-value-type = requires { typename T::value_type; }; // exposition only

template<class T>
 concept has-member-element-type = requires { typename T::element_type; }; // exposition only

template<class> struct indirectly_readable_traits { };

template<class T>
struct indirectly_readable_traits<T*>
 : cond-value-type<T> { };

template<class I>
 requires is_array_v<I>
struct indirectly_readable_traits<I> {
 using value_type = remove_cv_t<remove_extent_t<I>>;
};

template<class I>
struct indirectly_readable_traits<const I>
 : indirectly_readable_traits<I> { };

template<has-member-value-type T>
struct indirectly_readable_traits<T>
 : cond-value-type<typename T::value_type> { };

template<has-member-element-type T>
struct indirectly_readable_traits<T>
 : cond-value-type<typename T::element_type> { };

template<has-member-value-type T>
 requires has-member-element-type<T>
struct indirectly_readable_traits<T> { };

template<has-member-value-type T>
 requires has-member-element-type<T> &&
 same_as<remove_cv_t<typename T::element_type>, remove_cv_t<typename T::value_type>>
struct indirectly_readable_traits<T>

```

```
 : cond-value-type<typename T::value_type> { };
```

```
 template<class T> using iter_value_t = see below;
```

2 Let  $R_I$  be `remove_cvref_t<I>`. The type `iter_value_t<I>` denotes

- (2.1) — `indirectly_readable_traits<R_I>::value_type` if `iterator_traits<R_I>` names a specialization generated from the primary template, and
- (2.2) — `iterator_traits<R_I>::value_type` otherwise.

3 Class template `indirectly_readable_traits` may be specialized on program-defined types.

4 [Note 1: Some legacy output iterators define a nested type named `value_type` that is an alias for `void`. These types are not `indirectly_readable` and have no associated value types. — *end note*]

5 [Note 2: Smart pointers like `shared_ptr<int>` are `indirectly_readable` and have an associated value type, but a smart pointer like `shared_ptr<void>` is not `indirectly_readable` and has no associated value type. — *end note*]

### 25.3.2.3 Iterator traits

[iterator.traits]

1 To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator category that corresponds to a particular iterator type. Accordingly, it is required that if `I` is the type of an iterator, the type

```
 iterator_traits<I>::iterator_category
```

be defined as the iterator's iterator category. In addition, the types

```
 iterator_traits<I>::pointer
 iterator_traits<I>::reference
```

shall be defined as the iterator's pointer and reference types; that is, for an iterator object `a` of class type, the same type as `decltype(a.operator->())` and `decltype(*a)`, respectively. The type `iterator_traits<I>::pointer` shall be `void` for an iterator of class type `I` that does not support `operator->`. Additionally, in the case of an output iterator, the types

```
 iterator_traits<I>::value_type
 iterator_traits<I>::difference_type
 iterator_traits<I>::reference
```

may be defined as `void`.

2 The definitions in this subclause make use of the following exposition-only concepts:

```
template<class I>
concept cpp17-iterator =
 requires(I i) {
 { *i } -> can-reference;
 { ++i } -> same_as<I&>;
 { *i++ } -> can-reference;
 } && copyable<I>;
```

```
template<class I>
concept cpp17-input-iterator =
 cpp17-iterator<I> && equality_comparable<I> && requires(I i) {
 typename incrementable_traits<I>::difference_type;
 typename indirectly_readable_traits<I>::value_type;
 typename common_reference_t<iter_reference_t<I>&&,
 indirectly_readable_traits<I>::value_type&&;
 typename common_reference_t<decltype(*i++)&&,
 indirectly_readable_traits<I>::value_type&&;
 requires signed_integral<typename incrementable_traits<I>::difference_type>;
 };
```

```
template<class I>
concept cpp17-forward-iterator =
 cpp17-input-iterator<I> && constructible_from<I> &&
 is_lvalue_reference_v<iter_reference_t<I>> &&
 same_as<remove_cvref_t<iter_reference_t<I>>,
 typename indirectly_readable_traits<I>::value_type> &&
 requires(I i) {
 { i++ } -> convertible_to<const I&>;
```

```

 { *i++ } -> same_as<iter_reference_t<I>>;
};

template<class I>
concept cpp17-bidirectional-iterator =
 cpp17-forward-iterator<I> && requires(I i) {
 { --i } -> same_as<I&&>;
 { i-- } -> convertible_to<const I&&>;
 { *i-- } -> same_as<iter_reference_t<I>>;
};

template<class I>
concept cpp17-random-access-iterator =
 cpp17-bidirectional-iterator<I> && totally_ordered<I> &&
 requires(I i, typename incrementable_traits<I>::difference_type n) {
 { i += n } -> same_as<I&&>;
 { i -= n } -> same_as<I&&>;
 { i + n } -> same_as<I>;
 { n + i } -> same_as<I>;
 { i - n } -> same_as<I>;
 { i - i } -> same_as<decltype(n)>;
 { i[n] } -> convertible_to<iter_reference_t<I>>;
};

```

<sup>3</sup> The members of a specialization `iterator_traits<I>` generated from the `iterator_traits` primary template are computed as follows:

(3.1) — If `I` has valid (13.10.3) member types `difference_type`, `value_type`, `reference`, and `iterator_category`, then `iterator_traits<I>` has the following publicly accessible members:

```

using iterator_category = typename I::iterator_category;
using value_type = typename I::value_type;
using difference_type = typename I::difference_type;
using pointer = see below;
using reference = typename I::reference;

```

If the *qualified-id* `I::pointer` is valid and denotes a type, then `iterator_traits<I>::pointer` names that type; otherwise, it names `void`.

(3.2) — Otherwise, if `I` satisfies the exposition-only concept `cpp17-input-iterator`, `iterator_traits<I>` has the following publicly accessible members:

```

using iterator_category = see below;
using value_type = typename indirectly_readable_traits<I>::value_type;
using difference_type = typename incrementable_traits<I>::difference_type;
using pointer = see below;
using reference = see below;

```

(3.2.1) — If the *qualified-id* `I::pointer` is valid and denotes a type, `pointer` names that type. Otherwise, if `decltype(declval<I&&>().operator->())` is well-formed, then `pointer` names that type. Otherwise, `pointer` names `void`.

(3.2.2) — If the *qualified-id* `I::reference` is valid and denotes a type, `reference` names that type. Otherwise, `reference` names `iter_reference_t<I>`.

(3.2.3) — If the *qualified-id* `I::iterator_category` is valid and denotes a type, `iterator_category` names that type. Otherwise, `iterator_category` names:

- (3.2.3.1) — `random_access_iterator_tag` if `I` satisfies `cpp17-random-access-iterator`, or otherwise
- (3.2.3.2) — `bidirectional_iterator_tag` if `I` satisfies `cpp17-bidirectional-iterator`, or otherwise
- (3.2.3.3) — `forward_iterator_tag` if `I` satisfies `cpp17-forward-iterator`, or otherwise
- (3.2.3.4) — `input_iterator_tag`.

(3.3) — Otherwise, if `I` satisfies the exposition-only concept `cpp17-iterator`, then `iterator_traits<I>` has the following publicly accessible members:

```

using iterator_category = output_iterator_tag;
using value_type = void;

```

```

using difference_type = see below;
using pointer = void;
using reference = void;

```

If the *qualified-id* `incrementable_traits<I>::difference_type` is valid and denotes a type, then `difference_type` names that type; otherwise, it names `void`.

(3.4) — Otherwise, `iterator_traits<I>` has no members by any of the above names.

4 Explicit or partial specializations of `iterator_traits` may have a member type `iterator_concept` that is used to indicate conformance to the iterator concepts (25.3.4).

[*Example 1:* To indicate conformance to the `input_iterator` concept but a lack of conformance to the *Cpp17InputIterator* requirements (25.3.5.3), an `iterator_traits` specialization might have `iterator_concept` denote `input_iterator_tag` but not define `iterator_category`. — *end example*]

5 `iterator_traits` is specialized for pointers as

```

namespace std {
template<class T>
requires is_object_v<T>
struct iterator_traits<T*> {
using iterator_concept = contiguous_iterator_tag;
using iterator_category = random_access_iterator_tag;
using value_type = remove_cv_t<T>;
using difference_type = ptrdiff_t;
using pointer = T*;
using reference = T&;
};
}

```

6 [*Example 2:* To implement a generic reverse function, a C++ program can do the following:

```

template<class BI>
void reverse(BI first, BI last) {
typename iterator_traits<BI>::difference_type n =
distance(first, last);
--n;
while(n > 0) {
typename iterator_traits<BI>::value_type
tmp = *first;
*first++ = *--last;
*last = tmp;
n -- 2;
}
}

```

— *end example*]

### 25.3.3 Customization point objects

[`iterator.cust`]

#### 25.3.3.1 `ranges::iter_move`

[`iterator.cust.move`]

1 The name `ranges::iter_move` denotes a customization point object (16.3.3.3.6). The expression `ranges::iter_move(E)` for a subexpression `E` is expression-equivalent to:

(1.1) — `iter_move(E)`, if `E` has class or enumeration type and `iter_move(E)` is a well-formed expression when treated as an unevaluated operand, with overload resolution performed in a context that does not include a declaration of `ranges::iter_move` but does include the declaration

```
void iter_move();
```

(1.2) — Otherwise, if the expression `*E` is well-formed:

(1.2.1) — if `*E` is an lvalue, `std::move(*E)`;

(1.2.2) — otherwise, `*E`.

(1.3) — Otherwise, `ranges::iter_move(E)` is ill-formed.

[*Note 1:* This case can result in substitution failure when `ranges::iter_move(E)` appears in the immediate context of a template instantiation. — *end note*]

2 If `ranges::iter_move(E)` is not equal to `*E`, the program is ill-formed, no diagnostic required.

**25.3.3.2 ranges::iter\_swap****[iterator.cust.swap]**

- 1 The name `ranges::iter_swap` denotes a customization point object (16.3.3.3.6) that exchanges the values (18.4.9) denoted by its arguments.
- 2 Let *iter-exchange-move* be the exposition-only function:

```
template<class X, class Y>
constexpr iter_value_t<X> iter-exchange-move(X&& x, Y&& y)
 noexcept(noexcept(iter_value_t<X>(iter_move(x))) &&
 noexcept(*x = iter_move(y)));
```

- 3 *Effects*: Equivalent to:

```
iter_value_t<X> old_value(iter_move(x));
*x = iter_move(y);
return old_value;
```

- 4 The expression `ranges::iter_swap(E1, E2)` for subexpressions `E1` and `E2` is expression-equivalent to:

- (4.1) — `(void)iter_swap(E1, E2)`, if either `E1` or `E2` has class or enumeration type and `iter_swap(E1, E2)` is a well-formed expression with overload resolution performed in a context that includes the declaration

```
template<class I1, class I2>
void iter_swap(I1, I2) = delete;
```

and does not include a declaration of `ranges::iter_swap`. If the function selected by overload resolution does not exchange the values denoted by `E1` and `E2`, the program is ill-formed, no diagnostic required.

- (4.2) — Otherwise, if the types of `E1` and `E2` each model `indirectly_readable`, and if the reference types of `E1` and `E2` model `swappable_with` (18.4.9), then `ranges::swap(*E1, *E2)`.
- (4.3) — Otherwise, if the types `T1` and `T2` of `E1` and `E2` model `indirectly_movable_storable<T1, T2>` and `indirectly_movable_storable<T2, T1>`, then `(void)(*E1 = iter-exchange-move(E2, E1))`, except that `E1` is evaluated only once.
- (4.4) — Otherwise, `ranges::iter_swap(E1, E2)` is ill-formed.

[*Note 1*: This case can result in substitution failure when `ranges::iter_swap(E1, E2)` appears in the immediate context of a template instantiation. — *end note*]

**25.3.4 Iterator concepts****[iterator.concepts]****25.3.4.1 General****[iterator.concepts.general]**

- 1 For a type `I`, let `ITER_TRAITS(I)` denote the type `I` if `iterator_traits<I>` names a specialization generated from the primary template. Otherwise, `ITER_TRAITS(I)` denotes `iterator_traits<I>`.

- (1.1) — If the *qualified-id* `ITER_TRAITS(I)::iterator_concept` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.
- (1.2) — Otherwise, if the *qualified-id* `ITER_TRAITS(I)::iterator_category` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.
- (1.3) — Otherwise, if `iterator_traits<I>` names a specialization generated from the primary template, then `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`.
- (1.4) — Otherwise, `ITER_CONCEPT(I)` does not denote a type.

- 2 [*Note 1*: `ITER_TRAITS` enables independent syntactic determination of an iterator's category and concept. — *end note*]

[*Example 1*:

```
struct I {
 using value_type = int;
 using difference_type = int;

 int operator*() const;
 I& operator++();
 I operator++(int);
 I& operator--();
 I operator--(int);
```

```
 bool operator==(I) const;
};
```

iterator\_traits<I>::iterator\_category denotes input\_iterator\_tag, and ITER\_CONCEPT(I) denotes random\_access\_iterator\_tag. — *end example*]

### 25.3.4.2 Concept indirectly\_readable

[iterator.concept.readable]

- Types that are indirectly readable by applying operator\* model the indirectly\_readable concept, including pointers, smart pointers, and iterators.

```
template<class In>
concept indirectly_readable_impl =
 requires(const In in) {
 typename iter_value_t<In>;
 typename iter_reference_t<In>;
 typename iter_rvalue_reference_t<In>;
 { *in } -> same_as<iter_reference_t<In>>;
 { ranges::iter_move(in) } -> same_as<iter_rvalue_reference_t<In>>;
 } &&
 common_reference_with<iter_reference_t<In>&&, iter_value_t<In>&> &&
 common_reference_with<iter_reference_t<In>&&, iter_rvalue_reference_t<In>&&> &&
 common_reference_with<iter_rvalue_reference_t<In>&&, const iter_value_t<In>&>;

template<class In>
concept indirectly_readable =
 indirectly_readable_impl<remove_cvref_t<In>>;
```

- Given a value *i* of type *I*, *I* models indirectly\_readable only if the expression *\*i* is equality-preserving.

[Note 1: The expression *\*i* is indirectly required to be valid via the exposition-only *dereferenceable* concept (25.2). — *end note*]

### 25.3.4.3 Concept indirectly\_writable

[iterator.concept.writable]

- The indirectly\_writable concept specifies the requirements for writing a value into an iterator's referenced object.

```
template<class Out, class T>
concept indirectly_writable =
 requires(Out&& o, T&& t) {
 *o = std::forward<T>(t); // not required to be equality-preserving
 *std::forward<Out>(o) = std::forward<T>(t); // not required to be equality-preserving
 const_cast<const iter_reference_t<Out>&&>(*o) =
 std::forward<T>(t); // not required to be equality-preserving
 const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
 std::forward<T>(t); // not required to be equality-preserving
 };
```

- Let *E* be an expression such that `decltype((E))` is *T*, and let *o* be a dereferenceable object of type *Out*. *Out* and *T* model indirectly\_writable<Out, T> only if

(2.1) — If *Out* and *T* model indirectly\_readable<Out> && same\_as<iter\_value\_t<Out>, decay\_t<T>>, then *\*o* after any above assignment is equal to the value of *E* before the assignment.

- After evaluating any above assignment expression, *o* is not required to be dereferenceable.

- If *E* is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (16.4.6.15).

[Note 1: The only valid use of an operator\* is on the left side of the assignment statement. Assignment through the same value of the indirectly\_writable type happens only once. — *end note*]

[Note 2: indirectly\_writable has the awkward const\_cast expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit const rvalue assignment. Consequently, an iterator type *I* that returns `std::string` by value does not model indirectly\_writable<I, std::string>. — *end note*]

### 25.3.4.4 Concept weakly\_incrementable

[iterator.concept.winc]

- The weakly\_incrementable concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be equality\_comparable.

```
template<class T>
inline constexpr bool is-integer-like = see below; // exposition only
```

```

template<class T>
 inline constexpr bool is_signed-integer-like = see below; // exposition only

template<class I>
 concept weakly_incrementable =
 movable<I> &&
 requires(I i) {
 typename iter_difference_t<I>;
 requires is_signed-integer-like<iter_difference_t<I>>;
 { ++i } -> same_as<I&&>; // not required to be equality-preserving
 i++; // not required to be equality-preserving
 };

```

- <sup>2</sup> A type *I* is an *integer-class type* if it is in a set of implementation-defined types that behave as integer types do, as defined below.

[*Note 1*: An integer-class type is not necessarily a class type. — *end note*]

- <sup>3</sup> The range of representable values of an integer-class type is the continuous set of values over which it is defined. For any integer-class type, its range of representable values is either  $-2^{N-1}$  to  $2^{N-1} - 1$  (inclusive) for some integer  $N$ , in which case it is a *signed-integer-class type*, or 0 to  $2^N - 1$  (inclusive) for some integer  $N$ , in which case it is an *unsigned-integer-class type*. In both cases,  $N$  is called the *width* of the integer-class type. The width of an integer-class type is greater than that of every integral type of the same signedness.
- <sup>4</sup> A type *I* other than *cv bool* is *integer-like* if it models `integral<I>` or if it is an integer-class type. An integer-like type *I* is *signed-integer-like* if it models `signed_integral<I>` or if it is a signed-integer-class type. An integer-like type *I* is *unsigned-integer-like* if it models `unsigned_integral<I>` or if it is an unsigned-integer-class type.

- <sup>5</sup> For every integer-class type *I*, let  $B(I)$  be a unique hypothetical extended integer type of the same signedness with the same width (6.8.2) as *I*.

[*Note 2*: The corresponding hypothetical specialization `numeric_limits<B(I)>` meets the requirements on `numeric_limits` specializations for integral types (17.3.5). — *end note*]

For every integral type *J*, let  $B(J)$  be the same type as *J*.

- <sup>6</sup> Expressions of integer-class type are explicitly convertible to any integer-like type, and implicitly convertible to any integer-class type of equal or greater width and the same signedness. Expressions of integral type are both implicitly and explicitly convertible to any integer-class type. Conversions between integral and integer-class types and between two integer-class types do not exit via an exception. The result of such a conversion is the unique value of the destination type that is congruent to the source modulo  $2^N$ , where  $N$  is the width of the destination type.
- <sup>7</sup> Let *a* be an object of integer-class type *I*, let *b* be an object of integer-like type *I2* such that the expression *b* is implicitly convertible to *I*, let *x* and *y* be, respectively, objects of type  $B(I)$  and  $B(I2)$  as described above that represent the same values as *a* and *b*, and let *c* be an lvalue of any integral type.
- (7.1) — The expressions `a++` and `a--` shall be prvalues of type *I* whose values are equal to that of *a* prior to the evaluation of the expressions. The expression `a++` shall modify the value of *a* by adding 1 to it. The expression `a--` shall modify the value of *a* by subtracting 1 from it.
- (7.2) — The expressions `++a`, `--a`, and `&a` shall be expression-equivalent to `a += 1`, `a -= 1`, and `addressof(a)`, respectively.
- (7.3) — For every *unary-operator* `@` other than `&` for which the expression `@x` is well-formed, `@a` shall also be well-formed and have the same value, effects, and value category as `@x`. If `@x` has type `bool`, so too does `@a`; if `@x` has type  $B(I)$ , then `@a` has type *I*.
- (7.4) — For every assignment operator `@=` for which `c @= x` is well-formed, `c @= a` shall also be well-formed and shall have the same value and effects as `c @= x`. The expression `c @= a` shall be an lvalue referring to *c*.
- (7.5) — For every assignment operator `@=` for which `x @= y` is well-formed, `a @= b` shall also be well-formed and shall have the same effects as `x @= y`, except that the value that would be stored into *x* is stored into *a*. The expression `a @= b` shall be an lvalue referring to *a*.
- (7.6) — For every non-assignment binary operator `@` for which `x @ y` and `y @ x` are well-formed, `a @ b` and `b @ a` shall also be well-formed and shall have the same value, effects, and value category as `x @ y` and `y @ x`, respectively. If `x @ y` or `y @ x` has type  $B(I)$ , then `a @ b` or `b @ a`, respectively, has type *I*; if `x @ y` or `y @ x` has type  $B(I2)$ , then `a @ b` or `b @ a`, respectively, has type *I2*; if `x @ y` or `y @ x` has any other type, then `a @ b` or `b @ a`, respectively, has that type.

- 8 An expression *E* of integer-class type *I* is contextually convertible to `bool` as if by `bool(E != I(0))`.
- 9 All integer-class types model `regular` (18.6) and `three_way_comparable<strong_ordering>` (17.11.4).
- 10 A value-initialized object of integer-class type has value 0.
- 11 For every (possibly cv-qualified) integer-class type *I*, `numeric_limits<I>` is specialized such that each static data member *m* has the same value as `numeric_limits<B(I)>::m`, and each static member function *f* returns `I(numeric_limits<B(I)>::f())`.
- 12 For any two integer-like types *I1* and *I2*, at least one of which is an integer-class type, `common_type_t<I1, I2>` denotes an integer-class type whose width is not less than that of *I1* or *I2*. If both *I1* and *I2* are signed-integer-like types, then `common_type_t<I1, I2>` is also a signed-integer-like type.
- 13 `is-integer-like<I>` is true if and only if *I* is an integer-like type. `is-signed-integer-like<I>` is true if and only if *I* is a signed-integer-like type.
- 14 Let *i* be an object of type *I*. When *i* is in the domain of both pre- and post-increment, *i* is said to be *incrementable*. *I* models `weakly_incrementable<I>` only if
- (14.1) — The expressions `++i` and `i++` have the same domain.
- (14.2) — If *i* is incrementable, then both `++i` and `i++` advance *i* to the next element.
- (14.3) — If *i* is incrementable, then `addressof(++i)` is equal to `addressof(i)`.
- 15 *Recommended practice*: The implementation of an algorithm on a weakly incrementable type should never attempt to pass through the same incrementable value twice; such an algorithm should be a single-pass algorithm.
- [Note 3: For `weakly_incrementable` types, `a equals b` does not imply that `++a equals ++b`. (Equality does not guarantee the substitution property or referential transparency.) Such algorithms can be used with `istream`s as the source of the input data through the `istream_iterator` class template. — end note]

### 25.3.4.5 Concept `incrementable`

[`iterator.concept.inc`]

- 1 The `incrementable` concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be `equality_comparable`.
- [Note 1: This supersedes the annotations on the increment expressions in the definition of `weakly_incrementable`. — end note]
- ```
template<class I>
    concept incrementable =
        regular<I> &&
        weakly_incrementable<I> &&
        requires(I i) {
            { i++ } -> same_as<I>;
        };
```
- 2 Let *a* and *b* be incrementable objects of type *I*. *I* models `incrementable` only if
- (2.1) — If `bool(a == b)` then `bool(a++ == b)`.
- (2.2) — If `bool(a == b)` then `bool(((void)a++, a) == ++b)`.
- 3 [Note 2: The requirement that `a equals b` implies `++a equals ++b` (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model `incrementable`. — end note]

25.3.4.6 Concept `input_or_output_iterator`

[`iterator.concept.iterator`]

- 1 The `input_or_output_iterator` concept forms the basis of the iterator concept taxonomy; every iterator models `input_or_output_iterator`. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (25.3.4.7), to read (25.3.4.9) or write (25.3.4.10) values, or to provide a richer set of iterator movements (25.3.4.11, 25.3.4.12, 25.3.4.13).
- ```
template<class I>
 concept input_or_output_iterator =
 requires(I i) {
 { *i } -> can-reference;
 } &&
 weakly_incrementable<I>;
```
- 2 [Note 1: Unlike the `Cpp17Iterator` requirements, the `input_or_output_iterator` concept does not require copyability. — end note]

**25.3.4.7 Concept sentinel\_for****[iterator.concept.sentinel]**

- 1 The `sentinel_for` concept specifies the relationship between an `input_or_output_iterator` type and a semiregular type whose values denote a range.

```
template<class S, class I>
concept sentinel_for =
 semiregular<S> &&
 input_or_output_iterator<I> &&
 weakly-equality-comparable-with<S, I>; // see 18.5.3
```

- 2 Let  $s$  and  $i$  be values of type  $S$  and  $I$  such that  $[i, s)$  denotes a range. Types  $S$  and  $I$  model `sentinel_for<S, I>` only if
- (2.1) —  $i == s$  is well-defined.
- (2.2) — If  $\text{bool}(i != s)$  then  $i$  is dereferenceable and  $[++i, s)$  denotes a range.
- (2.3) — `assignable_from<I&, S>` is either modeled or not satisfied.
- 3 The domain of `==` is not static. Given an iterator  $i$  and sentinel  $s$  such that  $[i, s)$  denotes a range and  $i != s$ ,  $i$  and  $s$  are not required to continue to denote a range after incrementing any other iterator equal to  $i$ . Consequently,  $i == s$  is no longer required to be well-defined.

**25.3.4.8 Concept sized\_sentinel\_for****[iterator.concept.sizedsentinel]**

- 1 The `sized_sentinel_for` concept specifies requirements on an `input_or_output_iterator` type  $I$  and a corresponding `sentinel_for<I>` that allow the use of the `-` operator to compute the distance between them in constant time.

```
template<class S, class I>
concept sized_sentinel_for =
 sentinel_for<S, I> &&
 !disable_sized_sentinel_for<remove_cv_t<S>, remove_cv_t<I>> &&
 requires(const I& i, const S& s) {
 { s - i } -> same_as<iter_difference_t<I>>;
 { i - s } -> same_as<iter_difference_t<I>>;
 };
```

- 2 Let  $i$  be an iterator of type  $I$ , and  $s$  a sentinel of type  $S$  such that  $[i, s)$  denotes a range. Let  $N$  be the smallest number of applications of `++i` necessary to make  $\text{bool}(i == s)$  be true.  $S$  and  $I$  model `sized_sentinel_for<S, I>` only if
- (2.1) — If  $N$  is representable by `iter_difference_t<I>`, then  $s - i$  is well-defined and equals  $N$ .
- (2.2) — If  $-N$  is representable by `iter_difference_t<I>`, then  $i - s$  is well-defined and equals  $-N$ .

```
template<class S, class I>
inline constexpr bool disable_sized_sentinel_for = false;
```

- 3 *Remarks:* Pursuant to 16.4.5.2.1, users may specialize `disable_sized_sentinel_for` for cv-unqualified non-array object types  $S$  and  $I$  if  $S$  and/or  $I$  is a program-defined type. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.
- 4 [Note 1: `disable_sized_sentinel_for` allows use of sentinels and iterators with the library that satisfy but do not in fact model `sized_sentinel_for`. — end note]
- 5 [Example 1: The `sized_sentinel_for` concept is modeled by pairs of `random_access_iterators` (25.3.4.13) and by counted iterators and their sentinels (25.5.6.1). — end example]

**25.3.4.9 Concept input\_iterator****[iterator.concept.input]**

- 1 The `input_iterator` concept defines requirements for a type whose referenced values can be read (from the requirement for `indirectly_readable` (25.3.4.2)) and which can be both pre- and post-incremented.

[Note 1: Unlike the *Cpp17InputIterator* requirements (25.3.5.3), the `input_iterator` concept does not need equality comparison since iterators are typically compared to sentinels. — end note]

```
template<class I>
concept input_iterator =
 input_or_output_iterator<I> &&
 indirectly_readable<I> &&
 requires { typename ITER_CONCEPT(I); } &&
```

```
derived_from<ITER_CONCEPT(I), input_iterator_tag>;
```

### 25.3.4.10 Concept output\_iterator

[iterator.concept.output]

- 1 The `output_iterator` concept defines requirements for a type that can be used to write values (from the requirement for `indirectly_writable` (25.3.4.3)) and which can be both pre- and post-incremented.

[Note 1: Output iterators are not required to model `equality_comparable`. — end note]

```
template<class I, class T>
concept output_iterator =
 input_or_output_iterator<I> &&
 indirectly_writable<I, T> &&
 requires(I i, T&& t) {
 *i++ = std::forward<T>(t); // not required to be equality-preserving
 };
```

- 2 Let `E` be an expression such that `decltype((E))` is `T`, and let `i` be a dereferenceable object of type `I`. `I` and `T` model `output_iterator<I, T>` only if `*i++ = E`; has effects equivalent to:

```
*i = E;
++i;
```

- 3 *Recommended practice*: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

### 25.3.4.11 Concept forward\_iterator

[iterator.concept.forward]

- 1 The `forward_iterator` concept adds copyability, equality comparison, and the multi-pass guarantee, specified below.

```
template<class I>
concept forward_iterator =
 input_iterator<I> &&
 derived_from<ITER_CONCEPT(I), forward_iterator_tag> &&
 incrementable<I> &&
 sentinel_for<I, I>;
```

- 2 The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type.

[Note 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

- 3 Pointers and references obtained from a forward iterator into a range `[i, s)` shall remain valid while `[i, s)` continues to denote a range.

- 4 Two dereferenceable iterators `a` and `b` of type `X` offer the *multi-pass guarantee* if:

(4.1) — `a == b` implies `++a == ++b` and

(4.2) — the expression `((void)[](X x){++x;})(a), *a` is equivalent to the expression `*a`.

- 5 [Note 2: The requirement that `a == b` implies `++a == ++b` and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. — end note]

### 25.3.4.12 Concept bidirectional\_iterator

[iterator.concept.bidir]

- 1 The `bidirectional_iterator` concept adds the ability to move an iterator backward as well as forward.

```
template<class I>
concept bidirectional_iterator =
 forward_iterator<I> &&
 derived_from<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
 requires(I i) {
 { --i } -> same_as<I&>;
 { i-- } -> same_as<I>;
 };
```

- 2 A bidirectional iterator `r` is decrementable if and only if there exists some `q` such that `++q == r`. Decrementable iterators `r` shall be in the domain of the expressions `--r` and `r--`.

- 3 Let `a` and `b` be equal objects of type `I`. `I` models `bidirectional_iterator` only if:

(3.1) — If `a` and `b` are decrementable, then all of the following are true:

- (3.1.1) — `addressof(--a) == addressof(a)`
- (3.1.2) — `bool(a-- == b)`
- (3.1.3) — after evaluating both `a--` and `--b`, `bool(a == b)` is still true
- (3.1.4) — `bool(++(--a) == b)`
- (3.2) — If `a` and `b` are incrementable, then `bool(--(++a) == b)`.

#### 25.3.4.13 Concept `random_access_iterator`

[`iterator.concept.random.access`]

- <sup>1</sup> The `random_access_iterator` concept adds support for constant-time advancement with `+=`, `+`, `-=`, and `-`, as well as the computation of distance in constant time with `-`. Random access iterators also support array notation via subscripting.

```
template<class I>
concept random_access_iterator =
 bidirectional_iterator<I> &&
 derived_from<ITER_CONCEPT(I), random_access_iterator_tag> &&
 totally_ordered<I> &&
 sized_sentinel_for<I, I> &&
 requires(I i, const I j, const iter_difference_t<I> n) {
 { i += n } -> same_as<I&&>;
 { j + n } -> same_as<I>;
 { n + j } -> same_as<I>;
 { i -= n } -> same_as<I&&>;
 { j - n } -> same_as<I>;
 { j[n] } -> same_as<iter_reference_t<I>>;
 };
```

- <sup>2</sup> Let `a` and `b` be valid iterators of type `I` such that `b` is reachable from `a` after `n` applications of `++a`, let `D` be `iter_difference_t<I>`, and let `n` denote a value of type `D`. `I` models `random_access_iterator` only if

- (2.1) — `(a += n)` is equal to `b`.
- (2.2) — `addressof(a += n)` is equal to `addressof(a)`.
- (2.3) — `(a + n)` is equal to `(a += n)`.
- (2.4) — For any two positive values `x` and `y` of type `D`, if `(a + D(x + y))` is valid, then `(a + D(x + y))` is equal to `((a + x) + y)`.
- (2.5) — `(a + D(0))` is equal to `a`.
- (2.6) — If `(a + D(n - 1))` is valid, then `(a + n)` is equal to `[(I c){ return ++c; }](a + D(n - 1))`.
- (2.7) — `(b += D(-n))` is equal to `a`.
- (2.8) — `(b -= n)` is equal to `a`.
- (2.9) — `addressof(b -= n)` is equal to `addressof(b)`.
- (2.10) — `(b - n)` is equal to `(b -= n)`.
- (2.11) — If `b` is dereferenceable, then `a[n]` is valid and is equal to `*b`.
- (2.12) — `bool(a <= b)` is true.

#### 25.3.4.14 Concept `contiguous_iterator`

[`iterator.concept.contiguous`]

- <sup>1</sup> The `contiguous_iterator` concept provides a guarantee that the denoted elements are stored contiguously in memory.

```
template<class I>
concept contiguous_iterator =
 random_access_iterator<I> &&
 derived_from<ITER_CONCEPT(I), contiguous_iterator_tag> &&
 is_lvalue_reference_v<iter_reference_t<I>> &&
 same_as<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>> &&
 requires(const I& i) {
 { to_address(i) } -> same_as<add_pointer_t<iter_reference_t<I>>>;
 };
```

- <sup>2</sup> Let `a` and `b` be dereferenceable iterators and `c` be a non-dereferenceable iterator of type `I` such that `b` is reachable from `a` and `c` is reachable from `b`, and let `D` be `iter_difference_t<I>`. The type `I` models `contiguous_iterator` only if

- (2.1) — `to_address(a) == addressof(*a)`,

- (2.2) — `to_address(b) == to_address(a) + D(b - a)`,
- (2.3) — `to_address(c) == to_address(a) + D(c - a)`,
- (2.4) — `ranges::iter_move(a)` has the same type, value category, and effects as `std::move(*a)`, and
- (2.5) — if `ranges::iter_swap(a, b)` is well-formed, it has effects equivalent to `ranges::swap(*a, *b)`.

### 25.3.5 C++17 iterator requirements

[iterator.cpp17]

#### 25.3.5.1 General

[iterator.cpp17.general]

- <sup>1</sup> In the following sections, `a` and `b` denote values of type `X` or `const X`, `difference_type` and `reference` refer to the types `iterator_traits<X>::difference_type` and `iterator_traits<X>::reference`, respectively, `n` denotes a value of `difference_type`, `u`, `tmp`, and `m` denote identifiers, `r` denotes a value of `X&`, `t` denotes a value of value type `T`, `o` denotes a value of some type that is writable to the output iterator.

[Note 1: For an iterator type `X` there must be an instantiation of `iterator_traits<X>` (25.3.2.3). — end note]

#### 25.3.5.2 Cpp17Iterator

[iterator.iterators]

- <sup>1</sup> The *Cpp17Iterator* requirements form the basis of the iterator taxonomy; every iterator meets the *Cpp17Iterator* requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (25.3.5.3) or write (25.3.5.4) values, or to provide a richer set of iterator movements (25.3.5.5, 25.3.5.6, 25.3.5.7).
- <sup>2</sup> A type `X` meets the *Cpp17Iterator* requirements if:
- (2.1) — `X` meets the *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements (16.4.4.2) and lvalues of type `X` are swappable (16.4.4.3), and
- (2.2) — `iterator_traits<X>::difference_type` is a signed integer type or `void`, and
- (2.3) — the expressions in Table 82 are valid and have the indicated semantics.

Table 82: *Cpp17Iterator* requirements [tab:iterator]

| Expression       | Return type         | Operational semantics | Assertion/note pre-/post-condition                       |
|------------------|---------------------|-----------------------|----------------------------------------------------------|
| <code>*r</code>  | unspecified         |                       | <i>Preconditions:</i> <code>r</code> is dereferenceable. |
| <code>++r</code> | <code>X&amp;</code> |                       |                                                          |

#### 25.3.5.3 Input iterators

[input.iterators]

- <sup>1</sup> A class or pointer type `X` meets the requirements of an input iterator for the value type `T` if `X` meets the *Cpp17Iterator* (25.3.5.2) and *Cpp17EqualityComparable* (Table 27) requirements and the expressions in Table 83 are valid and have the indicated semantics.
- <sup>2</sup> In Table 83, the term *the domain of ==* is used in the ordinary mathematical sense to denote the set of values over which `==` is (required to be) defined. This set can change over time. Each algorithm places additional requirements on the domain of `==` for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of `==` and `!=`.

[Example 1: The call `find(a, b, x)` is defined only if the value of `a` has the property `p` defined as follows: `b` has property `p` and a value `i` has property `p` if `(*i==x)` or if `(*i!=x` and `++i` has property `p`). — end example]

Table 83: *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*) [tab:inputiterator]

| Expression          | Return type                                   | Operational semantics  | Assertion/note pre-/post-condition                                              |
|---------------------|-----------------------------------------------|------------------------|---------------------------------------------------------------------------------|
| <code>a != b</code> | contextually convertible to <code>bool</code> | <code>!(a == b)</code> | <i>Preconditions:</i> <code>(a, b)</code> is in the domain of <code>==</code> . |

Table 83: *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*) (continued)

| Expression             | Return type                    | Operational semantics                           | Assertion/note pre-/post-condition                                                                                                                                                                                                                                                     |
|------------------------|--------------------------------|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>*a</code>        | reference,<br>convertible to T |                                                 | <i>Preconditions:</i> a is dereferenceable.<br>The expression <code>(void)*a</code> , <code>*a</code> is equivalent to <code>*a</code> .<br>If <code>a == b</code> and <code>(a, b)</code> is in the domain of <code>==</code> then <code>*a</code> is equivalent to <code>*b</code> . |
| <code>a-&gt;m</code>   |                                | <code>(*a).m</code>                             | <i>Preconditions:</i> a is dereferenceable.                                                                                                                                                                                                                                            |
| <code>++r</code>       | X&                             |                                                 | <i>Preconditions:</i> r is dereferenceable.<br><i>Postconditions:</i> r is dereferenceable or r is past-the-end;<br>any copies of the previous value of r are no longer required to be dereferenceable nor to be in the domain of <code>==</code> .                                    |
| <code>(void)r++</code> |                                |                                                 | equivalent to <code>(void)++r</code>                                                                                                                                                                                                                                                   |
| <code>*r++</code>      | convertible to T               | <pre>{ T tmp = *r;   ++r;   return tmp; }</pre> |                                                                                                                                                                                                                                                                                        |

- <sup>3</sup> *Recommended practice:* The implementation of an algorithm on input iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single pass algorithm.

[*Note 1:* For input iterators,  $a == b$  does not imply  $++a == ++b$ . (Equality does not guarantee the substitution property or referential transparency.) Value type  $T$  is not required to be a *Cpp17CopyAssignable* type (Table 33). Such an algorithm can be used with istreams as the source of the input data through the `istream_iterator` class template. — *end note*]

### 25.3.5.4 Output iterators

[**output.iterators**]

- <sup>1</sup> A class or pointer type  $X$  meets the requirements of an output iterator if  $X$  meets the *Cpp17Iterator* requirements (25.3.5.2) and the expressions in Table 84 are valid and have the indicated semantics.

Table 84: *Cpp17OutputIterator* requirements (in addition to *Cpp17Iterator*) [tab:outputiterator]

| Expression | Return type                        | Operational semantics                                        | Assertion/note pre-/post-condition                                                                                                                                                  |
|------------|------------------------------------|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $*r = o$   | result is not used                 |                                                              | <i>Remarks:</i> After this operation $r$ is not required to be dereferenceable.<br><i>Postconditions:</i> $r$ is incrementable.                                                     |
| $++r$      | $X\&$                              |                                                              | $\text{addressof}(r) == \text{addressof}(++r)$ .<br><i>Remarks:</i> After this operation $r$ is not required to be dereferenceable.<br><i>Postconditions:</i> $r$ is incrementable. |
| $r++$      | convertible to $\text{const } X\&$ | $\{ X \text{ tmp} = r;$<br>$++r;$<br>$\text{return tmp}; \}$ | <i>Remarks:</i> After this operation $r$ is not required to be dereferenceable.<br><i>Postconditions:</i> $r$ is incrementable.                                                     |
| $*r++ = o$ | result is not used                 |                                                              | <i>Remarks:</i> After this operation $r$ is not required to be dereferenceable.<br><i>Postconditions:</i> $r$ is incrementable.                                                     |

- <sup>2</sup> *Recommended practice:* The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

[*Note 1:* The only valid use of an operator $*$  is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Equality and inequality are not necessarily defined. — *end note*]

### 25.3.5.5 Forward iterators

[**forward.iterators**]

- <sup>1</sup> A class or pointer type  $X$  meets the requirements of a forward iterator if
- (1.1) —  $X$  meets the *Cpp17InputIterator* requirements (25.3.5.3),
  - (1.2) —  $X$  meets the *Cpp17DefaultConstructible* requirements (16.4.4.2),
  - (1.3) — if  $X$  is a mutable iterator, `reference` is a reference to  $T$ ; if  $X$  is a constant iterator, `reference` is a reference to  $\text{const } T$ ,
  - (1.4) — the expressions in Table 85 are valid and have the indicated semantics, and
  - (1.5) — objects of type  $X$  offer the multi-pass guarantee, described below.
- <sup>2</sup> The domain of  $==$  for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type.
- [*Note 1:* Value-initialized iterators behave as if they refer past the end of the same empty sequence. — *end note*]
- <sup>3</sup> Two dereferenceable iterators  $a$  and  $b$  of type  $X$  offer the *multi-pass guarantee* if:
- (3.1) —  $a == b$  implies  $++a == ++b$  and
  - (3.2) —  $X$  is a pointer type or the expression  $(\text{void})++X(a)$ ,  $*a$  is equivalent to the expression  $*a$ .

- 4 [Note 2: The requirement that  $a == b$  implies  $++a == ++b$  (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. — end note]

Table 85: *Cpp17ForwardIterator* requirements (in addition to *Cpp17InputIterator*) [tab:forwarditerator]

| Expression | Return type                        | Operational semantics                      | Assertion/note pre-/post-condition |
|------------|------------------------------------|--------------------------------------------|------------------------------------|
| $r++$      | convertible to $\text{const } X\&$ | { $X$ tmp = r;<br>$++r$ ;<br>return tmp; } |                                    |
| $*r++$     | reference                          |                                            |                                    |

- 5 If  $a$  and  $b$  are equal, then either  $a$  and  $b$  are both dereferenceable or else neither is dereferenceable.  
6 If  $a$  and  $b$  are both dereferenceable, then  $a == b$  if and only if  $*a$  and  $*b$  are bound to the same object.

### 25.3.5.6 Bidirectional iterators

[bidirectional.iterators]

- 1 A class or pointer type  $X$  meets the requirements of a bidirectional iterator if, in addition to meeting the *Cpp17ForwardIterator* requirements, the following expressions are valid as shown in Table 86.

Table 86: *Cpp17BidirectionalIterator* requirements (in addition to *Cpp17ForwardIterator*) [tab:bidirectionaliterator]

| Expression | Return type                        | Operational semantics                      | Assertion/note pre-/post-condition                                                                                                                                                                                         |
|------------|------------------------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $--r$      | $X\&$                              |                                            | <i>Preconditions:</i> there exists $s$ such that $r == ++s$ .<br><i>Postconditions:</i> $r$ is dereferenceable.<br>$--(++r) == r$ .<br>$--r == --s$ implies $r == s$ .<br>$\text{addressof}(r) == \text{addressof}(--r)$ . |
| $r--$      | convertible to $\text{const } X\&$ | { $X$ tmp = r;<br>$--r$ ;<br>return tmp; } |                                                                                                                                                                                                                            |
| $*r--$     | reference                          |                                            |                                                                                                                                                                                                                            |

- 2 [Note 1: Bidirectional iterators allow algorithms to move iterators backward as well as forward. — end note]

### 25.3.5.7 Random access iterators

[random.access.iterators]

- 1 A class or pointer type  $X$  meets the requirements of a random access iterator if, in addition to meeting the *Cpp17BidirectionalIterator* requirements, the following expressions are valid as shown in Table 87.

Table 87: *Cpp17RandomAccessIterator* requirements (in addition to *Cpp17BidirectionalIterator*) [tab:randomaccessiterator]

| Expression         | Return type | Operational semantics                                                                                              | Assertion/note pre-/post-condition |
|--------------------|-------------|--------------------------------------------------------------------------------------------------------------------|------------------------------------|
| $r += n$           | $X\&$       | { difference_type m = n;<br>if (m >= 0)<br>while (m--)<br>$++r$ ;<br>else<br>while (m++)<br>$--r$ ;<br>return r; } |                                    |
| $a + n$<br>$n + a$ | $X$         | { $X$ tmp = a;<br>return tmp += n; }                                                                               | $a + n == n + a$ .                 |

Table 87: *Cpp17RandomAccessIterator* requirements (in addition to *Cpp17BidirectionalIterator*) (continued)

| Expression             | Return type                                     | Operational semantics                                              | Assertion/note pre-/post-condition                                                                                                                                     |
|------------------------|-------------------------------------------------|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>r -= n</code>    | X&                                              | return <code>r += -n</code> ;                                      | <i>Preconditions</i> : the absolute value of <code>n</code> is in the range of representable values of <code>difference_type</code> .                                  |
| <code>a - n</code>     | X                                               | { X <code>tmp = a</code> ;<br>return <code>tmp -= n</code> ; }     |                                                                                                                                                                        |
| <code>b - a</code>     | <code>difference_type</code>                    | return <code>n</code>                                              | <i>Preconditions</i> : there exists a value <code>n</code> of type <code>difference_type</code> such that <code>a + n == b</code> .<br><code>b == a + (b - a)</code> . |
| <code>a[n]</code>      | convertible to reference                        | <code>*(a + n)</code>                                              |                                                                                                                                                                        |
| <code>a &lt; b</code>  | contextually convertible to <code>bool</code>   | <i>Effects</i> : Equivalent to: return <code>b - a &gt; 0</code> ; | <code>&lt;</code> is a total ordering relation                                                                                                                         |
| <code>a &gt; b</code>  | contextually convertible to <code>bool</code>   | <code>b &lt; a</code>                                              | <code>&gt;</code> is a total ordering relation opposite to <code>&lt;</code> .                                                                                         |
| <code>a &gt;= b</code> | contextually convertible to <code>bool</code>   | <code>!(a &lt; b)</code>                                           |                                                                                                                                                                        |
| <code>a &lt;= b</code> | contextually convertible to <code>bool</code> . | <code>!(a &gt; b)</code>                                           |                                                                                                                                                                        |

### 25.3.6 Indirect callable requirements

[indirectcallable]

#### 25.3.6.1 General

[indirectcallable.general]

- <sup>1</sup> There are several concepts that group requirements of algorithms that take callable objects (22.10.3) as arguments.

#### 25.3.6.2 Indirect callables

[indirectcallable.indirectinvocable]

- <sup>1</sup> The indirect callable concepts are used to constrain those algorithms that accept callable objects (22.10.3) as arguments.

```

namespace std {
 template<class F, class I>
 concept indirectly_unary_invocable =
 indirectly_readable<I> &&
 copy_constructible<F> &&
 invocable<F&, iter_value_t<I>&> &&
 invocable<F&, iter_reference_t<I>> &&
 invocable<F&, iter_common_reference_t<I>> &&
 common_reference_with<
 invoke_result_t<F&, iter_value_t<I>&>,
 invoke_result_t<F&, iter_reference_t<I>>>;

 template<class F, class I>
 concept indirectly_regular_unary_invocable =
 indirectly_readable<I> &&
 copy_constructible<F> &&
 regular_invocable<F&, iter_value_t<I>&> &&
 regular_invocable<F&, iter_reference_t<I>> &&
 regular_invocable<F&, iter_common_reference_t<I>> &&
 common_reference_with<
 invoke_result_t<F&, iter_value_t<I>&>,
 invoke_result_t<F&, iter_reference_t<I>>>;

```

```

template<class F, class I>
concept indirect_unary_predicate =
 indirectly_readable<I> &&
 copy_constructible<F> &&
 predicate<F&, iter_value_t<I>&> &&
 predicate<F&, iter_reference_t<I>>> &&
 predicate<F&, iter_common_reference_t<I>>>;

template<class F, class I1, class I2>
concept indirect_binary_predicate =
 indirectly_readable<I1> && indirectly_readable<I2> &&
 copy_constructible<F> &&
 predicate<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
 predicate<F&, iter_value_t<I1>&, iter_reference_t<I2>>> &&
 predicate<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
 predicate<F&, iter_reference_t<I1>, iter_reference_t<I2>>> &&
 predicate<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>>;

template<class F, class I1, class I2 = I1>
concept indirect_equivalence_relation =
 indirectly_readable<I1> && indirectly_readable<I2> &&
 copy_constructible<F> &&
 equivalence_relation<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
 equivalence_relation<F&, iter_value_t<I1>&, iter_reference_t<I2>>> &&
 equivalence_relation<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
 equivalence_relation<F&, iter_reference_t<I1>, iter_reference_t<I2>>> &&
 equivalence_relation<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>>;

template<class F, class I1, class I2 = I1>
concept indirect_strict_weak_order =
 indirectly_readable<I1> && indirectly_readable<I2> &&
 copy_constructible<F> &&
 strict_weak_order<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
 strict_weak_order<F&, iter_value_t<I1>&, iter_reference_t<I2>>> &&
 strict_weak_order<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
 strict_weak_order<F&, iter_reference_t<I1>, iter_reference_t<I2>>> &&
 strict_weak_order<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>>;
}

```

### 25.3.6.3 Class template projected

[projected]

- <sup>1</sup> Class template projected is used to constrain algorithms that accept callable objects and projections (3.45). It combines an `indirectly_readable` type `I` and a callable object type `Proj` into a new `indirectly_readable` type whose reference type is the result of applying `Proj` to the `iter_reference_t` of `I`.

```

namespace std {
 template<indirectly_readable I, indirectly_regular_unary_invocable<I> Proj>
 struct projected {
 using value_type = remove_cvref_t<indirect_result_t<Proj&, I>>;
 indirect_result_t<Proj&, I> operator*() const; // not defined
 };

 template<weakly_incrementable I, class Proj>
 struct incrementable_traits<projected<I, Proj>> {
 using difference_type = iter_difference_t<I>;
 };
}

```

## 25.3.7 Common algorithm requirements

[alg.req]

### 25.3.7.1 General

[alg.req.general]

- <sup>1</sup> There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values

are transferred between `indirectly_readable` and `indirectly_writable` types: `indirectly_movable`, `indirectly_copyable`, and `indirectly_swappable`. There are three relational concepts for rearrangements: `permutable`, `mergeable`, and `sortable`. There is one relational concept for comparing values from different sequences: `indirectly_comparable`.

- <sup>2</sup> [Note 1: The `ranges::less` function object type used in the concepts below imposes constraints on the concepts' arguments in addition to those that appear in the concepts' bodies (22.10.9). — *end note*]

### 25.3.7.2 Concept `indirectly_movable`

[alg.req.ind.move]

- <sup>1</sup> The `indirectly_movable` concept specifies the relationship between a `indirectly_readable` type and a `indirectly_writable` type between which values may be moved.

```
template<class In, class Out>
concept indirectly_movable =
 indirectly_readable<In> &&
 indirectly_writable<Out, iter_rvalue_reference_t<In>>;
```

- <sup>2</sup> The `indirectly_movable_storable` concept augments `indirectly_movable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type.

```
template<class In, class Out>
concept indirectly_movable_storable =
 indirectly_movable<In, Out> &&
 indirectly_writable<Out, iter_value_t<In>> &&
 movable<iter_value_t<In>> &&
 constructible_from<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
 assignable_from<iter_value_t<In>&, iter_rvalue_reference_t<In>>;
```

- <sup>3</sup> Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_movable_storable<In, Out>` only if after the initialization of the object `obj` in

```
iter_value_t<In> obj(ranges::iter_move(i));
```

`obj` is equal to the value previously denoted by `*i`. If `iter_rvalue_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.15).

### 25.3.7.3 Concept `indirectly_copyable`

[alg.req.ind.copy]

- <sup>1</sup> The `indirectly_copyable` concept specifies the relationship between a `indirectly_readable` type and a `indirectly_writable` type between which values may be copied.

```
template<class In, class Out>
concept indirectly_copyable =
 indirectly_readable<In> &&
 indirectly_writable<Out, iter_reference_t<In>>;
```

- <sup>2</sup> The `indirectly_copyable_storable` concept augments `indirectly_copyable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type. It also requires the capability to make copies of values.

```
template<class In, class Out>
concept indirectly_copyable_storable =
 indirectly_copyable<In, Out> &&
 indirectly_writable<Out, iter_value_t<In>&> &&
 indirectly_writable<Out, const iter_value_t<In>&> &&
 indirectly_writable<Out, iter_value_t<In>&&> &&
 indirectly_writable<Out, const iter_value_t<In>&&> &&
 copyable<iter_value_t<In>> &&
 constructible_from<iter_value_t<In>, iter_reference_t<In>> &&
 assignable_from<iter_value_t<In>&, iter_reference_t<In>>;
```

- <sup>3</sup> Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_copyable_storable<In, Out>` only if after the initialization of the object `obj` in

```
iter_value_t<In> obj(*i);
```

`obj` is equal to the value previously denoted by `*i`. If `iter_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.15).

**25.3.7.4 Concept indirectly\_swappable****[alg.req.ind.swap]**

- <sup>1</sup> The `indirectly_swappable` concept specifies a swappable relationship between the values referenced by two `indirectly_readable` types.

```
template<class I1, class I2 = I1>
concept indirectly_swappable =
 indirectly_readable<I1> && indirectly_readable<I2> &&
 requires(const I1 i1, const I2 i2) {
 ranges::iter_swap(i1, i1);
 ranges::iter_swap(i2, i2);
 ranges::iter_swap(i1, i2);
 ranges::iter_swap(i2, i1);
 };
```

**25.3.7.5 Concept indirectly\_comparable****[alg.req.ind.cmp]**

- <sup>1</sup> The `indirectly_comparable` concept specifies the common requirements of algorithms that compare values from two different sequences.

```
template<class I1, class I2, class R, class P1 = identity,
 class P2 = identity>
concept indirectly_comparable =
 indirect_binary_predicate<R, projected<I1, P1>, projected<I2, P2>>;
```

**25.3.7.6 Concept permutable****[alg.req.permutable]**

- <sup>1</sup> The `permutable` concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```
template<class I>
concept permutable =
 forward_iterator<I> &&
 indirectly_movable_storable<I, I> &&
 indirectly_swappable<I, I>;
```

**25.3.7.7 Concept mergeable****[alg.req.mergeable]**

- <sup>1</sup> The `mergeable` concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```
template<class I1, class I2, class Out, class R = ranges::less,
 class P1 = identity, class P2 = identity>
concept mergeable =
 input_iterator<I1> &&
 input_iterator<I2> &&
 weakly_incrementable<Out> &&
 indirectly_copyable<I1, Out> &&
 indirectly_copyable<I2, Out> &&
 indirect_strict_weak_order<R, projected<I1, P1>, projected<I2, P2>>;
```

**25.3.7.8 Concept sortable****[alg.req.sortable]**

- <sup>1</sup> The `sortable` concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., `sort`).

```
template<class I, class R = ranges::less, class P = identity>
concept sortable =
 permutable<I> &&
 indirect_strict_weak_order<R, projected<I, P>>;
```

**25.4 Iterator primitives****[iterator.primitives]****25.4.1 General****[iterator.primitives.general]**

- <sup>1</sup> To simplify the use of iterators, the library provides several classes and functions.

## 25.4.2 Standard iterator tags

[std.iterator.tags]

- <sup>1</sup> It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces *category tag* classes which are used as compile time tags for algorithm selection. They are: `output_iterator_tag`, `input_iterator_tag`, `forward_iterator_tag`, `bidirectional_iterator_tag`, `random_access_iterator_tag`, and `contiguous_iterator_tag`. For every iterator of type `I`, `iterator_traits<I>::iterator_category` shall be defined to be a category tag that describes the iterator's behavior. Additionally, `iterator_traits<I>::iterator_concept` may be used to indicate conformance to the iterator concepts (25.3.4).

```
namespace std {
 struct output_iterator_tag { };
 struct input_iterator_tag { };
 struct forward_iterator_tag: public input_iterator_tag { };
 struct bidirectional_iterator_tag: public forward_iterator_tag { };
 struct random_access_iterator_tag: public bidirectional_iterator_tag { };
 struct contiguous_iterator_tag: public random_access_iterator_tag { };
}
```

- <sup>2</sup> [Example 1: A program-defined iterator `BinaryTreeIterator` can be included into the bidirectional iterator category by specializing the `iterator_traits` template:

```
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
 using iterator_category = bidirectional_iterator_tag;
 using difference_type = ptrdiff_t;
 using value_type = T;
 using pointer = T*;
 using reference = T&;
};
```

—end example]

- <sup>3</sup> [Example 2: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```
template<class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
 evolve(first, last,
 typename iterator_traits<BidirectionalIterator>::iterator_category());
}
```

```
template<class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
 bidirectional_iterator_tag) {
 // more generic, but less efficient algorithm
}
```

```
template<class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
 random_access_iterator_tag) {
 // more efficient, but less generic algorithm
}
```

—end example]

## 25.4.3 Iterator operations

[iterator.operations]

- <sup>1</sup> Since only random access iterators provide `+` and `-` operators, the library provides two function templates `advance` and `distance`. These function templates use `+` and `-` for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use `++` to provide linear time implementations.

```
template<class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);
```

- <sup>2</sup> *Preconditions:* `n` is negative only for bidirectional iterators.

- <sup>3</sup> *Effects:* Increments `i` by `n` if `n` is non-negative, and decrements `i` by `-n` otherwise.

```
template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);
```

4 *Preconditions:* last is reachable from first, or InputIterator meets the *Cpp17RandomAccessIterator* requirements and first is reachable from last.

5 *Effects:* If InputIterator meets the *Cpp17RandomAccessIterator* requirements, returns (last - first); otherwise, increments first until last is reached and returns the number of increments.

```
template<class InputIterator>
constexpr InputIterator next(InputIterator x,
 typename iterator_traits<InputIterator>::difference_type n = 1);
```

6 *Effects:* Equivalent to: advance(x, n); return x;

```
template<class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x,
 typename iterator_traits<BidirectionalIterator>::difference_type n = 1);
```

7 *Effects:* Equivalent to: advance(x, -n); return x;

## 25.4.4 Range iterator operations

[range.iter.ops]

### 25.4.4.1 General

[range.iter.ops.general]

1 The library includes the function templates `ranges::advance`, `ranges::distance`, `ranges::next`, and `ranges::prev` to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type.

[Example 1: `ranges::advance` uses the `+` operator to move a `random_access_iterator` forward `n` steps in constant time. For an iterator type that does not model `random_access_iterator`, `ranges::advance` instead performs `n` individual increments with the `++` operator. — end example]

2 The function templates defined in 25.4.4 are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the *postfix-expression* in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

[Example 2:

```
void foo() {
 using namespace std::ranges;
 std::vector<int> vec{1,2,3};
 distance(begin(vec), end(vec)); // #1
}
```

The function call expression at #1 invokes `std::ranges::distance`, not `std::distance`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::distance` is more specialized (13.7.7.3) than `std::ranges::distance` since the former requires its first two parameters to have the same type. — end example]

3 The number and order of deducible template parameters for the function templates defined in 25.4.4 is unspecified, except where explicitly stated otherwise.

### 25.4.4.2 `ranges::advance`

[range.iter.op.advance]

```
template<input_or_output_iterator I>
constexpr void ranges::advance(I& i, iter_difference_t<I> n);
```

1 *Preconditions:* If I does not model `bidirectional_iterator`, `n` is not negative.

2 *Effects:*

(2.1) — If I models `random_access_iterator`, equivalent to `i += n`.

(2.2) — Otherwise, if `n` is non-negative, increments `i` by `n`.

(2.3) — Otherwise, decrements `i` by `-n`.

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr void ranges::advance(I& i, S bound);
```

3 *Preconditions:* Either `assignable_from<I&, S> || sized_sentinel_for<S, I>` is modeled, or `[i, bound)` denotes a range.

4 *Effects:*

- (4.1) — If I and S model assignable\_from<I&, S>, equivalent to `i = std::move(bound)`.
- (4.2) — Otherwise, if S and I model sized\_sentinel\_for<S, I>, equivalent to `ranges::advance(i, bound - i)`.
- (4.3) — Otherwise, while `bool(i != bound)` is true, increments i.

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::advance(I& i, iter_difference_t<I> n, S bound);
```

5 *Preconditions:* If  $n > 0$ , `[i, bound)` denotes a range. If  $n == 0$ , `[i, bound)` or `[bound, i)` denotes a range. If  $n < 0$ , `[bound, i)` denotes a range, I models bidirectional\_iterator, and I and S model same\_as<I, S>.

6 *Effects:*

- (6.1) — If S and I model sized\_sentinel\_for<S, I>:
- (6.1.1) — If  $|n| \geq |bound - i|$ , equivalent to `ranges::advance(i, bound)`.
- (6.1.2) — Otherwise, equivalent to `ranges::advance(i, n)`.
- (6.2) — Otherwise,
- (6.2.1) — if n is non-negative, while `bool(i != bound)` is true, increments i but at most n times.
- (6.2.2) — Otherwise, while `bool(i != bound)` is true, decrements i but at most -n times.

7 *Returns:*  $n - M$ , where  $M$  is the difference between the ending and starting positions of i.

**25.4.4.3 ranges::distance****[range.iter.op.distance]**

```
template<input_or_output_iterator I, sentinel_for<I> S>
requires (!sized_sentinel_for<S, I>)
constexpr iter_difference_t<I> ranges::distance(I first, S last);
```

1 *Preconditions:* `[first, last)` denotes a range.

2 *Effects:* Increments first until last is reached and returns the number of increments.

```
template<input_or_output_iterator I, sized_sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::distance(const I& first, const S& last);
```

3 *Effects:* Equivalent to: `return last - first;`

```
template<range R>
constexpr range_difference_t<R> ranges::distance(R&& r);
```

4 *Effects:* If R models sized\_range, equivalent to:

```
return static_cast<range_difference_t<R>>(ranges::size(r)); // 26.3.10
```

Otherwise, equivalent to:

```
return ranges::distance(ranges::begin(r), ranges::end(r)); // 26.3
```

**25.4.4.4 ranges::next****[range.iter.op.next]**

```
template<input_or_output_iterator I>
constexpr I ranges::next(I x);
```

1 *Effects:* Equivalent to: `++x; return x;`

```
template<input_or_output_iterator I>
constexpr I ranges::next(I x, iter_difference_t<I> n);
```

2 *Effects:* Equivalent to: `ranges::advance(x, n); return x;`

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, S bound);
```

3 *Effects:* Equivalent to: `ranges::advance(x, bound); return x;`

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, iter_difference_t<I> n, S bound);
```

4 *Effects:* Equivalent to: `ranges::advance(x, n, bound)`; return `x`;

#### 25.4.4.5 `ranges::prev`

[range.iter.op.prev]

```
template<bidirectional_iterator I>
constexpr I ranges::prev(I x);
```

1 *Effects:* Equivalent to: `--x`; return `x`;

```
template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n);
```

2 *Effects:* Equivalent to: `ranges::advance(x, -n)`; return `x`;

```
template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n, I bound);
```

3 *Effects:* Equivalent to: `ranges::advance(x, -n, bound)`; return `x`;

## 25.5 Iterator adaptors

[predef.iterators]

### 25.5.1 Reverse iterators

[reverse.iterators]

#### 25.5.1.1 General

[reverse.iterators.general]

1 Class template `reverse_iterator` is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

#### 25.5.1.2 Class template `reverse_iterator`

[reverse.iterator]

```
namespace std {
 template<class Iterator>
 class reverse_iterator {
 public:
 using iterator_type = Iterator;
 using iterator_concept = see below;
 using iterator_category = see below;
 using value_type = iter_value_t<Iterator>;
 using difference_type = iter_difference_t<Iterator>;
 using pointer = typename iterator_traits<Iterator>::pointer;
 using reference = iter_reference_t<Iterator>;

 constexpr reverse_iterator();
 constexpr explicit reverse_iterator(Iterator x);
 template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
 template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

 constexpr Iterator base() const;
 constexpr reference operator*() const;
 constexpr pointer operator->() const requires see below;

 constexpr reverse_iterator& operator++();
 constexpr reverse_iterator operator++(int);
 constexpr reverse_iterator& operator--();
 constexpr reverse_iterator operator--(int);

 constexpr reverse_iterator operator+ (difference_type n) const;
 constexpr reverse_iterator& operator+=(difference_type n);
 constexpr reverse_iterator operator- (difference_type n) const;
 constexpr reverse_iterator& operator-=(difference_type n);
 constexpr unspecified operator[](difference_type n) const;

 friend constexpr iter_rvalue_reference_t<Iterator>
 iter_move(const reverse_iterator& i) noexcept(see below);
 };
}
```

```

 template<indirectly_swappable<Iterator> Iterator2>
 friend constexpr void
 iter_swap(const reverse_iterator& x,
 const reverse_iterator<Iterator2>& y) noexcept(see below);

protected:
 Iterator current;
};
}

```

1 The member *typedef-name* `iterator_concept` denotes

- (1.1) — `random_access_iterator_tag` if `Iterator` models `random_access_iterator`, and
- (1.2) — `bidirectional_iterator_tag` otherwise.

2 The member *typedef-name* `iterator_category` denotes

- (2.1) — `random_access_iterator_tag` if the type `iterator_traits<Iterator>::iterator_category` models `derived_from<random_access_iterator_tag>`, and
- (2.2) — `iterator_traits<Iterator>::iterator_category` otherwise.

### 25.5.1.3 Requirements

[reverse.iter.requirements]

1 The template parameter `Iterator` shall either meet the requirements of a *Cpp17BidirectionalIterator* (25.3.5.6) or model `bidirectional_iterator` (25.3.4.12).

2 Additionally, `Iterator` shall either meet the requirements of a *Cpp17RandomAccessIterator* (25.3.5.7) or model `random_access_iterator` (25.3.4.13) if the definitions of any of the members

- (2.1) — `operator+`, `operator-`, `operator+=`, `operator-=` (25.5.1.7), or
- (2.2) — `operator[]` (25.5.1.6),

or the non-member operators (25.5.1.8)

- (2.3) — `operator<`, `operator>`, `operator<=`, `operator>=`, `operator-`, or `operator+` (25.5.1.9)

are instantiated (13.9.2).

### 25.5.1.4 Construction and assignment

[reverse.iter.cons]

```
constexpr reverse_iterator();
```

1 *Effects:* Value-initializes `current`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `Iterator`.

```
constexpr explicit reverse_iterator(Iterator x);
```

2 *Effects:* Initializes `current` with `x`.

```
template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
```

3 *Constraints:* `is_same_v<U, Iterator>` is false and `const U&` models `convertible_to<Iterator>`.

4 *Effects:* Initializes `current` with `u.current`.

```
template<class U>
constexpr reverse_iterator&
operator=(const reverse_iterator<U>& u);
```

5 *Constraints:* `is_same_v<U, Iterator>` is false, `const U&` models `convertible_to<Iterator>`, and `assignable_from<Iterator&, const U&>` is modeled.

6 *Effects:* Assigns `u.current` to `current`.

7 *Returns:* `*this`.

### 25.5.1.5 Conversion

[reverse.iter.conv]

```
constexpr Iterator base() const; // explicit
```

1 *Returns:* `current`.

**25.5.1.6 Element access****[reverse.iter.elem]**

```
constexpr reference operator*() const;
```

1 *Effects:* As if by:

```
 Iterator tmp = current;
 return *--tmp;
```

```
constexpr pointer operator->() const
requires (is_pointer_v<Iterator> ||
 requires(const Iterator i) { i.operator->(); });
```

2 *Effects:*

(2.1) — If `Iterator` is a pointer type, equivalent to: `return prev(current);`

(2.2) — Otherwise, equivalent to: `return prev(current).operator->();`

```
constexpr unspecified operator[](difference_type n) const;
```

3 *Returns:* `current[-n-1]`.

**25.5.1.7 Navigation****[reverse.iter.nav]**

```
constexpr reverse_iterator operator+(difference_type n) const;
```

1 *Returns:* `reverse_iterator(current-n)`.

```
constexpr reverse_iterator operator-(difference_type n) const;
```

2 *Returns:* `reverse_iterator(current+n)`.

```
constexpr reverse_iterator& operator++();
```

3 *Effects:* As if by: `--current;`

4 *Returns:* `*this`.

```
constexpr reverse_iterator operator++(int);
```

5 *Effects:* As if by:

```
 reverse_iterator tmp = *this;
 --current;
 return tmp;
```

```
constexpr reverse_iterator& operator--();
```

6 *Effects:* As if by `++current`.

7 *Returns:* `*this`.

```
constexpr reverse_iterator operator--(int);
```

8 *Effects:* As if by:

```
 reverse_iterator tmp = *this;
 ++current;
 return tmp;
```

```
constexpr reverse_iterator& operator+=(difference_type n);
```

9 *Effects:* As if by: `current -= n;`

10 *Returns:* `*this`.

```
constexpr reverse_iterator& operator-=(difference_type n);
```

11 *Effects:* As if by: `current += n;`

12 *Returns:* `*this`.

**25.5.1.8 Comparisons****[reverse.iter.cmp]**

```
template<class Iterator1, class Iterator2>
constexpr bool operator==(
```

```
const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
```

1 *Constraints:*  $x.base() == y.base()$  is well-formed and convertible to `bool`.

2 *Returns:*  $x.base() == y.base()$ .

```
template<class Iterator1, class Iterator2>
constexpr bool operator!=(
const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
```

3 *Constraints:*  $x.base() != y.base()$  is well-formed and convertible to `bool`.

4 *Returns:*  $x.base() != y.base()$ .

```
template<class Iterator1, class Iterator2>
constexpr bool operator<(
const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
```

5 *Constraints:*  $x.base() > y.base()$  is well-formed and convertible to `bool`.

6 *Returns:*  $x.base() > y.base()$ .

```
template<class Iterator1, class Iterator2>
constexpr bool operator<(
const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
```

7 *Constraints:*  $x.base() < y.base()$  is well-formed and convertible to `bool`.

8 *Returns:*  $x.base() < y.base()$ .

```
template<class Iterator1, class Iterator2>
constexpr bool operator<=(
const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
```

9 *Constraints:*  $x.base() >= y.base()$  is well-formed and convertible to `bool`.

10 *Returns:*  $x.base() >= y.base()$ .

```
template<class Iterator1, class Iterator2>
constexpr bool operator>=(
const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
```

11 *Constraints:*  $x.base() <= y.base()$  is well-formed and convertible to `bool`.

12 *Returns:*  $x.base() <= y.base()$ .

```
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
```

13 *Returns:*  $y.base() <=> x.base()$ .

14 [Note 1: The argument order in the *Returns*: element is reversed because this is a reverse iterator. — end note]

### 25.5.1.9 Non-member functions

[reverse.iter.nonmember]

```
template<class Iterator1, class Iterator2>
constexpr auto operator-(
const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
```

1 *Returns:*  $y.base() - x.base()$ .

```
template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(
 iter_difference_t<Iterator> n,
 const reverse_iterator<Iterator>& x);
```

2 *Returns:* reverse\_iterator<Iterator>(x.base() - n).

```
friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const reverse_iterator& i) noexcept(see below);
```

3 *Effects:* Equivalent to:

```
auto tmp = i.base();
return ranges::iter_move(--tmp);
```

4 *Remarks:* The exception specification is equivalent to:

```
is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_move(--declval<Iterator>()))
```

```
template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const reverse_iterator& x,
 const reverse_iterator<Iterator2>& y) noexcept(see below);
```

5 *Effects:* Equivalent to:

```
auto xtmp = x.base();
auto ytmp = y.base();
ranges::iter_swap(--xtmp, --ytmp);
```

6 *Remarks:* The exception specification is equivalent to:

```
is_nothrow_copy_constructible_v<Iterator> &&
is_nothrow_copy_constructible_v<Iterator2> &&
noexcept(ranges::iter_swap(--declval<Iterator>(), --declval<Iterator2>()))
```

```
template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);
```

7 *Returns:* reverse\_iterator<Iterator>(i).

## 25.5.2 Insert iterators

[insert.iterators]

### 25.5.2.1 General

[insert.iterators.general]

1 To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called *insert iterators*, are provided in the library. With regular iterator classes,

```
while (first != last) *result++ = *first++;
```

causes a range [first, last) to be copied into a range starting with result. The same code with result being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the *insert mode* instead of the *regular overwrite mode*.

2 An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators meet the requirements of output iterators. operator\* returns the insert iterator itself. The assignment operator=(const T& x) is defined on insert iterators to allow writing into them, it inserts x right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. back\_insert\_iterator inserts elements at the end of a container, front\_insert\_iterator inserts elements at the beginning of a container, and insert\_iterator inserts elements where the iterator points to in a container. back\_inserter, front\_inserter, and inserter are three functions making the insert iterators out of a container.

### 25.5.2.2 Class template back\_insert\_iterator

[back.insert.iterator]

```
namespace std {
template<class Container>
class back_insert_iterator {
protected:
 Container* container;
```

```

public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using container_type = Container;

 constexpr explicit back_insert_iterator(Container& x);
 constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
 constexpr back_insert_iterator& operator=(typename Container::value_type&& value);

 constexpr back_insert_iterator& operator*();
 constexpr back_insert_iterator& operator++();
 constexpr back_insert_iterator operator++(int);
};
}

```

### 25.5.2.2.1 Operations

[back.insert.iter.ops]

```

constexpr explicit back_insert_iterator(Container& x);
1 Effects: Initializes container with addressof(x).

constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
2 Effects: As if by: container->push_back(value);
3 Returns: *this.

constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
4 Effects: As if by: container->push_back(std::move(value));
5 Returns: *this.

constexpr back_insert_iterator& operator*();
6 Returns: *this.

constexpr back_insert_iterator& operator++();
constexpr back_insert_iterator operator++(int);
7 Returns: *this.

```

### 25.5.2.2.2 back\_inserter

[back.inserter]

```

template<class Container>
 constexpr back_insert_iterator<Container> back_inserter(Container& x);
1 Returns: back_insert_iterator<Container>(x).

```

### 25.5.2.3 Class template front\_insert\_iterator

[front.insert.iterator]

```

namespace std {
 template<class Container>
 class front_insert_iterator {
 protected:
 Container* container;

 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using container_type = Container;

```

```

constexpr explicit front_insert_iterator(Container& x);
constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

constexpr front_insert_iterator& operator*();
constexpr front_insert_iterator& operator++();
constexpr front_insert_iterator operator++(int);
};
}

```

### 25.5.2.3.1 Operations

[front.insert.iter.ops]

```
constexpr explicit front_insert_iterator(Container& x);
```

1 *Effects:* Initializes container with `addressof(x)`.

```
constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects:* As if by: `container->push_front(value)`;

3 *Returns:* `*this`.

```
constexpr front_insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects:* As if by: `container->push_front(std::move(value))`;

5 *Returns:* `*this`.

```
constexpr front_insert_iterator& operator*();
```

6 *Returns:* `*this`.

```
constexpr front_insert_iterator& operator++();
constexpr front_insert_iterator operator++(int);
```

7 *Returns:* `*this`.

### 25.5.2.3.2 front\_inserter

[front.inserter]

```
template<class Container>
constexpr front_insert_iterator<Container> front_inserter(Container& x);
```

1 *Returns:* `front_insert_iterator<Container>(x)`.

### 25.5.2.4 Class template insert\_iterator

[insert.iterator]

```

namespace std {
 template<class Container>
 class insert_iterator {
 protected:
 Container* container;
 ranges::iterator_t<Container> iter;

 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using container_type = Container;

 constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
 constexpr insert_iterator& operator=(const typename Container::value_type& value);
 constexpr insert_iterator& operator=(typename Container::value_type&& value);

 constexpr insert_iterator& operator*();
 constexpr insert_iterator& operator++();
 constexpr insert_iterator& operator++(int);
 };
}

```

**25.5.2.4.1 Operations****[insert.iter.ops]**

```
constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
```

1 *Effects:* Initializes container with `addressof(x)` and `iter` with `i`.

```
constexpr insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects:* As if by:

```
iter = container->insert(iter, value);
++iter;
```

3 *Returns:* `*this`.

```
constexpr insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects:* As if by:

```
iter = container->insert(iter, std::move(value));
++iter;
```

5 *Returns:* `*this`.

```
constexpr insert_iterator& operator*();
```

6 *Returns:* `*this`.

```
constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);
```

7 *Returns:* `*this`.

**25.5.2.4.2 inserter****[inserter]**

```
template<class Container>
constexpr insert_iterator<Container>
inserter(Container& x, ranges::iterator_t<Container> i);
```

1 *Returns:* `insert_iterator<Container>(x, i)`.

**25.5.3 Move iterators and sentinels****[move.iterators]****25.5.3.1 General****[move.iterators.general]**

1 Class template `move_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

2 [Example 1:

```
list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end()); // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
 make_move_iterator(s.end())); // moves strings into v2
```

—end example]

**25.5.3.2 Class template move\_iterator****[move.iterator]**

```
namespace std {
template<class Iterator>
class move_iterator {
public:
using iterator_type = Iterator;
using iterator_concept = input_iterator_tag;
using iterator_category = see below; // not always present
using value_type = iter_value_t<Iterator>;
using difference_type = iter_difference_t<Iterator>;
using pointer = Iterator;
using reference = iter_rvalue_reference_t<Iterator>;
```

```

constexpr move_iterator();
constexpr explicit move_iterator(Iterator i);
template<class U> constexpr move_iterator(const move_iterator<U>& u);
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

constexpr const Iterator& base() const & noexcept;
constexpr Iterator base() &&;
constexpr reference operator*() const;

constexpr move_iterator& operator++();
constexpr auto operator++(int);
constexpr move_iterator& operator--();
constexpr move_iterator operator--(int);

constexpr move_iterator operator+(difference_type n) const;
constexpr move_iterator& operator+=(difference_type n);
constexpr move_iterator operator-(difference_type n) const;
constexpr move_iterator& operator-=(difference_type n);
constexpr reference operator[](difference_type n) const;

template<sentinel_for<Iterator> S>
 friend constexpr bool
 operator==(const move_iterator& x, const move_sentinel<S>& y);
template<sentinel_for<Iterator> S>
 friend constexpr iter_difference_t<Iterator>
 operator-(const move_sentinel<S>& x, const move_iterator& y);
template<sentinel_for<Iterator> S>
 friend constexpr iter_difference_t<Iterator>
 operator-(const move_iterator& x, const move_sentinel<S>& y);
friend constexpr iter_rvalue_reference_t<Iterator>
 iter_move(const move_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current)));
template<indirectly_swappable<Iterator> Iterator2>
 friend constexpr void
 iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
 noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

private:
 Iterator current; // exposition only
};
}

```

- <sup>1</sup> The member *typedef-name* `iterator_category` is defined if and only if the *qualified-id* `iterator_traits<Iterator>::iterator_category` is valid and denotes a type. In that case, `iterator_category` denotes
- (1.1) — `random_access_iterator_tag` if the type `iterator_traits<Iterator>::iterator_category` models `derived_from<random_access_iterator_tag>`, and
  - (1.2) — `iterator_traits<Iterator>::iterator_category` otherwise.

### 25.5.3.3 Requirements

[move.iter.requirements]

- <sup>1</sup> The template parameter `Iterator` shall either meet the *Cpp17InputIterator* requirements (25.3.5.3) or model `input_iterator` (25.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the *Cpp17BidirectionalIterator* requirements (25.3.5.6) or model `bidirectional_iterator` (25.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the *Cpp17RandomAccessIterator* requirements (25.3.5.7) or model `random_access_iterator` (25.3.4.13).

### 25.5.3.4 Construction and assignment

[move.iter.cons]

```
constexpr move_iterator();
```

- <sup>1</sup> *Effects:* Value-initializes `current`.

```
constexpr explicit move_iterator(Iterator i);
```

- <sup>2</sup> *Effects:* Initializes `current` with `std::move(i)`.

```
template<class U> constexpr move_iterator(const move_iterator<U>& u);
```

3 *Constraints:* `is_same_v<U, Iterator>` is false and `const U&` models `convertible_to<Iterator>`.

4 *Effects:* Initializes `current` with `u.current`.

```
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);
```

5 *Constraints:* `is_same_v<U, Iterator>` is false, `const U&` models `convertible_to<Iterator>`, and `assignable_from<Iterator&, const U&>` is modeled.

6 *Effects:* Assigns `u.current` to `current`.

### 25.5.3.5 Conversion

[[move.iter.op.conv](#)]

```
constexpr const Iterator& base() const & noexcept;
```

1 *Returns:* `current`.

```
constexpr Iterator base() &&;
```

2 *Returns:* `std::move(current)`.

### 25.5.3.6 Element access

[[move.iter.elem](#)]

```
constexpr reference operator*() const;
```

1 *Effects:* Equivalent to: `return ranges::iter_move(current);`

```
constexpr reference operator[](difference_type n) const;
```

2 *Effects:* Equivalent to: `return ranges::iter_move(current + n);`

### 25.5.3.7 Navigation

[[move.iter.nav](#)]

```
constexpr move_iterator& operator++();
```

1 *Effects:* As if by `++current`.

2 *Returns:* `*this`.

```
constexpr auto operator++(int);
```

3 *Effects:* If `Iterator` models `forward_iterator`, equivalent to:

```
 move_iterator tmp = *this;
 ++current;
 return tmp;
```

Otherwise, equivalent to `++current`.

```
constexpr move_iterator& operator--();
```

4 *Effects:* As if by `--current`.

5 *Returns:* `*this`.

```
constexpr move_iterator operator--(int);
```

6 *Effects:* As if by:

```
 move_iterator tmp = *this;
 --current;
 return tmp;
```

```
constexpr move_iterator operator+(difference_type n) const;
```

7 *Returns:* `move_iterator(current + n)`.

```
constexpr move_iterator& operator+=(difference_type n);
```

8 *Effects:* As if by: `current += n;`

9 *Returns:* `*this`.

```
constexpr move_iterator operator-(difference_type n) const;
```

10 *Returns:* move\_iterator(current - n).

```
constexpr move_iterator& operator--(difference_type n);
```

11 *Effects:* As if by: current -= n;

12 *Returns:* \*this.

### 25.5.3.8 Comparisons

[move.iter.op.comp]

```
template<class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x,
 const move_iterator<Iterator2>& y);
```

```
template<sentinel_for<Iterator> S>
friend constexpr bool operator==(const move_iterator& x,
 const move_sentinel<S>& y);
```

1 *Constraints:* x.base() == y.base() is well-formed and convertible to bool.

2 *Returns:* x.base() == y.base().

```
template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

3 *Constraints:* x.base() < y.base() is well-formed and convertible to bool.

4 *Returns:* x.base() < y.base().

```
template<class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

5 *Constraints:* y.base() < x.base() is well-formed and convertible to bool.

6 *Returns:* y < x.

```
template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

7 *Constraints:* y.base() < x.base() is well-formed and convertible to bool.

8 *Returns:* !(y < x).

```
template<class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

9 *Constraints:* x.base() < y.base() is well-formed and convertible to bool.

10 *Returns:* !(x < y).

```
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const move_iterator<Iterator1>& x,
 const move_iterator<Iterator2>& y);
```

11 *Returns:* x.base() <=> y.base().

### 25.5.3.9 Non-member functions

[move.iter.nonmember]

```
template<class Iterator1, class Iterator2>
constexpr auto operator-(
 const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y)
-> decltype(x.base() - y.base());
```

```
template<sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_sentinel<S>& x, const move_iterator& y);
```

```
template<sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_iterator& x, const move_sentinel<S>& y);
```

1 *Returns:* x.base() - y.base().

```

template<class Iterator>
constexpr move_iterator<Iterator>
operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);

```

2 *Constraints:* `x.base() + n` is well-formed and has type `Iterator`.

3 *Returns:* `x + n`.

```

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));

```

4 *Effects:* Equivalent to: `return ranges::iter_move(i.current);`

```

template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

```

5 *Effects:* Equivalent to: `ranges::iter_swap(x.current, y.current)`.

```

template<class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);

```

6 *Returns:* `move_iterator<Iterator>(std::move(i))`.

### 25.5.3.10 Class template `move_sentinel`

[**move.sentinel**]

1 Class template `move_sentinel` is a sentinel adaptor useful for denoting ranges together with `move_iterator`. When an input iterator type `I` and sentinel type `S` model `sentinel_for<S, I>`, `move_sentinel<S>` and `move_iterator<I>` model `sentinel_for<move_sentinel<S>, move_iterator<I>>` as well.

2 [Example 1: A `move_if` algorithm is easily implemented with `copy_if` using `move_iterator` and `move_sentinel`:

```

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
 indirect_unary_predicate<I> Pred>
requires indirectly_movable<I, O>
void move_if(I first, S last, O out, Pred pred) {
 std::ranges::copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}

```

—end example]

```

namespace std {
 template<semiregular S>
 class move_sentinel {
 public:
 constexpr move_sentinel();
 constexpr explicit move_sentinel(S s);
 template<class S2>
 requires convertible_to<const S2&, S>
 constexpr move_sentinel(const move_sentinel<S2>& s);
 template<class S2>
 requires assignable_from<S&, const S2&>
 constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

 constexpr S base() const;
 private:
 S last; // exposition only
 };
}

```

### 25.5.3.11 Operations

[**move.sent.ops**]

```

constexpr move_sentinel();

```

1 *Effects:* Value-initializes `last`. If `is_trivially_default_constructible_v<S>` is true, then this constructor is a `constexpr` constructor.

```
constexpr explicit move_sentinel(S s);
```

- 2 *Effects:* Initializes last with `std::move(s)`.

```
template<class S2>
 requires convertible_to<const S2&, S>
 constexpr move_sentinel(const move_sentinel<S2>& s);
```

- 3 *Effects:* Initializes last with `s.last`.

```
template<class S2>
 requires assignable_from<S&, const S2&>
 constexpr move_sentinel& operator=(const move_sentinel<S2>& s);
```

- 4 *Effects:* Equivalent to: `last = s.last; return *this;`

```
constexpr S base() const;
```

- 5 *Returns:* last.

## 25.5.4 Common iterators

[iterators.common]

### 25.5.4.1 Class template common\_iterator

[common.iterator]

- 1 Class template `common_iterator` is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

- 2 [Note 1: The `common_iterator` type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. —end note]

- 3 [Example 1:

```
template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);

list<int> s;
// populate the list s
using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
// call fun on a range of 10 ints
fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));
```

—end example]

```
namespace std {
 template<input_or_output_iterator I, sentinel_for<I> S>
 requires (!same_as<I, S> && copyable<I>)
 class common_iterator {
 public:
 constexpr common_iterator() requires default_initializable<I> = default;
 constexpr common_iterator(I i);
 constexpr common_iterator(S s);
 template<class I2, class S2>
 requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
 constexpr common_iterator(const common_iterator<I2, S2>& x);

 template<class I2, class S2>
 requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
 assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
 constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);

 constexpr decltype(auto) operator*();
 constexpr decltype(auto) operator*() const
 requires dereferenceable<const I>;
 constexpr decltype(auto) operator->() const
 requires see below;

 constexpr common_iterator& operator++();
 constexpr decltype(auto) operator++(int);
```

```

template<class I2, sentinel_for<I> S2>
 requires sentinel_for<S, I2>
friend constexpr bool operator==(
 const common_iterator& x, const common_iterator<I2, S2>& y);
template<class I2, sentinel_for<I> S2>
 requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend constexpr bool operator==(
 const common_iterator& x, const common_iterator<I2, S2>& y);

template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
 requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(
 const common_iterator& x, const common_iterator<I2, S2>& y);

friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
 noexcept(noexcept(ranges::iter_move(declval<const I&>())))
 requires input_iterator<I>;
template<indirectly_swappable<I> I2, class S2>
 friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
 noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));

private:
 variant<I, S> v_; // exposition only
};

template<class I, class S>
struct incrementable_traits<common_iterator<I, S>> {
 using difference_type = iter_difference_t<I>;
};

template<input_iterator I, class S>
struct iterator_traits<common_iterator<I, S>> {
 using iterator_concept = see_below;
 using iterator_category = see_below;
 using value_type = iter_value_t<I>;
 using difference_type = iter_difference_t<I>;
 using pointer = see_below;
 using reference = iter_reference_t<I>;
};
}

```

#### 25.5.4.2 Associated types

[common.iter.types]

- <sup>1</sup> The nested *typedef-names* of the specialization of `iterator_traits` for `common_iterator<I, S>` are defined as follows.
- (1.1) — `iterator_concept` denotes `forward_iterator_tag` if `I` models `forward_iterator`; otherwise it denotes `input_iterator_tag`.
  - (1.2) — `iterator_category` denotes `forward_iterator_tag` if the *qualified-id* `iterator_traits<I>::iterator_category` is valid and denotes a type that models `derived_from<forward_iterator_tag>`; otherwise it denotes `input_iterator_tag`.
  - (1.3) — Let `a` denote an lvalue of type `const common_iterator<I, S>`. If the expression `a.operator->()` is well-formed, then `pointer` denotes `decltype(a.operator->())`. Otherwise, `pointer` denotes `void`.

#### 25.5.4.3 Constructors and conversions

[common.iter.const]

```
constexpr common_iterator(I i);
```

- <sup>1</sup> *Effects:* Initializes `v_` as if by `v_{in_place_type<I>, std::move(i)}`.

```
constexpr common_iterator(S s);
```

- <sup>2</sup> *Effects:* Initializes `v_` as if by `v_{in_place_type<S>, std::move(s)}`.

```
template<class I2, class S2>
requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
constexpr common_iterator(const common_iterator<I2, S2>& x);
```

3 *Preconditions:* `x.v_.valueless_by_exception()` is false.

4 *Effects:* Initializes `v_` as if by `v_{{in_place_index<i>, get<i>(x.v_)}}`, where `i` is `x.v_.index()`.

```
template<class I2, class S2>
requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);
```

5 *Preconditions:* `x.v_.valueless_by_exception()` is false.

6 *Effects:* Equivalent to:

(6.1) — If `v_.index() == x.v_.index()`, then `get<i>(v_) = get<i>(x.v_)`.

(6.2) — Otherwise, `v_.emplace<i>(get<i>(x.v_))`.

where `i` is `x.v_.index()`.

7 *Returns:* `*this`

#### 25.5.4.4 Accessors

[common.iter.access]

```
constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
requires dereferenceable<const I>;
```

1 *Preconditions:* `holds_alternative<I>(v_)` is true.

2 *Effects:* Equivalent to: `return *get<I>(v_)`;

```
constexpr decltype(auto) operator->() const
requires see below;
```

3 The expression in the *requires-clause* is equivalent to:

```
indirectly_readable<const I> &&
(requires(const I& i) { i.operator->(); } ||
is_reference_v<iter_reference_t<I>> ||
constructible_from<iter_value_t<I>, iter_reference_t<I>>)
```

4 *Preconditions:* `holds_alternative<I>(v_)` is true.

5 *Effects:*

(5.1) — If `I` is a pointer type or if the expression `get<I>(v_).operator->()` is well-formed, equivalent to: `return get<I>(v_)`;

(5.2) — Otherwise, if `iter_reference_t<I>` is a reference type, equivalent to:

```
auto&& tmp = *get<I>(v_);
return addressof(tmp);
```

(5.3) — Otherwise, equivalent to: `return proxy(*get<I>(v_))`; where *proxy* is the exposition-only class:

```
class proxy {
iter_value_t<I> keep_;
constexpr proxy(iter_reference_t<I>&& x)
: keep_(std::move(x)) {}
public:
constexpr const iter_value_t<I>* operator->() const noexcept {
return addressof(keep_);
}
};
```

#### 25.5.4.5 Navigation

[common.iter.nav]

```
constexpr common_iterator& operator++();
```

1 *Preconditions:* `holds_alternative<I>(v_)` is true.

2 *Effects:* Equivalent to `++get<I>(v_)`.

3 *Returns:* \*this.

```
constexpr decltype(auto) operator++(int);
```

4 *Preconditions:* holds\_alternative<I>(v\_) is true.

5 *Effects:* If I models forward\_iterator, equivalent to:

```
common_iterator tmp = *this;
++*this;
return tmp;
```

Otherwise, if requires(I& i) { { \*i++ } -> can-reference; } is true or

```
indirectly_readable<I> && constructible_from<iter_value_t<I>, iter_reference_t<I>> &&
move_constructible<iter_value_t<I>>
```

is false, equivalent to:

```
return get<I>(v_)+;
```

Otherwise, equivalent to:

```
postfix-proxy p(**this);
++*this;
return p;
```

where *postfix-proxy* is the exposition-only class:

```
class postfix-proxy {
 iter_value_t<I> keep_;
 constexpr postfix-proxy(iter_reference_t<I>&& x)
 : keep_(std::forward<iter_reference_t<I>>(x)) {}
public:
 constexpr const iter_value_t<I>& operator*() const noexcept {
 return keep_;
 }
};
```

#### 25.5.4.6 Comparisons

[common.iter.cmp]

```
template<class I2, sentinel_for<I> S2>
 requires sentinel_for<S, I2>
friend constexpr bool operator==(
 const common_iterator& x, const common_iterator<I2, S2>& y);
```

1 *Preconditions:* x.v\_.valueless\_by\_exception() and y.v\_.valueless\_by\_exception() are each false.

2 *Returns:* true if *i* == *j*, and otherwise get<*i*>(x.v\_) == get<*j*>(y.v\_), where *i* is x.v\_.index() and *j* is y.v\_.index().

```
template<class I2, sentinel_for<I> S2>
 requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend constexpr bool operator==(
 const common_iterator& x, const common_iterator<I2, S2>& y);
```

3 *Preconditions:* x.v\_.valueless\_by\_exception() and y.v\_.valueless\_by\_exception() are each false.

4 *Returns:* true if *i* and *j* are each 1, and otherwise get<*i*>(x.v\_) == get<*j*>(y.v\_), where *i* is x.v\_.index() and *j* is y.v\_.index().

```
template< sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
 requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(
 const common_iterator& x, const common_iterator<I2, S2>& y);
```

5 *Preconditions:* x.v\_.valueless\_by\_exception() and y.v\_.valueless\_by\_exception() are each false.

6 *Returns:* 0 if *i* and *j* are each 1, and otherwise get<*i*>(x.v\_) - get<*j*>(y.v\_), where *i* is x.v\_.index() and *j* is y.v\_.index().

**25.5.4.7 Customizations****[common.iter.cust]**

```
friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
noexcept(noexcept(ranges::iter_move(declval<const I&>())))
requires input_iterator<I>;
```

- 1 *Preconditions:* holds\_alternative<I>(i.v\_) is true.
- 2 *Effects:* Equivalent to: return ranges::iter\_move(get<I>(i.v\_));

```
template<indirectly_swappable<I> I2, class S2>
friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));
```

- 3 *Preconditions:* holds\_alternative<I>(x.v\_) and holds\_alternative<I2>(y.v\_) are each true.
- 4 *Effects:* Equivalent to ranges::iter\_swap(get<I>(x.v\_), get<I2>(y.v\_)).

**25.5.5 Default sentinel****[default.sentinel]**

```
namespace std {
struct default_sentinel_t { };
}
```

- 1 Class default\_sentinel\_t is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., counted\_iterator (25.5.6.1)).

**25.5.6 Counted iterators****[iterators.counted]****25.5.6.1 Class template counted\_iterator****[counted.iterator]**

- 1 Class template counted\_iterator is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with default\_sentinel in calls to generic algorithms to operate on a range of  $N$  elements starting at a given position without needing to know the end position a priori.

- 2 [Example 1:

```
list<string> s;
// populate the list s with at least 10 strings
vector<string> v;
// copies 10 strings into v:
ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
```

— end example]

- 3 Two values i1 and i2 of types counted\_iterator<I1> and counted\_iterator<I2> refer to elements of the same sequence if and only if there exists some integer  $n$  such that next(i1.base(), i1.count() +  $n$ ) and next(i2.base(), i2.count() +  $n$ ) refer to the same (possibly past-the-end) element.

```
namespace std {
template<input_or_output_iterator I>
class counted_iterator {
public:
using iterator_type = I;
using value_type = iter_value_t<I>; // present only
// if I models indirectly_readable
using difference_type = iter_difference_t<I>;
using iterator_concept = typename I::iterator_concept; // present only
// if the qualified-id I::iterator_concept is valid and denotes a type
using iterator_category = typename I::iterator_category; // present only
// if the qualified-id I::iterator_category is valid and denotes a type
constexpr counted_iterator() requires default_initializable<I> = default;
constexpr counted_iterator(I x, iter_difference_t<I> n);
template<class I2>
requires convertible_to<const I2&, I>
constexpr counted_iterator(const counted_iterator<I2>& x);

template<class I2>
requires assignable_from<I&, const I2&>
constexpr counted_iterator& operator=(const counted_iterator<I2>& x);
};
```

```

constexpr const I& base() const & noexcept;
constexpr I base() &&;
constexpr iter_difference_t<I> count() const noexcept;
constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
 requires dereferenceable<const I>;

constexpr auto operator->() const noexcept
 requires contiguous_iterator<I>;

constexpr counted_iterator& operator++();
constexpr decltype(auto) operator++(int);
constexpr counted_iterator operator++(int)
 requires forward_iterator<I>;
constexpr counted_iterator& operator--();
constexpr counted_iterator operator--(int)
 requires bidirectional_iterator<I>;

constexpr counted_iterator operator+(iter_difference_t<I> n) const
 requires random_access_iterator<I>;
friend constexpr counted_iterator operator+(
 iter_difference_t<I> n, const counted_iterator& x)
 requires random_access_iterator<I>;
constexpr counted_iterator& operator+=(iter_difference_t<I> n)
 requires random_access_iterator<I>;

template<indirectly_swappable<I> I2>
 friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
 noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

private:
 I current = I(); // exposition only
 iter_difference_t<I> length = 0; // exposition only
};

```

```

template<input_iterator I>
 requires same_as<ITER_TRAITS(I), iterator_traits<I>> // see 25.3.4.1
struct iterator_traits<counted_iterator<I>> : iterator_traits<I> {
 using pointer = conditional_t<contiguous_iterator<I>,
 add_pointer_t<iter_reference_t<I>>, void>;
};
}

```

### 25.5.6.2 Constructors and conversions

[counted.iter.const]

```
constexpr counted_iterator(I i, iter_difference_t<I> n);
```

1 *Preconditions:*  $n \geq 0$ .

2 *Effects:* Initializes current with `std::move(i)` and length with `n`.

```

template<class I2>
 requires convertible_to<const I2&, I>
 constexpr counted_iterator(const counted_iterator<I2>& x);

```

3 *Effects:* Initializes current with `x.current` and length with `x.length`.

```

template<class I2>
 requires assignable_from<I&, const I2&>
 constexpr counted_iterator& operator=(const counted_iterator<I2>& x);

```

4 *Effects:* Assigns `x.current` to current and `x.length` to length.

5 *Returns:* `*this`.

### 25.5.6.3 Accessors

[counted.iter.access]

```
constexpr const I& base() const & noexcept;
```

1 *Effects:* Equivalent to: return current;

```
constexpr I base() &&;
```

2 *Returns:* `std::move(current)`.

```
constexpr iter_difference_t<I> count() const noexcept;
```

3 *Effects:* Equivalent to: return length;

### 25.5.6.4 Element access

[counted.iter.elem]

```

constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
 requires dereferenceable<const I>;

```

1 *Preconditions:* `length > 0` is true.

2 *Effects:* Equivalent to: return `*current`;

```

constexpr auto operator->() const noexcept
 requires contiguous_iterator<I>;

```

3 *Effects:* Equivalent to: return `to_address(current)`;

```

constexpr decltype(auto) operator[](iter_difference_t<I> n) const
 requires random_access_iterator<I>;

```

4 *Preconditions:*  $n < \text{length}$ .

5 *Effects:* Equivalent to: return `current[n]`;

### 25.5.6.5 Navigation

[counted.iter.nav]

```
constexpr counted_iterator& operator++();
```

1 *Preconditions:* `length > 0`.

2 *Effects:* Equivalent to:

```

 ++current;
 --length;
 return *this;

```

```
constexpr decltype(auto) operator++(int);
```

3     *Preconditions:* length > 0.

4     *Effects:* Equivalent to:

```

 --length;
 try { return current++; }
 catch(...) { ++length; throw; }

```

```
constexpr counted_iterator operator++(int)
requires forward_iterator<I>;
```

5     *Effects:* Equivalent to:

```

 counted_iterator tmp = *this;
 ++*this;
 return tmp;

```

```
constexpr counted_iterator& operator--()
requires bidirectional_iterator<I>;
```

6     *Effects:* Equivalent to:

```

 --current;
 ++length;
 return *this;

```

```
constexpr counted_iterator operator--(int)
requires bidirectional_iterator<I>;
```

7     *Effects:* Equivalent to:

```

 counted_iterator tmp = *this;
 --*this;
 return tmp;

```

```
constexpr counted_iterator operator+(iter_difference_t<I> n) const
requires random_access_iterator<I>;
```

8     *Effects:* Equivalent to: return counted\_iterator(current + n, length - n);

```
friend constexpr counted_iterator operator+(
 iter_difference_t<I> n, const counted_iterator& x)
requires random_access_iterator<I>;
```

9     *Effects:* Equivalent to: return x + n;

```
constexpr counted_iterator& operator+=(iter_difference_t<I> n)
requires random_access_iterator<I>;
```

10    *Preconditions:* n <= length.

11    *Effects:* Equivalent to:

```

 current += n;
 length -= n;
 return *this;

```

```
constexpr counted_iterator operator-(iter_difference_t<I> n) const
requires random_access_iterator<I>;
```

12    *Effects:* Equivalent to: return counted\_iterator(current - n, length + n);

```
template<common_with<I> I2>
friend constexpr iter_difference_t<I2> operator-(
 const counted_iterator& x, const counted_iterator<I2>& y);
```

13    *Preconditions:* x and y refer to elements of the same sequence (25.5.6.1).

14 *Effects:* Equivalent to: `return y.length - x.length;`

```
friend constexpr iter_difference_t<I> operator-(
 const counted_iterator& x, default_sentinel_t);
```

15 *Effects:* Equivalent to: `return -x.length;`

```
friend constexpr iter_difference_t<I> operator-(
 default_sentinel_t, const counted_iterator& y);
```

16 *Effects:* Equivalent to: `return y.length;`

```
constexpr counted_iterator& operator--(iter_difference_t<I> n)
 requires random_access_iterator<I>;
```

17 *Preconditions:* `-n <= length.`

18 *Effects:* Equivalent to:

```
 current -= n;
 length += n;
 return *this;
```

### 25.5.6.6 Comparisons

[counted.iter.cmp]

```
template<common_with<I> I2>
 friend constexpr bool operator==(
 const counted_iterator& x, const counted_iterator<I2>& y);
```

1 *Preconditions:* `x` and `y` refer to elements of the same sequence (25.5.6.1).

2 *Effects:* Equivalent to: `return x.length == y.length;`

```
friend constexpr bool operator==(
 const counted_iterator& x, default_sentinel_t);
```

3 *Effects:* Equivalent to: `return x.length == 0;`

```
template<common_with<I> I2>
 friend constexpr strong_ordering operator<=>(
 const counted_iterator& x, const counted_iterator<I2>& y);
```

4 *Preconditions:* `x` and `y` refer to elements of the same sequence (25.5.6.1).

5 *Effects:* Equivalent to: `return y.length <=> x.length;`

6 [Note 1: The argument order in the *Effects*: element is reversed because `length` counts down, not up. — end note]

### 25.5.6.7 Customizations

[counted.iter.cust]

```
friend constexpr iter_rvalue_reference_t<I>
 iter_move(const counted_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current)))
 requires input_iterator<I>;
```

1 *Preconditions:* `i.length > 0` is true.

2 *Effects:* Equivalent to: `return ranges::iter_move(i.current);`

```
template<indirectly_swappable<I> I2>
 friend constexpr void
 iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
 noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
```

3 *Preconditions:* Both `x.length > 0` and `y.length > 0` are true.

4 *Effects:* Equivalent to `ranges::iter_swap(x.current, y.current).`

### 25.5.7 Unreachable sentinel

[unreachable.sentinel]

1 Class `unreachable_sentinel_t` can be used with any weakly\_incrementable type to denote the “upper bound” of an unbounded interval.

2 [Example 1:

```
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable_sentinel, '\n');
```

Provided a newline character really exists in the buffer, the use of `unreachable_sentinel` above potentially makes the call to `find` more efficient since the loop test against the sentinel does not require a conditional branch. — *end example*]

```
namespace std {
 struct unreachable_sentinel_t {
 template<weakly_incrementable I>
 friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept
 { return false; }
 };
}
```

## 25.6 Stream iterators

[stream.iterators]

### 25.6.1 General

[stream.iterators.general]

- <sup>1</sup> To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[*Example 1:*

```
partial_sum(istream_iterator<double, char>(cin),
 istream_iterator<double, char>(),
 ostream_iterator<double, char>(cout, "\n"));
```

reads a file containing floating-point numbers from `cin`, and prints the partial sums onto `cout`. — *end example*]

### 25.6.2 Class template `istream_iterator`

[istream.iterator]

#### 25.6.2.1 General

[istream.iterator.general]

- <sup>1</sup> The class template `istream_iterator` is an input iterator (25.3.5.3) that reads successive elements from the input stream for which it was constructed.

```
namespace std {
 template<class T, class charT = char, class traits = char_traits<charT>,
 class Distance = ptrdiff_t>
 class istream_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = T;
 using difference_type = Distance;
 using pointer = const T*;
 using reference = const T&;
 using char_type = charT;
 using traits_type = traits;
 using istream_type = basic_istream<charT, traits>;

 constexpr istream_iterator();
 constexpr istream_iterator(default_sentinel_t);
 istream_iterator(istream_type& s);
 istream_iterator(const istream_iterator& x) = default;
 ~istream_iterator() = default;
 istream_iterator& operator=(const istream_iterator&) = default;

 const T& operator*() const;
 const T* operator->() const;
 istream_iterator& operator++();
 istream_iterator operator++(int);

 friend bool operator==(const istream_iterator& i, default_sentinel_t);

 private:
 basic_istream<charT, traits>* in_stream; // exposition only
 T value; // exposition only
 };
}
```

- 2 The type  $T$  shall meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and *Cpp17CopyAssignable* requirements.

### 25.6.2.2 Constructors and destructor

[istream.iterator.cons]

```
constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
```

- 1 *Effects*: Constructs the end-of-stream iterator, value-initializing value.

- 2 *Postconditions*: `in_stream == nullptr` is true.

- 3 *Remarks*: If the initializer  $T()$  in the declaration `auto x = T();` is a constant initializer (7.7), then these constructors are `constexpr` constructors.

```
istream_iterator(istream_type& s);
```

- 4 *Effects*: Initializes `in_stream` with `addressof(s)`, value-initializes value, and then calls `operator++()`.

```
istream_iterator(const istream_iterator& x) = default;
```

- 5 *Postconditions*: `in_stream == x.in_stream` is true.

- 6 *Remarks*: If `is_trivially_copy_constructible_v<T>` is true, then this constructor is trivial.

```
~istream_iterator() = default;
```

- 7 *Remarks*: If `is_trivially_destructible_v<T>` is true, then this destructor is trivial.

### 25.6.2.3 Operations

[istream.iterator.ops]

```
const T& operator*() const;
```

- 1 *Preconditions*: `in_stream != nullptr` is true.

- 2 *Returns*: value.

```
const T* operator->() const;
```

- 3 *Preconditions*: `in_stream != nullptr` is true.

- 4 *Returns*: `addressof(value)`.

```
istream_iterator& operator++();
```

- 5 *Preconditions*: `in_stream != nullptr` is true.

- 6 *Effects*: Equivalent to:

```
if (!(*in_stream >> value))
 in_stream = nullptr;
```

- 7 *Returns*: `*this`.

```
istream_iterator operator++(int);
```

- 8 *Preconditions*: `in_stream != nullptr` is true.

- 9 *Effects*: Equivalent to:

```
istream_iterator tmp = *this;
+++this;
return tmp;
```

```
template<class T, class charT, class traits, class Distance>
```

```
bool operator==(const istream_iterator<T, charT, traits, Distance>& x,
 const istream_iterator<T, charT, traits, Distance>& y);
```

- 10 *Returns*: `x.in_stream == y.in_stream`.

```
friend bool operator==(const istream_iterator& i, default_sentinel_t);
```

- 11 *Returns*: `!i.in_stream`.

**25.6.3 Class template ostream\_iterator****[ostream.iterator]****25.6.3.1 General****[ostream.iterator.general]**

- <sup>1</sup> ostream\_iterator writes (using operator<<) successive elements onto the output stream from which it was constructed. If it was constructed with charT\* as a constructor argument, this string, called a *delimiter string*, is written to the stream after every T is written.

```

namespace std {
 template<class T, class charT = char, class traits = char_traits<charT>>
 class ostream_iterator {
 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;
 using reference = void;
 using char_type = charT;
 using traits_type = traits;
 using ostream_type = basic_ostream<charT,traits>;

 ostream_iterator(ostream_type& s);
 ostream_iterator(ostream_type& s, const charT* delimiter);
 ostream_iterator(const ostream_iterator& x);
 ~ostream_iterator();
 ostream_iterator& operator=(const ostream_iterator&) = default;
 ostream_iterator& operator=(const T& value);

 ostream_iterator& operator*();
 ostream_iterator& operator++();
 ostream_iterator& operator++(int);

 private:
 basic_ostream<charT,traits>* out_stream; // exposition only
 const charT* delim; // exposition only
 };
}

```

**25.6.3.2 Constructors and destructor****[ostream.iterator.cons.des]**

```
ostream_iterator(ostream_type& s);
```

- <sup>1</sup> *Effects:* Initializes out\_stream with addressof(s) and delim with nullptr.

```
ostream_iterator(ostream_type& s, const charT* delimiter);
```

- <sup>2</sup> *Effects:* Initializes out\_stream with addressof(s) and delim with delimiter.

**25.6.3.3 Operations****[ostream.iterator.ops]**

```
ostream_iterator& operator=(const T& value);
```

- <sup>1</sup> *Effects:* As if by:

```

*out_stream << value;
if (delim)
 *out_stream << delim;
return *this;

```

```
ostream_iterator& operator*();
```

- <sup>2</sup> *Returns:* \*this.

```
ostream_iterator& operator++();
ostream_iterator& operator++(int);
```

- <sup>3</sup> *Returns:* \*this.

## 25.6.4 Class template `istreambuf_iterator`

[istreambuf.iterator]

### 25.6.4.1 General

[istreambuf.iterator.general]

- 1 The class template `istreambuf_iterator` defines an input iterator (25.3.5.3) that reads successive *characters* from the `streambuf` for which it was constructed. `operator*` provides access to the current input character, if any. Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`streambuf_type::sgetc()` returns `traits::eof()`), the iterator becomes equal to the *end-of-stream* iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(nullptr)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.
- 2 The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class istreambuf_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = charT;
 using difference_type = typename traits::off_type;
 using pointer = unspecified;
 using reference = charT;
 using char_type = charT;
 using traits_type = traits;
 using int_type = typename traits::int_type;
 using streambuf_type = basic_streambuf<charT,traits>;
 using istream_type = basic_istream<charT,traits>;

 class proxy; // exposition only

 constexpr istreambuf_iterator() noexcept;
 constexpr istreambuf_iterator(default_sentinel_t) noexcept;
 istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
 ~istreambuf_iterator() = default;
 istreambuf_iterator(istream_type& s) noexcept;
 istreambuf_iterator(streambuf_type* s) noexcept;
 istreambuf_iterator(const proxy& p) noexcept;
 istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
 charT operator*() const;
 istreambuf_iterator& operator++();
 proxy operator++(int);
 bool equal(const istreambuf_iterator& b) const;

 friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);

 private:
 streambuf_type* sbuf_; // exposition only
 };
}

```

### 25.6.4.2 Class `istreambuf_iterator::proxy`

[istreambuf.iterator.proxy]

- 1 Class `istreambuf_iterator<charT,traits>::proxy` is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_iterator<charT,traits>::proxy` provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

```

namespace std {
 template<class charT, class traits>
 class istreambuf_iterator<charT, traits>::proxy { // exposition only
 charT keep_;
 basic_streambuf<charT,traits>* sbuf_;
 proxy(charT c, basic_streambuf<charT,traits>* sbuf)
 : keep_(c), sbuf_(sbuf) { }
 };
}

```

```

public:
 charT operator*() { return keep_; }
};
}

```

### 25.6.4.3 Constructors

[istreambuf.iterator.cons]

- 1 For each `istreambuf_iterator` constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member `sbuf_` is initialized with a null pointer value.

```

constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel_t) noexcept;

```

- 2 *Effects:* Initializes `sbuf_` with `nullptr`.

```
istreambuf_iterator(istream_type& s) noexcept;
```

- 3 *Effects:* Initializes `sbuf_` with `s.rdbuf()`.

```
istreambuf_iterator(streambuf_type* s) noexcept;
```

- 4 *Effects:* Initializes `sbuf_` with `s`.

```
istreambuf_iterator(const proxy& p) noexcept;
```

- 5 *Effects:* Initializes `sbuf_` with `p.sbuf_`.

### 25.6.4.4 Operations

[istreambuf.iterator.ops]

```
charT operator*() const;
```

- 1 *Returns:* The character obtained via the `streambuf` member `sbuf_>sgetc()`.

```
istreambuf_iterator& operator++();
```

- 2 *Effects:* As if by `sbuf_>sbumpc()`.

- 3 *Returns:* `*this`.

```
proxy operator++(int);
```

- 4 *Returns:* `proxy(sbuf_>sbumpc(), sbuf_)`.

```
bool equal(const istreambuf_iterator& b) const;
```

- 5 *Returns:* `true` if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what `streambuf` object they use.

```

template<class charT, class traits>
bool operator==(const istreambuf_iterator<charT,traits>& a,
 const istreambuf_iterator<charT,traits>& b);

```

- 6 *Returns:* `a.equal(b)`.

```
friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
```

- 7 *Returns:* `i.equal(s)`.

## 25.6.5 Class template `ostreambuf_iterator`

[ostreambuf.iterator]

### 25.6.5.1 General

[ostreambuf.iterator.general]

- 1 The class template `ostreambuf_iterator` writes successive *characters* onto the output stream from which it was constructed.

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class ostreambuf_iterator {
 public:
 using iterator_category = output_iterator_tag;
 using value_type = void;
 using difference_type = ptrdiff_t;
 using pointer = void;

```

```

using reference = void;
using char_type = charT;
using traits_type = traits;
using streambuf_type = basic_streambuf<charT,traits>;
using ostream_type = basic_ostream<charT,traits>;

ostreambuf_iterator(ostream_type& s) noexcept;
ostreambuf_iterator(streambuf_type* s) noexcept;
ostreambuf_iterator& operator=(charT c);

ostreambuf_iterator& operator*();
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
bool failed() const noexcept;

private:
 streambuf_type* sbuf_; // exposition only
};
}

```

### 25.6.5.2 Constructors

[ostreambuf.iter.cons]

```

ostreambuf_iterator(ostream_type& s) noexcept;
1 Preconditions: s.rdbuf() is not a null pointer.
2 Effects: Initializes sbuf_ with s.rdbuf().

ostreambuf_iterator(streambuf_type* s) noexcept;
3 Preconditions: s is not a null pointer.
4 Effects: Initializes sbuf_ with s.

```

### 25.6.5.3 Operations

[ostreambuf.iter.ops]

```

ostreambuf_iterator& operator=(charT c);
1 Effects: If failed() yields false, calls sbuf_->sputc(c); otherwise has no effect.
2 Returns: *this.

ostreambuf_iterator& operator*();
3 Returns: *this.

ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
4 Returns: *this.

bool failed() const noexcept;
5 Returns: true if in any prior use of member operator=, the call to sbuf_->sputc() returned traits::eof(); or
 false otherwise.

```

## 25.7 Range access

[iterator.range]

- <sup>1</sup> In addition to being available via inclusion of the <iterator> header, the function templates in 25.7 are available when any of the following headers are included: <array> (24.3.2), <deque> (24.3.3), <forward\_list> (24.3.4), <list> (24.3.5), <map> (24.4.2), <regex> (32.3), <set> (24.4.3), <span> (24.7.2), <string> (23.4.2), <string\_view> (23.3.2), <unordered\_map> (24.5.2), <unordered\_set> (24.5.3), and <vector> (24.3.6). Each of these templates is a designated customization point (16.4.5.2.1).

```

template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());

```

- <sup>2</sup> *Returns:* c.begin().

```
template<class C> constexpr auto end(C& c) -> decltype(c.end());
template<class C> constexpr auto end(const C& c) -> decltype(c.end());
```

3       *Returns:* c.end().

```
template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
```

4       *Returns:* array.

```
template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;
```

5       *Returns:* array + N.

```
template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
-> decltype(std::begin(c));
```

6       *Returns:* std::begin(c).

```
template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
-> decltype(std::end(c));
```

7       *Returns:* std::end(c).

```
template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template<class C> constexpr auto rbegin(const C& c) -> decltype(c.rbegin());
```

8       *Returns:* c.rbegin().

```
template<class C> constexpr auto rend(C& c) -> decltype(c.rend());
template<class C> constexpr auto rend(const C& c) -> decltype(c.rend());
```

9       *Returns:* c.rend().

```
template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);
```

10      *Returns:* reverse\_iterator<T\*>(array + N).

```
template<class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);
```

11      *Returns:* reverse\_iterator<T\*>(array).

```
template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);
```

12      *Returns:* reverse\_iterator<const E\*>(il.end()).

```
template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);
```

13      *Returns:* reverse\_iterator<const E\*>(il.begin()).

```
template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));
```

14      *Returns:* std::rbegin(c).

```
template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));
```

15      *Returns:* std::rend(c).

```
template<class C> constexpr auto size(const C& c) -> decltype(c.size());
```

16      *Returns:* c.size().

```
template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
```

17      *Returns:* N.

```
template<class C> constexpr auto ssize(const C& c)
-> common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>;
```

18      *Effects:* Equivalent to:

```
return static_cast<common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>>(c.size());
```

```
template<class T, ptrdiff_t N> constexpr ptrdiff_t ssize(const T (&array)[N]) noexcept;
```

19      *Returns:* N.

```
template<class C> [[nodiscard]] constexpr auto empty(const C& c) -> decltype(c.empty());
20 Returns: c.empty().

template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
21 Returns: false.

template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;
22 Returns: il.size() == 0.

template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());
23 Returns: c.data().

template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
24 Returns: array.

template<class E> constexpr const E* data(initializer_list<E> il) noexcept;
25 Returns: il.begin().
```

## 26 Ranges library

[ranges]

### 26.1 General

[ranges.general]

- <sup>1</sup> This Clause describes components for dealing with ranges of elements.
- <sup>2</sup> The following subclauses describe range and view requirements, and components for range primitives as summarized in [Table 88](#).

Table 88: Ranges library summary [tab:range.summary]

|                      | Subclause       | Header   |
|----------------------|-----------------|----------|
| <a href="#">26.3</a> | Range access    | <ranges> |
| <a href="#">26.4</a> | Requirements    |          |
| <a href="#">26.5</a> | Range utilities |          |
| <a href="#">26.6</a> | Range factories |          |
| <a href="#">26.7</a> | Range adaptors  |          |

### 26.2 Header <ranges> synopsis

```

- 1 Within this Clause, for an integer-like type  $X$  (25.3.4.4), *make-unsigned-like-t<X>* denotes `make_unsigned_t<X>` if  $X$  is an integer type; otherwise, it denotes a corresponding unspecified unsigned-integer-like type of the same width as  $X$ . For an expression  $x$  of type  $X$ , *to-unsigned-like(x)* is  $x$  explicitly converted to *make-unsigned-like-t<X>*.
- 2 Also within this Clause, *make-signed-like-t<X>* for an integer-like type  $X$  denotes `make_signed_t<X>` if  $X$  is an integer type; otherwise, it denotes a corresponding unspecified signed-integer-like type of the same width as  $X$ .

## 26.3 Range access

[range.access]

### 26.3.1 General

[range.access.general]

- 1 In addition to being available via inclusion of the `<ranges>` header, the customization point objects in 26.3 are available when `<iterator>` (25.2) is included.
- 2 Within 26.3, the *reified object* of a subexpression  $E$  denotes
  - (2.1) — the same object as  $E$  if  $E$  is a glvalue, or
  - (2.2) — the result of applying the temporary materialization conversion (7.3.5) to  $E$  otherwise.

### 26.3.2 `ranges::begin`

[range.access.begin]

- 1 The name `ranges::begin` denotes a customization point object (16.3.3.3.6).
- 2 Given a subexpression  $E$  with type  $T$ , let  $t$  be an lvalue that denotes the reified object for  $E$ . Then:
  - (2.1) — If  $E$  is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::begin(E)` is ill-formed.
  - (2.2) — Otherwise, if  $T$  is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::begin(E)` is ill-formed with no diagnostic required.
  - (2.3) — Otherwise, if  $T$  is an array type, `ranges::begin(E)` is expression-equivalent to `t + 0`.
  - (2.4) — Otherwise, if `auto(t.begin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::begin(E)` is expression-equivalent to `auto(t.begin())`.
  - (2.5) — Otherwise, if  $T$  is a class or enumeration type and `auto(begin(t))` is a valid expression whose type models `input_or_output_iterator` with overload resolution performed in a context in which unqualified lookup for `begin` finds only the declarations

```

void begin(auto&) = delete;
void begin(const auto&) = delete;

```

then `ranges::begin(E)` is expression-equivalent to `auto(begin(t))` with overload resolution performed in the above context.
  - (2.6) — Otherwise, `ranges::begin(E)` is ill-formed.
- 3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::begin(E)` appears in the immediate context of a template instantiation. — end note]
- 4 [Note 2: Whenever `ranges::begin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

### 26.3.3 `ranges::end`

[range.access.end]

- 1 The name `ranges::end` denotes a customization point object (16.3.3.3.6).

- 2 Given a subexpression *E* with type *T*, let *t* be an lvalue that denotes the reified object for *E*. Then:
- (2.1) — If *E* is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::end(E)` is ill-formed.
  - (2.2) — Otherwise, if *T* is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::end(E)` is ill-formed with no diagnostic required.
  - (2.3) — Otherwise, if *T* is an array of unknown bound, `ranges::end(E)` is ill-formed.
  - (2.4) — Otherwise, if *T* is an array, `ranges::end(E)` is expression-equivalent to `t + extent_v<T>`.
  - (2.5) — Otherwise, if `auto(t.end())` is a valid expression whose type models `sentinel_for<iterator_t<T>>` then `ranges::end(E)` is expression-equivalent to `auto(t.end())`.
  - (2.6) — Otherwise, if *T* is a class or enumeration type and `auto(end(t))` is a valid expression whose type models `sentinel_for<iterator_t<T>>` with overload resolution performed in a context in which unqualified lookup for `end` finds only the declarations
 

```
void end(auto&) = delete;
void end(const auto&) = delete;
```

 then `ranges::end(E)` is expression-equivalent to `auto(end(t))` with overload resolution performed in the above context.
  - (2.7) — Otherwise, `ranges::end(E)` is ill-formed.
- 3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::end(E)` appears in the immediate context of a template instantiation. — end note]
- 4 [Note 2: Whenever `ranges::end(E)` is a valid expression, the types *S* and *I* of `ranges::end(E)` and `ranges::begin(E)` model `sentinel_for<S, I>`. — end note]

#### 26.3.4 `ranges::cbegin`

[range.access.cbegin]

- 1 The name `ranges::cbegin` denotes a customization point object (16.3.3.3.6). The expression `ranges::cbegin(E)` for a subexpression *E* of type *T* is expression-equivalent to:
- (1.1) — `ranges::begin(static_cast<const T&>(E))` if *E* is an lvalue.
  - (1.2) — Otherwise, `ranges::begin(static_cast<const T&&>(E))`.
- 2 [Note 1: Whenever `ranges::cbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

#### 26.3.5 `ranges::cend`

[range.access.cend]

- 1 The name `ranges::cend` denotes a customization point object (16.3.3.3.6). The expression `ranges::cend(E)` for a subexpression *E* of type *T* is expression-equivalent to:
- (1.1) — `ranges::end(static_cast<const T&>(E))` if *E* is an lvalue.
  - (1.2) — Otherwise, `ranges::end(static_cast<const T&&>(E))`.
- 2 [Note 1: Whenever `ranges::cend(E)` is a valid expression, the types *S* and *I* of the expressions `ranges::cend(E)` and `ranges::cbegin(E)` model `sentinel_for<S, I>`. — end note]

#### 26.3.6 `ranges::rbegin`

[range.access.rbegin]

- 1 The name `ranges::rbegin` denotes a customization point object (16.3.3.3.6).
- 2 Given a subexpression *E* with type *T*, let *t* be an lvalue that denotes the reified object for *E*. Then:
- (2.1) — If *E* is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rbegin(E)` is ill-formed.
  - (2.2) — Otherwise, if *T* is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rbegin(E)` is ill-formed with no diagnostic required.
  - (2.3) — Otherwise, if `auto(t.rbegin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::rbegin(E)` is expression-equivalent to `auto(t.rbegin())`.
  - (2.4) — Otherwise, if *T* is a class or enumeration type and `auto(rbegin(t))` is a valid expression whose type models `input_or_output_iterator` with overload resolution performed in a context in which unqualified lookup for `rbegin` finds only the declarations
 

```
void rbegin(auto&) = delete;
void rbegin(const auto&) = delete;
```

then `ranges::rbegin(E)` is expression-equivalent to `auto(rbegin(t))` with overload resolution performed in the above context.

(2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (25.3.4.12), `ranges::rbegin(E)` is expression-equivalent to `make_reverse_iterator(ranges::end(t))`.

(2.6) — Otherwise, `ranges::rbegin(E)` is ill-formed.

<sup>3</sup> [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation. — end note]

<sup>4</sup> [Note 2: Whenever `ranges::rbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

### 26.3.7 `ranges::rend`

[range.access.rend]

<sup>1</sup> The name `ranges::rend` denotes a customization point object (16.3.3.3.6).

<sup>2</sup> Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rend(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rend(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `auto(t.rend())` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` then `ranges::rend(E)` is expression-equivalent to `auto(t.rend())`.

(2.4) — Otherwise, if `T` is a class or enumeration type and `auto(rend(t))` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` with overload resolution performed in a context in which unqualified lookup for `rend` finds only the declarations

```
void rend(auto&) = delete;
void rend(const auto&) = delete;
```

then `ranges::rend(E)` is expression-equivalent to `auto(rend(t))` with overload resolution performed in the above context.

(2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (25.3.4.12), then `ranges::rend(E)` is expression-equivalent to `make_reverse_iterator(ranges::begin(t))`.

(2.6) — Otherwise, `ranges::rend(E)` is ill-formed.

<sup>3</sup> [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rend(E)` appears in the immediate context of a template instantiation. — end note]

<sup>4</sup> [Note 2: Whenever `ranges::rend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::rend(E)` and `ranges::rbegin(E)` model `sentinel_for<S, I>`. — end note]

### 26.3.8 `ranges::crbegin`

[range.access.crbegin]

<sup>1</sup> The name `ranges::crbegin` denotes a customization point object (16.3.3.3.6). The expression `ranges::crbegin(E)` for a subexpression `E` of type `T` is expression-equivalent to:

(1.1) — `ranges::rbegin(static_cast<const T&>(E))` if `E` is an lvalue.

(1.2) — Otherwise, `ranges::rbegin(static_cast<const T&>(E))`.

<sup>2</sup> [Note 1: Whenever `ranges::crbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

### 26.3.9 `ranges::crend`

[range.access.crend]

<sup>1</sup> The name `ranges::crend` denotes a customization point object (16.3.3.3.6). The expression `ranges::crend(E)` for a subexpression `E` of type `T` is expression-equivalent to:

(1.1) — `ranges::rend(static_cast<const T&>(E))` if `E` is an lvalue.

(1.2) — Otherwise, `ranges::rend(static_cast<const T&>(E))`.

<sup>2</sup> [Note 1: Whenever `ranges::crend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::crend(E)` and `ranges::crbegin(E)` model `sentinel_for<S, I>`. — end note]

**26.3.10 ranges::size****[range.prim.size]**

- 1 The name `ranges::size` denotes a customization point object (16.3.3.3.6).
- 2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:
  - (2.1) — If `T` is an array of unknown bound (9.3.4.5), `ranges::size(E)` is ill-formed.
  - (2.2) — Otherwise, if `T` is an array type, `ranges::size(E)` is expression-equivalent to `auto(extent_v<T>)`.
  - (2.3) — Otherwise, if `disable_sized_range<remove_cv_t<T>>` (26.4.3) is false and `auto(t.size())` is a valid expression of integer-like type (25.3.4.4), `ranges::size(E)` is expression-equivalent to `auto(t.size())`.
  - (2.4) — Otherwise, if `T` is a class or enumeration type, `disable_sized_range<remove_cv_t<T>>` is false and `auto(size(t))` is a valid expression of integer-like type with overload resolution performed in a context in which unqualified lookup for `size` finds only the declarations
 

```
void size(auto&) = delete;
void size(const auto&) = delete;
```

 then `ranges::size(E)` is expression-equivalent to `auto(size(t))` with overload resolution performed in the above context.
  - (2.5) — Otherwise, if `to_unsigned_like(ranges::end(t) - ranges::begin(t))` (26.2) is a valid expression and the types `I` and `S` of `ranges::begin(t)` and `ranges::end(t)` (respectively) model both `sized_sentinel_for<S, I>` (25.3.4.8) and `forward_iterator<I>`, then `ranges::size(E)` is expression-equivalent to `to_unsigned_like(ranges::end(t) - ranges::begin(t))`.
  - (2.6) — Otherwise, `ranges::size(E)` is ill-formed.
- 3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::size(E)` appears in the immediate context of a template instantiation. — end note]
- 4 [Note 2: Whenever `ranges::size(E)` is a valid expression, its type is integer-like. — end note]

**26.3.11 ranges::ssize****[range.prim.ssize]**

- 1 The name `ranges::ssize` denotes a customization point object (16.3.3.3.6).
- 2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. If `ranges::size(t)` is ill-formed, `ranges::ssize(E)` is ill-formed. Otherwise let `D` be `make_signed_like_t<decltype(ranges::size(t))>`, or `ptrdiff_t` if it is wider than that type; `ranges::ssize(E)` is expression-equivalent to `static_cast<D>(ranges::size(t))`.

**26.3.12 ranges::empty****[range.prim.empty]**

- 1 The name `ranges::empty` denotes a customization point object (16.3.3.3.6).
- 2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:
  - (2.1) — If `T` is an array of unknown bound (9.3.4.5), `ranges::empty(E)` is ill-formed.
  - (2.2) — Otherwise, if `bool(t.empty())` is a valid expression, `ranges::empty(E)` is expression-equivalent to `bool(t.empty())`.
  - (2.3) — Otherwise, if `(ranges::size(t) == 0)` is a valid expression, `ranges::empty(E)` is expression-equivalent to `(ranges::size(t) == 0)`.
  - (2.4) — Otherwise, if `bool(ranges::begin(t) == ranges::end(t))` is a valid expression and the type of `ranges::begin(t)` models `forward_iterator`, `ranges::empty(E)` is expression-equivalent to `bool(ranges::begin(t) == ranges::end(t))`.
  - (2.5) — Otherwise, `ranges::empty(E)` is ill-formed.
- 3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::empty(E)` appears in the immediate context of a template instantiation. — end note]
- 4 [Note 2: Whenever `ranges::empty(E)` is a valid expression, it has type `bool`. — end note]

**26.3.13 ranges::data****[range.prim.data]**

- 1 The name `ranges::data` denotes a customization point object (16.3.3.3.6).
- 2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:
  - (2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::data(E)` is ill-formed.
  - (2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::data(E)` is ill-formed with no diagnostic required.

- (2.3) — Otherwise, if `auto(t.data())` is a valid expression of pointer to object type, `ranges::data(E)` is expression-equivalent to `auto(t.data())`.
- (2.4) — Otherwise, if `ranges::begin(t)` is a valid expression whose type models `contiguous_iterator`, `ranges::data(E)` is expression-equivalent to `to_address(ranges::begin(t))`.
- (2.5) — Otherwise, `ranges::data(E)` is ill-formed.
- <sup>3</sup> [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::data(E)` appears in the immediate context of a template instantiation. — *end note*]
- <sup>4</sup> [Note 2: Whenever `ranges::data(E)` is a valid expression, it has pointer to object type. — *end note*]

### 26.3.14 `ranges::cdata`

[range.prim.cdata]

- <sup>1</sup> The name `ranges::cdata` denotes a customization point object (16.3.3.3.6). The expression `ranges::cdata(E)` for a subexpression `E` of type `T` is expression-equivalent to:
- (1.1) — `ranges::data(static_cast<const T&>(E))` if `E` is an lvalue.
- (1.2) — Otherwise, `ranges::data(static_cast<const T&&>(E))`.
- <sup>2</sup> [Note 1: Whenever `ranges::cdata(E)` is a valid expression, it has pointer to object type. — *end note*]

## 26.4 Range requirements

[range.req]

### 26.4.1 General

[range.req.general]

- <sup>1</sup> Ranges are an abstraction that allow a C++ program to operate on elements of data structures uniformly. Calling `ranges::begin` on a range returns an object whose type models `input_or_output_iterator` (25.3.4.6). Calling `ranges::end` on a range returns an object whose type `S`, together with the type `I` of the object returned by `ranges::begin`, models `sentinel_for<S, I>`. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.
- <sup>2</sup> The range concept requires that `ranges::begin` and `ranges::end` return an iterator and a sentinel, respectively. The `sized_range` concept refines range with the requirement that `ranges::size` be amortized  $\mathcal{O}(1)$ . The view concept specifies requirements on a range type to provide operations with predictable complexity.
- <sup>3</sup> Several refinements of range group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which `ranges::begin` and `ranges::end` return objects of the same type. Random access ranges are ranges for which `ranges::begin` returns a type that models `random_access_iterator` (25.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

### 26.4.2 Ranges

[range.range]

- <sup>1</sup> The range concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```
template<class T>
concept range =
 requires(T& t) {
 ranges::begin(t); // sometimes equality-preserving (see below)
 ranges::end(t);
 };
```

- <sup>2</sup> The required expressions `ranges::begin(t)` and `ranges::end(t)` of the range concept do not require implicit expression variations (18.2).
- <sup>3</sup> Given an expression `t` such that `decltype((t))` is `T&`, `T` models range only if
- (3.1) — `[ranges::begin(t), ranges::end(t))` denotes a range (25.3.1),
- (3.2) — both `ranges::begin(t)` and `ranges::end(t)` are amortized constant time and non-modifying, and
- (3.3) — if the type of `ranges::begin(t)` models `forward_iterator`, `ranges::begin(t)` is equality-preserving.
- <sup>4</sup> [Note 1: Equality preservation of both `ranges::begin` and `ranges::end` enables passing a range whose iterator type models `forward_iterator` to multiple algorithms and making multiple passes over the range by repeated calls to `ranges::begin` and `ranges::end`. Since `ranges::begin` is not required to be equality-preserving when the return type does not model `forward_iterator`, it is possible for repeated calls to not return equal values or to not be well-defined. — *end note*]

```
template<class T>
concept borrowed_range =
 range<T> && (is_lvalue_reference_v<T> || enable_borrowed_range<remove_cvref_t<T>>);
```

5 Let  $U$  be `remove_reference_t<T>` if  $T$  is an rvalue reference type, and  $T$  otherwise. Given a variable  $u$  of type  $U$ ,  $T$  models `borrowed_range` only if the validity of iterators obtained from  $u$  is not tied to the lifetime of that variable.

6 [Note 2: Since the validity of iterators is not tied to the lifetime of a variable whose type models `borrowed_range`, a function with a parameter of such a type can return iterators obtained from it without danger of dangling. — end note]

```
template<class>
inline constexpr bool enable_borrowed_range = false;
```

7 *Remarks:* Pursuant to 16.4.5.2.1, users may specialize `enable_borrowed_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

8 [Example 1: Each specialization  $S$  of class template `subrange` (26.5.4) models `borrowed_range` because

(8.1) — `enable_borrowed_range<S>` is specialized to have the value `true`, and

(8.2) —  $S$ 's iterators do not have validity tied to the lifetime of an  $S$  object because they are “borrowed” from some other range. — end example]

### 26.4.3 Sized ranges

[range.sized]

1 The `sized_range` concept refines `range` with the requirement that the number of elements in the range can be determined in amortized constant time using `ranges::size`.

```
template<class T>
concept sized_range =
 range<T> && requires(T& t) { ranges::size(t); };
```

2 Given an lvalue  $t$  of type `remove_reference_t<T>`,  $T$  models `sized_range` only if

(2.1) — `ranges::size(t)` is amortized  $\mathcal{O}(1)$ , does not modify  $t$ , and is equal to `ranges::distance(ranges::begin(t), ranges::end(t))`, and

(2.2) — if `iterator_t<T>` models `forward_iterator`, `ranges::size(t)` is well-defined regardless of the evaluation of `ranges::begin(t)`.

[Note 1: `ranges::size(t)` is otherwise not required to be well-defined after evaluating `ranges::begin(t)`. For example, it is possible for `ranges::size(t)` to be well-defined for a `sized_range` whose iterator type does not model `forward_iterator` only if evaluated before the first call to `ranges::begin(t)`. — end note]

```
template<class>
inline constexpr bool disable_sized_range = false;
```

3 *Remarks:* Pursuant to 16.4.5.2.1, users may specialize `disable_sized_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

4 [Note 2: `disable_sized_range` allows use of range types with the library that satisfy but do not in fact model `sized_range`. — end note]

### 26.4.4 Views

[range.view]

1 The `view` concept specifies the requirements of a range type that has the semantic properties below, which make it suitable for use in constructing range adaptor pipelines (26.7).

```
template<class T>
concept view =
 range<T> && movable<T> && enable_view<T>;
```

2  $T$  models `view` only if:

(2.1) —  $T$  has  $\mathcal{O}(1)$  move construction; and

(2.2) — move assignment of an object of type  $T$  is no more complex than destruction followed by move construction; and

(2.3) — if  $N$  copies and/or moves are made from an object of type  $T$  that contained  $M$  elements, then those  $N$  objects have  $\mathcal{O}(N + M)$  destruction; and

(2.4) — `copy_constructible<T>` is `false`, or  $T$  has  $\mathcal{O}(1)$  copy construction; and

- (2.5) — `copyable<T>` is false, or copy assignment of an object of type `T` is no more complex than destruction followed by copy construction.

3 [Note 1: The constraints on copying and moving imply that a moved-from object of type `T` has  $\mathcal{O}(1)$  destruction. — end note]

4 [Example 1: Examples of views are:

- (4.1) — A range type that wraps a pair of iterators.  
 (4.2) — A range type that holds its elements by `shared_ptr` and shares ownership with all its copies.  
 (4.3) — A range type that generates its elements on demand.

A container such as `vector<string>` does not meet the semantic requirements of `view` since copying the container copies all of the elements, which cannot be done in constant time. — end example]

- 5 Since the difference between `range` and `view` is largely semantic, the two are differentiated with the help of `enable_view`.

```
template<class T>
 inline constexpr bool is-derived-from-view-interface = see below; // exposition only
template<class T>
 inline constexpr bool enable_view =
 derived_from<T, view_base> || is-derived-from-view-interface<T>;
```

- 6 For a type `T`, `is-derived-from-view-interface<T>` is true if and only if `T` has exactly one public base class `view_interface<U>` for some type `U` and `T` has no base classes of type `view_interface<V>` for any other type `V`.

- 7 *Remarks:* Pursuant to 16.4.5.2.1, users may specialize `enable_view` to true for cv-unqualified program-defined types which model `view`, and false for types which do not. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

## 26.4.5 Other range refinements

[range.refinements]

- 1 The `output_range` concept specifies requirements of a range type for which `ranges::begin` returns a model of `output_iterator` (25.3.4.10). `input_range`, `forward_range`, `bidirectional_range`, and `random_access_range` are defined similarly.

```
template<class R, class T>
 concept output_range =
 range<R> && output_iterator<iterator_t<R>, T>;

template<class T>
 concept input_range =
 range<T> && input_iterator<iterator_t<T>>;

template<class T>
 concept forward_range =
 input_range<T> && forward_iterator<iterator_t<T>>;

template<class T>
 concept bidirectional_range =
 forward_range<T> && bidirectional_iterator<iterator_t<T>>;

template<class T>
 concept random_access_range =
 bidirectional_range<T> && random_access_iterator<iterator_t<T>>;
```

- 2 `contiguous_range` additionally requires that the `ranges::data` customization point object (26.3.13) is usable with the `range`.

```
template<class T>
 concept contiguous_range =
 random_access_range<T> && contiguous_iterator<iterator_t<T>> &&
 requires(T& t) {
 { ranges::data(t) } -> same_as<add_pointer_t<range_reference_t<T>>>;
 };
```

- 3 Given an expression `t` such that `decltype((t))` is `T&`, `T` models `contiguous_range` only if `to_address(ranges::begin(t)) == ranges::data(t)` is true.

- 4 The `common_range` concept specifies requirements of a range type for which `ranges::begin` and `ranges::end` return objects of the same type.

[*Example 1: The standard containers (Clause 24) model `common_range`. — end example*]

```
template<class T>
 concept common_range =
 range<T> && same_as<iterator_t<T>, sentinel_t<T>>;
```

```
template<class R>
 inline constexpr bool is-initializer-list = see below; // exposition only
```

- 5 For a type `R`, `is-initializer-list<R>` is true if and only if `remove_cvref_t<R>` is a specialization of `initializer_list`.

- 6 The `viewable_range` concept specifies the requirements of a range type that can be converted to a view safely.

```
template<class T>
 concept viewable_range =
 range<T> &&
 ((view<remove_cvref_t<T>> && constructible_from<remove_cvref_t<T>, T>) ||
 (!view<remove_cvref_t<T>> &&
 (is_lvalue_reference_v<T> || (movable<remove_reference_t<T>> && !is-initializer-list<T>))));
```

## 26.5 Range utilities

[range.utility]

### 26.5.1 General

[range.utility.general]

- 1 The components in 26.5 are general utilities for representing and manipulating ranges.

### 26.5.2 Helper concepts

[range.utility.helpers]

- 1 Many of the types in subclause 26.5 are specified in terms of the following exposition-only concepts:

```
template<class R>
 concept simple-view = // exposition only
 view<R> && range<const R> &&
 same_as<iterator_t<R>, iterator_t<const R>> &&
 same_as<sentinel_t<R>, sentinel_t<const R>>;

template<class I>
 concept has-arrow = // exposition only
 input_iterator<I> && (is_pointer_v<I> || requires(I i) { i.operator->(); });

template<class T, class U>
 concept different-from = // exposition only
 !same_as<remove_cvref_t<T>, remove_cvref_t<U>>;
```

### 26.5.3 View interface

[view.interface]

#### 26.5.3.1 General

[view.interface.general]

- 1 The class template `view_interface` is a helper for defining view-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

```
namespace std::ranges {
 template<class D>
 requires is_class_v<D> && same_as<D, remove_cv_t<D>>
 class view_interface {
 private:
 constexpr D& derived() noexcept { // exposition only
 return static_cast<D&>(*this);
 }
 constexpr const D& derived() const noexcept { // exposition only
 return static_cast<const D&>(*this);
 }
 };
}
```

```

public:
 constexpr bool empty() requires forward_range<D> {
 return ranges::begin(derived()) == ranges::end(derived());
 }
 constexpr bool empty() const requires forward_range<const D> {
 return ranges::begin(derived()) == ranges::end(derived());
 }

 constexpr explicit operator bool()
 requires requires { ranges::empty(derived()); } {
 return !ranges::empty(derived());
 }
 constexpr explicit operator bool() const
 requires requires { ranges::empty(derived()); } {
 return !ranges::empty(derived());
 }

 constexpr auto data() requires contiguous_iterator<iterator_t<D>> {
 return to_address(ranges::begin(derived()));
 }
 constexpr auto data() const
 requires range<const D> && contiguous_iterator<iterator_t<const D>> {
 return to_address(ranges::begin(derived()));
 }

 constexpr auto size() requires forward_range<D> &&
 sized_sentinel_for<sentinel_t<D>, iterator_t<D>> {
 return ranges::end(derived()) - ranges::begin(derived());
 }
 constexpr auto size() const requires forward_range<const D> &&
 sized_sentinel_for<sentinel_t<const D>, iterator_t<const D>> {
 return ranges::end(derived()) - ranges::begin(derived());
 }

 constexpr decltype(auto) front() requires forward_range<D>;
 constexpr decltype(auto) front() const requires forward_range<const D>;

 constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
 constexpr decltype(auto) back() const
 requires bidirectional_range<const D> && common_range<const D>;

 template<random_access_range R = D>
 constexpr decltype(auto) operator[](range_difference_t<R> n) {
 return ranges::begin(derived())[n];
 }
 template<random_access_range R = const D>
 constexpr decltype(auto) operator[](range_difference_t<R> n) const {
 return ranges::begin(derived())[n];
 }
};
}

```

- <sup>2</sup> The template parameter `D` for `view_interface` may be an incomplete type. Before any member of the resulting specialization of `view_interface` other than special member functions is referenced, `D` shall be complete, and model both `derived_from<view_interface<D>>` and `view`.

### 26.5.3.2 Members

[view.interface.members]

```

constexpr decltype(auto) front() requires forward_range<D>;
constexpr decltype(auto) front() const requires forward_range<const D>;

```

- <sup>1</sup> *Preconditions:* `!empty()` is true.
- <sup>2</sup> *Effects:* Equivalent to: `return *ranges::begin(derived());`

```
constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
constexpr decltype(auto) back() const
requires bidirectional_range<const D> && common_range<const D>;
```

3     *Preconditions:* !empty() is true.

4     *Effects:* Equivalent to: return \*ranges::prev(ranges::end(derived()));

## 26.5.4 Sub-ranges

[range.subrange]

### 26.5.4.1 General

[range.subrange.general]

1 The subrange class template combines together an iterator and a sentinel into a single object that models the view concept. Additionally, it models the sized\_range concept when the final template parameter is subrange\_kind::sized.

```
namespace std::ranges {
 template<class From, class To>
 concept uses-nonqualification-pointer-conversion = // exposition only
 is_pointer_v<From> && is_pointer_v<To> &&
 !convertible_to<remove_pointer_t<From>(*)[], remove_pointer_t<To>(*)[]>;

 template<class From, class To>
 concept convertible-to-non-slicing = // exposition only
 convertible_to<From, To> &&
 !uses-nonqualification-pointer-conversion<decay_t<From>, decay_t<To>>;

 template<class T>
 concept pair-like = // exposition only
 !is_reference_v<T> && requires(T t) {
 typename tuple_size<T>::type; // ensures tuple_size<T> is complete
 requires derived_from<tuple_size<T>, integral_constant<size_t, 2>>;
 typename tuple_element_t<0, remove_const_t<T>>;
 typename tuple_element_t<1, remove_const_t<T>>;
 { std::get<0>(t) } -> convertible_to<const tuple_element_t<0, T>&>;
 { std::get<1>(t) } -> convertible_to<const tuple_element_t<1, T>&>;
 };

 template<class T, class U, class V>
 concept pair-like-convertible-from = // exposition only
 !range<T> && pair-like<T> &&
 constructible_from<T, U, V> &&
 convertible-to-non-slicing<U, tuple_element_t<0, T>> &&
 convertible_to<V, tuple_element_t<1, T>>;

 template<input_or_output_iterator I, sentinel_for<I> S = I, subrange_kind K =
 sized_sentinel_for<S, I> ? subrange_kind::sized : subrange_kind::unsized>
 requires (K == subrange_kind::sized || !sized_sentinel_for<S, I>)
 class subrange : public view_interface<subrange<I, S, K>> {
 private:
 static constexpr bool StoreSize = // exposition only
 K == subrange_kind::sized && !sized_sentinel_for<S, I>;
 I begin_ = I(); // exposition only
 S end_ = S(); // exposition only
 make_unsigned_like_t<iter_difference_t<I>> size_ = 0; // exposition only; present only
 // when StoreSize is true

 public:
 subrange() requires default_initializable<I> = default;

 constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);

 constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
 make_unsigned_like_t<iter_difference_t<I>> n)
 requires (K == subrange_kind::sized);
```

```

template<different-from<subrange> R>
 requires borrowed_range<R> &&
 convertible-to-non-slicing<iterator_t<R>, I> &&
 convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);

template<borrowed_range R>
 requires convertible-to-non-slicing<iterator_t<R>, I> &&
 convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r, make_unsigned_like_t<iter_difference_t<I>> n)
 requires (K == subrange_kind::sized)
 : subrange{ranges::begin(r), ranges::end(r), n} {};

template<different-from<subrange> PairLike>
 requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;

constexpr I begin() const requires copyable<I>;
[[nodiscard]] constexpr I begin() requires (!copyable<I>);
constexpr S end() const;

constexpr bool empty() const;
constexpr make_unsigned_like_t<iter_difference_t<I>> size() const
 requires (K == subrange_kind::sized);

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
 requires forward_iterator<I>;
[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&;
[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
 requires bidirectional_iterator<I>;
constexpr subrange& advance(iter_difference_t<I> n);
};

template<input_or_output_iterator I, sentinel_for<I> S>
subrange(I, S) -> subrange<I, S>;

template<input_or_output_iterator I, sentinel_for<I> S>
subrange(I, S, make_unsigned_like_t<iter_difference_t<I>>) ->
subrange<I, S, subrange_kind::sized>;

template<borrowed_range R>
subrange(R&&) ->
subrange<iterator_t<R>, sentinel_t<R>,
(sized_range<R> || sized_sentinel_for<sentinel_t<R>, iterator_t<R>>)
? subrange_kind::sized : subrange_kind::unsized>;

template<borrowed_range R>
subrange(R&&, make_unsigned_like_t<range_difference_t<R>>) ->
subrange<iterator_t<R>, sentinel_t<R>, subrange_kind::sized>;

template<size_t N, class I, class S, subrange_kind K>
 requires ((N == 0 && copyable<I>) || N == 1)
constexpr auto get(const subrange<I, S, K>& r);

template<size_t N, class I, class S, subrange_kind K>
 requires (N < 2)
constexpr auto get(subrange<I, S, K>&& r);
}

namespace std {
 using ranges::get;
}

```

**26.5.4.2 Constructors and conversions****[range.subrange.ctor]**

```
constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);
```

1     *Preconditions:* [i, s) is a valid range.

2     *Effects:* Initializes *begin\_* with `std::move(i)` and *end\_* with *s*.

```
constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
 make-unsigned-like-t<iter_difference_t<I>> n)
requires (K == subrange_kind::sized);
```

3     *Preconditions:* [i, s) is a valid range, and  $n == \text{to-unsigned-like}(\text{ranges::distance}(i, s))$  is true.

4     *Effects:* Initializes *begin\_* with `std::move(i)` and *end\_* with *s*. If *StoreSize* is true, initializes *size\_* with *n*.

5     [*Note 1:* Accepting the length of the range and storing it to later return from `size()` enables `subrange` to model `sized_range` even when it stores an iterator and sentinel that do not model `sized_sentinel_for`. — *end note*]

```
template<different-from<subrange> R>
requires borrowed_range<R> &&
 convertible-to-non-slicing<iterator_t<R>, I> &&
 convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);
```

6     *Effects:* Equivalent to:

(6.1)     — If *StoreSize* is true, `subrange(r, static_cast<decltype(size_)>(ranges::size(r)))`.

(6.2)     — Otherwise, `subrange(ranges::begin(r), ranges::end(r))`.

```
template<different-from<subrange> PairLike>
requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;
```

7     *Effects:* Equivalent to: `return PairLike(begin_, end_);`

**26.5.4.3 Accessors****[range.subrange.access]**

```
constexpr I begin() const requires copyable<I>;
```

1     *Effects:* Equivalent to: `return begin_;`

```
[[nodiscard]] constexpr I begin() requires (!copyable<I>);
```

2     *Effects:* Equivalent to: `return std::move(begin_);`

```
constexpr S end() const;
```

3     *Effects:* Equivalent to: `return end_;`

```
constexpr bool empty() const;
```

4     *Effects:* Equivalent to: `return begin_ == end_;`

```
constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
requires (K == subrange_kind::sized);
```

5     *Effects:*

(5.1)     — If *StoreSize* is true, equivalent to: `return size_;`

(5.2)     — Otherwise, equivalent to: `return to-unsigned-like(end_ - begin_);`

```
[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
requires forward_iterator<I>;
```

6     *Effects:* Equivalent to:

```
auto tmp = *this;
tmp.advance(n);
return tmp;
```

```
[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&;
```

7 *Effects:* Equivalent to:

```
advance(n);
return std::move(*this);
```

```
[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
requires bidirectional_iterator<I>;
```

8 *Effects:* Equivalent to:

```
auto tmp = *this;
tmp.advance(-n);
return tmp;
```

```
constexpr subrange& advance(iter_difference_t<I> n);
```

9 *Effects:* Equivalent to:

```
if constexpr (bidirectional_iterator<I>) {
 if (n < 0) {
 ranges::advance(begin_, n);
 if constexpr (StoreSize)
 size_ += to-unsigned-like(-n);
 return *this;
 }

 auto d = n - ranges::advance(begin_, n, end_);
 if constexpr (StoreSize)
 size_ -= to-unsigned-like(d);
 return *this;
}
```

```
template<size_t N, class I, class S, subrange_kind K>
requires ((N == 0 && copyable<I>) || N == 1)
```

```
constexpr auto get(const subrange<I, S, K>& r);
```

```
template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
```

```
constexpr auto get(subrange<I, S, K>&& r);
```

10 *Effects:* Equivalent to:

```
if constexpr (N == 0)
 return r.begin();
else
 return r.end();
```

### 26.5.5 Dangling iterator handling

[range.dangling]

1 The tag type `dangling` is used together with the template aliases `borrowed_iterator_t` and `borrowed_subrange_t`. When an algorithm that typically returns an iterator into, or a subrange of, a range argument is called with an rvalue range argument that does not model `borrowed_range` (26.4.2), the return value possibly refers to a range whose lifetime has ended. In such cases, the tag type `dangling` is returned instead of an iterator or subrange.

```
namespace std::ranges {
 struct dangling {
 constexpr dangling() noexcept = default;
 constexpr dangling(auto&&...) noexcept {}
 };
}
```

2 [Example 1:

```
vector<int> f();
auto result1 = ranges::find(f(), 42); // #1
static_assert(same_as<decltype(result1), ranges::dangling>);
auto vec = f();
auto result2 = ranges::find(vec, 42); // #2
static_assert(same_as<decltype(result2), vector<int>::iterator>);
auto result3 = ranges::find(ranges::subrange{vec}, 42); // #3
```

```
static_assert(same_as<decltype(result3), vector<int>::iterator>);
```

The call to `ranges::find` at #1 returns `ranges::dangling` since `f()` is an rvalue vector; it is possible for the vector to be destroyed before a returned iterator is dereferenced. However, the calls at #2 and #3 both return iterators since the lvalue `vec` and specializations of `subrange` model `borrowed_range`. — *end example*]

3 For a type `R` that models `range`:

- (3.1) — if `R` models `borrowed_range`, then `borrowed_iterator_t<R>` denotes `iterator_t<R>`, and `borrowed_subrange_t<R>` denotes `subrange<iterator_t<R>>`;
- (3.2) — otherwise, both `borrowed_iterator_t<R>` and `borrowed_subrange_t<R>` denote `dangling`.

## 26.5.6 Range conversions

[[range.utility.conv](#)]

### 26.5.6.1 General

[[range.utility.conv.general](#)]

- 1 The range conversion functions construct an object (usually a container) from a range, by using a constructor taking a range, a `from_range_t` tagged constructor, or a constructor taking a pair of iterators, or by inserting each element of the range into the default-constructed object.
- 2 `ranges::to` is applied recursively, allowing the conversion of a range of ranges.

[*Example 1:*

```
string_view str = "the quick brown fox";
auto words = views::split(str, ' ') | to<vector<string>>();
// words is vector<string>{"the", "quick", "brown", "fox"}
```

— *end example*]

3 Let *reservable-container* be defined as follows:

```
template<class Container>
constexpr bool reservable-container = // exposition only
 sized_range<Container> &&
 requires(Container& c, range_size_t<Container> n) {
 c.reserve(n);
 { c.capacity() } -> same_as<decltype(n)>;
 { c.max_size() } -> same_as<decltype(n)>;
};
```

4 Let *container-insertable* be defined as follows:

```
template<class Container, class Ref>
constexpr bool container-insertable = // exposition only
 requires(Container& c, Ref&& ref) {
 requires (requires { c.push_back(std::forward<Ref>(ref)); } ||
 requires { c.insert(c.end(), std::forward<Ref>(ref)); });
};
```

5 Let *container-inserter* be defined as follows:

```
template<typename Ref>
auto container-inserter(C& c) { // exposition only
 if constexpr (requires { c.push_back(declval<Ref>()); })
 return back_inserter(c);
 else
 return inserter(c, c.end());
};
```

### 26.5.6.2 `ranges::to`

[[range.utility.conv.to](#)]

```
template<class C, input_range R, class... Args> requires (!view<C>)
constexpr C to(R&& r, Args&&... args);
```

1 *Returns:* An object of type `C` constructed from the elements of `r` in the following manner:

- (1.1) — If `convertible_to<range_reference_t<R>, range_value_t<C>>` is true:
- (1.1.1) — If `constructible_from<C, R, Args...>` is true:
 

```
C(std::forward<R>(r), std::forward<Args>(args)...)

```

- (1.1.2) — Otherwise, if `constructible_from<C, from_range_t, R, Args...>` is true:  
`C(from_range, std::forward<R>(r), std::forward<Args>(args)...)`
- (1.1.3) — Otherwise, if
- (1.1.3.1) — `common_range<R>` is true,
- (1.1.3.2) — `cpp17-input-iterator<iterator_t<R>>` is true, and
- (1.1.3.3) — `constructible_from<C, iterator_t<R>, sentinel_t<R>, Args...>` is true:  
`C(ranges::begin(r), ranges::end(r), std::forward<Args>(args)...)`
- (1.1.4) — Otherwise, if
- (1.1.4.1) — `constructible_from<C, Args...>` is true, and
- (1.1.4.2) — `container-insertable<C, range_reference_t<R>>` is true:  
`C c(std::forward<Args>(args)...);`  
`if constexpr (sized_range<R> && reservable-container<C>)`  
`c.reserve(ranges::size(r));`  
`ranges::copy(r, container-inserter<range_reference_t<R>>(c));`
- (1.2) — Otherwise, if `input_range<range_reference_t<R>>` is true:  
`to<C>(r | views::transform([](auto&& elem) {`  
`return to<range_value_t<C>>(std::forward<decltype(elem)>(elem));`  
`}), std::forward<Args>(args)...);`
- (1.3) — Otherwise, the program is ill-formed.

```
template<template<class...> class C, input_range R, class... Args>
constexpr auto to(R&& r, Args&&... args);
```

2 Let `input-iterator` be an exposition-only type:

```
struct input-iterator { // exposition only
 using iterator_category = input_iterator_tag;
 using value_type = range_value_t<R>;
 using difference_type = ptrdiff_t;
 using pointer = add_pointer_t<range_reference_t<R>>;
 using reference = range_reference_t<R>;
 reference operator*() const;
 pointer operator->() const;
 input_iterator& operator++();
 input_iterator operator++(int);
 bool operator==(const input_iterator&) const;
};
```

[Note 1: `input-iterator` meets the syntactic requirements of `Cpp17InputIterator`. — end note]

3 Let `DEDUCE_EXPR` be defined as follows:

- (3.1) — `C(declval<R>(), declval<Args>()...)` if that is a valid expression,
- (3.2) — otherwise, `C(from_range, declval<R>(), declval<Args>()...)` if that is a valid expression,
- (3.3) — otherwise,  
`C(declval<input-iterator>(), declval<input-iterator>(), declval<Args>()...)`  
if that is a valid expression,
- (3.4) — otherwise, the program is ill-formed.

4 Returns: `to<decltype(DEDUCE_EXPR)>(std::forward<R>(r), std::forward<Args>(args)...)` .

### 26.5.6.3 `ranges::to` adaptors

[`range.utility.conv.adaptors`]

```
template<class C, class... Args> requires (!view<C>)
constexpr auto to(Args&&... args);
```

```
template<template<class...> class C, class... Args>
constexpr auto to(Args&&... args);
```

- 1 *Returns:* A range adaptor closure object (26.7.2) *f* that is a perfect forwarding call wrapper (22.10.4) with the following properties:
- (1.1) — It has no target object.
  - (1.2) — Its bound argument entities *bound\_args* consist of objects of types `decay_t<Args>...` direct-non-list-initialized with `std::forward<Args>(args)...`, respectively.
  - (1.3) — Its call pattern is `to<C>(r, bound_args...)`, where *r* is the argument used in a function call expression of *f*.

## 26.6 Range factories

[range.factories]

### 26.6.1 General

[range.factories.general]

- 1 Subclause 26.6 defines *range factories*, which are utilities to create a view.
- 2 Range factories are declared in namespace `std::ranges::views`.

### 26.6.2 Empty view

[range.empty]

#### 26.6.2.1 Overview

[range.empty.overview]

- 1 `empty_view` produces a view of no elements of a particular type.
- 2 [Example 1:

```
auto e = views::empty<int>;
static_assert(ranges::empty(e));
static_assert(0 == e.size());
```

—end example]

#### 26.6.2.2 Class template `empty_view`

[range.empty.view]

```
namespace std::ranges {
 template<class T>
 requires is_object_v<T>
 class empty_view : public view_interface<empty_view<T>> {
 public:
 static constexpr T* begin() noexcept { return nullptr; }
 static constexpr T* end() noexcept { return nullptr; }
 static constexpr T* data() noexcept { return nullptr; }
 static constexpr size_t size() noexcept { return 0; }
 static constexpr bool empty() noexcept { return true; }
 };
}
```

### 26.6.3 Single view

[range.single]

#### 26.6.3.1 Overview

[range.single.overview]

- 1 `single_view` produces a view that contains exactly one element of a specified value.
- 2 The name `views::single` denotes a customization point object (16.3.3.3.6). Given a subexpression *E*, the expression `views::single(E)` is expression-equivalent to `single_view<decay_t<decltype((E))>>(E)`.
- 3 [Example 1:

```
for (int i : views::single(4))
 cout << i; // prints 4
```

—end example]

#### 26.6.3.2 Class template `single_view`

[range.single.view]

```
namespace std::ranges {
 template<copy_constructible T>
 requires is_object_v<T>
 class single_view : public view_interface<single_view<T>> {
 private:
 copyable_box<T> value_; // exposition only (see 26.7.3)
 };
}
```

```

public:
 single_view() requires default_initializable<T> = default;
 constexpr explicit single_view(const T& t);
 constexpr explicit single_view(T&& t);
 template<class... Args>
 requires constructible_from<T, Args...>
 constexpr explicit single_view(in_place_t, Args&&... args);

 constexpr T* begin() noexcept;
 constexpr const T* begin() const noexcept;
 constexpr T* end() noexcept;
 constexpr const T* end() const noexcept;
 static constexpr size_t size() noexcept;
 constexpr T* data() noexcept;
 constexpr const T* data() const noexcept;
};

```

```

template<class T>
 single_view(T) -> single_view<T>;
}

```

```
constexpr explicit single_view(const T& t);
```

1 *Effects:* Initializes *value\_* with *t*.

```
constexpr explicit single_view(T&& t);
```

2 *Effects:* Initializes *value\_* with `std::move(t)`.

```

template<class... Args>
 requires constructible_from<T, Args...>
 constexpr explicit single_view(in_place_t, Args&&... args);

```

3 *Effects:* Initializes *value\_* as if by `value_{in_place, std::forward<Args>(args)...}`.

```
constexpr T* begin() noexcept;
constexpr const T* begin() const noexcept;
```

4 *Effects:* Equivalent to: `return data();`

```
constexpr T* end() noexcept;
constexpr const T* end() const noexcept;
```

5 *Effects:* Equivalent to: `return data() + 1;`

```
static constexpr size_t size() noexcept;
```

6 *Effects:* Equivalent to: `return 1;`

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

7 *Effects:* Equivalent to: `return value_.operator->();`

## 26.6.4 Iota view

**[range.iota]**

### 26.6.4.1 Overview

**[range.iota.overview]**

1 `iota_view` generates a sequence of elements by repeatedly incrementing an initial value.

2 The name `views::iota` denotes a customization point object (16.3.3.3.6). Given subexpressions *E* and *F*, the expressions `views::iota(E)` and `views::iota(E, F)` are expression-equivalent to `iota_view(E)` and `iota_view(E, F)`, respectively.

3 [Example 1:

```

for (int i : views::iota(1, 10))
 cout << i << ' '; // prints: 1 2 3 4 5 6 7 8 9

```

—end example]

26.6.4.2 Class template `iota_view`

[range.iota.view]

```

namespace std::ranges {
 template<class I>
 concept decrementable = see below; // exposition only

 template<class I>
 concept advanceable = see below; // exposition only

 template<weakly_incrementable W, semiregular Bound = unreachable_sentinel_t>
 requires weakly-equality-comparable-with<W, Bound> && copyable<W>
 class iota_view : public view_interface<iota_view<W, Bound>> {
 private:
 // 26.6.4.3, class iota_view::iterator
 struct iterator; // exposition only

 // 26.6.4.4, class iota_view::sentinel
 struct sentinel; // exposition only

 W value_ = W(); // exposition only
 Bound bound_ = Bound(); // exposition only

 public:
 iota_view() requires default_initializable<W> = default;
 constexpr explicit iota_view(W value);
 constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
 constexpr iota_view(iterator first, see below last);

 constexpr iterator begin() const;
 constexpr auto end() const;
 constexpr iterator end() const requires same_as<W, Bound>;

 constexpr auto size() const requires see below;
 };

 template<class W, class Bound>
 requires (!is-integer-like<W> || !is-integer-like<Bound> ||
 (is-signed-integer-like<W> == is-signed-integer-like<Bound>))
 iota_view(W, Bound) -> iota_view<W, Bound>;
}

```

1 Let *IOTA-DIFF-T*(W) be defined as follows:

- (1.1) — If W is not an integral type, or if it is an integral type and `sizeof(iter_difference_t<W>)` is greater than `sizeof(W)`, then *IOTA-DIFF-T*(W) denotes `iter_difference_t<W>`.
- (1.2) — Otherwise, *IOTA-DIFF-T*(W) is a signed integer type of width greater than the width of W if such a type exists.
- (1.3) — Otherwise, *IOTA-DIFF-T*(W) is an unspecified signed-integer-like type (25.3.4.4) of width not less than the width of W.

[Note 1: It is unspecified whether this type satisfies `weakly_incrementable`. — end note]

2 The exposition-only *decrementable* concept is equivalent to:

```

template<class I>
 concept decrementable = // exposition only
 incrementable<I> && requires(I i) {
 { --i } -> same_as<I&&>;
 { i-- } -> same_as<I>;
 };

```

3 When an object is in the domain of both pre- and post-decrement, the object is said to be *decrementable*.

4 Let a and b be equal objects of type I. I models *decrementable* only if

- (4.1) — If a and b are *decrementable*, then the following are all true:
  - (4.1.1) — `addressof(--a) == addressof(a)`

- (4.1.2) — `bool(a-- == b)`
- (4.1.3) — `bool(((void)a--, a) == --b)`
- (4.1.4) — `bool(++(--a) == b)`.
- (4.2) — If `a` and `b` are incrementable, then `bool(--(++a) == b)`.

5 The exposition-only *advanceable* concept is equivalent to:

```
template<class I>
concept advanceable = // exposition only
 decrementable<I> && totally_ordered<I> &&
 requires(I i, const I j, const IOTA-DIFF-T(I) n) {
 { i += n } -> same_as<I&&>;
 { i -= n } -> same_as<I&&>;
 I(j + n);
 I(n + j);
 I(j - n);
 { j - j } -> convertible_to<IOTA-DIFF-T(I)>;
 };
```

Let `D` be *IOTA-DIFF-T(I)*. Let `a` and `b` be objects of type `I` such that `b` is reachable from `a` after `n` applications of `++a`, for some value `n` of type `D`. `I` models *advanceable* only if

- (5.1) — `(a += n)` is equal to `b`.
- (5.2) — `addressof(a += n)` is equal to `addressof(a)`.
- (5.3) — `I(a + n)` is equal to `(a += n)`.
- (5.4) — For any two positive values `x` and `y` of type `D`, if `I(a + D(x + y))` is well-defined, then `I(a + D(x + y))` is equal to `I(I(a + x) + y)`.
- (5.5) — `I(a + D(0))` is equal to `a`.
- (5.6) — If `I(a + D(n - 1))` is well-defined, then `I(a + n)` is equal to `[](I c) { return ++c; }(I(a + D(n - 1)))`.
- (5.7) — `(b += -n)` is equal to `a`.
- (5.8) — `(b -= n)` is equal to `a`.
- (5.9) — `addressof(b -= n)` is equal to `addressof(b)`.
- (5.10) — `I(b - n)` is equal to `(b -= n)`.
- (5.11) — `D(b - a)` is equal to `n`.
- (5.12) — `D(a - b)` is equal to `D(-n)`.
- (5.13) — `bool(a <= b)` is true.

```
constexpr explicit iota_view(W value);
```

6 *Preconditions:* `Bound` denotes `unreachable_sentinel_t` or `Bound()` is reachable from `value`.

7 *Effects:* Initializes `value_` with `value`.

```
constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
```

8 *Preconditions:* `Bound` denotes `unreachable_sentinel_t` or `bound` is reachable from `value`. When `W` and `Bound` model `totally_ordered_with`, then `bool(value <= bound)` is true.

9 *Effects:* Initializes `value_` with `value` and `bound_` with `bound`.

```
constexpr iota_view(iterator first, see below last);
```

10 *Effects:* Equivalent to:

- (10.1) — If `same_as<W, Bound>` is true, `iota_view(first.value_, last.value_)`.
- (10.2) — Otherwise, if `Bound` denotes `unreachable_sentinel_t`, `iota_view(first.value_, last)`.
- (10.3) — Otherwise, `iota_view(first.value_, last.bound_)`.

11 *Remarks:* The type of `last` is:

- (11.1) — If `same_as<W, Bound>` is true, `iterator`.

(11.2) — Otherwise, if `Bound` denotes `unreachable_sentinel_t`, `Bound`.

(11.3) — Otherwise, `sentinel`.

```
constexpr iterator begin() const;
```

12 *Effects:* Equivalent to: `return iterator{value_};`

```
constexpr auto end() const;
```

13 *Effects:* Equivalent to:

```
if constexpr (same_as<Bound, unreachable_sentinel_t>)
 return unreachable_sentinel;
else
 return sentinel{bound_};
```

```
constexpr iterator end() const requires same_as<W, Bound>;
```

14 *Effects:* Equivalent to: `return iterator{bound_};`

```
constexpr auto size() const requires see below;
```

15 *Effects:* Equivalent to:

```
if constexpr (is-integer-like<W> && is-integer-like<Bound>)
 return (value_ < 0)
 ? ((bound_ < 0)
 ? to-unsigned-like(-value_) - to-unsigned-like(-bound_)
 : to-unsigned-like(bound_) + to-unsigned-like(-value_))
 : to-unsigned-like(bound_) - to-unsigned-like(value_);
else
 return to-unsigned-like(bound_ - value_);
```

16 *Remarks:* The expression in the *requires-clause* is equivalent to:

```
(same_as<W, Bound> && advanceable<W>) || (is-integer-like<W> && is-integer-like<Bound>) ||
 sized_sentinel_for<Bound, W>
```

### 26.6.4.3 Class `iota_view::iterator`

[range.iota.iterator]

```
namespace std::ranges {
 template<weakly_incrementable W, semiregular Bound>
 requires weakly-equality-comparable-with<W, Bound> && copyable<W>
 struct iota_view<W, Bound>::iterator {
 private:
 W value_ = W(); // exposition only
 public:
 using iterator_concept = see below;
 using iterator_category = input_iterator_tag; // present only if W models incrementable
 using value_type = W;
 using difference_type = IOTA-DIFF-T(W);

 iterator() requires default_initializable<W> = default;
 constexpr explicit iterator(W value);

 constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);

 constexpr iterator& operator++();
 constexpr void operator++(int);
 constexpr iterator operator++(int) requires incrementable<W>;

 constexpr iterator& operator--() requires decrementable<W>;
 constexpr iterator operator--(int) requires decrementable<W>;

 constexpr iterator& operator+=(difference_type n)
 requires advanceable<W>;
 constexpr iterator& operator-=(difference_type n)
 requires advanceable<W>;
```

```

constexpr W operator[](difference_type n) const
 requires advanceable<W>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<W>;

friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires totally_ordered<W>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires totally_ordered<W>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires totally_ordered<W>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires totally_ordered<W>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires totally_ordered<W> && three_way_comparable<W>;

friend constexpr iterator operator+(iterator i, difference_type n)
 requires advanceable<W>;
friend constexpr iterator operator+(difference_type n, iterator i)
 requires advanceable<W>;

friend constexpr iterator operator-(iterator i, difference_type n)
 requires advanceable<W>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires advanceable<W>;
};
}

```

1 `iterator::iterator_concept` is defined as follows:

- (1.1) — If `W` models *advanceable*, then `iterator_concept` is `random_access_iterator_tag`.
- (1.2) — Otherwise, if `W` models *decrementable*, then `iterator_concept` is `bidirectional_iterator_tag`.
- (1.3) — Otherwise, if `W` models *incrementable*, then `iterator_concept` is `forward_iterator_tag`.
- (1.4) — Otherwise, `iterator_concept` is `input_iterator_tag`.

2 [Note 1: Overloads for `iter_move` and `iter_swap` are omitted intentionally. — end note]

```
constexpr explicit iterator(W value);
```

3 *Effects*: Initializes `value_` with `value`.

```
constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);
```

4 *Effects*: Equivalent to: return `value_`;

5 [Note 2: The `noexcept` clause is needed by the default `iter_move` implementation. — end note]

```
constexpr iterator& operator++();
```

6 *Effects*: Equivalent to:

```
++value_;
return *this;
```

```
constexpr void operator++(int);
```

7 *Effects*: Equivalent to `+++this`.

```
constexpr iterator operator++(int) requires incrementable<W>;
```

8 *Effects*: Equivalent to:

```
auto tmp = *this;
+++this;
return tmp;
```

```
constexpr iterator& operator--() requires decrementable<W>;
```

9 *Effects*: Equivalent to:

```
--value_;
return *this;
```

```
constexpr iterator operator--(int) requires decrementable<W>;
```

10 *Effects:* Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type n)
requires advanceable<W>;
```

11 *Effects:* Equivalent to:

```
if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
 if (n >= difference_type(0))
 value_ += static_cast<W>(n);
 else
 value_ -= static_cast<W>(-n);
} else {
 value_ += n;
}
return *this;
```

```
constexpr iterator& operator-=(difference_type n)
requires advanceable<W>;
```

12 *Effects:* Equivalent to:

```
if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
 if (n >= difference_type(0))
 value_ -= static_cast<W>(n);
 else
 value_ += static_cast<W>(-n);
} else {
 value_ -= n;
}
return *this;
```

```
constexpr W operator[](difference_type n) const
requires advanceable<W>;
```

13 *Effects:* Equivalent to: return W(value\_ + n);

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
requires equality_comparable<W>;
```

14 *Effects:* Equivalent to: return x.value\_ == y.value\_;

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
requires totally_ordered<W>;
```

15 *Effects:* Equivalent to: return x.value\_ < y.value\_;

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
requires totally_ordered<W>;
```

16 *Effects:* Equivalent to: return y < x;

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
requires totally_ordered<W>;
```

17 *Effects:* Equivalent to: return !(y < x);

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
requires totally_ordered<W>;
```

18 *Effects:* Equivalent to: return !(x < y);

```

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires totally_ordered<W> && three_way_comparable<W>;
19 Effects: Equivalent to: return x.value_ <=> y.value_;

friend constexpr iterator operator+(iterator i, difference_type n)
 requires advanceable<W>;
20 Effects: Equivalent to:
 i += n;
 return i;

friend constexpr iterator operator+(difference_type n, iterator i)
 requires advanceable<W>;
21 Effects: Equivalent to: return i + n;

friend constexpr iterator operator-(iterator i, difference_type n)
 requires advanceable<W>;
22 Effects: Equivalent to:
 i -= n;
 return i;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires advanceable<W>;
23 Effects: Equivalent to:
 using D = difference_type;
 if constexpr (is_integer_like<W>) {
 if constexpr (is_signed_integer_like<W>)
 return D(D(x.value_) - D(y.value_));
 else
 return (y.value_ > x.value_)
 ? D(-D(y.value_ - x.value_))
 : D(x.value_ - y.value_);
 } else {
 return x.value_ - y.value_;
 }

```

#### 26.6.4.4 Class `iota_view::sentinel`

[range.iota.sentinel]

```

namespace std::ranges {
 template<weakly_incrementable W, semiregular Bound>
 requires weakly_equality_comparable_with<W, Bound> && copyable<W>
 struct iota_view<W, Bound>::sentinel {
 private:
 Bound bound_ = Bound(); // exposition only
 public:
 sentinel() = default;
 constexpr explicit sentinel(Bound bound);

 friend constexpr bool operator==(const iterator& x, const sentinel& y);

 friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
 requires sized_sentinel_for<Bound, W>;
 friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
 requires sized_sentinel_for<Bound, W>;
 };
}

constexpr explicit sentinel(Bound bound);
1 Effects: Initializes bound_ with bound.

friend constexpr bool operator==(const iterator& x, const sentinel& y);
2 Effects: Equivalent to: return x.value_ == y.bound_;

```

```
friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
 requires sized_sentinel_for<Bound, W>;
```

3 *Effects:* Equivalent to: `return x.value_ - y.bound_;`

```
friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
 requires sized_sentinel_for<Bound, W>;
```

4 *Effects:* Equivalent to: `return -(y - x);`

## 26.6.5 Istream view

[range.istream]

### 26.6.5.1 Overview

[range.istream.overview]

1 `basic_istream_view` models `input_range` and reads (using `operator>>`) successive elements from its corresponding input stream.

2 The name `views::istream<T>` denotes a customization point object (16.3.3.3.6). Given a type `T` and a subexpression `E` of type `U`, if `U` models `derived_from<basic_istream<typename U::char_type, typename U::traits_type>>`, then the expression `views::istream<T>(E)` is expression-equivalent to `basic_istream_view<T, typename U::char_type, typename U::traits_type>(E)`; otherwise, `views::istream<T>(E)` is ill-formed.

3 [Example 1:

```
auto ints = istringstream{"0 1 2 3 4"};
ranges::copy(ranges::istream_view<int>(ints), ostream_iterator<int>{cout, "-"});
// prints 0-1-2-3-4-
```

—end example]

### 26.6.5.2 Class template `basic_istream_view`

[range.istream.view]

```
namespace std::ranges {
 template<class Val, class CharT, class Traits>
 concept stream_extractable = // exposition only
 requires(basic_istream<CharT, Traits>& is, Val& t) {
 is >> t;
 };

 template<movable Val, class CharT, class Traits = char_traits<CharT>>
 requires default_initializable<Val> &&
 stream_extractable<Val, CharT, Traits>
 class basic_istream_view : public view_interface<basic_istream_view<Val, CharT, Traits>> {
 public:
 constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);

 constexpr auto begin() {
 *stream_ >> value_;
 return iterator{*this};
 }

 constexpr default_sentinel_t end() const noexcept;

 private:
 struct iterator; // exposition only
 basic_istream<CharT, Traits>* stream_; // exposition only
 Val value_ = Val(); // exposition only
 };
 }
}
```

```
constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);
```

1 *Effects:* Initializes `stream_` with `addressof(stream)`.

```
constexpr default_sentinel_t end() const noexcept;
```

2 *Effects:* Equivalent to: `return default_sentinel;`

**26.6.5.3 Class template `basic_istream_view::iterator`****[range.istream.iterator]**

```

namespace std::ranges {
 template<movable Val, class CharT, class Traits>
 requires default_initializable<Val> &&
 stream_extractable<Val, CharT, Traits>
 class basic_istream_view<Val, CharT, Traits>::iterator {
 public:
 using iterator_concept = input_iterator_tag;
 using difference_type = ptrdiff_t;
 using value_type = Val;

 constexpr explicit iterator(basic_istream_view& parent) noexcept;

 iterator(const iterator&) = delete;
 iterator(iterator&&) = default;

 iterator& operator=(const iterator&) = delete;
 iterator& operator=(iterator&&) = default;

 iterator& operator++();
 void operator++(int);

 Val& operator*() const;

 friend bool operator==(const iterator& x, default_sentinel_t);

 private:
 basic_istream_view* parent_; // exposition only
 };
}

```

```
constexpr explicit iterator(basic_istream_view& parent) noexcept;
```

1 *Effects:* Initializes `parent_` with `addressof(parent)`.

```
iterator& operator++();
```

2 *Effects:* Equivalent to:

```

 *parent_->stream_ >> parent_->value_;
 return *this;

```

```
void operator++(int);
```

3 *Effects:* Equivalent to `+++this`.

```
Val& operator*() const;
```

4 *Effects:* Equivalent to: return `parent_>value_;`

```
friend bool operator==(const iterator& x, default_sentinel_t);
```

5 *Effects:* Equivalent to: return `!*x.parent_>stream_;`

**26.7 Range adaptors****[range.adaptors]****26.7.1 General****[range.adaptors.general]**

1 Subclause 26.7 defines *range adaptors*, which are utilities that transform a range into a view with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.

2 Range adaptors are declared in namespace `std::ranges::views`.

3 The bitwise OR operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.

4 [Example 1:

```
vector<int> ints{0,1,2,3,4,5};
```

```

auto even = [](int i) { return 0 == i % 2; };
auto square = [](int i) { return i * i; };
for (int i : ints | views::filter(even) | views::transform(square)) {
 cout << i << ' '; //prints: 0 4 16
}
assert(ranges::equal(ints | views::filter(even), views::filter(ints, even)));
—end example]

```

## 26.7.2 Range adaptor objects

[range.adaptor.object]

- 1 A *range adaptor closure object* is a unary function object that accepts a range argument. For a range adaptor closure object  $C$  and an expression  $R$  such that `decltype((R))` models `range`, the following expressions are equivalent:

```

C(R)
R | C

```

Given an additional range adaptor closure object  $D$ , the expression  $C | D$  produces another range adaptor closure object  $E$ .  $E$  is a perfect forwarding call wrapper (22.10.4) with the following properties:

- (1.1) — Its target object is an object  $d$  of type `decay_t<decltype((D))>` direct-non-list-initialized with  $D$ .
- (1.2) — It has one bound argument entity, an object  $c$  of type `decay_t<decltype((C))>` direct-non-list-initialized with  $C$ .
- (1.3) — Its call pattern is `d(c(arg))`, where  $arg$  is the argument used in a function call expression of  $E$ .

The expression  $C | D$  is well-formed if and only if the initializations of the state entities of  $E$  are all well-formed.

- 2 Given an object  $t$  of type  $T$ , where

- (2.1) —  $t$  is a unary function object that accepts a range argument,
- (2.2) —  $T$  models `derived_from<range_adaptor_closure<T>>`,
- (2.3) —  $T$  has no other base classes of type `range_adaptor_closure<U>` for any other type  $U$ , and
- (2.4) —  $T$  does not model `range`

then the implementation ensures that  $t$  is a range adaptor closure object.

- 3 The template parameter  $D$  for `range_adaptor_closure` may be an incomplete type. If an expression of type `cv D` is used as an operand to the `|` operator,  $D$  shall be complete and model `derived_from<range_adaptor_closure<D>>`. The behavior of an expression involving an object of type `cv D` as an operand to the `|` operator is undefined if overload resolution selects a program-defined operator `|` function.
- 4 If an expression of type `cv U` is used as an operand to the `|` operator, where  $U$  has a base class of type `range_adaptor_closure<T>` for some type  $T$  other than  $U$ , the behavior is undefined.
- 5 The behavior of a program that adds a specialization for `range_adaptor_closure` is undefined.
- 6 A *range adaptor object* is a customization point object (16.3.3.3.6) that accepts a `viewable_range` as its first argument and returns a `view`.
- 7 If a range adaptor object accepts only one argument, then it is a range adaptor closure object.
- 8 If a range adaptor object `adaptor` accepts more than one argument, then let `range` be an expression such that `decltype((range))` models `viewable_range`, let `args...` be arguments such that `adaptor(range, args...)` is a well-formed expression as specified in the rest of subclause 26.7, and let `BoundArgs` be a pack that denotes `decay_t<decltype((args))>...`. The expression `adaptor(args...)` produces a range adaptor closure object  $f$  that is a perfect forwarding call wrapper (22.10.4) with the following properties:
  - (8.1) — Its target object is a copy of `adaptor`.
  - (8.2) — Its bound argument entities `bound_args` consist of objects of types `BoundArgs...` direct-non-list-initialized with `std::forward<decltype((args))>(args)...`, respectively.
  - (8.3) — Its call pattern is `adaptor(r, bound_args...)`, where  $r$  is the argument used in a function call expression of  $f$ .

The expression `adaptor(args...)` is well-formed if and only if the initialization of the bound argument entities of the result, as specified above, are all well-formed.

## 26.7.3 Copyable wrapper

[range.copy.wrap]

- 1 Many types in this subclause are specified in terms of an exposition-only class template `copyable_box`. `copyable_box<T>` behaves exactly like `optional<T>` with the following differences:

- (1.1) — *copyable-box*<T> constrains its type parameter T with `copy_constructible<T> && is_object_v<T>`.
- (1.2) — The default constructor of *copyable-box*<T> is equivalent to:

```
constexpr copyable-box() noexcept(is_nothrow_default_constructible_v<T>)
 requires default_initializable<T>
 : copyable-box{in_place} {}
```

- (1.3) — If *copyable*<T> is not modeled, the copy assignment operator is equivalent to:

```
constexpr copyable-box& operator=(const copyable-box& that)
 noexcept(is_nothrow_copy_constructible_v<T>) {
 if (this != addressof(that)) {
 if (that) emplace(*that);
 else reset();
 }
 return *this;
}
```

- (1.4) — If *movable*<T> is not modeled, the move assignment operator is equivalent to:

```
constexpr copyable-box& operator=(copyable-box&& that)
 noexcept(is_nothrow_move_constructible_v<T>) {
 if (this != addressof(that)) {
 if (that) emplace(std::move(*that));
 else reset();
 }
 return *this;
}
```

- 2 *Recommended practice:* *copyable-box*<T> should store only a T if either T models *copyable* or *is\_nothrow\_move\_constructible\_v<T> && is\_nothrow\_copy\_constructible\_v<T>* is true.

#### 26.7.4 Non-propagating cache

[range.nonprop.cache]

- 1 Some types in subclause 26.7 are specified in terms of an exposition-only class template *non-propagating-cache*. *non-propagating-cache*<T> behaves exactly like *optional*<T> with the following differences:

- (1.1) — *non-propagating-cache*<T> constrains its type parameter T with `is_object_v<T>`.

- (1.2) — The copy constructor is equivalent to:

```
constexpr non-propagating-cache(const non-propagating-cache&) noexcept {}
```

- (1.3) — The move constructor is equivalent to:

```
constexpr non-propagating-cache(non-propagating-cache&& other) noexcept {
 other.reset();
}
```

- (1.4) — The copy assignment operator is equivalent to:

```
constexpr non-propagating-cache& operator=(const non-propagating-cache& other) noexcept {
 if (addressof(other) != this)
 reset();
 return *this;
}
```

- (1.5) — The move assignment operator is equivalent to:

```
constexpr non-propagating-cache& operator=(non-propagating-cache&& other) noexcept {
 reset();
 other.reset();
 return *this;
}
```

- (1.6) — *non-propagating-cache*<T> has an additional member function template specified as follows:

```
template<class I>
constexpr T& emplace-deref(const I& i); // exposition only
```

*Mandates:* The declaration `T t(*i);` is well-formed for some invented variable `t`.

[Note 1: If `*i` is a prvalue of type `cv T`, there is no requirement that it is movable (9.4.1). — end note]

*Effects:* Calls `reset()`. Then `direct-non-list-initializes` the contained value with `*i`.

*Postconditions:* `*this` contains a value.

*Returns:* A reference to the new contained value.

*Throws:* Any exception thrown by the initialization of the contained value.

*Remarks:* If an exception is thrown during the initialization of `T`, `*this` does not contain a value, and the previous value (if any) has been destroyed.

<sup>2</sup> [Note 2: *non-propagating-cache* enables an input view to temporarily cache values as it is iterated over. —end note]

## 26.7.5 All view

[range.all]

### 26.7.5.1 General

[range.all.general]

<sup>1</sup> `views::all` returns a view that includes all elements of its range argument.

<sup>2</sup> The name `views::all` denotes a range adaptor object (26.7.2). Given a subexpression `E`, the expression `views::all(E)` is expression-equivalent to:

- (2.1) — `decay-copy(E)` if the decayed type of `E` models `view`.
- (2.2) — `ref_view{E}` if that expression is well-formed.
- (2.3) — Otherwise, `owning_view{E}`.

### 26.7.5.2 Class template `ref_view`

[range.ref.view]

<sup>1</sup> `ref_view` is a view of the elements of some other range.

```
namespace std::ranges {
 template<range R>
 requires is_object_v<R>
 class ref_view : public view_interface<ref_view<R>> {
 private:
 R* r_; // exposition only
 public:
 template<different-from<ref_view> T>
 requires see below
 constexpr ref_view(T&& t);

 constexpr R& base() const { return *r_; }

 constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
 constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

 constexpr bool empty() const
 requires requires { ranges::empty(*r_); }
 { return ranges::empty(*r_); }

 constexpr auto size() const requires sized_range<R>
 { return ranges::size(*r_); }

 constexpr auto data() const requires contiguous_range<R>
 { return ranges::data(*r_); }
 };

 template<class R>
 ref_view(R&) -> ref_view<R>;
}
```

```
template<different-from<ref_view> T>
 requires see below
 constexpr ref_view(T&& t);
```

<sup>2</sup> *Effects:* Initializes `r_` with `addressof(static_cast<R&>(std::forward<T>(t)))`.

<sup>3</sup> *Remarks:* Let `FUN` denote the exposition-only functions

```
void FUN(R&);
void FUN(R&&) = delete;
```

The expression in the *requires-clause* is equivalent to:

```
convertible_to<T, R&> && requires { FUN(declval<T>()); }
```

### 26.7.5.3 Class template `owning_view`

[range.owning.view]

<sup>1</sup> `owning_view` is a move-only view of the elements of some other range.

```
namespace std::ranges {
 template<range R>
 requires movable<R> && (!is-initializer-list<R>) // see 26.4.5
 class owning_view : public view_interface<owning_view<R>> {
 private:
 R r_ = R(); // exposition only
 public:
 owning_view() requires default_initializable<R> = default;
 constexpr owning_view(R&& t);

 owning_view(owning_view&&) = default;
 owning_view& operator=(owning_view&&) = default;

 constexpr R& base() & noexcept { return r_; }
 constexpr const R& base() const & noexcept { return r_; }
 constexpr R&& base() && noexcept { return std::move(r_); }
 constexpr const R&& base() const && noexcept { return std::move(r_); }

 constexpr iterator_t<R> begin() { return ranges::begin(r_); }
 constexpr sentinel_t<R> end() { return ranges::end(r_); }

 constexpr auto begin() const requires range<const R>
 { return ranges::begin(r_); }
 constexpr auto end() const requires range<const R>
 { return ranges::end(r_); }

 constexpr bool empty() requires requires { ranges::empty(r_); }
 { return ranges::empty(r_); }
 constexpr bool empty() const requires requires { ranges::empty(r_); }
 { return ranges::empty(r_); }

 constexpr auto size() requires sized_range<R>
 { return ranges::size(r_); }
 constexpr auto size() const requires sized_range<const R>
 { return ranges::size(r_); }

 constexpr auto data() requires contiguous_range<R>
 { return ranges::data(r_); }
 constexpr auto data() const requires contiguous_range<const R>
 { return ranges::data(r_); }
 };
}
```

```
constexpr owning_view(R&& t);
```

<sup>2</sup> *Effects:* Initializes `r_` with `std::move(t)`.

## 26.7.6 Filter view

[range.filter]

### 26.7.6.1 Overview

[range.filter.overview]

<sup>1</sup> `filter_view` presents a view of the elements of an underlying sequence that satisfy a predicate.

<sup>2</sup> The name `views::filter` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `P`, the expression `views::filter(E, P)` is expression-equivalent to `filter_view(E, P)`.

<sup>3</sup> [Example 1:

```
vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };
auto evens = views::filter(is, [](int i) { return 0 == i % 2; });
```

```

for (int i : evens)
 cout << i << ' '; //prints: 0 2 4 6
—end example]

```

### 26.7.6.2 Class template `filter_view`

[range.filter.view]

```

namespace std::ranges {
 template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
 requires view<V> && is_object_v<Pred>
 class filter_view : public view_interface<filter_view<V, Pred>> {
 private:
 V base_ = V(); // exposition only
 copyable_box<Pred> pred_; // exposition only

 // 26.7.6.3, class filter_view::iterator
 class iterator; // exposition only

 // 26.7.6.4, class filter_view::sentinel
 class sentinel; // exposition only

 public:
 filter_view() requires default_initializable<V> && default_initializable<Pred> = default;
 constexpr filter_view(V base, Pred pred);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr const Pred& pred() const;

 constexpr iterator begin();
 constexpr auto end() {
 if constexpr (common_range<V>)
 return iterator{*this, ranges::end(base_)};
 else
 return sentinel{*this};
 }
 };

 template<class R, class Pred>
 filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
}

```

```
constexpr filter_view(V base, Pred pred);
```

1 *Effects:* Initializes `base_` with `std::move(base)` and initializes `pred_` with `std::move(pred)`.

```
constexpr const Pred& pred() const;
```

2 *Effects:* Equivalent to: `return *pred_;`

```
constexpr iterator begin();
```

3 *Preconditions:* `pred_.has_value()` is true.

4 *Returns:* `{*this, ranges::find_if(base_, ref(*pred_))}`.

5 *Remarks:* In order to provide the amortized constant time complexity required by the range concept when `filter_view` models `forward_range`, this function caches the result within the `filter_view` for use on subsequent calls.

### 26.7.6.3 Class `filter_view::iterator`

[range.filter.iterator]

```

namespace std::ranges {
 template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
 requires view<V> && is_object_v<Pred>
 class filter_view<V, Pred>::iterator {
 private:
 iterator_t<V> current_ = iterator_t<V>(); // exposition only
 filter_view* parent_ = nullptr; // exposition only
 };
}

```

```

public:
 using iterator_concept = see below;
 using iterator_category = see below; // not always present
 using value_type = range_value_t<V>;
 using difference_type = range_difference_t<V>;

 iterator() requires default_initializable<iterator_t<V>> = default;
 constexpr iterator(filter_view& parent, iterator_t<V> current);

 constexpr const iterator_t<V>& base() const & noexcept;
 constexpr iterator_t<V> base() &&;
 constexpr range_reference_t<V> operator*() const;
 constexpr iterator_t<V> operator->() const
 requires has_arrow<iterator_t<V>> && copyable<iterator_t<V>>;

 constexpr iterator& operator++();
 constexpr void operator++(int);
 constexpr iterator operator++(int) requires forward_range<V>;

 constexpr iterator& operator--() requires bidirectional_range<V>;
 constexpr iterator operator--(int) requires bidirectional_range<V>;

 friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<iterator_t<V>>;

 friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
 noexcept(noexcept(ranges::iter_move(i.current_)));

 friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
 requires indirectly_swappable<iterator_t<V>>;
};
}

```

<sup>1</sup> Modification of the element a `filter_view::iterator` denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

<sup>2</sup> `iterator::iterator_concept` is defined as follows:

- (2.1) — If `V` models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
- (2.2) — Otherwise, if `V` models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.
- (2.3) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

<sup>3</sup> The member *typedef-name* `iterator_category` is defined if and only if `V` models `forward_range`. In that case, `iterator::iterator_category` is defined as follows:

- (3.1) — Let `C` denote the type `iterator_traits<iterator_t<V>>::iterator_category`.
- (3.2) — If `C` models `derived_from<bidirectional_iterator_tag>`, then `iterator_category` denotes `bidirectional_iterator_tag`.
- (3.3) — Otherwise, if `C` models `derived_from<forward_iterator_tag>`, then `iterator_category` denotes `forward_iterator_tag`.
- (3.4) — Otherwise, `iterator_category` denotes `C`.

```
constexpr iterator(filter_view& parent, iterator_t<V> current);
```

<sup>4</sup> *Effects:* Initializes `current_` with `std::move(current)` and `parent_` with `addressof(parent)`.

```
constexpr const iterator_t<V>& base() const & noexcept;
```

<sup>5</sup> *Effects:* Equivalent to: return `current_`;

```
constexpr iterator_t<V> base() &&;
```

<sup>6</sup> *Effects:* Equivalent to: return `std::move(current_)`;

```
constexpr range_reference_t<V> operator*() const;
```

7 *Effects:* Equivalent to: return *\*current\_;*

```
constexpr iterator_t<V> operator->() const
requires has_arrow<iterator_t<V>> && copyable<iterator_t<V>>;
```

8 *Effects:* Equivalent to: return *current\_;*

```
constexpr iterator& operator++();
```

9 *Effects:* Equivalent to:

```
current_ = ranges::find_if(std::move(++current_), ranges::end(parent_->base_),
 ref(*parent_->pred_));
return *this;
```

```
constexpr void operator++(int);
```

10 *Effects:* Equivalent to *+++this.*

```
constexpr iterator operator++(int) requires forward_range<V>;
```

11 *Effects:* Equivalent to:

```
auto tmp = *this;
+++this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<V>;
```

12 *Effects:* Equivalent to:

```
do
 --current_;
while (!invoke(*parent_->pred_, *current_));
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<V>;
```

13 *Effects:* Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
requires equality_comparable<iterator_t<V>>;
```

14 *Effects:* Equivalent to: return *x.current\_ == y.current\_;*

```
friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
noexcept(noexcept(ranges::iter_move(i.current_)));
```

15 *Effects:* Equivalent to: return *ranges::iter\_move(i.current\_);*

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
requires indirectly_swappable<iterator_t<V>>;
```

16 *Effects:* Equivalent to *ranges::iter\_swap(x.current\_, y.current\_).*

#### 26.7.6.4 Class `filter_view::sentinel`

[range.filter.sentinel]

```
namespace std::ranges {
 template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
 requires view<V> && is_object_v<Pred>
 class filter_view<V, Pred>::sentinel {
 private:
 sentinel_t<V> end_ = sentinel_t<V>(); // exposition only

 public:
 sentinel() = default;
```

```

constexpr explicit sentinel(filter_view& parent);

constexpr sentinel_t<V> base() const;

friend constexpr bool operator==(const iterator& x, const sentinel& y);
};
}

```

```
constexpr explicit sentinel(filter_view& parent);
```

1 *Effects:* Initializes `end_` with `ranges::end(parent.base_)`.

```
constexpr sentinel_t<V> base() const;
```

2 *Effects:* Equivalent to: return `end_`;

```
friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

3 *Effects:* Equivalent to: return `x.current_ == y.end_`;

## 26.7.7 Transform view

[range.transform]

### 26.7.7.1 Overview

[range.transform.overview]

1 `transform_view` presents a view of an underlying sequence after applying a transformation function to each element.

2 The name `views::transform` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::transform(E, F)` is expression-equivalent to `transform_view(E, F)`.

3 [Example 1:

```

vector<int> is{ 0, 1, 2, 3, 4 };
auto squares = views::transform(is, [](int i) { return i * i; });
for (int i : squares)
 cout << i << ' '; //prints: 0 1 4 9 16

```

—end example]

### 26.7.7.2 Class template `transform_view`

[range.transform.view]

```

namespace std::ranges {
 template<input_range V, copy_constructible F>
 requires view<V> && is_object_v<F> &&
 regular_invocable<F&, range_reference_t<V>> &&
 can_reference_invoke_result_t<F&, range_reference_t<V>>>
 class transform_view : public view_interface<transform_view<V, F>> {
 private:
 // 26.7.7.3, class template transform_view::iterator
 template<bool> struct iterator; // exposition only

 // 26.7.7.4, class template transform_view::sentinel
 template<bool> struct sentinel; // exposition only

 V base_ = V(); // exposition only
 copyable_box<F> fun_; // exposition only

 public:
 transform_view() requires default_initializable<V> && default_initializable<F> = default;
 constexpr transform_view(V base, F fun);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr iterator<false> begin();
 constexpr iterator<true> begin() const
 requires range<const V> &&
 regular_invocable<const F&, range_reference_t<const V>>;

```

```

constexpr sentinel<false> end();
constexpr iterator<false> end() requires common_range<V>;
constexpr sentinel<true> end() const
 requires range<const V> &&
 regular_invocable<const F&, range_reference_t<const V>>;
constexpr iterator<true> end() const
 requires common_range<const V> &&
 regular_invocable<const F&, range_reference_t<const V>>;

constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
constexpr auto size() const requires sized_range<const V>
 { return ranges::size(base_); }
};

```

```

template<class R, class F>
 transform_view(R&&, F) -> transform_view<views::all_t<R>, F>;
}

```

```
constexpr transform_view(V base, F fun);
```

1 *Effects:* Initializes *base\_* with `std::move(base)` and *fun\_* with `std::move(fun)`.

```
constexpr iterator<false> begin();
```

2 *Effects:* Equivalent to:

```
 return iterator<false>{*this, ranges::begin(base_)};
```

```
constexpr iterator<true> begin() const
```

```
 requires range<const V> &&
```

```
 regular_invocable<const F&, range_reference_t<const V>>;
```

3 *Effects:* Equivalent to:

```
 return iterator<true>{*this, ranges::begin(base_)};
```

```
constexpr sentinel<false> end();
```

4 *Effects:* Equivalent to:

```
 return sentinel<false>{ranges::end(base_)};
```

```
constexpr iterator<false> end() requires common_range<V>;
```

5 *Effects:* Equivalent to:

```
 return iterator<false>{*this, ranges::end(base_)};
```

```
constexpr sentinel<true> end() const
```

```
 requires range<const V> &&
```

```
 regular_invocable<const F&, range_reference_t<const V>>;
```

6 *Effects:* Equivalent to:

```
 return sentinel<true>{ranges::end(base_)};
```

```
constexpr iterator<true> end() const
```

```
 requires common_range<const V> &&
```

```
 regular_invocable<const F&, range_reference_t<const V>>;
```

7 *Effects:* Equivalent to:

```
 return iterator<true>{*this, ranges::end(base_)};
```

### 26.7.7.3 Class template `transform_view::iterator`

[range.transform.iterator]

```

namespace std::ranges {
 template<input_range V, copy_constructible F>
 requires view<V> && is_object_v<F> &&
 regular_invocable<F&, range_reference_t<V>> &&
 can_reference<invoke_result_t<F&, range_reference_t<V>>>
 template<bool Const>
 class transform_view<V, F>::iterator {

```

```

private:
 using Parent = maybe-const<Const, transform_view>; // exposition only
 using Base = maybe-const<Const, V>; // exposition only
 iterator_t<Base> current_ = iterator_t<Base>(); // exposition only
 Parent* parent_ = nullptr; // exposition only

public:
 using iterator_concept = see below;
 using iterator_category = see below; // not always present
 using value_type =
 remove_cvref_t<invoke_result_t<F&, range_reference_t<Base>>>;
 using difference_type = range_difference_t<Base>;

 iterator() requires default_initializable<iterator_t<Base>> = default;
 constexpr iterator(Parent& parent, iterator_t<Base> current);
 constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

 constexpr const iterator_t<Base>& base() const & noexcept;
 constexpr iterator_t<Base> base() &&;

 constexpr decltype(auto) operator*() const
 noexcept(noexcept(invoke(*parent_->fun_, *current_))) {
 return invoke(*parent_->fun_, *current_);
 }

 constexpr iterator& operator++();
 constexpr void operator++(int);
 constexpr iterator operator++(int) requires forward_range<Base>;

 constexpr iterator& operator--() requires bidirectional_range<Base>;
 constexpr iterator operator--(int) requires bidirectional_range<Base>;

 constexpr iterator& operator+=(difference_type n)
 requires random_access_range<Base>;
 constexpr iterator& operator-=(difference_type n)
 requires random_access_range<Base>;

 constexpr decltype(auto) operator[](difference_type n) const
 requires random_access_range<Base> {
 return invoke(*parent_->fun_, current_[n]);
 }

 friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<iterator_t<Base>>;

 friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

 friend constexpr iterator operator+(iterator i, difference_type n)
 requires random_access_range<Base>;
 friend constexpr iterator operator+(difference_type n, iterator i)
 requires random_access_range<Base>;

 friend constexpr iterator operator-(iterator i, difference_type n)
 requires random_access_range<Base>;

```

```

 friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
};
}

```

1 `iterator::iterator_concept` is defined as follows:

- (1.1) — If *Base* models `random_access_range`, then `iterator_concept` denotes `random_access_iterator_tag`.
- (1.2) — Otherwise, if *Base* models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
- (1.3) — Otherwise, if *Base* models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.
- (1.4) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 The member *typedef-name* `iterator_category` is defined if and only if *Base* models `forward_range`. In that case, `iterator::iterator_category` is defined as follows: Let *C* denote the type `iterator_traits<iterator_t<Base>>::iterator_category`.

- (2.1) — If `is_lvalue_reference_v<invoke_result_t<F&, range_reference_t<Base>>>` is true, then
  - (2.1.1) — if *C* models `derived_from<contiguous_iterator_tag>`, `iterator_category` denotes `random_access_iterator_tag`;
  - (2.1.2) — otherwise, `iterator_category` denotes *C*.
- (2.2) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, iterator_t<Base> current);
```

3 *Effects*: Initializes `current_` with `std::move(current)` and `parent_` with `addressof(parent)`.

```
constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

4 *Effects*: Initializes `current_` with `std::move(i.current_)` and `parent_` with `i.parent_`.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

5 *Effects*: Equivalent to: return `current_`;

```
constexpr iterator_t<Base> base() &&;
```

6 *Effects*: Equivalent to: return `std::move(current_)`;

```

 requires random_access_range<Base>;
21 Effects: Equivalent to: return iterator{*i.parent_, i.current_ - n};

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
22 Effects: Equivalent to: return x.current_ - y.current_;

```

#### 26.7.7.4 Class template transform\_view::sentinel

[range.transform.sentinel]

```

namespace std::ranges {
 template<input_range V, copy_constructible F>
 requires view<V> && is_object_v<F> &&
 regular_invocable<F&, range_reference_t<V>> &&
 can_reference<invoke_result_t<F&, range_reference_t<V>>>

```

```

template<bool Const>
class transform_view<V, F>::sentinel {
private:
 using Parent = maybe-const<Const, transform_view>; // exposition only
 using Base = maybe-const<Const, V>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
public:
 sentinel() = default;
 constexpr explicit sentinel(sentinel_t<Base> end);
 constexpr sentinel(sentinel_t<Const> i)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

 constexpr sentinel_t<Base> base() const;

template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator_t<OtherConst>& x, const sentinel& y);

template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const iterator_t<OtherConst>& x, const sentinel& y);

template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const sentinel& y, const iterator_t<OtherConst>& x);
};
}

```

```
constexpr explicit sentinel(sentinel_t<Base> end);
```

1 *Effects:* Initializes *end\_* with *end*.

```
constexpr sentinel(sentinel_t<Const> i)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects:* Initializes *end\_* with `std::move(i.end_)`.

```
constexpr sentinel_t<Base> base() const;
```

3 *Effects:* Equivalent to: return *end\_*;

```
template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator_t<OtherConst>& x, const sentinel& y);
```

4 *Effects:* Equivalent to: return `x.current_ == y.end_`;

```
template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const iterator_t<OtherConst>& x, const sentinel& y);
```

5 *Effects:* Equivalent to: return `x.current_ - y.end_`;

```
template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const sentinel& y, const iterator_t<OtherConst>& x);
```

6 *Effects:* Equivalent to: return `y.end_ - x.current_`;

## 26.7.8 Take view

[range.take]

### 26.7.8.1 Overview

[range.take.overview]

1 `take_view` produces a view of the first *N* elements from another view, or all the elements if the adapted view contains fewer than *N*.

<sup>2</sup> The name `views::take` denotes a range adaptor object (26.7.2). Let `E` and `F` be expressions, let `T` be `remove_cvref_t<decltype((E))>`, and let `D` be `range_difference_t<decltype((E))>`. If `decltype((F))` does not model `convertible_to<D>`, `views::take(E, F)` is ill-formed. Otherwise, the expression `views::take(E, F)` is expression-equivalent to:

- (2.1) — If `T` is a specialization of `ranges::empty_view` (26.6.2.2), then `((void) F, decay-copy(E))`, except that the evaluations of `E` and `F` are indeterminately sequenced.
- (2.2) — Otherwise, if `T` models `random_access_range` and `sized_range` and is a specialization of `span` (24.7.3), `basic_string_view` (23.3), or `ranges::subrange` (26.5.4), then `U(ranges::begin(E), ranges::begin(E) + std::min<D>(ranges::distance(E), F))`, except that `E` is evaluated only once, where `U` is a type determined as follows:
  - (2.2.1) — if `T` is a specialization of `span`, then `U` is `span<typename T::element_type>`;
  - (2.2.2) — otherwise, if `T` is a specialization of `basic_string_view`, then `U` is `T`;
  - (2.2.3) — otherwise, `T` is a specialization of `ranges::subrange`, and `U` is `ranges::subrange<iterator_t<T>>`;
- (2.3) — otherwise, if `T` is a specialization of `ranges::iota_view` (26.6.4.2) that models `random_access_range` and `sized_range`, then `ranges::iota_view(*ranges::begin(E), *(ranges::begin(E) + std::min<D>(ranges::distance(E), F)))`, except that `E` is evaluated only once;
- (2.4) — Otherwise, `ranges::take_view(E, F)`.

<sup>3</sup> [Example 1:

```
vector<int> is{0,1,2,3,4,5,6,7,8,9};
for (int i : is | views::take(5))
 cout << i << ' '; //prints: 0 1 2 3 4
```

—end example]

### 26.7.8.2 Class template `take_view`

[range.take.view]

```
namespace std::ranges {
 template<view V>
 class take_view : public view_interface<take_view<V>> {
 private:
 V base_ = V(); // exposition only
 range_difference_t<V> count_ = 0; // exposition only

 // 26.7.8.3, class template take_view::sentinel
 template<bool> struct sentinel; // exposition only

 public:
 take_view() requires default_initializable<V> = default;
 constexpr take_view(V base, range_difference_t<V> count);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() requires (!simple_view<V>) {
 if constexpr (sized_range<V>) {
 if constexpr (random_access_range<V>) {
 return ranges::begin(base_);
 } else {
 auto sz = range_difference_t<V>(size());
 return counted_iterator(ranges::begin(base_), sz);
 }
 } else {
 return counted_iterator(ranges::begin(base_), count_);
 }
 }

 constexpr auto begin() const requires range<const V> {
 if constexpr (sized_range<const V>) {
 if constexpr (random_access_range<const V>) {
 return ranges::begin(base_);
 } else {

```

```

 auto sz = range_difference_t<const V>(size());
 return counted_iterator(ranges::begin(base_), sz);
 }
} else {
 return counted_iterator(ranges::begin(base_), count_);
}
}

constexpr auto end() requires (!simple-view<V>) {
 if constexpr (sized_range<V>) {
 if constexpr (random_access_range<V>)
 return ranges::begin(base_) + range_difference_t<V>(size());
 else
 return default_sentinel;
 } else {
 return sentinel<false>{ranges::end(base_)};
 }
}

constexpr auto end() const requires range<const V> {
 if constexpr (sized_range<const V>) {
 if constexpr (random_access_range<const V>)
 return ranges::begin(base_) + range_difference_t<const V>(size());
 else
 return default_sentinel;
 } else {
 return sentinel<true>{ranges::end(base_)};
 }
}

constexpr auto size() requires sized_range<V> {
 auto n = ranges::size(base_);
 return ranges::min(n, static_cast<decltype(n)>(count_));
}

constexpr auto size() const requires sized_range<const V> {
 auto n = ranges::size(base_);
 return ranges::min(n, static_cast<decltype(n)>(count_));
}
};

template<class R>
take_view(R&&, range_difference_t<R>)
 -> take_view<views::all_t<R>>;
}

```

```
constexpr take_view(V base, range_difference_t<V> count);
```

<sup>1</sup> *Effects:* Initializes *base\_* with `std::move(base)` and *count\_* with `count`.

### 26.7.8.3 Class template `take_view::sentinel`

[range.take.sentinel]

```

namespace std::ranges {
 template<view V>
 template<bool Const>
 class take_view<V>::sentinel {
 private:
 using Base = maybe-const<Const, V>; // exposition only
 template<bool OtherConst>
 using CI = counted_iterator<iterator_t<maybe-const<OtherConst, V>>>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
 public:
 sentinel() = default;
 constexpr explicit sentinel(sentinel_t<Base> end);
 };
}

```

```
constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

constexpr sentinel_t<Base> base() const;

friend constexpr bool operator==(const CI<Const>& y, const sentinel& x);

template<bool OtherConst = !Const>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const CI<OtherConst>& y, const sentinel& x);
};
}
```

```
constexpr explicit sentinel(sentinel_t<Base> end);
```

1 *Effects:* Initializes `end_` with `end`.

```
constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects:* Initializes `end_` with `std::move(s.end_)`.

```
constexpr sentinel_t<Base> base() const;
```

3 *Effects:* Equivalent to: return `end_`;

```
friend constexpr bool operator==(const CI<Const>& y, const sentinel& x);
```

```
template<bool OtherConst = !Const>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const CI<OtherConst>& y, const sentinel& x);
```

4 *Effects:* Equivalent to: return `y.count() == 0 || y.base() == x.end_`;

## 26.7.9 Take while view

[range.take.while]

### 26.7.9.1 Overview

[range.take.while.overview]

1 Given a unary predicate `pred` and a view `r`, `take_while_view` produces a view of the range `[begin(r), ranges::find_if_not(r, pred))`.

2 The name `views::take_while` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::take_while(E, F)` is expression-equivalent to `take_while_view(E, F)`.

3 [Example 1:

```
auto input = istream<int>{"0 1 2 3 4 5 6 7 8 9"};
auto small = [](const auto x) noexcept { return x < 5; };
auto small_ints = istream_view<int>(input) | views::take_while(small);
for (const auto i : small_ints) {
 cout << i << ' ';
}
// prints 0 1 2 3 4

auto i = 0;
input >> i;
cout << i;
// prints 6
```

—end example]

### 26.7.9.2 Class template `take_while_view`

[range.take.while.view]

```
namespace std::ranges {
 template<view V, class Pred>
 requires input_range<V> && is_object_v<Pred> &&
 indirect_unary_predicate<const Pred, iterator_t<V>>
 class take_while_view : public view_interface<take_while_view<V, Pred>> {
 // 26.7.9.3, class template take_while_view::sentinel
 template<bool> class sentinel; // exposition only

 V base_ = V(); // exposition only
 copyable_box<Pred> pred_; // exposition only
 };
}
```

```

public:
 take_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
 constexpr take_while_view(V base, Pred pred);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr const Pred& pred() const;

 constexpr auto begin() requires (!simple-view<V>)
 { return ranges::begin(base_); }

 constexpr auto begin() const
 requires range<const V> &&
 indirect_unary_predicate<const Pred, iterator_t<const V>>
 { return ranges::begin(base_); }

 constexpr auto end() requires (!simple-view<V>)
 { return sentinel<false>(ranges::end(base_), addressof(*pred_)); }

 constexpr auto end() const
 requires range<const V> &&
 indirect_unary_predicate<const Pred, iterator_t<const V>>
 { return sentinel<true>(ranges::end(base_), addressof(*pred_)); }
};

template<class R, class Pred>
 take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;
}

```

```
constexpr take_while_view(V base, Pred pred);
```

<sup>1</sup> *Effects:* Initializes *base\_* with `std::move(base)` and *pred\_* with `std::move(pred)`.

```
constexpr const Pred& pred() const;
```

<sup>2</sup> *Effects:* Equivalent to: `return *pred_;`

### 26.7.9.3 Class template `take_while_view::sentinel`

[range.take.while.sentinel]

```

namespace std::ranges {
 template<view V, class Pred>
 requires input_range<V> && is_object_v<Pred> &&
 indirect_unary_predicate<const Pred, iterator_t<V>>
 template<bool Const>
 class take_while_view<V, Pred>::sentinel {
 using Base = maybe_const<Const, V>; // exposition only

 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
 const Pred* pred_ = nullptr; // exposition only

 public:
 sentinel() = default;
 constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);
 constexpr sentinel(sentinel_t<Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

 constexpr sentinel_t<Base> base() const { return end_; }

 friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

 template<bool OtherConst = !Const>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator_t<maybe_const<OtherConst, V>>& x,
 const sentinel& y);
 };
}

```

```
};
}
```

```
constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);
```

- 1 *Effects:* Initializes *end\_* with *end* and *pred\_* with *pred*.

```
constexpr sentinel(sentinel<!Const> s)
```

```
requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

- 2 *Effects:* Initializes *end\_* with *s.end\_* and *pred\_* with *s.pred\_*.

```
friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);
```

```
template<bool OtherConst = !Const>
```

```
requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
```

```
friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x,
 const sentinel& y);
```

- 3 *Effects:* Equivalent to: `return y.end_ == x || !invoke(*y.pred_, *x);`

## 26.7.10 Drop view

[range.drop]

### 26.7.10.1 Overview

[range.drop.overview]

- 1 `drop_view` produces a view excluding the first *N* elements from another view, or an empty range if the adapted view contains fewer than *N* elements.

- 2 The name `views::drop` denotes a range adaptor object (26.7.2). Let *E* and *F* be expressions, let *T* be `remove_cvref_t<decltype((E))>`, and let *D* be `range_difference_t<decltype((E))>`. If `decltype((F))` does not model `convertible_to<D>`, `views::drop(E, F)` is ill-formed. Otherwise, the expression `views::drop(E, F)` is expression-equivalent to:

- (2.1) — If *T* is a specialization of `ranges::empty_view` (26.6.2.2), then `((void) F, decay-copy(E))`, except that the evaluations of *E* and *F* are indeterminately sequenced.
- (2.2) — Otherwise, if *T* models `random_access_range` and `sized_range` and is
- (2.2.1) — a specialization of `span` (24.7.3),
- (2.2.2) — a specialization of `basic_string_view` (23.3),
- (2.2.3) — a specialization of `ranges::iota_view` (26.6.4.2), or
- (2.2.4) — a specialization of `ranges::subrange` (26.5.4) where `T::StoreSize` is `false`, then `U(ranges::begin(E) + std::min<D>(ranges::distance(E), F), ranges::end(E))`, except that *E* is evaluated only once, where *U* is `span<typename T::element_type>` if *T* is a specialization of `span` and *T* otherwise.
- (2.3) — Otherwise, if *T* is a specialization of `ranges::subrange` (26.5.4) that models `random_access_range` and `sized_range`, then `T(ranges::begin(E) + std::min<D>(ranges::distance(E), F), ranges::end(E), to-unsigned-like(ranges::distance(E) - std::min<D>(ranges::distance(E), F)))`, except that *E* and *F* are each evaluated only once.
- (2.4) — Otherwise, `ranges::drop_view(E, F)`.

- 3 [Example 1:

```
auto ints = views::iota(0) | views::take(10);
for (auto i : ints | views::drop(5)) {
 cout << i << ' ';
} // prints 5 6 7 8 9
```

— end example]

### 26.7.10.2 Class template `drop_view`

[range.drop.view]

```
namespace std::ranges {
 template<view V>
 class drop_view : public view_interface<drop_view<V>> {
 public:
 drop_view() requires default_initializable<V> = default;
 constexpr drop_view(V base, range_difference_t<V> count);
```

```

constexpr V base() const & requires copy_constructible<V> { return base_; }
constexpr V base() && { return std::move(base_); }

constexpr auto begin()
 requires (!simple-view<V> &&
 random_access_range<const V> && sized_range<const V>);
constexpr auto begin() const
 requires random_access_range<const V> && sized_range<const V>;

constexpr auto end() requires (!simple-view<V>)
{ return ranges::end(base_); }

constexpr auto end() const requires range<const V>
{ return ranges::end(base_); }

constexpr auto size() requires sized_range<V> {
 const auto s = ranges::size(base_);
 const auto c = static_cast<decltype(s)>(count_);
 return s < c ? 0 : s - c;
}

constexpr auto size() const requires sized_range<const V> {
 const auto s = ranges::size(base_);
 const auto c = static_cast<decltype(s)>(count_);
 return s < c ? 0 : s - c;
}

private:
 V base_ = V(); // exposition only
 range_difference_t<V> count_ = 0; // exposition only
};

template<class R>
 drop_view(R&&, range_difference_t<R>) -> drop_view<views::all_t<R>>;
}

```

```
constexpr drop_view(V base, range_difference_t<V> count);
```

1 *Preconditions:* count >= 0 is true.

2 *Effects:* Initializes *base\_* with `std::move(base)` and *count\_* with *count*.

```

constexpr auto begin()
 requires (!simple-view<V> &&
 random_access_range<const V> && sized_range<const V>);
constexpr auto begin() const
 requires random_access_range<const V> && sized_range<const V>;

```

3 *Returns:* `ranges::next(ranges::begin(base_), count_, ranges::end(base_))`.

4 *Remarks:* In order to provide the amortized constant-time complexity required by the range concept when `drop_view` models `forward_range`, the first overload caches the result within the `drop_view` for use on subsequent calls.

[*Note 1:* Without this, applying a `reverse_view` over a `drop_view` would have quadratic iteration complexity. — end note]

## 26.7.11 Drop while view

[range.drop.while]

### 26.7.11.1 Overview

[range.drop.while.overview]

1 Given a unary predicate *pred* and a view *r*, `drop_while_view` produces a view of the range `[ranges::find_if_not(r, pred), ranges::end(r))`.

2 The name `views::drop_while` denotes a range adaptor object (26.7.2). Given subexpressions *E* and *F*, the expression `views::drop_while(E, F)` is expression-equivalent to `drop_while_view(E, F)`.

3 [*Example 1:*

```
constexpr auto source = " \t \t \t hello there";
```

```

auto is_invisible = [](const auto x) { return x == ' ' || x == '\t'; };
auto skip_ws = views::drop_while(source, is_invisible);
for (auto c : skip_ws) {
 cout << c; // prints hello there with no leading space
}

```

—end example]

### 26.7.11.2 Class template `drop_while_view`

[range.drop.while.view]

```

namespace std::ranges {
 template<view V, class Pred>
 requires input_range<V> && is_object_v<Pred> &&
 indirect_unary_predicate<const Pred, iterator_t<V>>
 class drop_while_view : public view_interface<drop_while_view<V, Pred>> {
 public:
 drop_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
 constexpr drop_while_view(V base, Pred pred);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr const Pred& pred() const;

 constexpr auto begin();

 constexpr auto end() { return ranges::end(base_); }

 private:
 V base_ = V(); // exposition only
 copyable_box<Pred> pred_; // exposition only
 };

 template<class R, class Pred>
 drop_while_view(R&&, Pred) -> drop_while_view<views::all_t<R>, Pred>;
}

```

constexpr `drop_while_view`(V base, Pred pred);

1 *Effects:* Initializes `base_` with `std::move(base)` and `pred_` with `std::move(pred)`.

constexpr const Pred& pred() const;

2 *Effects:* Equivalent to: return `*pred_`;

constexpr auto begin();

3 *Preconditions:* `pred_.has_value()` is true.

4 *Returns:* `ranges::find_if_not(base_, cref(*pred_))`.

5 *Remarks:* In order to provide the amortized constant-time complexity required by the range concept when `drop_while_view` models `forward_range`, the first call caches the result within the `drop_while_view` for use on subsequent calls.

[*Note 1:* Without this, applying a `reverse_view` over a `drop_while_view` would have quadratic iteration complexity. —end note]

## 26.7.12 Join view

[range.join]

### 26.7.12.1 Overview

[range.join.overview]

1 `join_view` flattens a view of ranges into a view.

2 The name `views::join` denotes a range adaptor object (26.7.2). Given a subexpression `E`, the expression `views::join(E)` is expression-equivalent to `join_view<views::all_t<decltype((E))>>{E}`.

3 [Example 1:

```
vector<string> ss{"hello", " ", "world", "!"};
```

```

for (char ch : ss | views::join)
 cout << ch; // prints: hello world!
—end example]

```

### 26.7.12.2 Class template `join_view`

[range.join.view]

```

namespace std::ranges {
 template<input_range V>
 requires view<V> && input_range<range_reference_t<V>>
 class join_view : public view_interface<join_view<V>> {
 private:
 using InnerRng = range_reference_t<V>; // exposition only

 // 26.7.12.3, class template join_view::iterator
 template<bool Const>
 struct iterator; // exposition only

 // 26.7.12.4, class template join_view::sentinel
 template<bool Const>
 struct sentinel; // exposition only

 V base_ = V(); // exposition only

 non-propagating_cache<remove_cv_t<InnerRng>> inner_; // exposition only, present only
 // when !is_reference_v<InnerRng>

 public:
 join_view() requires default_initializable<V> = default;
 constexpr explicit join_view(V base_);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() {
 constexpr bool use_const = simple_view<V> &&
 is_reference_v<range_reference_t<V>>;
 return iterator<use_const>{*this, ranges::begin(base_)};
 }

 constexpr auto begin() const
 requires input_range<const V> &&
 is_reference_v<range_reference_t<const V>>
 { return iterator<true>{*this, ranges::begin(base_)}; }

 constexpr auto end() {
 if constexpr (forward_range<V> &&
 is_reference_v<InnerRng> && forward_range<InnerRng> &&
 common_range<V> && common_range<InnerRng>)
 return iterator<simple_view<V>>{*this, ranges::end(base_)};
 else
 return sentinel<simple_view<V>>{*this};
 }

 constexpr auto end() const
 requires input_range<const V> &&
 is_reference_v<range_reference_t<const V>> {
 if constexpr (forward_range<const V> &&
 forward_range<range_reference_t<const V>> &&
 common_range<const V> &&
 common_range<range_reference_t<const V>>)
 return iterator<true>{*this, ranges::end(base_)};
 else
 return sentinel<true>{*this};
 }
 }
 }

```

```
};

template<class R>
explicit join_view(R&&) -> join_view<views::all_t<R>>;
}
```

```
constexpr explicit join_view(V base);
```

<sup>1</sup> *Effects:* Initializes *base\_* with `std::move(base)`.

### 26.7.12.3 Class template `join_view::iterator`

[range.join.iterator]

```
namespace std::ranges {
template<input_range V>
requires view<V> && input_range<range_reference_t<V>>
template<bool Const>
struct join_view<V>::iterator {
private:
using Parent = maybe_const<Const, join_view>; // exposition only
using Base = maybe_const<Const, V>; // exposition only
using OuterIter = iterator_t<Base>; // exposition only
using InnerIter = iterator_t<range_reference_t<Base>>; // exposition only

static constexpr bool ref-is-glvalue = // exposition only
is_reference_v<range_reference_t<Base>>;

OuterIter outer_ = OuterIter(); // exposition only
InnerIter inner_ = InnerIter(); // exposition only
Parent* parent_ = nullptr; // exposition only

constexpr void satisfy(); // exposition only

public:
using iterator_concept = see below;
using iterator_category = see below; // not always present
using value_type = range_value_t<range_reference_t<Base>>;
using difference_type = see below;

iterator() requires default_initializable<OuterIter> &&
default_initializable<InnerIter> = default;
constexpr iterator(Parent& parent, OuterIter outer);
constexpr iterator(iterator<!Const> i)
requires Const &&
convertible_to<iterator_t<V>, OuterIter> &&
convertible_to<iterator_t<InnerRng>, InnerIter>;

constexpr decltype(auto) operator*() const { return *inner_; }

constexpr InnerIter operator->() const
requires has_arrow<InnerIter> && copyable<InnerIter>;

constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int)
requires ref-is-glvalue && forward_range<Base> &&
forward_range<range_reference_t<Base>>;

constexpr iterator& operator--()
requires ref-is-glvalue && bidirectional_range<Base> &&
bidirectional_range<range_reference_t<Base>> &&
common_range<range_reference_t<Base>>;
```

```

constexpr iterator operator--(int)
 requires ref-is-glvalue && bidirectional_range<Base> &&
 bidirectional_range<range_reference_t<Base>> &&
 common_range<range_reference_t<Base>>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires ref-is-glvalue && equality_comparable<iterator_t<Base>> &&
 equality_comparable<iterator_t<range_reference_t<Base>>>;

friend constexpr decltype(auto) iter_move(const iterator& i)
noexcept(noexcept(ranges::iter_move(i.inner_))) {
 return ranges::iter_move(i.inner_);
}

friend constexpr void iter_swap(const iterator& x, const iterator& y)
noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)))
 requires indirectly_swappable<InnerIter>;
};
}

```

<sup>1</sup> `iterator::iterator_concept` is defined as follows:

- (1.1) — If *ref-is-glvalue* is true, *Base* models `bidirectional_range`, and `range_reference_t<Base>` models both `bidirectional_range` and `common_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
- (1.2) — Otherwise, if *ref-is-glvalue* is true and *Base* and `range_reference_t<Base>` each model `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.
- (1.3) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

<sup>2</sup> The member *typedef-name* `iterator_category` is defined if and only if *ref-is-glvalue* is true, *Base* models `forward_range`, and `range_reference_t<Base>` models `forward_range`. In that case, `iterator::iterator_category` is defined as follows:

- (2.1) — Let *OUTERC* denote `iterator_traits<iterator_t<Base>>::iterator_category`, and let *INNERC* denote `iterator_traits<iterator_t<range_reference_t<Base>>>::iterator_category`.
- (2.2) — If *OUTERC* and *INNERC* each model `derived_from<bidirectional_iterator_tag>` and `range_reference_t<Base>` models `common_range`, `iterator_category` denotes `bidirectional_iterator_tag`.
- (2.3) — Otherwise, if *OUTERC* and *INNERC* each model `derived_from<forward_iterator_tag>`, `iterator_category` denotes `forward_iterator_tag`.
- (2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

<sup>3</sup> `iterator::difference_type` denotes the type:

```

common_type_t<
 range_difference_t<Base>,
 range_difference_t<range_reference_t<Base>>>

```

<sup>4</sup> `join_view` iterators use the *satisfy* function to skip over empty inner ranges.

```

constexpr void satisfy(); // exposition only

```

<sup>5</sup> *Effects*: Equivalent to:

```

auto update_inner = [this](const iterator_t<Base>& x) -> auto&& {
 if constexpr (ref-is-glvalue) // *x is a reference
 return *x;
 else
 return parent_->inner_.emplace-deref(x);
};

for (; outer_ != ranges::end(parent_->base_); ++outer_) {
 auto&& inner = update_inner(outer_);
 inner_ = ranges::begin(inner);
 if (inner_ != ranges::end(inner))
 return;
}

```

```

 if constexpr (ref-is-glvalue)
 inner_ = InnerIter();

```

```
constexpr iterator(Parent& parent, OuterIter outer);
```

6 *Effects:* Initializes *outer\_* with `std::move(outer)` and *parent\_* with `addressof(parent)`; then calls *satisfy()*.

```
constexpr iterator(iterator<!Const> i)
requires Const &&
 convertible_to<iterator_t<V>, OuterIter> &&
 convertible_to<iterator_t<InnerRng>, InnerIter>;
```

7 *Effects:* Initializes *outer\_* with `std::move(i.outer_)`, *inner\_* with `std::move(i.inner_)`, and *parent\_* with *i.parent\_*.

```
constexpr InnerIter operator->() const
requires has-arrow<InnerIter> && copyable<InnerIter>;
```

8 *Effects:* Equivalent to return *inner\_*;

```
constexpr iterator& operator++();
```

9 Let *inner-range* be:

(9.1) — If *ref-is-glvalue* is true, *\*outer\_*.

(9.2) — Otherwise, *\*parent\_>inner\_*.

10 *Effects:* Equivalent to:

```

auto&& inner_rng = inner-range;
if (++inner_ == ranges::end(inner_rng)) {
 ++outer_;
 satisfy();
}
return *this;

```

```
constexpr void operator++(int);
```

11 *Effects:* Equivalent to: `+++this`.

```
constexpr iterator operator++(int)
requires ref-is-glvalue && forward_range<Base> &&
 forward_range<range_reference_t<Base>>;
```

12 *Effects:* Equivalent to:

```

auto tmp = *this;
+++this;
return tmp;

```

```
constexpr iterator& operator--()
requires ref-is-glvalue && bidirectional_range<Base> &&
 bidirectional_range<range_reference_t<Base>> &&
 common_range<range_reference_t<Base>>;
```

13 *Effects:* Equivalent to:

```

if (outer_ == ranges::end(parent_>base_))
 inner_ = ranges::end(*--outer_);
while (inner_ == ranges::begin(*outer_))
 inner_ = ranges::end(*--outer_);
--inner_;
return *this;

```

```
constexpr iterator operator--(int)
requires ref-is-glvalue && bidirectional_range<Base> &&
 bidirectional_range<range_reference_t<Base>> &&
 common_range<range_reference_t<Base>>;
```

14 *Effects:* Equivalent to:

```
auto tmp = *this;
```

```
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires ref-is-glvalue && equality_comparable<iterator_t<Base>> &&
 equality_comparable<iterator_t<range_reference_t<Base>>>;
```

15 *Effects:* Equivalent to: return `x.outer_ == y.outer_ && x.inner_ == y.inner_;`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)))
 requires indirectly_swappable<InnerIter>;
```

16 *Effects:* Equivalent to: return `ranges::iter_swap(x.inner_, y.inner_);`

#### 26.7.12.4 Class template `join_view::sentinel`

[range.join.sentinel]

```
namespace std::ranges {
 template<input_range V>
 requires view<V> && input_range<range_reference_t<V>>
 template<bool Const>
 struct join_view<V>::sentinel {
 private:
 using Parent = maybe-const<Const, join_view>; // exposition only
 using Base = maybe-const<Const, V>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only

 public:
 sentinel() = default;

 constexpr explicit sentinel(Parent& parent);
 constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

 template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
 };
 }
}
```

```
constexpr explicit sentinel(Parent& parent);
```

1 *Effects:* Initializes `end_` with `ranges::end(parent.base_)`.

```
constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects:* Initializes `end_` with `std::move(s.end_)`.

```
template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects:* Equivalent to: return `x.outer_ == y.end_;`

### 26.7.13 Join with view

[range.join.with]

#### 26.7.13.1 Overview

[range.join.with.overview]

1 `join_with_view` takes a view and a delimiter, and flattens the view, inserting every element of the delimiter in between elements of the view. The delimiter can be a single element or a view of elements.

2 The name `views::join_with` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::join_with(E, F)` is expression-equivalent to `join_with_view(E, F)`.

3 [Example 1:

```
vector<string> vs = {"the", "quick", "brown", "fox"};
for (char c : vs | join_with('-')) {
 cout << c;
}
```

The above prints: the-quick-brown-fox —*end example*]

### 26.7.13.2 Class template `join_with_view`

[`range.join.with.view`]

```

namespace std::ranges {
 template<class R, class P>
 concept compatible-joinable-ranges = // exposition only
 common_with<range_value_t<R>, range_value_t<P>> &&
 common_reference_with<range_reference_t<R>, range_reference_t<P>> &&
 common_reference_with<range_rvalue_reference_t<R>, range_rvalue_reference_t<P>>;

 template<class R>
 concept bidirectional-common = bidirectional_range<R> && common_range<R>; // exposition only

 template<input_range V, forward_range Pattern>
 requires view<V> && input_range<range_reference_t<V>>
 && view<Pattern>
 && compatible-joinable-ranges<range_reference_t<V>, Pattern>

 requires indirectly_swappable<InnerIter, PatternIter> {
 visit(ranges::iter_swap, x.inner_it_, y.inner_it_);
}
};
}

```

<sup>1</sup> *iterator::iterator\_concept* is defined as follows:

- (1.1) — If *ref-is-glvalue* is true, *Base* models *bidirectional\_range*, and *InnerBase* and *PatternBase* each model *bidirectional-common*, then *iterator\_concept* denotes *bidirectional\_iterator\_tag*.
- (1.2) — Otherwise, if *ref-is-glvalue* is true and *Base* and *InnerBase* each model *forward\_range*, then *iterator\_concept* denotes *forward\_iterator\_tag*.
- (1.3) — Otherwise, *iterator\_concept* denotes *input\_iterator\_tag*.

<sup>2</sup> The member *typedef-name* *iterator\_category* is defined if and only if *ref-is-glvalue* is true, and *Base* and *InnerBase* each model *forward\_range*. In that case, *iterator::iterator\_category* is defined as follows:

- (2.1) — Let *OUTERC* denote *iterator\_traits<OuterIter>::iterator\_category*, let *INNERC* denote *iterator\_traits<InnerIter>::iterator\_category*, and let *PATTERNC* denote *iterator\_traits<PatternIter>::iterator\_category*.
- (2.2) — If
 

```

is_lvalue_reference_v<common_reference_t<iter_reference_t<InnerIter>,
 iter_reference_t<PatternIter>>>

```

 is false, *iterator\_category* denotes *input\_iterator\_tag*.
- (2.3) — Otherwise, if *OUTERC*, *INNERC*, and *PATTERNC* each model *derived\_from<bidirectional\_iterator\_category>* and *InnerBase* and *PatternBase* each model *common\_range*, *iterator\_category* denotes *bidirectional\_iterator\_tag*.
- (2.4) — Otherwise, if *OUTERC*, *INNERC*, and *PATTERNC* each model *derived\_from<forward\_iterator\_tag>*, *iterator\_category* denotes *forward\_iterator\_tag*.

(2.5) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

3 `iterator::value_type` denotes the type:

```
common_type_t<iter_value_t<InnerIter>, iter_value_t<PatternIter>>
```

4 `iterator::difference_type` denotes the type:

```
common_type_t<
 iter_difference_t<OuterIter>,
 iter_difference_t<InnerIter>,
 iter_difference_t<PatternIter>>
```

```
constexpr auto&& update-inner(const OuterIter& x);
```

5 **Effects:** Equivalent to:

```
if constexpr (ref-is-glvalue)
 return *x;
else
 return parent_->inner_.emplace-deref(x);
```

```
constexpr auto&& get-inner(const OuterIter& x);
```

6 **Effects:** Equivalent to:

```
if constexpr (ref-is-glvalue)
 return *x;
else
 return *parent_->inner_;
```

```
constexpr void satisfy();
```

7 **Effects:** Equivalent to:

```
while (true) {
 if (inner_it_.index() == 0) {
 if (std::get<0>(inner_it_) != ranges::end(parent_->pattern_))
 break;
 auto&& inner = update-inner(outer_it_);
 inner_it_.emplace<1>(ranges::begin(inner));
 } else {
 auto&& inner = get-inner(outer_it_);
 if (std::get<1>(inner_it_) != ranges::end(inner))
 break;
 if (++outer_it_ == ranges::end(parent_->base_)) {
 if constexpr (ref-is-glvalue)
 inner_it_.emplace<0>();
 break;
 }
 inner_it_.emplace<0>(ranges::begin(parent_->pattern_));
 }
}
```

[Note 1: `join_with_view` iterators use the `satisfy` function to skip over empty inner ranges. — end note]

```
constexpr iterator(Parent& parent, iterator_t<Base> outer);
```

8 **Effects:** Initializes `parent_` with `addressof(parent)` and `outer_it_` with `std::move(outer)`. Then, equivalent to:

```
if (outer_it_ != ranges::end(parent_->base_)) {
 auto&& inner = update-inner(outer_it_);
 inner_it_.emplace<1>(ranges::begin(inner));
 satisfy();
}
```

```
constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, OuterIter> &&
 convertible_to<iterator_t<InnerRng>, InnerIter> &&
```

```
convertible_to<iterator_t<Pattern>, PatternIter>;
```

- 9 *Effects:* Initializes *outer\_it\_* with `std::move(i.outer_it_)` and *parent\_* with `i.parent_`. Then, equivalent to:

```
if (i.inner_it_.index() == 0)
 inner_it_.emplace<0>(std::get<0>(std::move(i.inner_it_)));
else
 inner_it_.emplace<1>(std::get<1>(std::move(i.inner_it_)));
```

```
constexpr decltype(auto) operator*() const;
```

- 10 *Effects:* Equivalent to:

```
using reference =
 common_reference_t<iter_reference_t<InnerIter>, iter_reference_t<PatternIter>>;
return visit([](auto& it) -> reference { return *it; }, inner_it_);
```

```
constexpr iterator& operator++();
```

- 11 *Effects:* Equivalent to:

```
visit([](auto& it){ ++it; }, inner_it_);
satisfy();
return *this;
```

```
constexpr void operator++(int);
```

- 12 *Effects:* Equivalent to `+++this`.

```
constexpr iterator operator++(int)
```

```
requires ref-is-glvalue && forward_iterator<OuterIter> && forward_iterator<InnerIter>;
```

- 13 *Effects:* Equivalent to:

```
iterator tmp = *this;
+++this;
return tmp;
```

```
constexpr iterator& operator--()
```

```
requires ref-is-glvalue && bidirectional_range<Base> &&
 bidirectional-common<InnerBase> && bidirectional-common<PatternBase>;
```

- 14 *Effects:* Equivalent to:

 return x.outer_it_ == y.outer_it_ && x.inner_it_ == y.inner_it_;

```

#### 26.7.13.4 Class template `join_with_view::sentinel`

[range.join.with.sentinel]

```

namespace std::ranges {
 template<input_range V, forward_range Pattern>
 requires view<V> && input_range<range_reference_t<V>>
 && view<Pattern> && compatible-joinable-ranges<range_reference_t<V>, Pattern>
 template<bool Const>
 class join_with_view<V, Pattern>::sentinel {
 using Parent = maybe-const<Const, join_with_view>; // exposition only
 using Base = maybe-const<Const, V>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only

 constexpr explicit sentinel(Parent& parent); // exposition only

 public:
 sentinel() = default;
 constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

 template <bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
 };

 constexpr explicit sentinel(Parent& parent);
1 Effects: Initializes end_ with ranges::end(parent.base_).

 constexpr sentinel(sentinel<!Const> s)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
2 Effects: Initializes end_ with std::move(s.end_).

 template <bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
3 Effects: Equivalent to: return x.outer_it_ == y.end_;

```

#### 26.7.14 Lazy split view

[range.lazy.split]

##### 26.7.14.1 Overview

[range.lazy.split.overview]

- 1 `lazy_split_view` takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.
- 2 The name `views::lazy_split` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::lazy_split(E, F)` is expression-equivalent to `lazy_split_view(E, F)`.
- 3 [Example 1:
 

```

 string str{"the quick brown fox"};

```

```

for (auto word : str | views::lazy_split(' ')) {
 for (char ch : word)
 cout << ch;
 cout << '*';
}
// The above prints: the*quick*brown*fox*
—end example]

```

### 26.7.14.2 Class template `lazy_split_view`

[`range.lazy.split.view`]

```

namespace std::ranges {
 template<auto> struct require-constant; // exposition only

 template<class R>
 concept tiny-range = // exposition only
 sized_range<R> &&
 requires { typename require-constant<remove_reference_t<R>::size()>; } &&
 (remove_reference_t<R>::size() <= 1);

 template<input_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
 (forward_range<V> || tiny-range<Pattern>)
 class lazy_split_view : public view_interface<lazy_split_view<V, Pattern>> {
 private:
 V base_ = V(); // exposition only
 Pattern pattern_ = Pattern(); // exposition only

 non-propagating-cache<iterator_t<V>> current_; // exposition only, present only
 // if !forward_range<V>

 // 26.7.14.3, class template lazy_split_view::outer-iterator
 template<bool> struct outer-iterator; // exposition only

 // 26.7.14.5, class template lazy_split_view::inner-iterator
 template<bool> struct inner-iterator; // exposition only

 public:
 lazy_split_view()
 requires default_initializable<V> && default_initializable<Pattern> = default;
 constexpr lazy_split_view(V base, Pattern pattern);

 template<input_range R>
 requires constructible_from<V, views::all_t<R>> &&
 constructible_from<Pattern, single_view<range_value_t<R>>>
 constexpr lazy_split_view(R&& r, range_value_t<R> e);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() {
 if constexpr (forward_range<V>) {
 return outer-iterator<simple-view<V> && simple-view<Pattern>>
 {*this, ranges::begin(base_)};
 } else {
 current_ = ranges::begin(base_);
 return outer-iterator<false>{*this};
 }
 }

 constexpr auto begin() const requires forward_range<V> && forward_range<const V> {
 return outer-iterator<true>{*this, ranges::begin(base_)};
 }
 }
}

```

```
constexpr auto end() requires forward_range<V> && common_range<V> {
 return outer-iterator<simple-view<V> && simple-view<Pattern>>
 {*this, ranges::end(base_)};
}

constexpr auto end() const {
 if constexpr (forward_range<V> && forward_range<const V> && common_range<const V>)
 return outer-iterator<true>{*this, ranges::end(base_)};
 else
 return default_sentinel;
}
};
```

```
template<class R, class P>
 lazy_split_view(R&&, P&&) -> lazy_split_view<views::all_t<R>, views::all_t<P>>;
```

```
template<input_range R>
 lazy_split_view(R&&, range_value_t<R>)
 -> lazy_split_view<views::all_t<R>, single_view<range_value_t<R>>>;
}
```

```
constexpr lazy_split_view(V base, Pattern pattern);
```

<sup>1</sup> *Effects:* Initializes *base\_* with `std::move(base)`, and *pattern\_* with `std::move(pattern)`.

```
template<input_range R>
 requires constructible_from<V, views::all_t<R>> &&
 constructible_from<Pattern, single_view<range_value_t<R>>>
constexpr lazy_split_view(R&& r, range_value_t<R> e);
```

<sup>2</sup> *Effects:* Initializes *base\_* with `views::all(std::forward<R>(r))`, and *pattern\_* with `views::single(std::move(e))`.

### 26.7.14.3 Class template `lazy_split_view::outer-iterator`

[range.lazy.split.outer]

```
namespace std::ranges {
 template<input_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
 (forward_range<V> || tiny_range<Pattern>)
 template<bool Const>
 struct lazy_split_view<V, Pattern>::outer-iterator {
 private:
 using Parent = maybe-const<Const, lazy_split_view>; // exposition only
 using Base = maybe-const<Const, V>; // exposition only
 Parent* parent_ = nullptr; // exposition only

 iterator_t<Base> current_ = iterator_t<Base>(); // exposition only, present only
 // if V models forward_range

 bool trailing_empty_ = false; // exposition only

 public:
 using iterator_concept =
 conditional_t<forward_range<Base>, forward_iterator_tag, input_iterator_tag>;

 using iterator_category = input_iterator_tag; // present only if Base
 // models forward_range

 // 26.7.14.4, class lazy_split_view::outer-iterator::value_type
 struct value_type;
 using difference_type = range_difference_t<Base>;

 outer-iterator() = default;
 constexpr explicit outer-iterator(Parent& parent)
 requires (!forward_range<Base>);
```

```

constexpr outer-iterator(Parent& parent, iterator_t<Base> current)
 requires forward_range<Base>;
constexpr outer-iterator(outer-iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

constexpr value_type operator*() const;

constexpr outer-iterator& operator++();
constexpr decltype(auto) operator++(int) {
 if constexpr (forward_range<Base>) {
 auto tmp = *this;
 ++this;
 return tmp;
 } else
 ++this;
}

friend constexpr bool operator==(const outer-iterator& x, const outer-iterator& y)
 requires forward_range<Base>;

friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);
};
}

```

- 1 Many of the specifications in 26.7.14 refer to the notional member *current* of *outer-iterator*. *current* is equivalent to *current\_* if *V* models *forward\_range*, and *\*parent\_->current\_* otherwise.

```

constexpr explicit outer-iterator(Parent& parent)
 requires (!forward_range<Base>);

```

- 2 *Effects*: Initializes *parent\_* with *addressof(parent)*.

```

constexpr outer-iterator(Parent& parent, iterator_t<Base> current)
 requires forward_range<Base>;

```

- 3 *Effects*: Initializes *parent\_* with *addressof(parent)* and *current\_* with *std::move(current)*.

```

constexpr outer-iterator(outer-iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

```

- 4 *Effects*: Initializes *parent\_* with *i.parent\_* and *current\_* with *std::move(i.current\_)*.

```

constexpr value_type operator*() const;

```

- 5 *Effects*: Equivalent to: *return value\_type{\*this};*

```

constexpr outer-iterator& operator++();

```

- 6 *Effects*: Equivalent to:

```

const auto end = ranges::end(parent_->base_);
if (current == end) {
 trailing_empty_ = false;
 return *this;
}
const auto [pbegin, pend] = subrange{parent_->pattern_};
if (pbegin == pend) ++current;
else if constexpr (tiny_range<Pattern>) {
 current = ranges::find(std::move(current), end, *pbegin);
 if (current != end) {
 ++current;
 if (current == end)
 trailing_empty_ = true;
 }
}
else {
 do {
 auto [b, p] = ranges::mismatch(current, end, pbegin, pend);

```

```

 if (p == pend) {
 current = b;
 if (current == end)
 trailing_empty_ = true;
 break; // The pattern matched; skip it
 }
 } while (++current != end);
}
return *this;

```

```

friend constexpr bool operator==(const outer_iterator& x, const outer_iterator& y)
 requires forward_range<Base>;

```

7 *Effects:* Equivalent to:

```

 return x.current_ == y.current_ && x.trailing_empty_ == y.trailing_empty_;

```

```

friend constexpr bool operator==(const outer_iterator& x, default_sentinel_t);

```

8 *Effects:* Equivalent to:

```

 return x.current == ranges::end(x.parent_->base_) && !x.trailing_empty_;

```

#### 26.7.14.4 Class `lazy_split_view::outer_iterator::value_type`

[range.lazy.split.outer.value]

```

namespace std::ranges {
 template<input_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
 (forward_range<V> || tiny_range<Pattern>)
 template<bool Const>
 struct lazy_split_view<V, Pattern>::outer_iterator<Const>::value_type
 : view_interface<value_type> {
 private:
 outer_iterator i_ = outer_iterator(); // exposition only
 public:
 value_type() = default;
 constexpr explicit value_type(outer_iterator i);

 constexpr inner_iterator<Const> begin() const;
 constexpr default_sentinel_t end() const noexcept;
 };
}

```

```

constexpr explicit value_type(outer_iterator i);

```

1 *Effects:* Initializes `i_` with `std::move(i)`.

```

constexpr inner_iterator<Const> begin() const;

```

2 *Effects:* Equivalent to: return `inner_iterator<Const>{i_}`;

```

constexpr default_sentinel_t end() const noexcept;

```

3 *Effects:* Equivalent to: return `default_sentinel`;

#### 26.7.14.5 Class template `lazy_split_view::inner_iterator`

[range.lazy.split.inner]

```

namespace std::ranges {
 template<input_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
 (forward_range<V> || tiny_range<Pattern>)
 template<bool Const>
 struct lazy_split_view<V, Pattern>::inner_iterator {
 private:
 using Base = maybe_const<Const, V>; // exposition only
 outer_iterator<Const> i_ = outer_iterator<Const>(); // exposition only
 bool incremented_ = false; // exposition only
 };
}

```

```

public:
 using iterator_concept = typename outer_iterator<Const>::iterator_concept;

 using iterator_category = see below; // present only if Base
 // models forward_range

 using value_type = range_value_t<Base>;
 using difference_type = range_difference_t<Base>;

 inner_iterator() = default;
 constexpr explicit inner_iterator(outer_iterator<Const> i);

 constexpr const iterator_t<Base>& base() const & noexcept;
 constexpr iterator_t<Base> base() && requires forward_range<V>;

 constexpr decltype(auto) operator*() const { return *i_.current; }

 constexpr inner_iterator& operator++();
 constexpr decltype(auto) operator++(int) {
 if constexpr (forward_range<Base>) {
 auto tmp = *this;
 ++this;
 return tmp;
 } else
 ++this;
 }

 friend constexpr bool operator==(const inner_iterator& x, const inner_iterator& y)
 requires forward_range<Base>;

 friend constexpr bool operator==(const inner_iterator& x, default_sentinel_t);

 friend constexpr decltype(auto) iter_move(const inner_iterator& i)
 noexcept(noexcept(ranges::iter_move(i.i_.current))) {
 return ranges::iter_move(i.i_.current);
 }

 friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
 requires indirectly_swappable<iterator_t<Base>>;
};

```

<sup>1</sup> If *Base* does not model *forward\_range* there is no member *iterator\_category*. Otherwise, the *typedef-name* *iterator\_category* denotes:

- (1.1) — *forward\_iterator\_tag* if `iterator_traits<iterator_t<Base>>::iterator_category` models `derived_from<forward_iterator_tag>`;
- (1.2) — otherwise, `iterator_traits<iterator_t<Base>>::iterator_category`.

```
constexpr explicit inner_iterator(outer_iterator<Const> i);
```

<sup>2</sup> *Effects*: Initializes *i\_* with `std::move(i)`.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

<sup>3</sup> *Effects*: Equivalent to: `return i_.current;`

```
constexpr iterator_t<Base> base() && requires forward_range<V>;
```

<sup>4</sup> *Effects*: Equivalent to: `return std::move(i_.current);`

```
constexpr inner_iterator& operator++();
```

<sup>5</sup> *Effects*: Equivalent to:

```
 incremented_ = true;
```

```

 if constexpr (!forward_range<Base>) {
 if constexpr (Pattern::size() == 0) {
 return *this;
 }
 }
 ++i_.current;
 return *this;

```

```

friend constexpr bool operator==(const inner_iterator& x, const inner_iterator& y)
 requires forward_range<Base>;

```

6 *Effects:* Equivalent to: `return x.i_.current == y.i_.current;`

```

friend constexpr bool operator==(const inner_iterator& x, default_sentinel_t);

```

7 *Effects:* Equivalent to:

```

 auto [pcur, pend] = subrange{x.i_.parent_->pattern_};
 auto end = ranges::end(x.i_.parent_->base_);
 if constexpr (tiny_range<Pattern>) {
 const auto & cur = x.i_.current;
 if (cur == end) return true;
 if (pcur == pend) return x.incremented_;
 return *cur == *pcur;
 } else {
 auto cur = x.i_.current;
 if (cur == end) return true;
 if (pcur == pend) return x.incremented_;
 do {
 if (*cur != *pcur) return false;
 if (++pcur == pend) return true;
 } while (++cur != end);
 return false;
 }

```

```

friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
 noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
 requires indirectly_swappable<iterator_t<Base>>;

```

8 *Effects:* Equivalent to `ranges::iter_swap(x.i_.current, y.i_.current).`

## 26.7.15 Split view

[range.split]

### 26.7.15.1 Overview

[range.split.overview]

1 `split_view` takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

2 The name `views::split` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `F`, the expression `views::split(E, F)` is expression-equivalent to `split_view(E, F)`.

3 [Example 1:

```

string str{"the quick brown fox"};
for (string_view word : split(str, ' ')) {
 cout << word << '*';
}

```

*// The above prints: the\*quick\*brown\*fox\**

—end example]

### 26.7.15.2 Class template `split_view`

[range.split.view]

```

namespace std::ranges {
 template<forward_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
 class split_view : public view_interface<split_view<V, Pattern>> {
 private:
 V base_ = V(); // exposition only
 Pattern pattern_ = Pattern(); // exposition only
 };

```

```

// 26.7.15.3, class split_view::iterator
struct iterator; // exposition only

// 26.7.15.4, class split_view::sentinel
struct sentinel; // exposition only

public:
split_view()
 requires default_initializable<V> && default_initializable<Pattern> = default;
constexpr split_view(V base, Pattern pattern);

template<forward_range R>
 requires constructible_from<V, views::all_t<R>> &&
 constructible_from<Pattern, single_view<range_value_t<R>>>
constexpr split_view(R&& r, range_value_t<R> e);

constexpr V base() const & requires copy_constructible<V> { return base_; }
constexpr V base() && { return std::move(base_); }

constexpr iterator begin();

constexpr auto end() {
 if constexpr (common_range<V>) {
 return iterator{*this, ranges::end(base_), {}};
 } else {
 return sentinel{*this};
 }
}

constexpr subrange<iterator_t<V>> find_next(iterator_t<V>); // exposition only
};

template<class R, class P>
split_view(R&&, P&&) -> split_view<views::all_t<R>, views::all_t<P>>;

template<forward_range R>
split_view(R&&, range_value_t<R>)
 -> split_view<views::all_t<R>, single_view<range_value_t<R>>>;
}

```

```
constexpr split_view(V base, Pattern pattern);
```

1 **Effects:** Initializes *base\_* with `std::move(base)`, and *pattern\_* with `std::move(pattern)`.

```

template<forward_range R>
 requires constructible_from<V, views::all_t<R>> &&
 constructible_from<Pattern, single_view<range_value_t<R>>>
constexpr split_view(R&& r, range_value_t<R> e);

```

2 **Effects:** Initializes *base\_* with `views::all(std::forward<R>(r))`, and *pattern\_* with `views::single(std::move(e))`.

```
constexpr iterator begin();
```

3 **Returns:** `{*this, ranges::begin(base_), find_next(ranges::begin(base_))}`.

4 **Remarks:** In order to provide the amortized constant time complexity required by the range concept, this function caches the result within the `split_view` for use on subsequent calls.

```
constexpr subrange<iterator_t<V>> find_next(iterator_t<V> it); // exposition only
```

5 **Effects:** Equivalent to:

```

auto [b, e] = ranges::search(subrange(it, ranges::end(base_)), pattern_);
if (b != ranges::end(base_) && ranges::empty(pattern_)) {
 ++b;
}

```

```

 ++e;
}
return {b, e};

```

### 26.7.15.3 Class `split_view::iterator`

[range.split.iterator]

```

namespace std::ranges {
 template<forward_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
 class split_view<V, Pattern>::iterator {
 private:
 split_view* parent_ = nullptr; // exposition only
 iterator_t<V> cur_ = iterator_t<V>(); // exposition only
 subrange<iterator_t<V>> next_ = subrange<iterator_t<V>>(); // exposition only
 bool trailing_empty_ = false; // exposition only

 public:
 using iterator_concept = forward_iterator_tag;
 using iterator_category = input_iterator_tag;
 using value_type = subrange<iterator_t<V>>;
 using difference_type = range_difference_t<V>;

 iterator() = default;
 constexpr iterator(split_view& parent, iterator_t<V> current, subrange<iterator_t<V>> next);

 constexpr iterator_t<V> base() const;
 constexpr value_type operator*() const;

 constexpr iterator& operator++();
 constexpr iterator operator++(int);

 friend constexpr bool operator==(const iterator& x, const iterator& y);
 };
}

```

```
constexpr iterator(split_view& parent, iterator_t<V> current, subrange<iterator_t<V>> next);
```

1 *Effects:* Initializes *parent\_* with `addressof(parent)`, *cur\_* with `std::move(current)`, and *next\_* with `std::move(next)`.

```
constexpr iterator_t<V> base() const;
```

2 *Effects:* Equivalent to return *cur\_*;

```
constexpr value_type operator*() const;
```

3 *Effects:* Equivalent to return `{cur_, next_.begin()};`

```
constexpr iterator& operator++();
```

4 *Effects:* Equivalent to:

```

 cur_ = next_.begin();
 if (cur_ != ranges::end(parent_>base_)) {
 cur_ = next_.end();
 if (cur_ == ranges::end(parent_>base_)) {
 trailing_empty_ = true;
 next_ = {cur_, cur_};
 } else {
 next_ = parent_>find-next(cur_);
 }
 } else {
 trailing_empty_ = false;
 }
 return *this;

```

```
constexpr iterator operator++(int);
```

5 *Effects:* Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

6 *Effects:* Equivalent to:

```
return x.cur_ == y.cur_ && x.trailing_empty_ == y.trailing_empty_;
```

#### 26.7.15.4 Class `split_view::sentinel`

[range.split.sentinel]

```
namespace std::ranges {
 template<forward_range V, forward_range Pattern>
 requires view<V> && view<Pattern> &&
 indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
 struct split_view<V, Pattern>::sentinel {
 private:
 sentinel_t<V> end_ = sentinel_t<V>(); // exposition only

 public:
 sentinel() = default;
 constexpr explicit sentinel(split_view& parent);

 friend constexpr bool operator==(const iterator& x, const sentinel& y);
 };
 }
```

```
constexpr explicit sentinel(split_view& parent);
```

1 *Effects:* Initializes `end_` with `ranges::end(parent.base_)`.

```
friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

2 *Effects:* Equivalent to: `return x.cur_ == y.end_ && !x.trailing_empty_;`

#### 26.7.16 Counted view

[range.counted]

1 A counted view presents a view of the elements of the counted range (25.3.1)  $i + [0, n)$  for an iterator  $i$  and non-negative integer  $n$ .

2 The name `views::counted` denotes a customization point object (16.3.3.3.6). Let  $E$  and  $F$  be expressions, let  $T$  be `decay_t<decltype(E)>`, and let  $D$  be `iter_difference_t<T>`. If `decltype(F)` does not model `convertible_to<D>`, `views::counted(E, F)` is ill-formed.

[Note 1: This case can result in substitution failure when `views::counted(E, F)` appears in the immediate context of a template instantiation. — end note]

Otherwise, `views::counted(E, F)` is expression-equivalent to:

(2.1) — If  $T$  models `contiguous_iterator`, then `span(to_address(E), static_cast<size_t>(static_cast<D>(F)))`.

(2.2) — Otherwise, if  $T$  models `random_access_iterator`, then `subrange(E, E + static_cast<D>(F))`, except that  $E$  is evaluated only once.

(2.3) — Otherwise, `subrange(counted_iterator(E, F), default_sentinel)`.

#### 26.7.17 Common view

[range.common]

##### 26.7.17.1 Overview

[range.common.overview]

1 `common_view` takes a view which has different types for its iterator and sentinel and turns it into a view of the same elements with an iterator and sentinel of the same type.

2 [Note 1: `common_view` is useful for calling legacy algorithms that expect a range's iterator and sentinel types to be the same. — end note]

3 The name `views::common` denotes a range adaptor object (26.7.2). Given a subexpression  $E$ , the expression `views::common(E)` is expression-equivalent to:

- (3.1) — `views::all(E)`, if `decltype((E))` models `common_range` and `views::all(E)` is a well-formed expression.
- (3.2) — Otherwise, `common_view{E}`.

4 [Example 1:

```
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);

template<forward_range R>
void my_algo(R&& r) {
 auto&& common = views::common(r);
 auto cnt = count(common.begin(), common.end());
 // ...
}
```

—end example]

### 26.7.17.2 Class template `common_view`

[range.common.view]

```
namespace std::ranges {
 template<view V>
 requires (!common_range<V> && copyable<iterator_t<V>>)
 class common_view : public view_interface<common_view<V>> {
 private:
 V base_ = V(); // exposition only
 public:
 common_view() requires default_initializable<V> = default;

 constexpr explicit common_view(V r);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() {
 if constexpr (random_access_range<V> && sized_range<V>)
 return ranges::begin(base_);
 else
 return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
 }

 constexpr auto begin() const requires range<const V> {
 if constexpr (random_access_range<const V> && sized_range<const V>)
 return ranges::begin(base_);
 else
 return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
 }

 constexpr auto end() {
 if constexpr (random_access_range<V> && sized_range<V>)
 return ranges::begin(base_) + ranges::size(base_);
 else
 return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
 }

 constexpr auto end() const requires range<const V> {
 if constexpr (random_access_range<const V> && sized_range<const V>)
 return ranges::begin(base_) + ranges::size(base_);
 else
 return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
 }

 constexpr auto size() requires sized_range<V> {
 return ranges::size(base_);
 }
 };
};
```

```
constexpr auto size() const requires sized_range<const V> {
 return ranges::size(base_);
}
};
```

```
template<class R>
 common_view(R&&) -> common_view<views::all_t<R>>;
}
```

```
constexpr explicit common_view(V base);
```

<sup>1</sup> *Effects:* Initializes *base\_* with `std::move(base)`.

## 26.7.18 Reverse view

[range.reverse]

### 26.7.18.1 Overview

[range.reverse.overview]

<sup>1</sup> `reverse_view` takes a bidirectional view and produces another view that iterates the same elements in reverse order.

<sup>2</sup> The name `views::reverse` denotes a range adaptor object (26.7.2). Given a subexpression *E*, the expression `views::reverse(E)` is expression-equivalent to:

- (2.1) — If the type of *E* is a (possibly cv-qualified) specialization of `reverse_view`, equivalent to `E.base()`.
- (2.2) — Otherwise, if the type of *E* is `cv subrange<reverse_iterator<I>, reverse_iterator<I>, K>` for some iterator type *I* and value *K* of type `subrange_kind`,
  - (2.2.1) — if *K* is `subrange_kind::sized`, equivalent to:
 

```
subrange<I, I, K>(E.end().base(), E.begin().base(), E.size())
```
  - (2.2.2) — otherwise, equivalent to:
 

```
subrange<I, I, K>(E.end().base(), E.begin().base())
```

However, in either case *E* is evaluated only once.

(2.3) — Otherwise, equivalent to `reverse_view{E}`.

<sup>3</sup> [Example 1:

```
vector<int> is {0,1,2,3,4};
for (int i : is | views::reverse)
 cout << i << ' '; //prints: 4 3 2 1 0
```

—end example]

### 26.7.18.2 Class template `reverse_view`

[range.reverse.view]

```
namespace std::ranges {
 template<view V>
 requires bidirectional_range<V>
 class reverse_view : public view_interface<reverse_view<V>> {
 private:
 V base_ = V(); // exposition only
 public:
 reverse_view() requires default_initializable<V> = default;

 constexpr explicit reverse_view(V r);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr reverse_iterator<iterator_t<V>> begin();
 constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
 constexpr auto begin() const requires common_range<const V>;

 constexpr reverse_iterator<iterator_t<V>> end();
 constexpr auto end() const requires common_range<const V>;

 constexpr auto size() requires sized_range<V> {
 return ranges::size(base_);
 }
 };
}
```

```
constexpr auto size() const requires sized_range<const V> {
 return ranges::size(base_);
}
};
```

```
template<class R>
reverse_view(R&&) -> reverse_view<views::all_t<R>>;
}
```

```
constexpr explicit reverse_view(V base);
```

1 *Effects:* Initializes *base\_* with `std::move(base)`.

```
constexpr reverse_iterator<iterator_t<V>> begin();
```

2 *Returns:*

```
make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))
```

3 *Remarks:* In order to provide the amortized constant time complexity required by the range concept, this function caches the result within the `reverse_view` for use on subsequent calls.

```
constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
constexpr auto begin() const requires common_range<const V>;
```

4 *Effects:* Equivalent to: `return make_reverse_iterator(ranges::end(base_));`

```
constexpr reverse_iterator<iterator_t<V>> end();
constexpr auto end() const requires common_range<const V>;
```

5 *Effects:* Equivalent to: `return make_reverse_iterator(ranges::begin(base_));`

## 26.7.19 Elements view

[range.elements]

### 26.7.19.1 Overview

[range.elements.overview]

- 1 `elements_view` takes a view of tuple-like values and a `size_t`, and produces a view with a value-type of the  $N^{\text{th}}$  element of the adapted view's value-type.
- 2 The name `views::elements<N>` denotes a range adaptor object (26.7.2). Given a subexpression `E` and constant expression `N`, the expression `views::elements<N>(E)` is expression-equivalent to `elements_view<views::all_t<decltype((E))>, N>{E}`.

[Example 1:

```
auto historical_figures = map{
 pair{"Lovelace"sv, 1815},
 {"Turing"sv, 1912},
 {"Babbage"sv, 1791},
 {"Hamilton"sv, 1936}
};

auto names = historical_figures | views::elements<0>;
for (auto&& name : names) {
 cout << name << ' '; // prints Babbage Hamilton Lovelace Turing
}

auto birth_years = historical_figures | views::elements<1>;
for (auto&& born : birth_years) {
 cout << born << ' '; // prints 1791 1936 1815 1912
}
```

—end example]

- 3 `keys_view` is an alias for `elements_view<R, 0>`, and is useful for extracting keys from associative containers.

[Example 2:

```
auto names = historical_figures | views::keys;
for (auto&& name : names) {
 cout << name << ' '; // prints Babbage Hamilton Lovelace Turing
}
```

—end example]

- 4 values\_view is an alias for elements\_view<R, 1>, and is useful for extracting values from associative containers.

[Example 3:

```
auto is_even = [](const auto x) { return x % 2 == 0; };
cout << ranges::count_if(historical_figures | views::values, is_even); // prints 2
```

—end example]

### 26.7.19.2 Class template elements\_view

[range.elements.view]

```
namespace std::ranges {
 template<class T, size_t N>
 concept has-tuple-element = // exposition only
 requires(T t) {
 typename tuple_size<T>::type;
 requires N < tuple_size_v<T>;
 typename tuple_element_t<N, T>;
 { std::get<N>(t) } -> convertible_to<const tuple_element_t<N, T>&>;
 };

 template<class T, size_t N>
 concept returnable-element = // exposition only
 is_reference_v<T> || move_constructible<tuple_element_t<N, T>>;

 template<input_range V, size_t N>
 requires view<V> && has-tuple-element<range_value_t<V>, N> &&
 has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
 returnable-element<range_reference_t<V>, N>
 class elements_view : public view_interface<elements_view<V, N>> {
 public:
 elements_view() requires default_initializable<V> = default;
 constexpr explicit elements_view(V base);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr auto begin() requires (!simple-view<V>)
 { return iterator<false>(ranges::begin(base_)); }

 constexpr auto begin() const requires range<const V>
 { return iterator<true>(ranges::begin(base_)); }

 constexpr auto end() requires (!simple-view<V> && !common_range<V>)
 { return sentinel<false>(ranges::end(base_)); }

 constexpr auto end() requires (!simple-view<V> && common_range<V>)
 { return iterator<false>(ranges::end(base_)); }

 constexpr auto end() const requires range<const V>
 { return sentinel<true>(ranges::end(base_)); }

 constexpr auto end() const requires common_range<const V>
 { return iterator<true>(ranges::end(base_)); }

 constexpr auto size() requires sized_range<V>
 { return ranges::size(base_); }

 constexpr auto size() const requires sized_range<const V>
 { return ranges::size(base_); }

 private:
 // 26.7.19.3, class template elements_view::iterator
 template<bool> struct iterator; // exposition only
 };
};
```

```

// 26.7.19.4, class template elements_view::sentinel
template<bool> struct sentinel; // exposition only

V base_ = V(); // exposition only
};
}

```

```
constexpr explicit elements_view(V base);
```

<sup>1</sup> *Effects:* Initializes *base\_* with `std::move(base)`.

### 26.7.19.3 Class template `elements_view::iterator`

[range.elements.iterator]

```

namespace std::ranges {
 template<input_range V, size_t N>
 requires view<V> && has-tuple-element<range_value_t<V>, N> &&
 has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
 returnable-element<range_reference_t<V>, N>
 template<bool Const>
 class elements_view<V, N>::iterator {
 using Base = maybe-const<Const, V>; // exposition only

 iterator_t<Base> current_ = iterator_t<Base>(); // exposition only

 static constexpr decltype(auto) get-element(const iterator_t<Base>& i); // exposition only

 public:
 using iterator_concept = see below;
 using iterator_category = see below; // not always present
 using value_type = remove_cvref_t<tuple_element_t<N, range_value_t<Base>>>;
 using difference_type = range_difference_t<Base>;

 iterator() requires default_initializable<iterator_t<Base>> = default;
 constexpr explicit iterator(iterator_t<Base> current);
 constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

 constexpr const iterator_t<Base>& base() const & noexcept;
 constexpr iterator_t<Base> base() &&;

 constexpr decltype(auto) operator*() const
 { return get-element(current_); }

 constexpr iterator& operator++();
 constexpr void operator++(int);
 constexpr iterator operator++(int) requires forward_range<Base>;

 constexpr iterator& operator--() requires bidirectional_range<Base>;
 constexpr iterator operator--(int) requires bidirectional_range<Base>;

 constexpr iterator& operator+=(difference_type x)
 requires random_access_range<Base>;
 constexpr iterator& operator-=(difference_type x)
 requires random_access_range<Base>;

 constexpr decltype(auto) operator[](difference_type n) const
 requires random_access_range<Base>
 { return get-element(current_ + n); }

 friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<iterator_t<Base>>;

 friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;

```

```

friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

friend constexpr iterator operator+(const iterator& x, difference_type y)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& x, difference_type y)
 requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
};
}

```

1 The member *typedef-name* `iterator_concept` is defined as follows:

- (1.1) — If *Base* models `random_access_range`, then `iterator_concept` denotes `random_access_iterator_tag`.
- (1.2) — Otherwise, if *Base* models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
- (1.3) — Otherwise, if *Base* models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.
- (1.4) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 The member *typedef-name* `iterator_category` is defined if and only if *Base* models `forward_range`. In that case, `iterator_category` is defined as follows: Let *C* denote the type `iterator_traits<iterator_t<Base>>::iterator_category`.

- (2.1) — If `std::get<N>(*current_)` is an rvalue, `iterator_category` denotes `input_iterator_tag`.
- (2.2) — Otherwise, if *C* models `derived_from<random_access_iterator_tag>`, `iterator_category` denotes `random_access_iterator_tag`.
- (2.3) — Otherwise, `iterator_category` denotes *C*.

```
static constexpr decltype(auto) get_element(const iterator_t<Base>& i); // exposition only
```

3 *Effects*: Equivalent to:

```

if constexpr (is_reference_v<range_reference_t<Base>>) {
 return std::get<N>(*i);
} else {
 using E = remove_cv_t<tuple_element_t<N, range_reference_t<Base>>>;
 return static_cast<E>(std::get<N>(*i));
}

```

```
constexpr explicit iterator(iterator_t<Base> current);
```

4 *Effects*: Initializes `current_` with `std::move(current)`.

```
constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

5 *Effects*: Initializes `current_` with `std::move(i.current_)`.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

6 *Effects*: Equivalent to: return `current_`;

```
constexpr iterator_t<Base> base() &&;
```

7 *Effects*: Equivalent to: return `std::move(current_)`;

```
constexpr iterator& operator++();
```

8 *Effects:* Equivalent to:

```
++current_;
return *this;
```

```
constexpr void operator++(int);
```

9 *Effects:* Equivalent to: ++current\_.

```
constexpr iterator operator++(int) requires forward_range<Base>;
```

10 *Effects:* Equivalent to:

```
auto temp = *this;
++current_;
return temp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

11 *Effects:* Equivalent to:

```
--current_;
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

12 *Effects:* Equivalent to:

```
auto temp = *this;
--current_;
return temp;
```

```
constexpr iterator& operator+=(difference_type n);
requires random_access_range<Base>;
```

13 *Effects:* Equivalent to:

```
current_ += n;
return *this;
```

```
constexpr iterator& operator-=(difference_type n)
requires random_access_range<Base>;
```

14 *Effects:* Equivalent to:

```

22 Effects: Equivalent to: return y + x;

friend constexpr iterator operator-(const iterator& x, difference_type y)
 requires random_access_range<Base>;
23 Effects: Equivalent to: return iterator{x} -= y;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
24 Effects: Equivalent to: return x.current_ - y.current_;

```

#### 26.7.19.4 Class template `elements_view::sentinel`

[range.elements.sentinel]

```

namespace std::ranges {
 template<input_range V, size_t N>
 requires view<V> && has_tuple_element<range_value_t<V>, N> &&
 has_tuple_element<remove_reference_t<range_reference_t<V>>, N> &&
 returnable_element<range_reference_t<V>, N>
 template<bool Const>
 class elements_view<V, N>::sentinel {
 private:
 using Base = maybe_const<Const, V>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
 public:
 sentinel() = default;
 constexpr explicit sentinel(sentinel_t<Base> end);
 constexpr sentinel(sentinel_t<!Const> other)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

 constexpr sentinel_t<Base> base() const;

 template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe_const<OtherConst, V>>
 operator-(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe_const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe_const<OtherConst, V>>
 operator-(const sentinel& x, const iterator<OtherConst>& y);
 };
 }

 constexpr explicit sentinel(sentinel_t<Base> end);
1 Effects: Initializes end_ with end.

 constexpr sentinel(sentinel_t<!Const> other)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
2 Effects: Initializes end_ with std::move(other.end_).

```

```
constexpr sentinel_t<Base> base() const;
3 Effects: Equivalent to: return end_;

template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
4 Effects: Equivalent to: return x.current_ == y.end_;

template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const iterator<OtherConst>& x, const sentinel& y);
5 Effects: Equivalent to: return x.current_ - y.end_;

template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const sentinel& x, const iterator<OtherConst>& y);
6 Effects: Equivalent to: return x.end_ - y.current_;
```

## 26.7.20 Zip view

[range.zip]

### 26.7.20.1 Overview

[range.zip.overview]

- 1 zip\_view takes any number of views and produces a view of tuples of references to the corresponding elements of the constituent views.
- 2 The name views::zip denotes a customization point object (16.3.3.3.6). Given a pack of subexpressions Es..., the expression views::zip(Es...) is expression-equivalent to
- (2.1) — auto{views::empty<tuple<>>} if Es is an empty pack,
- (2.2) — otherwise, zip\_view<views::all\_t<decltype((Es))>...>(Es...).

[Example 1:

```
vector v = {1, 2};
list l = {'a', 'b', 'c'};

auto z = views::zip(v, l);
range_reference_t<decltype(z)> f = z.front(); // f is a pair<int&, char&
// that refers to the first element of v and l

for (auto&& [x, y] : z) {
 cout << '(' << x << ", " << y << " "; // prints: (1, a) (2, b)
}

```

—end example]

### 26.7.20.2 Class template zip\_view

[range.zip.view]

```
namespace std::ranges {
 template<class... Rs>
 concept zip-is-common = // exposition only
 (sizeof...(Rs) == 1 && (common_range<Rs> && ...)) ||
 (!(bidirectional_range<Rs> && ...) && (common_range<Rs> && ...)) ||
 ((random_access_range<Rs> && ...) && (sized_range<Rs> && ...));

 template<class... Ts>
 using tuple-or-pair = see below; // exposition only

 template<class F, class Tuple>
 constexpr auto tuple-transform(F&& f, Tuple&& tuple) { // exposition only
 return apply([&<class... Ts>(Ts&&... elements) {
 return tuple-or-pair<invoke_result_t<F&, Ts>...>(
 invoke(f, std::forward<Ts>(elements))...
);
 });
 }
}

```

```

 }, std::forward<Tuple>(tuple));
}

template<class F, class Tuple>
constexpr void tuple-for-each(F&& f, Tuple&& tuple) { // exposition only
 apply([&<class... Ts>(Ts&&... elements) {
 (invoke(f, std::forward<Ts>(elements)), ...);
 }, std::forward<Tuple>(tuple));
}

template<input_range... Views>
 requires (view<Views> && ...) && (sizeof...(Views) > 0)
class zip_view : public view_interface<zip_view<Views...>> {
 tuple<Views...> views_; // exposition only

 // 26.7.20.3, class template zip_view::iterator
 template<bool> class iterator; // exposition only

 // 26.7.20.4, class template zip_view::sentinel
 template<bool> class sentinel; // exposition only

public:
 zip_view() = default;
 constexpr explicit zip_view(Views... views);

 constexpr auto begin() requires (!(simple-view<Views> && ...)) {
 return iterator<false>(tuple-transform(ranges::begin, views_));
 }
 constexpr auto begin() const requires (range<const Views> && ...) {
 return iterator<true>(tuple-transform(ranges::begin, views_));
 }

 constexpr auto end() requires (!(simple-view<Views> && ...)) {
 if constexpr (!zip-is-common<Views...>) {
 return sentinel<false>(tuple-transform(ranges::end, views_));
 } else if constexpr ((random_access_range<Views> && ...)) {
 return begin() + iter_difference_t<iterator<false>>(size());
 } else {
 return iterator<false>(tuple-transform(ranges::end, views_));
 }
 }

 constexpr auto end() const requires (range<const Views> && ...) {
 if constexpr (!zip-is-common<const Views...>) {
 return sentinel<true>(tuple-transform(ranges::end, views_));
 } else if constexpr ((random_access_range<const Views> && ...)) {
 return begin() + iter_difference_t<iterator<true>>(size());
 } else {
 return iterator<true>(tuple-transform(ranges::end, views_));
 }
 }

 constexpr auto size() requires (sized_range<Views> && ...);
 constexpr auto size() const requires (sized_range<const Views> && ...);
};

template<class... Rs>
 zip_view(Rs&&...) -> zip_view<views::all_t<Rs>...>;
}

```

<sup>1</sup> Given some pack of types *Ts*, the alias template *tuple-or-pair* is defined as follows:

- (1.1) — If `sizeof...(Ts)` is 2, *tuple-or-pair*<*Ts*...> denotes `pair<Ts...>`.
- (1.2) — Otherwise, *tuple-or-pair*<*Ts*...> denotes `tuple<Ts...>`.

- <sup>2</sup> Two `zip_view` objects have the same underlying sequence if and only if the corresponding elements of `views_` are equal (18.2) and have the same underlying sequence.

[*Note 1:* In particular, comparison of iterators obtained from `zip_view` objects that do not have the same underlying sequence is not required to produce meaningful results (25.3.4.11). — *end note*]

```
constexpr explicit zip_view(Views... views);
```

- <sup>3</sup> *Effects:* Initializes `views_` with `std::move(views)...`

```
constexpr auto size() requires (sized_range<Views> && ...);
constexpr auto size() const requires (sized_range<const Views> && ...);
```

- <sup>4</sup> *Effects:* Equivalent to:

```
return apply([](auto... sizes) {
 using CT = make_unsigned_like_t<common_type_t<decltype(sizes)...>>;
 return ranges::min({CT(sizes)...});
}, tuple_transform(ranges::size, views_));
```

### 26.7.20.3 Class template `zip_view::iterator`

[`range.zip.iterator`]

```
namespace std::ranges {
 template<bool Const, class... Views>
 concept all-random-access = // exposition only
 (random_access_range<maybe-const<Const, Views>> && ...);
 template<bool Const, class... Views>
 concept all-bidirectional = // exposition only
 (bidirectional_range<maybe-const<Const, Views>> && ...);
 template<bool Const, class... Views>
 concept all-forward = // exposition only
 (forward_range<maybe-const<Const, Views>> && ...);

 template<input_range... Views>
 requires (view<Views> && ...) && (sizeof...(Views) > 0)
 template<bool Const>
 class zip_view<Views...>::iterator {
 tuple-or-pair<iterator_t<maybe-const<Const, Views>>...> current_; // exposition only
 constexpr explicit iterator(tuple-or-pair<iterator_t<maybe-const<Const, Views>>...>); // exposition only

 public:
 using iterator_category = input_iterator_tag; // not always present
 using iterator_concept = see below;
 using value_type = tuple-or-pair<range_value_t<maybe-const<Const, Views>>...>;
 using difference_type = common_type_t<range_difference_t<maybe-const<Const, Views>>...>;

 iterator() = default;
 constexpr iterator(iterator<!Const> i)

 requires all-random-access<Const, Views...>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires all-random-access<Const, Views...>;
friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires all-random-access<Const, Views...>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires (sized_sentinel_for<iterator_t<maybe-const<Const, Views>>,
 iterator_t<maybe-const<Const, Views>>> && ...);

friend constexpr auto iter_move(const iterator& i) noexcept(see below);

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
 requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);
};
}

```

<sup>1</sup> *iterator::iterator\_concept* is defined as follows:

- (1.1) — If *all-random-access<Const, Views...>* is modeled, then *iterator\_concept* denotes *random\_access\_iterator\_tag*.
- (1.2) — Otherwise, if *all-bidirectional<Const, Views...>* is modeled, then *iterator\_concept* denotes *bidirectional\_iterator\_tag*.
- (1.3) — Otherwise, if *all-forward<Const, Views...>* is modeled, then *iterator\_concept* denotes *forward\_iterator\_tag*.
- (1.4) — Otherwise, *iterator\_concept* denotes *input\_iterator\_tag*.

<sup>2</sup> *iterator::iterator\_category* is present if and only if *all-forward<Const, Views...>* is modeled.

<sup>3</sup> If the invocation of any non-const member function of *iterator* exits via an exception, the iterator acquires a singular value.

```
constexpr explicit iterator(tuple-or-pair<iterator_t<maybe-const<Const, Views>>...> current);
```

<sup>4</sup> *Effects*: Initializes *current\_* with `std::move(current)`.

```
constexpr iterator(iterator<!Const> i)
 requires Const &&
 (convertible_to<iterator_t<Views>, iterator_t<maybe-const<Const, Views>>> && ...);
```

<sup>5</sup> *Effects*: Initializes *current\_* with `std::move(i.current_)`.

```
constexpr auto operator*() const;
```

<sup>6</sup> *Effects*: Equivalent to:

```
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
```

```
constexpr iterator& operator++();
```

<sup>7</sup> *Effects*: Equivalent to:

```
tuple-for-each([](auto& i) { ++i; }, current_);
```

```
return *this;
```

```
constexpr void operator++(int);
```

8 *Effects:* Equivalent to `+++this`.

```
constexpr iterator operator++(int) requires all-forward<Const, Views...>;
```

9 *Effects:* Equivalent to:

```
auto tmp = *this;
+++this;
return tmp;
```

```
constexpr iterator& operator--() requires all-bidirectional<Const, Views...>;
```

10 *Effects:* Equivalent to:

```
tuple-for-each([&](auto& i) { --i; }, current_);
return *this;
```

```
constexpr iterator operator--(int) requires all-bidirectional<Const, Views...>;
```

11 *Effects:* Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
```

```
requires all-random-access<Const, Views...>;
```

12 *Effects:* Equivalent to:

```
tuple-for-each([&]<class I>(I& i) { i += iter_difference_t<I>(x); }, current_);
return *this;
```

```
constexpr iterator& operator-=(difference_type x)
```

```
requires all-random-access<Const, Views...>;
```

13 *Effects:* Equivalent to:

```
tuple-for-each([&]<class I>(I& i) { i -= iter_difference_t<I>(x); }, current_);
return *this;
```

```
constexpr auto operator[](difference_type n) const
```

```
requires all-random-access<Const, Views...>;
```

14 *Effects:* Equivalent to:

```
return tuple-transform([&]<class I>(I& i) -> decltype(auto) {
 return i[iter_difference_t<I>(n)];
}, current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
```

```
requires (equality_comparable<iterator_t<maybe-const<Const, Views...>>&& ...>);
```

15 *Returns:*

- (15.1) — `x.current_ == y.current_` if `all-bidirectional<Const, Views...>` is true.
- (15.2) — Otherwise, true if there exists an integer  $0 \leq i < \text{sizeof} \dots(\text{Views})$  such that `bool(std::get<i>(x.current_ - ) == std::get<i>(y.current_))` is true.  
 [Note 1: This allows `zip_view` to model `common_range` when all constituent views model `common_range`. —end note]
- (15.3) — Otherwise, false.

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
```

```
requires all-random-access<Const, Views...>;
```

16 *Returns:* `x.current_ < y.current_`.

```

friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires all-random-access<Const, Views...>;
17 Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires all-random-access<Const, Views...>;
18 Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires all-random-access<Const, Views...>;
19 Effects: Equivalent to: return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires all-random-access<Const, Views...> &&
 (three_way_comparable<iterator_t<maybe-const<Const, Views>>> && ...);
20 Returns: x.current_ <=> y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires all-random-access<Const, Views...>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires all-random-access<Const, Views...>;
21 Effects: Equivalent to:
 auto r = i;
 r += n;
 return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires all-random-access<Const, Views...>;
22 Effects: Equivalent to:
 auto r = i;
 r -= n;
 return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires (sized_sentinel_for<iterator_t<maybe-const<Const, Views>>,
 iterator_t<maybe-const<Const, Views>>> && ...);
23 Let $DIST(i)$ be $difference_type(std::get<i>(x.current_) - std::get<i>(y.current_))$.
24 Returns: The value with the smallest absolute value among $DIST(n)$ for all integers $0 \leq n < sizeof...(Views)$.

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
25 Effects: Equivalent to:
 return tuple-transform(ranges::iter_move, i.current_);
26 Remarks: The exception specification is equivalent to:
 (noexcept(ranges::iter_move(declval<const iterator_t<maybe-const<Const,
 Views>>&>())) && ...) &&
 (is_nothrow_move_constructible_v<range_rvalue_reference_t<maybe-const<Const,
 Views>>> && ...)

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
 requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);
27 Effects: For every integer $0 \leq i < sizeof...(Views)$, performs:
 ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))
28 Remarks: The exception specification is equivalent to the logical AND of the following expressions:
 noexcept(ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_)))
 for every integer $0 \leq i < sizeof...(Views)$.

```

26.7.20.4 Class template `zip_view::sentinel`

[range.zip.sentinel]

```

namespace std::ranges {
 template<input_range... Views>
 requires (view<Views> && ...) && (sizeof...(Views) > 0)
 template<bool Const>
 class zip_view<Views...>::sentinel {
 tuple-or-pair<sentinel_t<maybe-const<Const, Views>>...> end_; // exposition only
 constexpr explicit sentinel(tuple-or-pair<sentinel_t<maybe-const<Const, Views>>...> end); // exposition only

 public:
 sentinel() = default;
 constexpr sentinel(sentinel<!Const> i)
 requires Const &&
 (convertible_to<sentinel_t<Views>, sentinel_t<maybe-const<Const, Views>>> && ...);

 template<bool OtherConst>
 requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
 iterator_t<maybe-const<OtherConst, Views>>> && ...)
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
 iterator_t<maybe-const<OtherConst, Views>>> && ...)
 friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
 operator-(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
 iterator_t<maybe-const<OtherConst, Views>>> && ...)
 friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
 operator-(const sentinel& y, const iterator<OtherConst>& x);
 };
}

```

```
constexpr explicit sentinel(tuple-or-pair<sentinel_t<maybe-const<Const, Views>>...> end);
```

1 **Effects:** Initializes `end_` with `end`.

```
constexpr sentinel(sentinel<!Const> i)
 requires Const &&
 (convertible_to<sentinel_t<Views>, sentinel_t<maybe-const<Const, Views>>> && ...);
```

2 **Effects:** Initializes `end_` with `std::move(i.end_)`.

```
template<bool OtherConst>
 requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
 iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 **Returns:** true if there exists an integer  $0 \leq i < \text{sizeof} \dots (\text{Views})$  such that `bool(std::get<i>(x.current_) == std::get<i>(y.end_))` is true. Otherwise, false.

```
template<bool OtherConst>
 requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
 iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
 operator-(const iterator<OtherConst>& x, const sentinel& y);
```

4 Let `D` be the return type. Let `DIST(i)` be `D(std::get<i>(x.current_) - std::get<i>(y.end_))`.

5 **Returns:** The value with the smallest absolute value among `DIST(n)` for all integers  $0 \leq n < \text{sizeof} \dots (\text{Views})$ .

```
template<bool OtherConst>
 requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
 iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
```

```
operator-(const sentinel& y, const iterator<OtherConst>& x);
```

6 *Effects:* Equivalent to return  $-(x - y)$ ;

## 26.7.21 Zip transform view [range.zip.transform]

### 26.7.21.1 Overview [range.zip.transform.overview]

1 zip\_transform\_view takes an invocable object and any number of views and produces a view whose  $M^{\text{th}}$  element is the result of applying the invocable object to the  $M^{\text{th}}$  elements of all views.

2 The name views::zip\_transform denotes a customization point object (16.3.3.3.6). Let F be a subexpression, and let Es... be a pack of subexpressions.

(2.1) — If Es is an empty pack, let FD be decay\_t<decltype((F))>.

(2.1.1) — If copy\_constructible<FD> && regular\_invocable<FD&& is false, or if decay\_t<invoke\_result\_t<FD&&>> is not an object type, views::zip\_transform(F, Es...) is ill-formed.

(2.1.2) — Otherwise, the expression views::zip\_transform(F, Es...) is expression-equivalent to

```
((void)F, auto{views::empty<decay_t<invoke_result_t<FD&&>>>})
```

(2.2) — Otherwise, the expression views::zip\_transform(F, Es...) is expression-equivalent to zip\_transform\_view(F, Es...).

3 [Example 1:

```
vector v1 = {1, 2};
vector v2 = {4, 5, 6};

for (auto i : views::zip_transform(plus(), v1, v2)) {
 cout << i << ' '; // prints: 5 7
}

```

—end example]

### 26.7.21.2 Class template zip\_transform\_view [range.zip.transform.view]

```
namespace std::ranges {
 template<copy_constructible F, input_range... Views>
 requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
 regular_invocable<F&, range_reference_t<Views>...> &&
 can_reference<invoke_result_t<F&, range_reference_t<Views>...>>
 class zip_transform_view : public view_interface<zip_transform_view<F, Views...>> {
 copyable_box<F> fun_; // exposition only
 zip_view<Views...> zip_; // exposition only

 using InnerView = zip_view<Views...>; // exposition only
 template<bool Const>
 using ziperator = iterator_t<maybe_const<Const, InnerView>>; // exposition only
 template<bool Const>
 using zentinel = sentinel_t<maybe_const<Const, InnerView>>; // exposition only

 // 26.7.21.3, class template zip_transform_view::iterator
 template<bool> class iterator; // exposition only

 // 26.7.21.4, class template zip_transform_view::sentinel
 template<bool> class sentinel; // exposition only

 public:
 zip_transform_view() = default;

 constexpr explicit zip_transform_view(F fun, Views... views);

 constexpr auto begin() { return iterator<false>(*this, zip_.begin()); }

 constexpr auto begin() const
 requires range<const InnerView> &&
 regular_invocable<const F&, range_reference_t<const Views>...> {
 return iterator<true>(*this, zip_.begin());
 }
 };
}

```

```

}

constexpr auto end() {
 if constexpr (common_range<InnerView>) {
 return iterator<false>(*this, zip_.end());
 } else {
 return sentinel<false>(zip_.end());
 }
}

constexpr auto end() const
 requires range<const InnerView> &&
 regular_invocable<const F&, range_reference_t<const Views>...> {
 if constexpr (common_range<const InnerView>) {
 return iterator<true>(*this, zip_.end());
 } else {
 return sentinel<true>(zip_.end());
 }
}

constexpr auto size() requires sized_range<InnerView> {
 return zip_.size();
}

constexpr auto size() const requires sized_range<const InnerView> {
 return zip_.size();
}
};

template<class F, class... Rs>
zip_transform_view(F, Rs&&...) -> zip_transform_view<F, views::all_t<Rs>...>;
}

constexpr explicit zip_transform_view(F fun, Views... views);

```

<sup>1</sup> *Effects:* Initializes *fun\_* with `std::move(fun)` and *zip\_* with `std::move(views)`....

### 26.7.21.3 Class template `zip_transform_view::iterator`

[range.zip.transform.iterator]

```

namespace std::ranges {
 template<copy_constructible F, input_range... Views>
 requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
 regular_invocable<F&, range_reference_t<Views>...> &&
 can_reference<invoke_result_t<F&, range_reference_t<Views>...>>
 template<bool Const>
 class zip_transform_view<F, Views...>::iterator {
 using Parent = maybe_const<Const, zip_transform_view>; // exposition only
 using Base = maybe_const<Const, InnerView>; // exposition only
 Parent* parent_ = nullptr; // exposition only
 ziperator<Const> inner_; // exposition only

 constexpr iterator(Parent& parent, ziperator<Const> inner); // exposition only

 public:
 using iterator_category = see below; // not always present
 using iterator_concept = typename ziperator<Const>::iterator_concept;
 using value_type =
 remove_cvref_t<invoke_result_t<maybe_const<Const, F>&,
 range_reference_t<maybe_const<Const, Views>>...>>;
 using difference_type = range_difference_t<Base>;

 iterator() = default;
 constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<ziperator<false>, ziperator<Const>>;

```

```

constexpr decltype(auto) operator*() const noexcept(see below);
constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires forward_range<Base>;

constexpr iterator& operator--() requires bidirectional_range<Base>;
constexpr iterator operator--(int) requires bidirectional_range<Base>;

constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

constexpr decltype(auto) operator[](difference_type n) const
 requires random_access_range<Base>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<ziperator<Const>>;

friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> && three_way_comparable<ziperator<Const>>;

friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<ziperator<Const>, ziperator<Const>>;
};
}

```

<sup>1</sup> The member *typedef-name* `iterator::iterator_category` is defined if and only if *Base* models `forward_range`. In that case, `iterator::iterator_category` is defined as follows:

- (1.1) — If `invoke_result_t<maybe-const<Const, F>&, range_reference_t<maybe-const<Const, Views>>...>` is not an lvalue reference, `iterator_category` denotes `input_iterator_tag`.
- (1.2) — Otherwise, let *Cs* denote the pack of types `iterator_traits<iterator_t<maybe-const<Const, Views>>>::iterator_category...`
- (1.2.1) — If `(derived_from<Cs, random_access_iterator_tag> && ...)` is true, `iterator_category` denotes `random_access_iterator_tag`.
- (1.2.2) — Otherwise, if `(derived_from<Cs, bidirectional_iterator_tag> && ...)` is true, `iterator_category` denotes `bidirectional_iterator_tag`.
- (1.2.3) — Otherwise, if `(derived_from<Cs, forward_iterator_tag> && ...)` is true, `iterator_category` denotes `forward_iterator_tag`.
- (1.2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, ziperator<Const> inner);
```

<sup>2</sup> *Effects:* Initializes `parent_` with `addressof(parent)` and `inner_` with `std::move(inner)`.

```
constexpr iterator(iterator<!Const> i)
```

```
requires Const && convertible_to<ziperator<false>, ziperator<Const>>;
```

3 *Effects:* Initializes *parent\_* with *i.parent\_* and *inner\_* with `std::move(i.inner_)`.

```
constexpr decltype(auto) operator*() const noexcept(see below);
```

4 *Effects:* Equivalent to:

```
return apply([&](const auto&... iters) -> decltype(auto) {
 return invoke(*parent_->fun_, *iters...);
}, inner_.current_);
```

5 *Remarks:* Let *Is* be the pack `0, 1, ..., (sizeof...(Views)-1)`. The exception specification is equivalent to: `noexcept(invoke(*parent_->fun_, *std::get<Is>(inner_.current_)...))`.

```
constexpr iterator& operator++();
```

6 *Effects:* Equivalent to:

```
++inner_;
return *this;
```

```
constexpr void operator++(int);
```

7 *Effects:* Equivalent to: `+++this`.

```
constexpr iterator operator++(int) requires forward_range<Base>;
```

8 *Effects:* Equivalent to:

```
auto tmp = *this;
+++this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

9 *Effects:* Equivalent to:

```
--inner_;
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

10 *Effects:* Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
requires random_access_range<Base>;
```

11 *Effects:* Equivalent to:

```
inner_ += x;
return *this;
```

```
constexpr iterator& operator-=(difference_type x)
requires random_access_range<Base>;
```

12 *Effects:* Equivalent to:

```
inner_ -= x;
return *this;
```

```
constexpr decltype(auto) operator[](difference_type n) const
requires random_access_range<Base>;
```

13 *Effects:* Equivalent to:

```
return apply([&]<class... Is>(const Is&... iters) -> decltype(auto) {
 return invoke(*parent_->fun_, iters[iter_difference_t<Is>(n)]...);
}, inner_.current_);
```

```

friend constexpr bool operator==(const iterator& x, const iterator& y)
 requires equality_comparable<ziperator<Const>>;
friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> && three_way_comparable<ziperator<Const>>;

```

14 Let *op* be the operator.

15 *Effects*: Equivalent to: return *x.inner\_ op y.inner\_*;

```

friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires random_access_range<Base>;

```

16 *Effects*: Equivalent to: return *iterator(\*i.parent\_, i.inner\_ + n)*;

```

friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires random_access_range<Base>;

```

17 *Effects*: Equivalent to: return *iterator(\*i.parent\_, i.inner\_ - n)*;

```

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<ziperator<Const>, ziperator<Const>>;

```

18 *Effects*: Equivalent to: return *x.inner\_ - y.inner\_*;

#### 26.7.21.4 Class template `zip_transform_view::sentinel`

[range.zip.transform.sentinel]

```

namespace std::ranges {
 template<copy_constructible F, input_range... Views>
 requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
 regular_invocable<F&, range_reference_t<Views>...> &&
 can_reference<invoke_result_t<F&, range_reference_t<Views>...>>
 template<bool Const>
 class zip_transform_view<F, Views...>::sentinel {
 zentinel<Const> inner_; // exposition only
 constexpr explicit sentinel(zentinel<Const> inner); // exposition only

 public:
 sentinel() = default;
 constexpr sentinel(sentinel<!Const> i)
 requires Const && convertible_to<zentinel<false>, zentinel<Const>>;

 template<bool OtherConst>
 requires sentinel_for<zentinel<Const>, ziperator<OtherConst>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
 friend constexpr range_difference_t<maybe_const<OtherConst>, InnerView>>
 operator-(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
 friend constexpr range_difference_t<maybe_const<OtherConst>, InnerView>>
 operator-(const sentinel& x, const iterator<OtherConst>& y);
 };
}

```

```
constexpr explicit sentinel(z Sentinel<Const> inner);
```

1 *Effects:* Initializes *inner\_* with *inner*.

```
constexpr sentinel(sentinel<!Const> i)
requires Const && convertible_to<z Sentinel<false>, z Sentinel<Const>>;
```

2 *Effects:* Initializes *inner\_* with `std::move(i.inner_)`.

```
template<bool OtherConst>
requires sentinel_for<z Sentinel<Const>, ziperator<OtherConst>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects:* Equivalent to: `return x.inner_ == y.inner_;`

```
template<bool OtherConst>
requires sized_sentinel_for<z Sentinel<Const>, ziperator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
operator-(const iterator<OtherConst>& x, const sentinel& y);
template<bool OtherConst>
requires sized_sentinel_for<z Sentinel<Const>, ziperator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
operator-(const sentinel& x, const iterator<OtherConst>& y);
```

4 *Effects:* Equivalent to: `return x.inner_ - y.inner_;`

## 26.7.22 Adjacent view

[range.adjacent]

### 26.7.22.1 Overview

[range.adjacent.overview]

1 `adjacent_view` takes a view and produces a view whose  $M^{\text{th}}$  element is a tuple of references to the  $M^{\text{th}}$  through  $(M + N - 1)^{\text{th}}$  elements of the original view. If the original view has fewer than  $N$  elements, the resulting view is empty.

2 The name `views::adjacent<N>` denotes a range adaptor object (26.7.2). Given a subexpression  $E$  and a constant expression  $N$ , the expression `views::adjacent<N>(E)` is expression-equivalent to

(2.1) — `((void)E, auto{views::empty}<tuple<>>)` if  $N$  is equal to 0,

(2.2) — otherwise, `adjacent_view<views::all_t<decltype((E))>, N>(E)`.

[Example 1:

```
vector v = {1, 2, 3, 4};
```

```
for (auto i : v | views::adjacent<2>) {
 cout << "(" << i.first << ", " << i.second << ") "; // prints: (1, 2) (2, 3) (3, 4)
}
```

—end example]

3 Define `REPEAT(T, N)` as a pack of  $N$  types, each of which denotes the same type as  $T$ .

### 26.7.22.2 Class template `adjacent_view`

[range.adjacent.view]

```
namespace std::ranges {
 template<forward_range V, size_t N>
 requires view<V> && (N > 0)
 class adjacent_view : public view_interface<adjacent_view<V, N>> {
 V base_ = V(); // exposition only

 // 26.7.22.3, class template adjacent_view::iterator
 template<bool> class iterator; // exposition only

 // 26.7.22.4, class template adjacent_view::sentinel
 template<bool> class sentinel; // exposition only

 struct as-sentinel{}; // exposition only

 public:
 adjacent_view() requires default_initializable<V> = default;
 constexpr explicit adjacent_view(V base);
```

```

constexpr auto begin() requires (!simple-view<V>) {
 return iterator<false>(ranges::begin(base_), ranges::end(base_));
}

constexpr auto begin() const requires range<const V> {
 return iterator<true>(ranges::begin(base_), ranges::end(base_));
}

constexpr auto end() requires (!simple-view<V>) {
 if constexpr (common_range<V>) {
 return iterator<false>(as-sentinel{}, ranges::begin(base_), ranges::end(base_));
 } else {
 return sentinel<false>(ranges::end(base_));
 }
}

constexpr auto end() const requires range<const V> {
 if constexpr (common_range<const V>) {
 return iterator<true>(as-sentinel{}, ranges::begin(base_), ranges::end(base_));
 } else {
 return sentinel<true>(ranges::end(base_));
 }
}

constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
};
}

```

```
constexpr explicit adjacent_view(V base);
```

1 *Effects:* Initializes *base\_* with `std::move(base)`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

2 *Effects:* Equivalent to:

```

using ST = decltype(ranges::size(base_));
using CT = common_type_t<ST, size_t>;
auto sz = static_cast<CT>(ranges::size(base_));
sz -= std::min<CT>(sz, N - 1);
return static_cast<ST>(sz);

```

### 26.7.22.3 Class template `adjacent_view::iterator`

[`range.adjacent.iterator`]

```

namespace std::ranges {
 template<forward_range V, size_t N>
 requires view<V> && (N > 0)
 template<bool Const>
 class adjacent_view<V, N>::iterator {
 using Base = maybe_const<Const, V>; // exposition only
 array<iterator_t<Base>, N> current_ = array<iterator_t<Base>, N>(); // exposition only
 constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last); // exposition only
 constexpr iterator(as-sentinel, iterator_t<Base> first, iterator_t<Base> last); // exposition only

 public:
 using iterator_category = input_iterator_tag;
 using iterator_concept = see_below;
 using value_type = tuple-or-pair<REPEAT(range_value_t<Base>, N)...>;
 using difference_type = range_difference_t<Base>;

 iterator() = default;
 constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

```

```

constexpr auto operator*() const;
constexpr iterator& operator++();
constexpr iterator operator++(int);

constexpr iterator& operator--() requires bidirectional_range<Base>;
constexpr iterator operator--(int) requires bidirectional_range<Base>;

constexpr iterator& operator+=(difference_type x)
 requires random_access_range<Base>;
constexpr iterator& operator-=(difference_type x)
 requires random_access_range<Base>;

constexpr auto operator[](difference_type n) const
 requires random_access_range<Base>;

friend constexpr bool operator==(const iterator& x, const iterator& y);
friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> &&
 three_way_comparable<iterator_t<Base>>;

friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
 requires indirectly_swappable<iterator_t<Base>>;
};
}

```

<sup>1</sup> *iterator::iterator\_concept* is defined as follows:

- (1.1) — If *Base* models *random\_access\_range*, then *iterator\_concept* denotes *random\_access\_iterator\_tag*.
- (1.2) — Otherwise, if *Base* models *bidirectional\_range*, then *iterator\_concept* denotes *bidirectional\_iterator\_tag*.
- (1.3) — Otherwise, *iterator\_concept* denotes *forward\_iterator\_tag*.

<sup>2</sup> If the invocation of any non-const member function of *iterator* exits via an exception, the *iterator* acquires a singular value.

```
constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last);
```

- <sup>3</sup> *Postconditions*: *current\_[0] == first* is true, and for every integer  $1 \leq i < N$ , *current\_[i] == ranges::next(current\_[i-1], 1, last)* is true.

```
constexpr iterator(as-sentinel, iterator_t<Base> first, iterator_t<Base> last);
```

- <sup>4</sup> *Postconditions*: If *Base* does not model *bidirectional\_range*, each element of *current\_* is equal to *last*. Otherwise, *current\_[N-1] == last* is true, and for every integer  $0 \leq i < (N-1)$ , *current\_[i] == ranges::prev(current\_[i+1], 1, first)* is true.

```
constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

5       *Effects:* Initializes each element of *current\_* with the corresponding element of *i.current\_* as an xvalue.

```
constexpr auto operator*() const;
```

6       *Effects:* Equivalent to:

```
 return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
```

```
constexpr iterator& operator++();
```

7       *Preconditions:* *current\_.back()* is incrementable.

8       *Postconditions:* Each element of *current\_* is equal to `ranges::next(i)`, where *i* is the value of that element before the call.

9       *Returns:* *\*this*.

```
constexpr iterator operator++(int);
```

10      *Preconditions:* Equivalent to:

```
 auto tmp = *this;
 ++*this;
 return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

11      *Preconditions:* *current\_.front()* is decrementable.

12      *Postconditions:* Each element of *current\_* is equal to `ranges::prev(i)`, where *i* is the value of that element before the call.

13      *Returns:* *\*this*.

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

14      *Effects:* Equivalent to:

```
 auto tmp = *this;
 --*this;
 return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
 requires random_access_range<Base>;
```

15      *Preconditions:* *current\_.back()* + *x* has well-defined behavior.

16      *Postconditions:* Each element of *current\_* is equal to *i* + *x*, where *i* is the value of that element before the call.

17      *Returns:* *\*this*.

```
constexpr iterator& operator-=(difference_type x)
 requires random_access_range<Base>;
```

18      *Preconditions:* *current\_.front()* - *x* has well-defined behavior.

19      *Postconditions:* Each element of *current\_* is equal to *i* - *x*, where *i* is the value of that element before the call.

20      *Returns:* *\*this*.

```
constexpr auto operator[](difference_type n) const
 requires random_access_range<Base>;
```

21      *Effects:* Equivalent to:

```
 return tuple-transform([&](auto& i) -> decltype(auto) { return i[n]; }, current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

22      *Returns:* *x.current\_.back()* == *y.current\_.back()*.

```

friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
23 Returns: x.current_.back() < y.current_.back().

friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
24 Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
25 Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
26 Effects: Equivalent to: return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> &&
 three_way_comparable<iterator_t<Base>>;
27 Returns: x.current_.back() <=> y.current_.back().

friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires random_access_range<Base>;
28 Effects: Equivalent to:
 auto r = i;
 r += n;
 return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires random_access_range<Base>;
29 Effects: Equivalent to:
 auto r = i;
 r -= n;
 return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
30 Effects: Equivalent to: return x.current_.back() - y.current_.back();

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
31 Effects: Equivalent to: return tuple-transform(ranges::iter_move, i.current_);
32 Remarks: The exception specification is equivalent to:
 noexcept(ranges::iter_move(declval<const iterator_t<Base>&>())) &&
 is_nothrow_move_constructible_v<range_rvalue_reference_t<Base>>

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
 requires indirectly_swappable<iterator_t<Base>>;
33 Preconditions: None of the iterators in l.current_ is equal to an iterator in r.current_.
34 Effects: For every integer $0 \leq i < N$, performs ranges::iter_swap(l.current_[i], r.current_[i]).
35 Remarks: The exception specification is equivalent to:
 noexcept(ranges::iter_swap(declval<iterator_t<Base>>(), declval<iterator_t<Base>>()))

```

#### 26.7.22.4 Class template `adjacent_view::sentinel`

[`range.adjacent.sentinel`]

```

namespace std::ranges {
 template<forward_range V, size_t N>

```

```

 requires view<V> && (N > 0)
template<bool Const>
class adjacent_view<V, N>::sentinel {
 using Base = maybe-const<Const, V>; // exposition only
 sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
 constexpr explicit sentinel(sentinel_t<Base> end); // exposition only

public:
 sentinel() = default;
 constexpr sentinel(sentinel_t<!Const> i)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

 template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const iterator<OtherConst>& x, const sentinel& y);

 template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
 friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const sentinel& y, const iterator<OtherConst>& x);
};
}

```

```
constexpr explicit sentinel(sentinel_t<Base> end);
```

1 *Effects:* Initializes *end\_* with *end*.

```
constexpr sentinel(sentinel_t<!Const> i)
 requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects:* Initializes *end\_* with `std::move(i.end_)`.

```
template<bool OtherConst>
 requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects:* Equivalent to: `return x.current_.back() == y.end_;`

```
template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const iterator<OtherConst>& x, const sentinel& y);
```

4 *Effects:* Equivalent to: `return x.current_.back() - y.end_;`

```
template<bool OtherConst>
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
 operator-(const sentinel& y, const iterator<OtherConst>& x);
```

5 *Effects:* Equivalent to: `return y.end_ - x.current_.back();`

## 26.7.23 Adjacent transform view

[range.adjacent.transform]

### 26.7.23.1 Overview

[range.adjacent.transform.overview]

- 1 `adjacent_transform_view` takes an invocable object and a view and produces a view whose  $M^{\text{th}}$  element is the result of applying the invocable object to the  $M^{\text{th}}$  through  $(M + N - 1)^{\text{th}}$  elements of the original view. If the original view has fewer than  $N$  elements, the resulting view is empty.
- 2 The name `views::adjacent_transform<N>` denotes a range adaptor object (26.7.2). Given subexpressions  $E$  and  $F$  and a constant expression  $N$ :

- (2.1) — If  $N$  is equal to 0, `views::adjacent_transform<N>(E, F)` is expression-equivalent to `((void)E, views::zip_transform(F))`, except that the evaluations of  $E$  and  $F$  are indeterminately sequenced.
- (2.2) — Otherwise, the expression `views::adjacent_transform<N>(E, F)` is expression-equivalent to `adjacent_transform_view<views::all_t<decltype((E))>, decay_t<decltype((F))>, N>(E, F)`.

<sup>3</sup> [Example 1:

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::adjacent_transform<2>(std::multiplies())) {
 cout << i << ' '; // prints: 2 6 12
}

```

—end example]

### 26.7.23.2 Class template `adjacent_transform_view`

[range.adjacent.transform.view]

```
namespace std::ranges {
 template<forward_range V, copy_constructible F, size_t N>
 requires view<V> && (N > 0) && is_object_v<F> &&
 regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
 can_reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
 class adjacent_transform_view : public view_interface<adjacent_transform_view<V, F, N>> {
 copyable_box<F> fun_; // exposition only
 adjacent_view<V, N> inner_; // exposition only

 using InnerView = adjacent_view<V, N>; // exposition only
 template<bool Const>
 using inner_iterator = iterator_t<maybe_const<Const, InnerView>>; // exposition only
 template<bool Const>
 using inner_sentinel = sentinel_t<maybe_const<Const, InnerView>>; // exposition only

 // 26.7.23.3, class template adjacent_transform_view::iterator
 template<bool> class iterator; // exposition only

 // 26.7.23.4, class template adjacent_transform_view::sentinel
 template<bool> class sentinel; // exposition only

 public:
 adjacent_transform_view() = default;
 constexpr explicit adjacent_transform_view(V base, F fun);

 constexpr auto begin() {
 return iterator<false>(*this, inner_.begin());
 }

 constexpr auto begin() const
 requires range<const InnerView> &&
 regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
 return iterator<true>(*this, inner_.begin());
 }

 constexpr auto end() {
 if constexpr (common_range<InnerView>) {
 return iterator<false>(*this, inner_.end());
 } else {
 return sentinel<false>(inner_.end());
 }
 }

 constexpr auto end() const
 requires range<const InnerView> &&
 regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
 if constexpr (common_range<const InnerView>) {
 return iterator<true>(*this, inner_.end());
 } else {
 return sentinel<false>(*this, inner_.end());
 }
 }
 };
}

```

```

 return sentinel<true>(inner_.end());
 }
}

constexpr auto size() requires sized_range<InnerView> {
 return inner_.size();
}

constexpr auto size() const requires sized_range<const InnerView> {
 return inner_.size();
}
};
}

```

```
constexpr explicit adjacent_transform_view(V base, F fun);
```

<sup>1</sup> *Effects:* Initializes *fun\_* with `std::move(fun)` and *inner\_* with `std::move(base)`.

### 26.7.23.3 Class template `adjacent_transform_view::iterator` [range.adjacent.transform.iterator]

```

namespace std::ranges {
 template<forward_range V, copy_constructible F, size_t N>
 requires view<V> && (N > 0) && is_object_v<F> &&
 regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
 can_reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
 template<bool Const>
 class adjacent_transform_view<F, V...>::iterator {
 using Parent = maybe_const<Const, adjacent_transform_view>; // exposition only
 using Base = maybe_const<Const, V>; // exposition only
 Parent* parent_ = nullptr; // exposition only
 inner_iterator<Const> inner_; // exposition only

 constexpr iterator(Parent& parent, inner_iterator<Const> inner); // exposition only

 public:
 using iterator_category = see_below;
 using iterator_concept = typename inner_iterator<Const>::iterator_concept;
 using value_type =
 remove_cvref_t<invoke_result_t<maybe_const<Const, F>&,
 REPEAT(range_reference_t<Base>, N)...>>;
 using difference_type = range_difference_t<Base>;

 iterator() = default;
 constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<inner_iterator<false>, inner_iterator<Const>>;

 constexpr decltype(auto) operator*() const noexcept(see below);
 constexpr iterator& operator++();
 constexpr iterator& operator++(int);
 constexpr iterator& operator--() requires bidirectional_range<Base>;
 constexpr iterator& operator--(int) requires bidirectional_range<Base>;
 constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
 constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

 constexpr decltype(auto) operator[](difference_type n) const
 requires random_access_range<Base>;

 friend constexpr bool operator==(const iterator& x, const iterator& y);
 friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 };
}

```

```

friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> && three_way_comparable<inner-iterator<Const>>;

friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<inner-iterator<Const>, inner-iterator<Const>>;
};
}

```

<sup>1</sup> The member *typedef-name* `iterator::iterator_category` is defined as follows:

- (1.1) — If `invoke_result_t<maybe_const<Const, F>&, REPEAT(range_reference_t<Base>, N)...>` is not an lvalue reference, `iterator_category` denotes `input_iterator_tag`.
- (1.2) — Otherwise, let C denote the type `iterator_traits<iterator_t<Base>>::iterator_category`.
  - (1.2.1) — If `derived_from<C, random_access_iterator_tag>` is true, `iterator_category` denotes `random_access_iterator_tag`.
  - (1.2.2) — Otherwise, if `derived_from<C, bidirectional_iterator_tag>` is true, `iterator_category` denotes `bidirectional_iterator_tag`.
  - (1.2.3) — Otherwise, if `derived_from<C, forward_iterator_tag>` is true, `iterator_category` denotes `forward_iterator_tag`.
  - (1.2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, inner-iterator<Const> inner);
```

<sup>2</sup> *Effects:* Initializes `parent_` with `addressof(parent)` and `inner_` with `std::move(inner)`.

```
constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<inner-iterator<>false>, inner-iterator<Const>>;
```

<sup>3</sup> *Effects:* Initializes `parent_` with `i.parent_` and `inner_` with `std::move(i.inner_)`.

```
constexpr decltype(auto) operator*() const noexcept(see below);
```

<sup>4</sup> *Effects:* Equivalent to:

```
return apply([&](const auto&... iters) -> decltype(auto) {
 return invoke(*parent_->fun_, *iters...);
}, inner_.current_);
```

<sup>5</sup> *Remarks:* Let `Is` be the pack `0, 1, ..., (N-1)`. The exception specification is equivalent to:

```
noexcept(invoke(*parent_->fun_, *std::get<Is>(inner_.current_)...))
```

```
constexpr iterator& operator++();
```

<sup>6</sup> *Effects:* Equivalent to:

```
++inner_;
return *this;
```

```
constexpr iterator operator++(int);
```

<sup>7</sup> *Effects:* Equivalent to:

```
auto tmp = *this;
+++this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

<sup>8</sup> *Effects:* Equivalent to:

```
--inner_;
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

9 *Effects:* Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
```

10 *Effects:* Equivalent to:

```
inner_ += x;
return *this;
```

```
constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;
```

11 *Effects:* Equivalent to:

```
inner_ -= x;
return *this;
```

```
constexpr decltype(auto) operator[](difference_type n) const
requires random_access_range<Base>;
```

12 *Effects:* Equivalent to:

```
return apply([&](const auto&... iters) -> decltype(auto) {
 return invoke(*parent_->fun_, iters[n]...);
}, inner_.current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
```

```
requires random_access_range<Base>;
```

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
```

```
requires random_access_range<Base>;
```

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
```

```
requires random_access_range<Base>;
```

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
```

```
requires random_access_range<Base>;
```

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
```

```
requires random_access_range<Base> && three_way_comparable<inner-iterator<Const>>;
```

13 Let *op* be the operator.

14 *Effects:* Equivalent to: return *x*.*inner\_* *op* *y*.*inner\_*;

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
```

```
requires random_access_range<Base>;
```

```
friend constexpr iterator operator+(difference_type n, const iterator& i)
```

```
requires random_access_range<Base>;
```

15 *Effects:* Equivalent to: return *iterator*(\**i*.*parent\_*, *i*.*inner\_* + *n*);

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
```

```
requires random_access_range<Base>;
```

16 *Effects:* Equivalent to: return *iterator*(\**i*.*parent\_*, *i*.*inner\_* - *n*);

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
```

```
requires sized_sentinel_for<inner-iterator<Const>, inner-iterator<Const>>;
```

17 *Effects:* Equivalent to: return *x*.*inner\_* - *y*.*inner\_*;

#### 26.7.23.4 Class template `adjacent_transform_view::sentinel`

[range.adjacent.transform.sentinel]

```
namespace std::ranges {
```

```
template<forward_range V, copy_constructible F, size_t N>
```

```
requires view<V> && (N > 0) && is_object_v<F> &&
```

```
regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
```

```

 can-reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>

```

4 *Effects:* Equivalent to return `x.inner_ - y.inner_;`

## 26.7.24 Chunk view

[range.chunk]

### 26.7.24.1 Overview

[range.chunk.overview]

- 1 `chunk_view` takes a view and a number *N* and produces a range of views that are *N*-sized non-overlapping successive chunks of the elements of the original view, in order. The last view in the range can have fewer than *N* elements.
- 2 The name `views::chunk` denotes a range adaptor object (26.7.2). Given subexpressions *E* and *N*, the expression `views::chunk(E, N)` is expression-equivalent to `chunk_view(E, N)`.

[Example 1:

```
vector v = {1, 2, 3, 4, 5};
```

```

for (auto r : v | views::chunk(2)) {
 cout << '[';
 auto sep = "";
 for(auto i : r) {
 cout << sep << i;
 sep = ", ";
 }
 cout << "]" ";
}

```

The above prints: [1, 2] [3, 4] [5] — *end example*

### 26.7.24.2 chunk\_view for input ranges

[range.chunk.view.input]

```

namespace std::ranges {
 template<class I>
 constexpr I div-ceil(I num, I denom) { // exposition only
 I r = num / denom;
 if (num % denom)
 ++r;
 return r;
 }

 template<view V>
 requires input_range<V>
 class chunk_view : public view_interface<chunk_view<V>> {
 V base_ = V(); // exposition only
 range_difference_t<V> n_ = 0; // exposition only
 range_difference_t<V> remainder_ = 0; // exposition only

 non-propagating-cache<iterator_t<V>> current_; // exposition only

 // 26.7.24.3, class chunk_view::outer-iterator
 class outer-iterator; // exposition only

 // 26.7.24.5, class chunk_view::inner-iterator
 class inner-iterator; // exposition only

 public:
 chunk_view() requires default_initializable<V> = default;
 constexpr explicit chunk_view(V base, range_difference_t<V> n);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr outer-iterator begin();
 constexpr default_sentinel_t end() noexcept;

 constexpr auto size() requires sized_range<V>;
 constexpr auto size() const requires sized_range<const V>;
 };

 template<class R>
 chunk_view(R&& r, range_difference_t<R>) -> chunk_view<views::all_t<R>>;
}

```

```
constexpr explicit chunk_view(V base, range_difference_t<V> n);
```

1 *Preconditions:*  $n > 0$  is true.

2 *Effects:* Initializes *base\_* with `std::move(base)` and *n\_* with *n*.

```
constexpr outer-iterator begin();
```

3 *Effects:* Equivalent to:

```

current_ = ranges::begin(base_);
remainder_ = n_;

```

```
 return outer-iterator(*this);
```

```
constexpr default_sentinel_t end() noexcept;
```

4 *Returns:* default\_sentinel.

```
constexpr auto size() requires sized_range<V>;
```

```
constexpr auto size() const requires sized_range<const V>;
```

5 *Effects:* Equivalent to:

```
 return to-unsigned-like(div-ceil(ranges::distance(base_), n_));
```

### 26.7.24.3 Class chunk\_view::outer\_iterator

[range.chunk.outer.iter]

```
namespace std::ranges {
 template<view V>
 requires input_range<V>
 class chunk_view<V>::outer_iterator {
 chunk_view* parent_; // exposition only

 constexpr explicit outer-iterator(chunk_view& parent); // exposition only

 public:
 using iterator_concept = input_iterator_tag;
 using difference_type = range_difference_t<V>;

 // 26.7.24.4, class chunk_view::outer_iterator::value_type
 struct value_type;

 outer-iterator(outer-iterator&&) = default;
 outer-iterator& operator=(outer-iterator&&) = default;

 constexpr value_type operator*() const;
 constexpr outer-iterator& operator++();
 constexpr void operator++(int);

 friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);

 friend constexpr difference_type operator-(default_sentinel_t y, const outer-iterator& x)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
 friend constexpr difference_type operator-(const outer-iterator& x, default_sentinel_t y)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
 };
 }
}
```

```
constexpr explicit outer-iterator(chunk_view& parent);
```

1 *Effects:* Initializes *parent\_* with addressof(parent).

```
constexpr value_type operator*() const;
```

2 *Preconditions:* \*this == default\_sentinel is false.

3 *Returns:* value\_type(\*parent\_).

```
constexpr outer-iterator& operator++();
```

4 *Preconditions:* \*this == default\_sentinel is false.

5 *Effects:* Equivalent to:

```
 ranges::advance(*parent_->current_, parent_->remainder_, ranges::end(parent_->base_));
 parent_->remainder_ = parent_->n_;
 return *this;
```

```
constexpr void operator++(int);
```

6 *Effects:* Equivalent to ++\*this.

```
friend constexpr bool operator==(const outer_iterator& x, default_sentinel_t);
```

7 *Effects:* Equivalent to:

```
return *x.parent_->current_ == ranges::end(x.parent_->base_) && x.parent_->remainder_ != 0;
```

```
friend constexpr difference_type operator-(default_sentinel_t y, const outer_iterator& x)
requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

8 *Effects:* Equivalent to:

```
const auto dist = ranges::end(x.parent_->base_) - *x.parent_->current_;
if (dist < x.parent_->remainder_) {
 return dist == 0 ? 0 : 1;
}
return div-ceil(dist - x.parent_->remainder_, x.parent_->n_) + 1;
```

```
friend constexpr difference_type operator-(const outer_iterator& x, default_sentinel_t y)
requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

9 *Effects:* Equivalent to: return  $-(y - x)$ ;

#### 26.7.24.4 Class `chunk_view::outer_iterator::value_type`

[range.chunk.outer.value]

```
namespace std::ranges {
 template<view V>
 requires input_range<V>
 struct chunk_view<V>::outer_iterator::value_type : view_interface<value_type> {
 private:
 chunk_view* parent_; // exposition only

 constexpr explicit value_type(chunk_view& parent); // exposition only

 public:
 constexpr inner_iterator begin() const noexcept;
 constexpr default_sentinel_t end() const noexcept;

 constexpr auto size() const
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
 };
}
```

```
constexpr explicit value_type(chunk_view& parent);
```

1 *Effects:* Initializes `parent_` with `addressof(parent)`.

```
constexpr inner_iterator begin() const noexcept;
```

2 *Returns:* `inner_iterator(*parent_)`.

```
constexpr default_sentinel_t end() const noexcept;
```

3 *Returns:* `default_sentinel`.

```
constexpr auto size() const
requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

4 *Effects:* Equivalent to:

```
return ranges::min(parent_->remainder_, ranges::end(parent_->base_) - *parent_->current_);
```

#### 26.7.24.5 Class `chunk_view::inner_iterator`

[range.chunk.inner.iter]

```
namespace std::ranges {
 template<view V>
 requires input_range<V>
 class chunk_view<V>::inner_iterator {
 private:
 chunk_view* parent_; // exposition only

 constexpr explicit inner_iterator(chunk_view& parent) noexcept; // exposition only
 };
}
```

```

public:
 using iterator_concept = input_iterator_tag;
 using difference_type = range_difference_t<V>;
 using value_type = range_value_t<V>;

 inner-iterator(inner-iterator&&) = default;
 inner-iterator& operator=(inner-iterator&&) = default;

 constexpr const iterator_t<V>& base() const &;

 friend constexpr difference_type operator-(const inner-iterator& x, default_sentinel_t y)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
};
}

constexpr explicit inner-iterator(chunk_view& parent) noexcept;
1 Effects: Initializes parent_ with addressof(parent).

constexpr const iterator_t<V>& base() const &;
2 Effects: Equivalent to: return *parent_ -> current_;

constexpr range_reference_t<V> operator*() const;
3 Preconditions: *this == default_sentinel is false.
4 Effects: Equivalent to: return **parent_ -> current_;

constexpr inner-iterator& operator++();
5 Preconditions: *this == default_sentinel is false.
6 Effects: Equivalent to:
 +++parent_ -> current_;
 if (*parent_ -> current_ == ranges::end(parent_ -> base_))
 parent_ -> remainder_ = 0;
 else
 --parent_ -> remainder_;
 return *this;

constexpr void operator++(int);
7 Effects: Equivalent to +++this.

friend constexpr bool operator==(const inner-iterator& x, default_sentinel_t);
8 Returns: x.parent_ -> remainder_ == 0.

friend constexpr difference_type operator-(default_sentinel_t y, const inner-iterator& x)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
9 Effects: Equivalent to:
 return ranges::min(x.parent_ -> remainder_,
 ranges::end(x.parent_ -> base_) - *x.parent_ -> current_);

friend constexpr difference_type operator-(const inner-iterator& x, default_sentinel_t y)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
10 Effects: Equivalent to: return -(y - x);

```

26.7.24.6 **chunk\_view** for forward ranges

[range.chunk.view.fwd]

```

namespace std::ranges {
 template<view V>
 requires forward_range<V>
 class chunk_view<V> : public view_interface<chunk_view<V>> {

friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y)
 requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
27 Effects: Equivalent to: return $-(y - x)$;

```

## 26.7.25 Slide view

[range.slide]

### 26.7.25.1 Overview

[range.slide.overview]

- 1 slide\_view takes a view and a number  $N$  and produces a view whose  $M^{\text{th}}$  element is a view over the  $M^{\text{th}}$  through  $(M + N - 1)^{\text{th}}$  elements of the original view. If the original view has fewer than  $N$  elements, the resulting view is empty.
- 2 The name `views::slide` denotes a range adaptor object (26.7.2). Given subexpressions  $E$  and  $N$ , the expression `views::slide(E, N)` is expression-equivalent to `slide_view(E, N)`.

[Example 1:

```

vector v = {1, 2, 3, 4};

for (auto i : v | views::slide(2)) {
 cout << '[' << i[0] << ", " << i[1] << "] "; // prints: [1, 2] [2, 3] [3, 4]
}

```

—end example]

### 26.7.25.2 Class template slide\_view

[range.slide.view]

```

namespace std::ranges {
 template<class V>
 concept slide_caches_nothing = random_access_range<V> && sized_range<V>; // exposition only

 template<class V>
 concept slide_caches_last = // exposition only
 !slide_caches_nothing<V> && bidirectional_range<V> && common_range<V>;

 template<class V>
 concept slide_caches_first = // exposition only
 !slide_caches_nothing<V> && !slide_caches_last<V>;

 template<forward_range V>
 requires view<V>
 class slide_view : public view_interface<slide_view<V>> {
 V base_ = V(); // exposition only
 range_difference_t<V> n_ = 0; // exposition only

 // 26.7.25.3, class template slide_view::iterator
 template<bool> class iterator; // exposition only

 // 26.7.25.4, class slide_view::sentinel
 class sentinel; // exposition only
 };
}

```

```

public:
 slide_view() requires default_initializable<V> = default;
 constexpr explicit slide_view(V base, range_difference_t<V> n);

 constexpr auto begin()
 requires (!(simple-view<V> && slide-caches-nothing<const V>));
 constexpr auto begin() const requires slide-caches-nothing<const V>;

 constexpr auto end()
 requires (!(simple-view<V> && slide-caches-nothing<const V>));
 constexpr auto end() const requires slide-caches-nothing<const V>;

 constexpr auto size() requires sized_range<V>;
 constexpr auto size() const requires sized_range<const V>;
};

template<class R>
 slide_view(R&& r, range_difference_t<R>) -> slide_view<views::all_t<R>>;
}

```

```
constexpr explicit slide_view(V base, range_difference_t<V> n);
```

1 **Effects:** Initializes *base\_* with `std::move(base)` and *n\_* with *n*.

```
constexpr auto begin()
 requires (!(simple-view<V> && slide-caches-nothing<const V>));
```

2 **Returns:**

(2.1) — If *V* models *slide-caches-first*,

```
iterator<false>(ranges::begin(base_),
 ranges::next(ranges::begin(base_), n_ - 1, ranges::end(base_)), n_)
```

(2.2) — Otherwise, `iterator<false>(ranges::begin(base_), n_)`.

3 **Remarks:** In order to provide the amortized constant-time complexity required by the range concept, this function caches the result within the `slide_view` for use on subsequent calls when *V* models *slide-caches-first*.

```
constexpr auto begin() const requires slide-caches-nothing<const V>;
```

4 **Returns:** `iterator<true>(ranges::begin(base_), n_)`.

```
constexpr auto end()
 requires (!(simple-view<V> && slide-caches-nothing<const V>));
```

5 **Returns:**

(5.1) — If *V* models *slide-caches-nothing*,

```
iterator<false>(ranges::begin(base_) + range_difference_t<V>(size()), n_)
```

(5.2) — Otherwise, if *V* models *slide-caches-last*,

```
iterator<false>(ranges::prev(ranges::end(base_), n_ - 1, ranges::begin(base_)), n_)
```

(5.3) — Otherwise, if *V* models *common\_range*,

```
iterator<false>(ranges::end(base_), ranges::end(base_), n_)
```

(5.4) — Otherwise, `sentinel(ranges::end(base_))`.

6 **Remarks:** In order to provide the amortized constant-time complexity required by the range concept, this function caches the result within the `slide_view` for use on subsequent calls when *V* models *slide-caches-last*.

```
constexpr auto end() const requires slide-caches-nothing<const V>;
```

7 **Returns:** `begin() + range_difference_t<const V>(size())`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

8 **Effects:** Equivalent to:

```

 auto sz = ranges::distance(base_) - n_ + 1;
 if (sz < 0) sz = 0;
 return to-unsigned-like(sz);

```

### 26.7.25.3 Class template `slide_view::iterator`

[range.slide.iterator]

```

 friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
 friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> &&
 three_way_comparable<iterator_t<Base>>;

 friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires random_access_range<Base>;

```

```

 friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires random_access_range<Base>;
 friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires random_access_range<Base>;
 friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
};
}

```

1 *iterator::iterator\_concept* is defined as follows:

- (1.1) — If *Base* models *random\_access\_range*, then *iterator\_concept* denotes *random\_access\_iterator\_tag*.
- (1.2) — Otherwise, if *Base* models *bidirectional\_range*, then *iterator\_concept* denotes *bidirectional\_iterator\_tag*.
- (1.3) — Otherwise, *iterator\_concept* denotes *forward\_iterator\_tag*.

2 If the invocation of any non-const member function of *iterator* exits via an exception, the *iterator* acquires a singular value.

```

constexpr iterator(iterator_t<Base> current, range_difference_t<Base> n)
 requires (!slide-caches-first<Base>);

```

3 *Effects*: Initializes *current\_* with *current* and *n\_* with *n*.

```

constexpr iterator(iterator_t<Base> current, iterator_t<Base> last_ele,
 range_difference_t<Base> n)
 requires slide-caches-first<Base>;

```

4 *Effects*: Initializes *current\_* with *current*, *last\_ele\_* with *last\_ele*, and *n\_* with *n*.

```

constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

```

5 *Effects*: Initializes *current\_* with `std::move(i.current_)` and *n\_* with `i.n_`.

[*Note 1*: *iterator*<*true*> can only be formed when *Base* models *slide-caches-nothing*, in which case *last\_ele\_* is not present. — *end note*]

```

constexpr auto operator*() const;

```

6 *Returns*: `views::counted(current_, n_)`.

```

constexpr iterator& operator++();

```

7 *Preconditions*: *current\_* and *last\_ele\_* (if present) are incrementable.

8 *Postconditions*: *current\_* and *last\_ele\_* (if present) are each equal to `ranges::next(i)`, where *i* is the value of that data member before the call.

9 *Returns*: `*this`.

```

constexpr iterator operator++(int);

```

10 *Effects*: Equivalent to:

```

 auto tmp = *this;
 ***this;
 return tmp;

```

```

constexpr iterator& operator--() requires bidirectional_range<Base>;

```

11 *Preconditions*: *current\_* and *last\_ele\_* (if present) are decrementable.

12 *Postconditions*: *current\_* and *last\_ele\_* (if present) are each equal to `ranges::prev(i)`, where *i* is the value of that data member before the call.

13 *Returns*: `*this`.

```

constexpr iterator operator--(int) requires bidirectional_range<Base>;

```

14 *Effects*: Equivalent to:

```

 auto tmp = *this;

```

```

 --*this;
 return tmp;

constexpr iterator& operator+=(difference_type x)
 requires random_access_range<Base>;
15 Preconditions: current_ + x and last_ele_ + x (if last_ele_ is present) have well-defined behavior.
16 Postconditions: current_ and last_ele_ (if present) are each equal to i + x, where i is the value of that data
 member before the call.
17 Returns: *this.

constexpr iterator& operator-=(difference_type x)
 requires random_access_range<Base>;
18 Preconditions: current_ - x and last_ele_ - x (if last_ele_ is present) have well-defined behavior.
19 Postconditions: current_ and last_ele_ (if present) are each equal to i - x, where i is the value of that data
 member before the call.
20 Returns: *this.

constexpr auto operator[](difference_type n) const
 requires random_access_range<Base>;
21 Effects: Equivalent to: return views::counted(current_ + n, n);

friend constexpr bool operator==(const iterator& x, const iterator& y);
22 Returns: If last_ele_ is present, x.last_ele_ == y.last_ele_; otherwise, x.current_ == y.current_.

friend constexpr bool operator<(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
23 Returns: x.current_ < y.current_.

friend constexpr bool operator>(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
24 Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
25 Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y)
 requires random_access_range<Base>;
26 Effects: Equivalent to: return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
 requires random_access_range<Base> &&
 three_way_comparable<iterator_t<Base>>;
27 Returns: x.current_ <=> y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)
 requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
 requires random_access_range<Base>;
28 Effects: Equivalent to:
 auto r = i;
 r += n;
 return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)
 requires random_access_range<Base>;
29 Effects: Equivalent to:

```

```

 auto r = i;
 r -= n;
 return r;

```

```

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
 requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

```

30 *Returns:* If *last\_ele\_* is present, *x.last\_ele\_ - y.last\_ele\_*; otherwise, *x.current\_ - y.current\_*.

#### 26.7.25.4 Class `slide_view::sentinel`

[range.slide.sentinel]

```

namespace std::ranges {
 template<forward_range V>
 requires view<V>
 class slide_view<V>::sentinel {
 sentinel_t<V> end_ = sentinel_t<V>(); // exposition only
 constexpr explicit sentinel(sentinel_t<V> end); // exposition only

 public:
 sentinel() = default;

 friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

 friend constexpr range_difference_t<V>
 operator-(const iterator<false>& x, const sentinel& y)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

 friend constexpr range_difference_t<V>
 operator-(const sentinel& y, const iterator<false>& x)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
 };
}

```

<sup>1</sup> [Note 1: *sentinel* is used only when *slide-caches-first<V>* is true. — end note]

```

constexpr explicit sentinel(sentinel_t<V> end);

```

<sup>2</sup> *Effects:* Initializes *end\_* with *end*.

```

friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

```

<sup>3</sup> *Returns:* *x.last\_ele\_ == y.end\_*.

```

friend constexpr range_difference_t<V>
 operator-(const iterator<false>& x, const sentinel& y)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

```

<sup>4</sup> *Returns:* *x.last\_ele\_ - y.end\_*.

```

friend constexpr range_difference_t<V>
 operator-(const sentinel& y, const iterator<false>& x)
 requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

```

<sup>5</sup> *Returns:* *y.end\_ - x.last\_ele\_*.

### 26.7.26 Chunk by view

[range.chunk.by]

#### 26.7.26.1 Overview

[range.chunk.by.overview]

<sup>1</sup> `chunk_by_view` takes a view and a predicate, and splits the view into subranges between each pair of adjacent elements for which the predicate returns false.

<sup>2</sup> The name `views::chunk_by` denotes a range adaptor object (26.7.2). Given subexpressions *E* and *F*, the expression `views::chunk_by(E, F)` is expression-equivalent to `chunk_by_view(E, F)`.

[Example 1:

```

 vector v = {1, 2, 2, 3, 0, 4, 5, 2};

```

```

for (auto r : v | views::chunk_by(ranges::less_equal{})) {
 cout << '[';
 auto sep = "";
 for(auto i : r) {
 cout << sep << i;
 sep = ", ";
 }
 cout << "]" ";
}

```

The above prints: [1, 2, 2, 3] [0, 4, 5] [2] —*end example*]

### 26.7.26.2 Class template `chunk_by_view`

[`range.chunk.by.view`]

```

namespace std::ranges {
 template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
 requires view<V> && is_object_v<Pred>
 class chunk_by_view : public view_interface<chunk_by_view<V, Pred>> {
 V base_ = V(); // exposition only
 copyable_box<Pred> pred_ = Pred(); // exposition only

 // 26.7.26.3, class chunk_by_view::iterator
 class iterator; // exposition only

 public:
 chunk_by_view() requires default_initializable<V> && default_initializable<Pred> = default;
 constexpr explicit chunk_by_view(V base, Pred pred);

 constexpr V base() const & requires copy_constructible<V> { return base_; }
 constexpr V base() && { return std::move(base_); }

 constexpr const Pred& pred() const;

 constexpr iterator begin();
 constexpr auto end();

 constexpr iterator_t<V> find_next(iterator_t<V>); // exposition only
 constexpr iterator_t<V> find_prev(iterator_t<V>); // exposition only
 requires bidirectional_range<V>;
 };

 template<class R, class Pred>
 chunk_by_view(R&&, Pred) -> chunk_by_view<views::all_t<R>, Pred>;
}

```

constexpr explicit chunk\_by\_view(V base, Pred pred);

1 *Effects:* Initializes `base_` with `std::move(base)` and `pred_` with `std::move(pred)`.

constexpr const Pred& pred() const;

2 *Effects:* Equivalent to: return `*pred_`;

constexpr iterator begin();

3 *Preconditions:* `pred_.has_value()` is true.

4 *Returns:* `iterator(*this, ranges::begin(base_), find_next(ranges::begin(base_)))`.

5 *Remarks:* In order to provide the amortized constant-time complexity required by the range concept, this function caches the result within the `chunk_by_view` for use on subsequent calls.

constexpr auto end();

6 *Effects:* Equivalent to:

```

if constexpr (common_range<V>) {
 return iterator(*this, ranges::end(base_), ranges::end(base_));
} else {

```

```

 return default_sentinel;
 }

constexpr iterator_t<V> find-next(iterator_t<V> current);
7 Preconditions: pred_.has_value() is true.
8 Returns:
 ranges::next(ranges::adjacent_find(current, ranges::end(base_), not_fn(ref(*pred_))),
 1, ranges::end(base_))

constexpr iterator_t<V> find-prev(iterator_t<V> current) requires bidirectional_range<V>;
9 Preconditions:
(9.1) — current is not equal to ranges::begin(base_).
(9.2) — pred_.has_value() is true.
10 Returns: An iterator i in the range [ranges::begin(base_), current) such that:
(10.1) — ranges::adjacent_find(i, current, not_fn(ref(*pred_))) is equal to current; and
(10.2) — if i is not equal to ranges::begin(base_), then bool(invoke(*pred_, *ranges::prev(i), *i)) is
 false.

```

### 26.7.26.3 Class `chunk_by_view::iterator`

[range.chunk.by.iter]

```

namespace std::ranges {
 template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
 requires view<V> && is_object_v<Pred>
 class chunk_by_view<V, Pred>::iterator {
 chunk_by_view* parent_ = nullptr; // exposition only
 iterator_t<V> current_ = iterator_t<V>(); // exposition only
 iterator_t<V> next_ = iterator_t<V>(); // exposition only

 constexpr iterator(chunk_by_view& parent, iterator_t<V> current, // exposition only
 iterator_t<V> next);

 public:
 using value_type = subrange<iterator_t<V>>;
 using difference_type = range_difference_t<V>;
 using iterator_category = input_iterator_tag;
 using iterator_concept = see below;

 iterator() = default;

 constexpr value_type operator*() const;
 constexpr iterator& operator++();
 constexpr iterator operator++(int);

 constexpr iterator& operator--() requires bidirectional_range<V>;
 constexpr iterator operator--(int) requires bidirectional_range<V>;

 friend constexpr bool operator==(const iterator& x, const iterator& y);
 friend constexpr bool operator==(const iterator& x, default_sentinel_t);
 };
}

```

1 *iterator::iterator\_concept* is defined as follows:

- (1.1) — If *V* models *bidirectional\_range*, then *iterator\_concept* denotes *bidirectional\_iterator\_tag*.
- (1.2) — Otherwise, *iterator\_concept* denotes *forward\_iterator\_tag*.

```
constexpr iterator(chunk_by_view& parent, iterator_t<V> current, iterator_t<V> next);
```

2 *Effects:* Initializes *parent\_* with *addressof(parent)*, *current\_* with *current*, and *next\_* with *next*.

```

constexpr value_type operator*() const;
3 Preconditions: current_ is not equal to next_.
4 Returns: subrange(current_, next_).

constexpr iterator& operator++();
5 Preconditions: current_ is not equal to next_.
6 Effects: Equivalent to:
 current_ = next_;
 next_ = parent_->find-next(current_);
 return *this;

constexpr iterator operator++(int);
7 Effects: Equivalent to:
 auto tmp = *this;
 ++*this;
 return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;
8 Effects: Equivalent to:
 next_ = current_;
 current_ = parent_->find-prev(next_);
 return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;
9 Effects: Equivalent to:
 auto tmp = *this;
 --*this;
 return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y);
10 Returns: x.current_ == y.current_.

friend constexpr bool operator==(const iterator& x, default_sentinel_t);
11 Returns: x.current_ == x.next_.

```

## 27 Algorithms library

## [algorithms]

### 27.1 General

[algorithms.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 24) and other sequences.
- <sup>2</sup> The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 89.

Table 89: Algorithms library summary [tab:algorithms.summary]

| Subclause | Header                                   |
|-----------|------------------------------------------|
| 27.2      | Algorithms requirements                  |
| 27.3      | Parallel algorithms                      |
| 27.5      | Algorithm result types <algorithm>       |
| 27.6      | Non-modifying sequence operations        |
| 27.7      | Mutating sequence operations             |
| 27.8      | Sorting and related operations           |
| 27.10     | Generalized numeric operations <numeric> |
| 27.11     | Specialized <memory> algorithms <memory> |
| 27.12     | C library algorithms <cstdlib>           |

### 27.2 Algorithms requirements

[algorithms.requirements]

- <sup>1</sup> All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.
- <sup>2</sup> The entities defined in the `std::ranges` namespace in this Clause are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the *postfix-expression* in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

[Example 1:

```
void foo() {
 using namespace std::ranges;
 std::vector<int> vec{1,2,3};
 find(begin(vec), end(vec), 2); // #1
}
```

The function call expression at #1 invokes `std::ranges::find`, not `std::find`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::find` is more specialized (13.7.7.3) than `std::ranges::find` since the former requires its first two parameters to have the same type. — end example]

- <sup>3</sup> For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.
- <sup>4</sup> Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.
  - (4.1) — If an algorithm's template parameter is named `InputIterator`, `InputIterator1`, or `InputIterator2`, the template argument shall meet the *Cpp17InputIterator* requirements (25.3.5.3).
  - (4.2) — If an algorithm's template parameter is named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, the template argument shall meet the *Cpp17OutputIterator* requirements (25.3.5.4).
  - (4.3) — If an algorithm's template parameter is named `ForwardIterator`, `ForwardIterator1`, or `ForwardIterator2`, the template argument shall meet the *Cpp17ForwardIterator* requirements (25.3.5.5).
  - (4.4) — If an algorithm's template parameter is named `NoThrowForwardIterator`, the template argument shall meet the *Cpp17ForwardIterator* requirements (25.3.5.5), and is required to have the property that no exceptions are thrown from increment, assignment, or comparison of, or indirection through, valid iterators.

- (4.5) — If an algorithm's template parameter is named `BidirectionalIterator`, `BidirectionalIterator1`, or `BidirectionalIterator2` the template argument shall meet the *Cpp17BidirectionalIterator* requirements (25.3.5.6).
- (4.6) — If an algorithm's template parameter is named `RandomAccessIterator`, `RandomAccessIterator1`, or `RandomAccessIterator2`, the template argument shall meet the *Cpp17RandomAccessIterator* requirements (25.3.5.7).
- 5 If an algorithm's *Effects*: element specifies that a value pointed to by any iterator passed as an argument is modified, then that algorithm has an additional type requirement: The type of that argument shall meet the requirements of a mutable iterator (25.3).
- [*Note 1*: This requirement does not affect arguments that are named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, because output iterators must always be mutable, nor does it affect arguments that are constrained, for which mutability requirements are expressed explicitly. — *end note*]
- 6 Both in-place and copying versions are provided for certain algorithms.<sup>220</sup> When such a version is provided for *algorithm* it is called *algorithm\_copy*. Algorithms that take predicates end with the suffix `_if` (which follows the suffix `_copy`).
- 7 When not otherwise constrained, the `Predicate` parameter is used whenever an algorithm expects a function object (22.10) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as `true`. In other words, if an algorithm takes `Predicate pred` as its argument and `first` as its iterator argument with value type `T`, it should work correctly in the construct `pred(*first)` contextually converted to `bool` (7.3). The function object `pred` shall not apply any non-constant function through the dereferenced iterator. Given a glvalue `u` of type (possibly `const`) `T` that designates the same object as `*first`, `pred(u)` shall be a valid expression that is equal to `pred(*first)`.
- 8 When not otherwise constrained, the `BinaryPredicate` parameter is used whenever an algorithm expects a function object that when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature returns a value testable as `true`. In other words, if an algorithm takes `BinaryPredicate binary_pred` as its argument and `first1` and `first2` as its iterator arguments with respective value types `T1` and `T2`, it should work correctly in the construct `binary_pred(*first1, *first2)` contextually converted to `bool` (7.3). Unless otherwise specified, `BinaryPredicate` always takes the first iterator's `value_type` as its first argument, that is, in those cases when `T value` is part of the signature, it should work correctly in the construct `binary_pred(*first1, value)` contextually converted to `bool` (7.3). `binary_pred` shall not apply any non-constant function through the dereferenced iterators. Given a glvalue `u` of type (possibly `const`) `T1` that designates the same object as `*first1`, and a glvalue `v` of type (possibly `const`) `T2` that designates the same object as `*first2`, `binary_pred(u, *first2)`, `binary_pred(*first1, v)`, and `binary_pred(u, v)` shall each be a valid expression that is equal to `binary_pred(*first1, *first2)`, and `binary_pred(u, value)` shall be a valid expression that is equal to `binary_pred(*first1, value)`.
- 9 The parameters `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, and `BinaryOperation2` are used whenever an algorithm expects a function object (22.10).
- 10 [*Note 2*: Unless otherwise specified, algorithms that take function objects as arguments can copy those function objects freely. If object identity is important, a wrapper class that points to a noncopied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used. — *end note*]
- 11 When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either `true` or `false` in boolean contexts.
- 12 In the description of the algorithms, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as those of

```

auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;

```

Similarly, operator `-` is used for some combinations of iterators and sentinel types for which it does not have to be defined. If `[a, b)` denotes a range, the semantics of `b - a` in these cases are the same as those of

```

iter_difference_t<decltype(a)> n = 0;
for (auto tmp = a; tmp != b; ++tmp) ++n;
return n;

```

and if `[b, a)` denotes a range, the same as those of

```

iter_difference_t<decltype(b)> n = 0;
for (auto tmp = b; tmp != a; ++tmp) --n;

```

<sup>220</sup> The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users can invoke `copy` followed by `sort`.

```
return n;
```

- 13 In the description of the algorithms, given an iterator *a* whose difference type is *D*, and an expression *n* of integer-like type other than *cv D*, the semantics of *a + n* and *a - n* are, respectively, those of *a + D(n)* and *a - D(n)*.
- 14 In the description of algorithm return values, a sentinel value *s* denoting the end of a range [*i*, *s*) is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using `ranges::next(i, s)`.
- 15 Overloads of algorithms that take range arguments (26.4.2) behave as if they are implemented by calling `ranges::begin` and `ranges::end` on the range(s) and dispatching to the overload in namespace `ranges` that takes separate iterator and sentinel arguments.
- 16 The well-formedness and behavior of a call to an algorithm with an explicitly-specified template argument list is unspecified, except where explicitly stated otherwise.

[Note 3: Consequently, an implementation can declare an algorithm with different template parameters than those presented. — end note]

## 27.3 Parallel algorithms

[algorithms.parallel]

### 27.3.1 Preamble

[algorithms.parallel.defns]

- 1 Subclause 27.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.
- 2 A *parallel algorithm* is a function template listed in this document with a template parameter named `ExecutionPolicy`.
- 3 Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:
- (3.1) — All operations of the categories of the iterators that the algorithm is instantiated with.
- (3.2) — Operations on those sequence elements that are required by its specification.
- (3.3) — User-provided function objects to be applied during the execution of the algorithm, if required by the specification.
- (3.4) — Operations on those function objects required by the specification.

[Note 1: See 27.2. — end note]

These functions are herein called *element access functions*.

[Example 1: The `sort` function may invoke the following element access functions:

- (3.5) — Operations of the random-access iterator of the actual template argument (as per 25.3.5.7), as implied by the name of the template parameter `RandomAccessIterator`.
- (3.6) — The `swap` function on the elements of the sequence (as per the preconditions specified in 27.8.2.1).
- (3.7) — The user-provided `Compare` function object.

— end example]

- 4 A standard library function is *vectorization-unsafe* if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function.

[Note 2: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. — end note]

[Example 2:

```
int x = 0;
std::mutex m;
void f() {
 int a[] = {1,2};
 std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&](int) {
 std::lock_guard<mutex> guard(m); // incorrect: lock_guard constructor calls m.lock()
 ++x;
 });
}
```

The above program may result in two consecutive calls to `m.lock()` on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution. — end example]

### 27.3.2 Requirements on user-provided function objects [algorithms.parallel.user]

- 1 Unless otherwise specified, function objects passed into parallel algorithms as objects of type `Predicate`, `BinaryPredicate`, `Compare`, `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, `BinaryOperation2`, and the operators used by the analogous overloads to these parallel algorithms that are formed by an invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

### 27.3.3 Effect of execution policies on algorithm execution [algorithms.parallel.exec]

- 1 Parallel algorithms have template parameters named `ExecutionPolicy` (22.12) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.
- 2 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object.

[Note 1: For example, `swap`, `++`, `--`, `@=`, and assignments modify the object. For the assignment and `@=` operators, only the left argument is modified. — end note]

- 3 Unless otherwise stated, implementations may make arbitrary copies of elements (with type `T`) from sequences where `is_trivially_copy_constructible_v<T>` and `is_trivially_destructible_v<T>` are true.

[Note 2: This implies that user-supplied function objects cannot rely on object identity of arguments for such input sequences. If object identity of the arguments to these function objects is important, a wrapping iterator that returns a non-copied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used. — end note]

- 4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::sequenced_policy` all occur in the calling thread of execution.

[Note 3: The invocations are not interleaved; see 6.9.1. — end note]

- 5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::unsequenced_policy` are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution.

[Note 4: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — end note]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `execution::unsequenced_policy` algorithm.

[Note 5: Because `execution::unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — end note]

- 6 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_policy` are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by `thread` (33.4.3) or `jthread` (33.4.4) provide concurrent forward progress guarantees (6.9.2.3), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other.

[Note 6: It is the caller's responsibility to ensure that the invocation does not introduce data races or deadlocks. — end note]

[Example 1:

```
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
 v.push_back(i*2+1); // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — end example]

[Example 2:

```
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
 x.fetch_add(1, std::memory_order::relaxed);
 // spin wait for another iteration to change the value of x
 while (x.load(std::memory_order::relaxed) == 1) { } // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — *end example*]

[*Example 3:*

```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
 std::lock_guard<mutex> guard(m);
 ++x;
});
```

The above example synchronizes access to object x ensuring that it is incremented correctly. — *end example*]

- 7 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees.

[*Note 7:* This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — *end note*]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `execution::parallel_unsequenced_policy` algorithm.

[*Note 8:* Because `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — *end note*]

- 8 [*Note 9:* The semantics of invocation with `execution::unsequenced_policy`, `execution::parallel_policy`, or `execution::parallel_unsequenced_policy` allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation, e.g., due to lack of resources. — *end note*]

- 9 If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

- (9.1) — temporarily block with forward progress guarantee delegation (6.9.2.3) on the completion of these library-managed threads of execution, or
- (9.2) — eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished.

[*Note 10:* In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — *end note*]

- 10 The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

### 27.3.4 Parallel algorithm exceptions

[**algorithms.parallel.exceptions**]

- 1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.
- 2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the `ExecutionPolicy`.

### 27.3.5 ExecutionPolicy algorithm overloads

[**algorithms.parallel.overloads**]

- 1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter.

[*Note 1:* Not all algorithms have parallel algorithm overloads. — *end note*]

- 2 Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.
- 3 Unless otherwise specified, the complexity requirements of `ExecutionPolicy` algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says “at most *expr*” or “exactly *expr*”

and does not specify the number of assignments or swaps, and *expr* is not already expressed with  $\mathcal{O}()$  notation, the complexity of the algorithm shall be  $\mathcal{O}(expr)$ .

- 4 Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<remove_cvref_t<ExecutionPolicy>>` is true.

```

## 27.6 Non-modifying sequence operations

[alg.nonmodifying]

### 27.6.1 All of

[alg.all.of]

```

template<class InputIterator, class Predicate>
constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);

```

```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
 bool all_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
 constexpr bool ranges::all_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr bool ranges::all_of(R&& r, Pred pred, Proj proj = {});
```

1 Let  $E$  be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns:* false if  $E$  is false for some iterator  $i$  in the range  $[first, last)$ , and true otherwise.

3 *Complexity:* At most `last - first` applications of the predicate and any projection.

## 27.6.2 Any of

[alg.any.of]

```
template<class InputIterator, class Predicate>
 constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
 bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
 constexpr bool ranges::any_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr bool ranges::any_of(R&& r, Pred pred, Proj proj = {});
```

1 Let  $E$  be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns:* true if  $E$  is true for some iterator  $i$  in the range  $[first, last)$ , and false otherwise.

3 *Complexity:* At most `last - first` applications of the predicate and any projection.

## 27.6.3 None of

[alg.none.of]

```
template<class InputIterator, class Predicate>
 constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
 bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
 constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});
```

1 Let  $E$  be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns:* false if  $E$  is true for some iterator  $i$  in the range  $[first, last)$ , and true otherwise.

3 *Complexity:* At most `last - first` applications of the predicate and any projection.

**27.6.4 For each****[alg.foreach]**

```
template<class InputIterator, class Function>
constexpr Function for_each(InputIterator first, InputIterator last, Function f);
```

1 *Preconditions:* Function meets the *Cpp17MoveConstructible* requirements (Table 30).

[Note 1: Function need not meet the requirements of *Cpp17CopyConstructible* (Table 31). — end note]

2 *Effects:* Applies *f* to the result of dereferencing every iterator in the range  $[first, last)$ , starting from *first* and proceeding to  $last - 1$ .

[Note 2: If the type of *first* meets the requirements of a mutable iterator, *f* can apply non-constant functions through the dereferenced iterator. — end note]

3 *Returns:* *f*.

4 *Complexity:* Applies *f* exactly  $last - first$  times.

5 *Remarks:* If *f* returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Function>
void for_each(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Function f);
```

6 *Preconditions:* Function meets the *Cpp17CopyConstructible* requirements.

7 *Effects:* Applies *f* to the result of dereferencing every iterator in the range  $[first, last)$ .

[Note 3: If the type of *first* meets the requirements of a mutable iterator, *f* can apply non-constant functions through the dereferenced iterator. — end note]

8 *Complexity:* Applies *f* exactly  $last - first$  times.

9 *Remarks:* If *f* returns a result, the result is ignored. Implementations do not have the freedom granted under 27.3.3 to make arbitrary copies of elements from the input sequence.

10 [Note 4: Does not return a copy of its Function parameter, since parallelization often does not permit efficient state accumulation. — end note]

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
 indirectly_unary_invocable<projected<I, Proj>> Fun>
constexpr ranges::for_each_result<I, Fun>
 ranges::for_each(I first, S last, Fun f, Proj proj = {});
template<input_range R, class Proj = identity,
 indirectly_unary_invocable<projected<iterator_t<R>, Proj>> Fun>
constexpr ranges::for_each_result<borrowed_iterator_t<R>, Fun>
 ranges::for_each(R&& r, Fun f, Proj proj = {});
```

11 *Effects:* Calls `invoke(f, invoke(proj, *i))` for every iterator *i* in the range  $[first, last)$ , starting from *first* and proceeding to  $last - 1$ .

[Note 5: If the result of `invoke(proj, *i)` is a mutable reference, *f* can apply non-constant functions. — end note]

12 *Returns:* `{last, std::move(f)}`.

13 *Complexity:* Applies *f* and *proj* exactly  $last - first$  times.

14 *Remarks:* If *f* returns a result, the result is ignored.

15 [Note 6: The overloads in namespace `ranges` require `Fun` to model `copy_constructible`. — end note]

```
template<class InputIterator, class Size, class Function>
constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);
```

16 *Mandates:* The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

17 *Preconditions:*  $n >= 0$  is true. Function meets the *Cpp17MoveConstructible* requirements.

[Note 7: Function need not meet the requirements of *Cpp17CopyConstructible*. — end note]

18 *Effects:* Applies *f* to the result of dereferencing every iterator in the range  $[first, first + n)$  in order.

[Note 8: If the type of *first* meets the requirements of a mutable iterator, *f* can apply non-constant functions through the dereferenced iterator. — end note]

19 *Returns:* first + n.

20 *Remarks:* If f returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
 ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n,
 Function f);
```

21 *Mandates:* The type Size is convertible to an integral type (7.3.9, 11.4.8).

22 *Preconditions:* n >= 0 is true. Function meets the *Cpp17CopyConstructible* requirements.

23 *Effects:* Applies f to the result of dereferencing every iterator in the range [first, first + n).

[Note 9: If the type of first meets the requirements of a mutable iterator, f can apply non-constant functions through the dereferenced iterator. — end note]

24 *Returns:* first + n.

25 *Remarks:* If f returns a result, the result is ignored. Implementations do not have the freedom granted under 27.3.3 to make arbitrary copies of elements from the input sequence.

```
template<input_iterator I, class Proj = identity,
 indirectly_unary_invocable<projected<I, Proj>> Fun>
 constexpr ranges::for_each_n_result<I, Fun>
 ranges::for_each_n(I first, iter_difference_t<I> n, Fun f, Proj proj = {});
```

26 *Preconditions:* n >= 0 is true.

27 *Effects:* Calls invoke(f, invoke(proj, \*i)) for every iterator i in the range [first, first + n) in order.

[Note 10: If the result of invoke(proj, \*i) is a mutable reference, f can apply non-constant functions. — end note]

28 *Returns:* {first + n, std::move(f)}.

29 *Remarks:* If f returns a result, the result is ignored.

30 [Note 11: The overload in namespace ranges requires Fun to model copy\_constructible. — end note]

## 27.6.5 Find

[alg.find]

```
template<class InputIterator, class T>
 constexpr InputIterator find(InputIterator first, InputIterator last,
 const T& value);
```

```
template<class ExecutionPolicy, class ForwardIterator, class T>
 ForwardIterator find(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 const T& value);
```

```
template<class InputIterator, class Predicate>
 constexpr InputIterator find_if(InputIterator first, InputIterator last,
 Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
 ForwardIterator find_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 Predicate pred);
```

```
template<class InputIterator, class Predicate>
 constexpr InputIterator find_if_not(InputIterator first, InputIterator last,
 Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
 ForwardIterator find_if_not(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
 requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
 constexpr I ranges::find(I first, S last, const T& value, Proj proj = {});
```

```
template<input_range R, class T, class Proj = identity>
 requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
 constexpr borrowed_iterator_t<R>
 ranges::find(R&& r, const T& value, Proj proj = {});
```

```

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
 constexpr I ranges::find_if(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr borrowed_iterator_t<R>
 ranges::find_if(R&& r, Pred pred, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
 constexpr I ranges::find_if_not(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 constexpr borrowed_iterator_t<R>
 ranges::find_if_not(R&& r, Pred pred, Proj proj = {});

```

1 Let  $E$  be:

- (1.1) —  $*i == \text{value for find}$ ;
- (1.2) —  $\text{pred}(*i) != \text{false for find\_if}$ ;
- (1.3) —  $\text{pred}(*i) == \text{false for find\_if\_not}$ ;
- (1.4) —  $\text{bool}(\text{invoke}(\text{proj}, *i) == \text{value})$  for `ranges::find`;
- (1.5) —  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$  for `ranges::find_if`;
- (1.6) —  $\text{bool}(!\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$  for `ranges::find_if_not`.

2 **Returns:** The first iterator  $i$  in the range  $[\text{first}, \text{last})$  for which  $E$  is true. Returns last if no such iterator is found.

3 **Complexity:** At most  $\text{last} - \text{first}$  applications of the corresponding predicate and any projection.

## 27.6.6 Find end

[alg.find.end]

```

template<class ForwardIterator1, class ForwardIterator2>
 constexpr ForwardIterator1
 find_end(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
 ForwardIterator1
 find_end(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
 constexpr ForwardIterator1
 find_end(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
 ForwardIterator1
 find_end(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
 class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
 requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
 constexpr subrange<I1>
 ranges::find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});

```

```
template<forward_range R1, forward_range R2,
 class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
ranges::find_end(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

- (1.1) — `pred` be `equal_to{}` for the overloads with no parameter `pred`;
- (1.2) —  $E$  be:
  - (1.2.1) — `pred(*(i + n), *(first2 + n))` for the overloads in namespace `std`;
  - (1.2.2) — `invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n)))` for the overloads in namespace `ranges`;
- (1.3) —  $i$  be `last1` if `[first2, last2)` is empty, or if  $(last2 - first2) > (last1 - first1)$  is true, or if there is no iterator in the range `[first1, last1 - (last2 - first2))` such that for every non-negative integer  $n < (last2 - first2)$ ,  $E$  is true. Otherwise  $i$  is the last such iterator in `[first1, last1 - (last2 - first2))`.

2 Returns:

- (2.1) —  $i$  for the overloads in namespace `std`.
- (2.2) — `{i, i + (i == last1 ? 0 : last2 - first2)}` for the overloads in namespace `ranges`.

3 Complexity: At most  $(last2 - first2) * (last1 - first1 - (last2 - first2) + 1)$  applications of the corresponding predicate and any projections.

## 27.6.7 Find first

[alg.find.first.of]

```
template<class InputIterator, class ForwardIterator>
constexpr InputIterator
find_first_of(InputIterator first1, InputIterator last1,
 ForwardIterator first2, ForwardIterator last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
find_first_of(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator, class ForwardIterator,
 class BinaryPredicate>
constexpr InputIterator
find_first_of(InputIterator first1, InputIterator last1,
 ForwardIterator first2, ForwardIterator last2,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
ForwardIterator1
find_first_of(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
 class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr I1 ranges::find_first_of(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, forward_range R2,
 class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_iterator_t<R1>
ranges::find_first_of(R1&& r1, R2&& r2,
```

```
Pred pred = {},
Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let  $E$  be:
- (1.1) —  $*i == *j$  for the overloads with no parameter `pred`;
- (1.2) — `pred(*i, *j) != false` for the overloads with a parameter `pred` and no parameter `proj1`;
- (1.3) — `bool(invoke(pred, invoke(proj1, *i), invoke(proj2, *j)))` for the overloads with parameters `pred` and `proj1`.
- 2 *Effects*: Finds an element that matches one of a set of values.
- 3 *Returns*: The first iterator  $i$  in the range  $[first1, last1)$  such that for some iterator  $j$  in the range  $[first2, last2)$   $E$  holds. Returns `last1` if  $[first2, last2)$  is empty or if no such iterator is found.
- 4 *Complexity*: At most  $(last1 - first1) * (last2 - first2)$  applications of the corresponding predicate and any projections.

### 27.6.8 Adjacent find

[alg.adjacent.find]

```
template<class ForwardIterator>
constexpr ForwardIterator
adjacent_find(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator
adjacent_find(ForwardIterator first, ForwardIterator last,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 BinaryPredicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
 indirect_binary_predicate<projected<I, Proj>,
 projected<I, Proj>> Pred = ranges::equal_to>
constexpr I ranges::adjacent_find(I first, S last, Pred pred = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
 indirect_binary_predicate<projected<iterator_t<R>, Proj>,
 projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
constexpr borrowed_iterator_t<R> ranges::adjacent_find(R&& r, Pred pred = {}, Proj proj = {});
```

- 1 Let  $E$  be:
- (1.1) —  $*i == *(i + 1)$  for the overloads with no parameter `pred`;
- (1.2) — `pred(*i, *(i + 1)) != false` for the overloads with a parameter `pred` and no parameter `proj`;
- (1.3) — `bool(invoke(pred, invoke(proj, *i), invoke(proj, *(i + 1))))` for the overloads with both parameters `pred` and `proj`.
- 2 *Returns*: The first iterator  $i$  such that both  $i$  and  $i + 1$  are in the range  $[first, last)$  for which  $E$  holds. Returns `last` if no such iterator is found.
- 3 *Complexity*: For the overloads with no `ExecutionPolicy`, exactly

$$\min((i - first) + 1, (last - first) - 1)$$

applications of the corresponding predicate, where  $i$  is `adjacent_find`'s return value. For the overloads with an `ExecutionPolicy`,  $\mathcal{O}(last - first)$  applications of the corresponding predicate, and no more than twice as many applications of any projection.

**27.6.9 Count****[alg.count]**

```

template<class InputIterator, class T>
constexpr typename iterator_traits<InputIterator>::difference_type
count(InputIterator first, InputIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
typename iterator_traits<ForwardIterator>::difference_type
count(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr typename iterator_traits<InputIterator>::difference_type
count_if(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
typename iterator_traits<ForwardIterator>::difference_type
count_if(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr iter_difference_t<I>
ranges::count(I first, S last, const T& value, Proj proj = {});
template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr range_difference_t<R>
ranges::count(R&& r, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr iter_difference_t<I>
ranges::count_if(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr range_difference_t<R>
ranges::count_if(R&& r, Pred pred, Proj proj = {});

```

1 Let  $E$  be:

- (1.1) —  $*i == \text{value}$  for the overloads with no parameter  $\text{pred}$  or  $\text{proj}$ ;
- (1.2) —  $\text{pred}(*i) != \text{false}$  for the overloads with a parameter  $\text{pred}$  but no parameter  $\text{proj}$ ;
- (1.3) —  $\text{invoke}(\text{proj}, *i) == \text{value}$  for the overloads with a parameter  $\text{proj}$  but no parameter  $\text{pred}$ ;
- (1.4) —  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$  for the overloads with both parameters  $\text{proj}$  and  $\text{pred}$ .

2 **Effects:** Returns the number of iterators  $i$  in the range  $[\text{first}, \text{last})$  for which  $E$  holds.

3 **Complexity:** Exactly  $\text{last} - \text{first}$  applications of the corresponding predicate and any projection.

**27.6.10 Mismatch****[mismatch]**

```

template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>

```

1 Let  $last2$  be  $first2 + (last1 - first1)$  for the overloads with no parameter  $last2$  or  $r2$ .

2 Let  $E$  be:

(2.1) —  $!(*(first1 + n) == *(first2 + n))$  for the overloads with no parameter  $pred$ ;

(2.2) —  $pred(*(first1 + n), *(first2 + n)) == false$  for the overloads with a parameter  $pred$  and no parameter  $proj1$ ;

(2.3) —  $!invoke(pred, invoke(proj1, *(first1 + n)), invoke(proj2, *(first2 + n)))$  for the overloads with both parameters  $pred$  and  $proj1$ .

3 Let  $N$  be  $\min(last1 - first1, last2 - first2)$ .

4 *Returns:*  $\{ first1 + n, first2 + n \}$ , where  $n$  is the smallest integer in  $[0, N)$  such that  $E$  holds, or  $N$  if no such integer exists.

5 *Complexity:* At most  $N$  applications of the corresponding predicate and any projections.

### 27.6.11 Equal

[alg.equal]

```

template<class InputIterator1, class InputIterator2>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2);

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
 bool equal(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
 class BinaryPredicate>
 constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
 bool equal(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
 constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
 bool equal(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2,
 class BinaryPredicate>
 constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, InputIterator2 last2,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
 bool equal(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
 class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
 requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
 constexpr bool ranges::equal(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Pred = ranges::equal_to,
 class Proj1 = identity, class Proj2 = identity>
 requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
 constexpr bool ranges::equal(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});

```

1       **Let:**

- (1.1)     —  $last2$  be  $first2 + (last1 - first1)$  for the overloads with no parameter  $last2$  or  $r2$ ;
- (1.2)     —  $pred$  be `equal_to{}` for the overloads with no parameter  $pred$ ;
- (1.3)     —  $E$  be:
  - (1.3.1)   —  $pred(*i, *(first2 + (i - first1)))$  for the overloads with no parameter  $proj1$ ;
  - (1.3.2)   —  $invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1))))$  for the overloads with parameter  $proj1$ .

2       **Returns:** If  $last1 - first1 \neq last2 - first2$ , return false. Otherwise return true if  $E$  holds for every iterator  $i$  in the range  $[first1, last1)$  Otherwise, returns false.

3       **Complexity:** If

- (3.1)     — the types of  $first1$ ,  $last1$ ,  $first2$ , and  $last2$  meet the *Cpp17RandomAccessIterator* requirements (25.3.5.7) and  $last1 - first1 \neq last2 - first2$  for the overloads in namespace `std`;

- (3.2) — the types of `first1`, `last1`, `first2`, and `last2` pairwise model `sized_sentinel_for` (25.3.4.8) and `last1 - first1 != last2 - first2` for the first overload in namespace `ranges`,
- (3.3) — `R1` and `R2` each model `sized_range` and `ranges::distance(r1) != ranges::distance(r2)` for the second overload in namespace `ranges`,
- then no applications of the corresponding predicate and each projection; otherwise,
- (3.4) — For the overloads with no `ExecutionPolicy`, at most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the corresponding predicate and any projections.
- (3.5) — For the overloads with an `ExecutionPolicy`,  $\mathcal{O}(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$  applications of the corresponding predicate.

### 27.6.12 Is permutation

[alg.is.permutation]

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);
template<class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, BinaryPredicate pred);
template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);
template<class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);
```

- 1 Let `last2` be `first2 + (last1 - first1)` for the overloads with no parameter named `last2`, and let `pred` be `equal_to{}` for the overloads with no parameter `pred`.
- 2 *Mandates:* `ForwardIterator1` and `ForwardIterator2` have the same value type.
- 3 *Preconditions:* The comparison function is an equivalence relation.
- 4 *Returns:* If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range `[first2, last2)`, beginning with `ForwardIterator2` `begin`, such that `equal(first1, last1, begin, pred)` returns `true`; otherwise, returns `false`.
- 5 *Complexity:* No applications of the corresponding predicate if `ForwardIterator1` and `ForwardIterator2` meet the requirements of random access iterators and `last1 - first1 != last2 - first2`. Otherwise, exactly `last1 - first1` applications of the corresponding predicate if `equal(first1, last1, first2, last2, pred)` would return `true`; otherwise, at worst  $\mathcal{O}(N^2)$ , where  $N$  has the value `last1 - first1`.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
 sentinel_for<I2> S2, class Proj1 = identity, class Proj2 = identity,
 indirect_equivalence_relation<projected<I1, Proj1>,
 projected<I2, Proj2>> Pred = ranges::equal_to>
constexpr bool ranges::is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
 Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
 class Proj1 = identity, class Proj2 = identity,
 indirect_equivalence_relation<projected<iterator_t<R1>, Proj1>,
 projected<iterator_t<R2>, Proj2>> Pred = ranges::equal_to>
constexpr bool ranges::is_permutation(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 6 *Returns:* If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range `[first2, last2)`, bounded by `[pfirst, plast)`, such that `ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2)` returns `true`; otherwise, returns `false`.
- 7 *Complexity:* No applications of the corresponding predicate and projections if:
- (7.1) — for the first overload,

- (7.1.1) — S1 and I1 model `sized_sentinel_for<S1, I1>`,
- (7.1.2) — S2 and I2 model `sized_sentinel_for<S2, I2>`, and
- (7.1.3) — `last1 - first1 != last2 - first2`;
- (7.2) — for the second overload, R1 and R2 each model `sized_range`, and `ranges::distance(r1) != ranges::distance(r2)`.

Otherwise, exactly `last1 - first1` applications of the corresponding predicate and projections if `ranges::equal(first1, last1, first2, last2, pred, proj1, proj2)` would return `true`; otherwise, at worst  $\mathcal{O}(N^2)$ , where  $N$  has the value `last1 - first1`.

### 27.6.13 Search

[alg.search]

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
 search(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
 search(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2);
```

```
template<class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
constexpr ForwardIterator1
 search(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
ForwardIterator1
 search(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator2 last2,
 BinaryPredicate pred);
```

- 1 **Returns:** The first iterator  $i$  in the range  $[first1, last1 - (last2 - first2))$  such that for every non-negative integer  $n$  less than `last2 - first2` the following corresponding conditions hold: `*(i + n) == *(first2 + n)`, `pred(*(i + n), *(first2 + n)) != false`. Returns `first1` if  $[first2, last2)$  is empty, otherwise returns `last1` if no such iterator is found.
- 2 **Complexity:** At most  $(last1 - first1) * (last2 - first2)$  applications of the corresponding predicate.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
 sentinel_for<I2> S2, class Pred = ranges::equal_to,
 class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
 ranges::search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2, class Pred = ranges::equal_to,
 class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
 ranges::search(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 3 **Returns:**
- (3.1) —  $\{i, i + (last2 - first2)\}$ , where  $i$  is the first iterator in the range  $[first1, last1 - (last2 - first2))$  such that for every non-negative integer  $n$  less than `last2 - first2` the condition `bool(invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))))` is `true`.
- (3.2) — Returns  $\{last1, last1\}$  if no such iterator exists.

- 4 **Complexity:** At most  $(\text{last1} - \text{first1}) * (\text{last2} - \text{first2})$  applications of the corresponding predicate and projections.

```
template<class ForwardIterator, class Size, class T>
constexpr ForwardIterator
search_n(ForwardIterator first, ForwardIterator last,
 Size count, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator
search_n(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Size count, const T& value);

template<class ForwardIterator, class Size, class T,
 class BinaryPredicate>
constexpr ForwardIterator
search_n(ForwardIterator first, ForwardIterator last,
 Size count, const T& value,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T,
 class BinaryPredicate>
ForwardIterator
search_n(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Size count, const T& value,
 BinaryPredicate pred);
```

- 5 **Mandates:** The type `Size` is convertible to an integral type (7.3.9, 11.4.8).
- 6 **Returns:** The first iterator `i` in the range  $[\text{first}, \text{last} - \text{count})$  such that for every non-negative integer `n` less than `count` the following corresponding conditions hold:  $*(i + n) == \text{value}$ ,  $\text{pred}(*(i + n), \text{value}) != \text{false}$ . Returns `last` if no such iterator is found.
- 7 **Complexity:** At most  $\text{last} - \text{first}$  applications of the corresponding predicate.

```
template<forward_iterator I, sentinel_for<I> S, class T,
 class Pred = ranges::equal_to, class Proj = identity>
requires indirectly_comparable<I, const T*, Pred, Proj>
constexpr subrange<I>
ranges::search_n(I first, S last, iter_difference_t<I> count,
 const T& value, Pred pred = {}, Proj proj = {});
template<forward_range R, class T, class Pred = ranges::equal_to,
 class Proj = identity>
requires indirectly_comparable<iterator_t<R>, const T*, Pred, Proj>
constexpr borrowed_subrange_t<R>
ranges::search_n(R&& r, range_difference_t<R> count,
 const T& value, Pred pred = {}, Proj proj = {});
```

- 8 **Returns:**  $\{i, i + \text{count}\}$  where `i` is the first iterator in the range  $[\text{first}, \text{last} - \text{count})$  such that for every non-negative integer `n` less than `count`, the following condition holds:  $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *(i + n)), \text{value})$ . Returns  $\{\text{last}, \text{last}\}$  if no such iterator is found.
- 9 **Complexity:** At most  $\text{last} - \text{first}$  applications of the corresponding predicate and projection.

```
template<class ForwardIterator, class Searcher>
constexpr ForwardIterator
search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);
```

- 10 **Effects:** Equivalent to: `return searcher(first, last).first;`
- 11 **Remarks:** `Searcher` need not meet the *Cpp17CopyConstructible* requirements.

#### 27.6.14 Starts with

[alg.starts.with]

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
 class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::starts_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
```

```

 Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity,
 class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>>, Pred, Proj1, Proj2>
constexpr bool ranges::starts_with(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 *Returns:*

```

 ranges::mismatch(std::move(first1), last1, std::move(first2), last2,
 pred, proj1, proj2).in2 == last2

```

## 27.6.15 Ends with

[alg.ends.with]

```

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
 class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires (forward_iterator<I1> || sized_sentinel_for<S1, I1>) &&
 (forward_iterator<I2> || sized_sentinel_for<S2, I2>) &&
 indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::ends_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let  $N_1$  be  $\text{last1} - \text{first1}$  and  $N_2$  be  $\text{last2} - \text{first2}$ .

2 *Returns:* false if  $N_1 < N_2$ , otherwise

```

 ranges::equal(std::move(first1) + (N1 - N2), last1, std::move(first2), last2,
 pred, proj1, proj2)

```

```

template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity,
 class Proj2 = identity>
requires (forward_range<R1> || sized_range<R1>) &&
 (forward_range<R2> || sized_range<R2>) &&
 indirectly_comparable<iterator_t<R1>, iterator_t<R2>>, Pred, Proj1, Proj2>
constexpr bool ranges::ends_with(R1&& r1, R2&& r2, Pred pred = {},
 Proj1 proj1 = {}, Proj2 proj2 = {});

```

3 Let  $N_1$  be  $\text{ranges::distance}(r1)$  and  $N_2$  be  $\text{ranges::distance}(r2)$ .

4 *Returns:* false if  $N_1 < N_2$ , otherwise

```

 ranges::equal(ranges::drop_view(ranges::ref_view(r1), N1 - N2), r2, pred, proj1, proj2)

```

## 27.7 Mutating sequence operations

[alg.modifying.operations]

### 27.7.1 Copy

[alg.copy]

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator copy(InputIterator first, InputIterator last,
 OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);
template<input_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);

```

1 Let  $N$  be  $\text{last} - \text{first}$ .

2 *Preconditions:* result is not in the range  $[\text{first}, \text{last})$ .

3 *Effects:* Copies elements in the range  $[\text{first}, \text{last})$  into the range  $[\text{result}, \text{result} + N)$  starting from first and proceeding to last. For each non-negative integer  $n < N$ , performs  $\text{*}(\text{result} + n) = \text{*}(\text{first} + n)$ .

4 *Returns:*

(4.1) —  $\text{result} + N$  for the overload in namespace std.

(4.2) —  $\{\text{last}, \text{result} + N\}$  for the overloads in namespace ranges.

5 *Complexity:* Exactly  $N$  assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
 ForwardIterator2 copy(ExecutionPolicy&& policy,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result);
```

6     *Preconditions:* The ranges  $[first, last)$  and  $[result, result + (last - first))$  do not overlap.

7     *Effects:* Copies elements in the range  $[first, last)$  into the range  $[result, result + (last - first))$ . For each non-negative integer  $n < (last - first)$ , performs  $*(result + n) = *(first + n)$ .

8     *Returns:*  $result + (last - first)$ .

9     *Complexity:* Exactly  $last - first$  assignments.

```
template<class InputIterator, class Size, class OutputIterator>
 constexpr OutputIterator copy_n(InputIterator first, Size n,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
 ForwardIterator2 copy_n(ExecutionPolicy&& exec,
 ForwardIterator1 first, Size n,
 ForwardIterator2 result);
```

```
template<input_iterator I, weakly_incrementable O>
 requires indirectly_copyable<I, O>
 constexpr ranges::copy_n_result<I, O>
 ranges::copy_n(I first, iter_difference_t<I> n, O result);
```

10     Let  $N$  be  $\max(0, n)$ .

11     *Mandates:* The type  $Size$  is convertible to an integral type (7.3.9, 11.4.8).

12     *Effects:* For each non-negative integer  $i < N$ , performs  $*(result + i) = *(first + i)$ .

13     *Returns:*

(13.1)     —  $result + N$  for the overloads in namespace `std`.

(13.2)     —  $\{first + N, result + N\}$  for the overload in namespace `ranges`.

14     *Complexity:* Exactly  $N$  assignments.

```
template<class InputIterator, class OutputIterator, class Predicate>
 constexpr OutputIterator copy_if(InputIterator first, InputIterator last,
 OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class Predicate>
 ForwardIterator2 copy_if(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
 requires indirectly_copyable<I, O>
 constexpr ranges::copy_if_result<I, O>
 ranges::copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 requires indirectly_copyable<iterator_t<R>, O>
 constexpr ranges::copy_if_result<borrowed_iterator_t<R>, O>
 ranges::copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

15     Let  $E$  be:

(15.1)     —  $\text{bool}(\text{pred}(*i))$  for the overloads in namespace `std`;

(15.2)     —  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$  for the overloads in namespace `ranges`,  
and  $N$  be the number of iterators  $i$  in the range  $[first, last)$  for which the condition  $E$  holds.

16     *Preconditions:* The ranges  $[first, last)$  and  $[result, result + (last - first))$  do not overlap.

[*Note 1:* For the overload with an `ExecutionPolicy`, there might be a performance cost if `iterator_traits<ForwardIterator1>::value_type` is not `Cpp17MoveConstructible` (Table 30). — *end note*]

17 *Effects:* Copies all of the elements referred to by the iterator `i` in the range `[first, last)` for which `E` is true.

18 *Returns:*

(18.1) — `result + N` for the overloads in namespace `std`.

(18.2) — `{last, result + N}` for the overloads in namespace `ranges`.

19 *Complexity:* Exactly `last - first` applications of the corresponding predicate and any projection.

20 *Remarks:* Stable (16.4.6.8).

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
constexpr BidirectionalIterator2
copy_backward(BidirectionalIterator1 first,
 BidirectionalIterator1 last,
 BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
requires indirectly_copyable<I1, I2>
constexpr ranges::copy_backward_result<I1, I2>
ranges::copy_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
requires indirectly_copyable<iterator_t<R>, I>
constexpr ranges::copy_backward_result<borrowed_iterator_t<R>, I>
ranges::copy_backward(R&& r, I result);
```

21 Let  $N$  be `last - first`.

22 *Preconditions:* `result` is not in the range `(first, last]`.

23 *Effects:* Copies elements in the range `[first, last)` into the range `[result - N, result)` starting from `last - 1` and proceeding to `first`.<sup>221</sup> For each positive integer  $n \leq N$ , performs `*(result - n) = *(last - n)`.

24 *Returns:*

(24.1) — `result - N` for the overload in namespace `std`.

(24.2) — `{last, result - N}` for the overloads in namespace `ranges`.

25 *Complexity:* Exactly  $N$  assignments.

## 27.7.2 Move

[alg.move]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator move(InputIterator first, InputIterator last,
 OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_movable<I, O>
constexpr ranges::move_result<I, O>
ranges::move(I first, S last, O result);
template<input_range R, weakly_incrementable O>
requires indirectly_movable<iterator_t<R>, O>
constexpr ranges::move_result<borrowed_iterator_t<R>, O>
ranges::move(R&& r, O result);
```

1 Let  $E$  be

(1.1) — `std::move(*(first + n))` for the overload in namespace `std`;

(1.2) — `ranges::iter_move(first + n)` for the overloads in namespace `ranges`.

Let  $N$  be `last - first`.

2 *Preconditions:* `result` is not in the range `[first, last)`.

3 *Effects:* Moves elements in the range `[first, last)` into the range `[result, result + N)` starting from `first` and proceeding to `last`. For each non-negative integer  $n < N$ , performs `*(result + n) = E`.

<sup>221</sup> `copy_backward` can be used instead of `copy` when `last` is in the range `[result - N, result)`.

4 *Returns:*

- (4.1) —  $\text{result} + N$  for the overload in namespace `std`.  
 (4.2) —  $\{\text{last}, \text{result} + N\}$  for the overloads in namespace `ranges`.

5 *Complexity:* Exactly  $N$  assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
 ForwardIterator2 move(ExecutionPolicy&& policy,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result);
```

6 Let  $N$  be  $\text{last} - \text{first}$ .

7 *Preconditions:* The ranges  $[\text{first}, \text{last})$  and  $[\text{result}, \text{result} + N)$  do not overlap.

8 *Effects:* Moves elements in the range  $[\text{first}, \text{last})$  into the range  $[\text{result}, \text{result} + N)$ . For each non-negative integer  $n < N$ , performs  $\text{*(result} + n) = \text{std::move}(\text{*(first} + n))$ .

9 *Returns:*  $\text{result} + N$ .

10 *Complexity:* Exactly  $N$  assignments.

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
 constexpr BidirectionalIterator2
 move_backward(BidirectionalIterator1 first, BidirectionalIterator1 last,
 BidirectionalIterator2 result);
```

```
template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
 requires indirectly_movable<I1, I2>
 constexpr ranges::move_backward_result<I1, I2>
 ranges::move_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
 requires indirectly_movable<iterator_t<R>, I>
 constexpr ranges::move_backward_result<borrowed_iterator_t<R>, I>
 ranges::move_backward(R&& r, I result);
```

11 Let  $E$  be

- (11.1) —  $\text{std::move}(\text{*(last} - n))$  for the overload in namespace `std`;  
 (11.2) —  $\text{ranges::iter\_move}(\text{last} - n)$  for the overloads in namespace `ranges`.

Let  $N$  be  $\text{last} - \text{first}$ .

12 *Preconditions:*  $\text{result}$  is not in the range  $(\text{first}, \text{last}]$ .

13 *Effects:* Moves elements in the range  $[\text{first}, \text{last})$  into the range  $[\text{result} - N, \text{result})$  starting from  $\text{last} - 1$  and proceeding to  $\text{first}$ .<sup>222</sup> For each positive integer  $n \leq N$ , performs  $\text{*(result} - n) = E$ .

14 *Returns:*

- (14.1) —  $\text{result} - N$  for the overload in namespace `std`.  
 (14.2) —  $\{\text{last}, \text{result} - N\}$  for the overloads in namespace `ranges`.

15 *Complexity:* Exactly  $N$  assignments.

### 27.7.3 Swap

[alg.swap]

```
template<class ForwardIterator1, class ForwardIterator2>
 constexpr ForwardIterator2
 swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
 ForwardIterator2
 swap_ranges(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2);
```

<sup>222</sup> `move_backward` can be used instead of `move` when  $\text{last}$  is in the range  $[\text{result} - N, \text{result})$ .

```

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
 requires indirectly_swappable<I1, I2>
 constexpr ranges::swap_ranges_result<I1, I2>
 ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
template<input_range R1, input_range R2>
 requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
 constexpr ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
 ranges::swap_ranges(R1&& r1, R2&& r2);

```

1     **Let:**

(1.1)     —  $last2$  be  $first2 + (last1 - first1)$  for the overloads with no parameter named  $last2$ ;

(1.2)     —  $M$  be  $\min(last1 - first1, last2 - first2)$ .

2     **Preconditions:** The two ranges  $[first1, last1)$  and  $[first2, last2)$  do not overlap. For the overloads in namespace `std`,  $*(first1 + n)$  is swappable with (16.4.4.3)  $*(first2 + n)$ .

3     **Effects:** For each non-negative integer  $n < M$  performs:

(3.1)     — `swap(*(first1 + n), *(first2 + n))` for the overloads in namespace `std`;

(3.2)     — `ranges::iter_swap(first1 + n, first2 + n)` for the overloads in namespace `ranges`.

4     **Returns:**

(4.1)     —  $last2$  for the overloads in namespace `std`.

(4.2)     —  $\{first1 + M, first2 + M\}$  for the overloads in namespace `ranges`.

5     **Complexity:** Exactly  $M$  swaps.

```

template<class ForwardIterator1, class ForwardIterator2>
 constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);

```

6     **Preconditions:**  $a$  and  $b$  are dereferenceable.  $*a$  is swappable with (16.4.4.3)  $*b$ .

7     **Effects:** As if by `swap(*a, *b)`.

## 27.7.4 Transform

[alg.transform]

```

template<class InputIterator, class OutputIterator,
 class UnaryOperation>
 constexpr OutputIterator
 transform(InputIterator first1, InputIterator last1,
 OutputIterator result, UnaryOperation op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class UnaryOperation>
 ForwardIterator2
 transform(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 result, UnaryOperation op);

template<class InputIterator1, class InputIterator2,
 class OutputIterator, class BinaryOperation>
 constexpr OutputIterator
 transform(InputIterator1 first1, InputIterator1 last1,
 InputIterator2 first2, OutputIterator result,
 BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class ForwardIterator, class BinaryOperation>
 ForwardIterator
 transform(ExecutionPolicy&& exec,
 ForwardIterator1 first1, ForwardIterator1 last1,
 ForwardIterator2 first2, ForwardIterator result,
 BinaryOperation binary_op);

```

```

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
 copy_constructible F, class Proj = identity>
 requires indirectly_writable<O, indirect_result_t<F&, projected<I, Proj>>>
 constexpr ranges::unary_transform_result<I, O>
 ranges::transform(I first1, S last1, O result, F op, Proj proj = {});
template<input_range R, weakly_incrementable O, copy_constructible F,
 class Proj = identity>
 requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R>, Proj>>>
 constexpr ranges::unary_transform_result<borrowed_iterator_t<R>, O>
 ranges::transform(R&& r, O result, F op, Proj proj = {});
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
 weakly_incrementable O, copy_constructible F, class Proj1 = identity,
 class Proj2 = identity>
 requires indirectly_writable<O, indirect_result_t<F&, projected<I1, Proj1>,
 projected<I2, Proj2>>>
 constexpr ranges::binary_transform_result<I1, I2, O>
 ranges::transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
 F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
 copy_constructible F, class Proj1 = identity, class Proj2 = identity>
 requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>,
 projected<iterator_t<R2>, Proj2>>>
 constexpr ranges::binary_transform_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
 ranges::transform(R1&& r1, R2&& r2, O result,
 F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});

```

1     **Let:**

- (1.1)     —  $last2$  be  $first2 + (last1 - first1)$  for the overloads with parameter  $first2$  but no parameter  $last2$ ;
- (1.2)     —  $N$  be  $last1 - first1$  for unary transforms, or  $\min(last1 - first1, last2 - first2)$  for binary transforms;
- (1.3)     —  $E$  be
  - (1.3.1)     —  $op(*(first1 + (i - result)))$  for unary transforms defined in namespace `std`;
  - (1.3.2)     —  $binary\_op(*(first1 + (i - result)), *(first2 + (i - result)))$  for binary transforms defined in namespace `std`;
  - (1.3.3)     —  $invoke(op, invoke(proj, *(first1 + (i - result))))$  for unary transforms defined in namespace `ranges`;
  - (1.3.4)     —  $invoke(binary\_op, invoke(proj1, *(first1 + (i - result))), invoke(proj2, *(first2 + (i - result))))$  for binary transforms defined in namespace `ranges`.

2     **Preconditions:** `op` and `binary_op` do not invalidate iterators or subranges, nor modify elements in the ranges

- (2.1)     —  $[first1, first1 + N]$ ,
- (2.2)     —  $[first2, first2 + N]$ , and
- (2.3)     —  $[result, result + N]$ .<sup>223</sup>

3     **Effects:** Assigns through every iterator  $i$  in the range  $[result, result + N)$  a new corresponding value equal to  $E$ .

4     **Returns:**

- (4.1)     —  $result + N$  for the overloads defined in namespace `std`.
- (4.2)     —  $\{first1 + N, result + N\}$  for unary transforms defined in namespace `ranges`.
- (4.3)     —  $\{first1 + N, first2 + N, result + N\}$  for binary transforms defined in namespace `ranges`.

5     **Complexity:** Exactly  $N$  applications of `op` or `binary_op`, and any projections. This requirement also applies to the overload with an `ExecutionPolicy`.

6     **Remarks:**  $result$  may be equal to  $first1$  or  $first2$ .

---

223) The use of fully closed ranges is intentional.

## 27.7.5 Replace

[alg.replace]

```

template<class ForwardIterator, class T>
 constexpr void replace(ForwardIterator first, ForwardIterator last,
 const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class T>
 void replace(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
 constexpr void replace_if(ForwardIterator first, ForwardIterator last,
 Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T>
 void replace_if(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, class Proj = identity>
 requires indirectly_writable<I, const T2> &&
 indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>
 constexpr I
 ranges::replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {});
template<input_range R, class T1, class T2, class Proj = identity>
 requires indirectly_writable<iterator_t<R>, const T2> &&
 indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>
 constexpr borrowed_iterator_t<R>
 ranges::replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
 requires indirectly_writable<I, const T>
 constexpr I ranges::replace_if(I first, S last, Pred pred, const T& new_value, Proj proj = {});
template<input_range R, class T, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 requires indirectly_writable<iterator_t<R>, const T>
 constexpr borrowed_iterator_t<R>
 ranges::replace_if(R&& r, Pred pred, const T& new_value, Proj proj = {});

```

1 Let  $E$  be

- (1.1) —  $\text{bool}(*i == \text{old\_value})$  for `replace`;
- (1.2) —  $\text{bool}(\text{pred}(*i))$  for `replace_if`;
- (1.3) —  $\text{bool}(\text{invoke}(\text{proj}, *i) == \text{old\_value})$  for `ranges::replace`;
- (1.4) —  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$  for `ranges::replace_if`.

2 **Mandates:** `new_value` is writable (25.3.1) to `first`.

3 **Effects:** Substitutes elements referred by the iterator  $i$  in the range  $[\text{first}, \text{last})$  with `new_value`, when  $E$  is true.

4 **Returns:** `last` for the overloads in namespace `ranges`.

5 **Complexity:** Exactly `last - first` applications of the corresponding predicate and any projection.

```

template<class InputIterator, class OutputIterator, class T>
 constexpr OutputIterator
 replace_copy(InputIterator first, InputIterator last,
 OutputIterator result,
 const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
 ForwardIterator2
 replace_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result,
 const T& old_value, const T& new_value);

```

```

template<class InputIterator, class OutputIterator, class Predicate, class T>
constexpr OutputIterator
 replace_copy_if(InputIterator first, InputIterator last,
 OutputIterator result,
 Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class Predicate, class T>
ForwardIterator2
 replace_copy_if(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result,
 Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, output_iterator<const T2> O,
 class Proj = identity>
requires indirectly_copyable<I, O> &&
 indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>
constexpr ranges::replace_copy_result<I, O>
 ranges::replace_copy(I first, S last, O result, const T1& old_value, const T2& new_value,
 Proj proj = {});
template<input_range R, class T1, class T2, output_iterator<const T2> O,
 class Proj = identity>
requires indirectly_copyable<iterator_t<R>, O> &&
 indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>
constexpr ranges::replace_copy_result<borrowed_iterator_t<R>, O>
 ranges::replace_copy(R&& r, O result, const T1& old_value, const T2& new_value,
 Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class T, output_iterator<const T> O,
 class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
constexpr ranges::replace_copy_if_result<I, O>
 ranges::replace_copy_if(I first, S last, O result, Pred pred, const T& new_value,
 Proj proj = {});
template<input_range R, class T, output_iterator<const T> O, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::replace_copy_if_result<borrowed_iterator_t<R>, O>
 ranges::replace_copy_if(R&& r, O result, Pred pred, const T& new_value,
 Proj proj = {});

```

6 Let  $E$  be

- (6.1) — `bool(*(first + (i - result)) == old_value)` for `replace_copy`;
- (6.2) — `bool(pred(*(first + (i - result))))` for `replace_copy_if`;
- (6.3) — `bool(invoke(proj, *(first + (i - result))) == old_value)` for `ranges::replace_copy`;
- (6.4) — `bool(invoke(pred, invoke(proj, *(first + (i - result)))))` for `ranges::replace_copy_if`.

7 **Mandates:** The results of the expressions `*first` and `new_value` are writable (25.3.1) to `result`.

8 **Preconditions:** The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.

9 **Effects:** Assigns through every iterator  $i$  in the range `[result, result + (last - first))` a new corresponding value

- (9.1) — `new_value` if  $E$  is true or
- (9.2) — `*(first + (i - result))` otherwise.

10 **Returns:**

- (10.1) — `result + (last - first)` for the overloads in namespace `std`.
- (10.2) — `{last, result + (last - first)}` for the overloads in namespace `ranges`.

11 **Complexity:** Exactly `last - first` applications of the corresponding predicate and any projection.

**27.7.6 Fill****[alg.fill]**

```

template<class ForwardIterator, class T>
constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
void fill(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator fill_n(ExecutionPolicy&& exec,
 ForwardIterator first, Size n, const T& value);

```

```

template<class T, output_iterator<const T&> O, sentinel_for<O> S>
constexpr O ranges::fill(O first, S last, const T& value);
template<class T, output_range<const T&> R>
constexpr borrowed_iterator_t<R> ranges::fill(R&& r, const T& value);
template<class T, output_iterator<const T&> O>
constexpr O ranges::fill_n(O first, iter_difference_t<O> n, const T& value);

```

1 Let  $N$  be  $\max(0, n)$  for the `fill_n` algorithms, and  $\text{last} - \text{first}$  for the `fill` algorithms.

2 *Mandates:* The expression value is writable (25.3.1) to the output iterator. The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects:* Assigns value through all the iterators in the range  $[\text{first}, \text{first} + N)$ .

4 *Returns:*  $\text{first} + N$ .

5 *Complexity:* Exactly  $N$  assignments.

**27.7.7 Generate****[alg.generate]**

```

template<class ForwardIterator, class Generator>
constexpr void generate(ForwardIterator first, ForwardIterator last,
 Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Generator>
void generate(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Generator gen);

template<class OutputIterator, class Size, class Generator>
constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
ForwardIterator generate_n(ExecutionPolicy&& exec,
 ForwardIterator first, Size n, Generator gen);

template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
constexpr O ranges::generate(O first, S last, F gen);
template<class R, copy_constructible F>
requires invocable<F&> && output_range<R, invoke_result_t<F&>>
constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);
template<input_or_output_iterator O, copy_constructible F>
requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);

```

1 Let  $N$  be  $\max(0, n)$  for the `generate_n` algorithms, and  $\text{last} - \text{first}$  for the `generate` algorithms.

2 *Mandates:* `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects:* Assigns the result of successive evaluations of `gen()` through each iterator in the range  $[\text{first}, \text{first} + N)$ .

4 *Returns:*  $\text{first} + N$ .

5 *Complexity:* Exactly  $N$  evaluations of `gen()` and assignments.

## 27.7.8 Remove

[alg.remove]

```

template<class ForwardIterator, class T>
 constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
 const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
 ForwardIterator remove(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 const T& value);

template<class ForwardIterator, class Predicate>
 constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
 Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
 ForwardIterator remove_if(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 Predicate pred);

template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
 requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
 constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class T, class Proj = identity>
 requires permutable<iterator_t<R>> &&
 indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
 constexpr borrowed_subrange_t<R>
 ranges::remove(R&& r, const T& value, Proj proj = {});
template<permutable I, sentinel_for<I> S, class Proj = identity,
 indirect_unary_predicate<projected<I, Proj>> Pred>
 constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 requires permutable<iterator_t<R>>
 constexpr borrowed_subrange_t<R>
 ranges::remove_if(R&& r, Pred pred, Proj proj = {});

```

1 Let  $E$  be

- (1.1) —  $\text{bool}(*i == \text{value})$  for `remove`;
- (1.2) —  $\text{bool}(\text{pred}(*i))$  for `remove_if`;
- (1.3) —  $\text{bool}(\text{invoke}(\text{proj}, *i) == \text{value})$  for `ranges::remove`;
- (1.4) —  $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *i)))$  for `ranges::remove_if`.

2 **Preconditions:** For the algorithms in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 32).

3 **Effects:** Eliminates all the elements referred to by iterator  $i$  in the range  $[first, last)$  for which  $E$  holds.

4 **Returns:** Let  $j$  be the end of the resulting range. Returns:

- (4.1) —  $j$  for the overloads in namespace `std`.
- (4.2) —  $\{j, last\}$  for the overloads in namespace `ranges`.

5 **Complexity:** Exactly  $last - first$  applications of the corresponding predicate and any projection.

6 **Remarks:** Stable (16.4.6.8).

7 [Note 1: Each element in the range  $[ret, last)$ , where  $ret$  is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — end note]

```

template<class InputIterator, class OutputIterator, class T>
 constexpr OutputIterator
 remove_copy(InputIterator first, InputIterator last,
 OutputIterator result, const T& value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class T>
 ForwardIterator2
 remove_copy(ExecutionPolicy&& exec,

```

```

 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, const T& value);

template<class InputIterator, class OutputIterator, class Predicate>
 constexpr OutputIterator
 remove_copy_if(InputIterator first, InputIterator last,
 OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class Predicate>
 ForwardIterator2
 remove_copy_if(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
 class Proj = identity>
 requires indirectly_copyable<I, O> &&
 indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
 constexpr ranges::remove_copy_result<I, O>
 ranges::remove_copy(I first, S last, O result, const T& value, Proj proj = {});
template<input_range R, weakly_incrementable O, class T, class Proj = identity>
 requires indirectly_copyable<iterator_t<R>, O> &&
 indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
 constexpr ranges::remove_copy_result<borrowed_iterator_t<R>, O>
 ranges::remove_copy(R&& r, O result, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
 class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
 requires indirectly_copyable<I, O>
 constexpr ranges::remove_copy_if_result<I, O>
 ranges::remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
 indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
 requires indirectly_copyable<iterator_t<R>, O>
 constexpr ranges::remove_copy_if_result<borrowed_iterator_t<R>, O>
 ranges::remove_copy_if(R&& r, O result, Pred pred, Proj proj = {});
8 Let E be
(8.1) — bool(*i == value) for remove_copy;
(8.2) — bool(pred(*i)) for remove_copy_if;
(8.3) — bool(invoke(proj, *i) == value) for ranges::remove_copy;
(8.4) — bool(invoke(pred, invoke(proj, *i))) for ranges::remove_copy_if.
9 Let N be the number of elements in $[first, last)$ for which E is false.
10 Mandates: *first is writable (25.3.1) to result.
11 Preconditions: The ranges $[first, last)$ and $[result, result + (last - first))$ do not overlap.
 [Note 2: For the overloads with an ExecutionPolicy, there might be a performance cost if iterator_traits<ForwardIterator1>::value_
 type does not meet the Cpp17MoveConstructible (Table 30) requirements. — end note]
12 Effects: Copies all the elements referred to by the iterator i in the range $[first, last)$ for which E is false.
13 Returns:
(13.1) — result + N, for the algorithms in namespace std.
(13.2) — $\{last, result + N\}$, for the algorithms in namespace ranges.
14 Complexity: Exactly last - first applications of the corresponding predicate and any projection.
15 Remarks: Stable (16.4.6.8).

```

### 27.7.9 Unique

[alg.unique]

```

template<class ForwardIterator>
 constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);

```

```

template<class ExecutionPolicy, class ForwardIterator>
 ForwardIterator unique(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
 constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,
 BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
 ForwardIterator unique(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last,
 BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
 indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
 constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
 indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
 requires permutable<iterator_t<R>>
 constexpr borrowed_subrange_t<R>
 ranges::unique(R&& r, C comp = {}, Proj proj = {});

```

- 1 Let `pred` be `equal_to{}` for the overloads with no parameter `pred`, and let  $E$  be
- (1.1) — `bool(pred(*(i - 1), *i))` for the overloads in namespace `std`;
- (1.2) — `bool(invoke(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace `ranges`.
- 2 **Preconditions:** For the overloads in namespace `std`, `pred` is an equivalence relation and the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 32).
- 3 **Effects:** For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator `i` in the range `[first + 1, last)` for which  $E$  is true.
- 4 **Returns:** Let  $j$  be the end of the resulting range. Returns:
- (4.1) —  $j$  for the overloads in namespace `std`.
- (4.2) — `{j, last}` for the overloads in namespace `ranges`.
- 5 **Complexity:** For nonempty ranges, exactly  $(last - first) - 1$  applications of the corresponding predicate and no more than twice as many applications of any projection.

```

template<class InputIterator, class OutputIterator>
 constexpr OutputIterator
 unique_copy(InputIterator first, InputIterator last,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
 ForwardIterator2
 unique_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result);

template<class InputIterator, class OutputIterator,
 class BinaryPredicate>
 constexpr OutputIterator
 unique_copy(InputIterator first, InputIterator last,
 OutputIterator result, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
 class BinaryPredicate>
 ForwardIterator2
 unique_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 last,
 ForwardIterator2 result, BinaryPredicate pred);

```

```

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
 indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
requires indirectly_copyable<I, O> &&
 (forward_iterator<I> ||
 (input_iterator<O> && same_as<iter_value_t<I>, iter_value_t<O>>) ||
 indirectly_copyable_storable<I, O>)
constexpr ranges::unique_copy_result<I, O>
 ranges::unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
 indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires indirectly_copyable<iterator_t<R>, O> &&
 (forward_iterator<iterator_t<R>> ||
 (input_iterator<O> && same_as<range_value_t<R>, iter_value_t<O>>) ||
 indirectly_copyable_storable<iterator_t<R>, O>)
constexpr ranges::unique_copy_result<borrowed_iterator_t<R>, O>
 ranges::unique_copy(R&& r, O result, C comp = {}, Proj proj = {});

```

- 6 Let `pred` be `equal_to{}` for the overloads in namespace `std` with no parameter `pred`, and let  $E$  be
- (6.1) — `bool(pred(*i, *(i - 1)))` for the overloads in namespace `std`;
- (6.2) — `bool(involve(comp, involve(proj, *i), involve(proj, *(i - 1))))` for the overloads in namespace `ranges`.

7 **Mandates:** `*first` is writable (25.3.1) to `result`.

8 **Preconditions:**

- (8.1) — The ranges `[first, last)` and `[result, result+(last-first))` do not overlap.
- (8.2) — For the overloads in namespace `std`:
- (8.2.1) — The comparison function is an equivalence relation.
- (8.2.2) — For the overloads with no `ExecutionPolicy`, let  $T$  be the value type of `InputIterator`. If `InputIterator` meets the *Cpp17ForwardIterator* requirements, then there are no additional requirements for  $T$ . Otherwise, if `OutputIterator` meets the *Cpp17ForwardIterator* requirements and its value type is the same as  $T$ , then  $T$  meets the *Cpp17CopyAssignable* (Table 33) requirements. Otherwise,  $T$  meets both the *Cpp17CopyConstructible* (Table 31) and *Cpp17CopyAssignable* requirements.

[Note 1: For the overloads with an `ExecutionPolicy`, there might be a performance cost if the value type of `ForwardIterator1` does not meet both the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements.  
— end note]

9 **Effects:** Copies only the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first, last)` for which  $E$  holds.

10 **Returns:**

- (10.1) — `result + N` for the overloads in namespace `std`.
- (10.2) — `{last, result + N}` for the overloads in namespace `ranges`.

11 **Complexity:** Exactly `last - first - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

### 27.7.10 Reverse

[alg.reverse]

```

template<class BidirectionalIterator>
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void reverse(ExecutionPolicy&& exec,
 BidirectionalIterator first, BidirectionalIterator last);

template<bidirectional_iterator I, sentinel_for<I> S>
requires permutable<I>
constexpr I ranges::reverse(I first, S last);
template<bidirectional_range R>
requires permutable<iterator_t<R>>

```

```
constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);
```

1 *Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

2 *Effects:* For each non-negative integer  $i < (last - first) / 2$ , applies `std::iter_swap`, or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators  $first + i$ ,  $(last - i) - 1$ .

3 *Returns:* `last` for the overloads in namespace `ranges`.

4 *Complexity:* Exactly  $(last - first)/2$  swaps.

```
template<class BidirectionalIterator, class OutputIterator>
constexpr OutputIterator
reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
 OutputIterator result);
template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
ForwardIterator
reverse_copy(ExecutionPolicy&& exec,
 BidirectionalIterator first, BidirectionalIterator last,
 ForwardIterator result);
```

```
template<bidirectional_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::reverse_copy_result<I, O>
reverse_copy(I first, S last, O result);
template<bidirectional_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O>
reverse_copy(R&& r, O result);
```

5 Let  $N$  be  $last - first$ .

6 *Preconditions:* The ranges  $[first, last)$  and  $[result, result + N)$  do not overlap.

7 *Effects:* Copies the range  $[first, last)$  to the range  $[result, result + N)$  such that for every non-negative integer  $i < N$  the following assignment takes place:  $*(result + N - 1 - i) = *(first + i)$ .

8 *Returns:*

(8.1) —  $result + N$  for the overloads in namespace `std`.

(8.2) —  $\{last, result + N\}$  for the overloads in namespace `ranges`.

9 *Complexity:* Exactly  $N$  assignments.

### 27.7.11 Rotate

[alg.rotate]

```
template<class ForwardIterator>
constexpr ForwardIterator
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::rotate(I first, I middle, S last);
```

1 *Preconditions:*  $[first, middle)$  and  $[middle, last)$  are valid ranges. For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of  $*first$  meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.

2 *Effects:* For each non-negative integer  $i < (last - first)$ , places the element from the position  $first + i$  into position  $first + (i + (last - middle)) \% (last - first)$ .

[Note 1: This is a left rotate. — end note]

3 *Returns:*

(3.1) —  $first + (last - middle)$  for the overloads in namespace `std`.

(3.2) — {first + (last - middle), last} for the overload in namespace ranges.

4 **Complexity:** At most last - first swaps.

```
template<forward_range R>
 requires permutable<iterator_t<R>>
 constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);
```

5 **Effects:** Equivalent to: return ranges::rotate(ranges::begin(r), middle, ranges::end(r));

```
template<class ForwardIterator, class OutputIterator>
 constexpr OutputIterator
 rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
 OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
 ForwardIterator2
 rotate_copy(ExecutionPolicy&& exec,
 ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
 ForwardIterator2 result);
```

```
template<forward_iterator I, sentinel_for<I> S, weakly_incrementable O>
 requires indirectly_copyable<I, O>
 constexpr ranges::rotate_copy_result<I, O>
 ranges::rotate_copy(I first, I middle, S last, O result);
```

6 Let  $N$  be last - first.

7 **Preconditions:** [first, middle) and [middle, last) are valid ranges. The ranges [first, last) and [result, result +  $N$ ) do not overlap.

8 **Effects:** Copies the range [first, last) to the range [result, result +  $N$ ) such that for each non-negative integer  $i < N$  the following assignment takes place:  $*(result + i) = *(first + (i + (middle - first)) \% N)$ .

9 **Returns:**

(9.1) — result +  $N$  for the overloads in namespace std.

(9.2) — {last, result +  $N$ } for the overload in namespace ranges.

10 **Complexity:** Exactly  $N$  assignments.

```
template<forward_range R, weakly_incrementable O>
 requires indirectly_copyable<iterator_t<R>, O>
 constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O>
 ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);
```

11 **Effects:** Equivalent to:

```
return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), result);
```

### 27.7.12 Sample

[alg.random.sample]

```
template<class PopulationIterator, class SampleIterator,
 class Distance, class UniformRandomBitGenerator>
 SampleIterator sample(PopulationIterator first, PopulationIterator last,
 SampleIterator out, Distance n,
 UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
 requires (forward_iterator<I> || random_access_iterator<O>) &&
 indirectly_copyable<I, O> &&
 uniform_random_bit_generator<remove_reference_t<Gen>>
 O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
template<input_range R, weakly_incrementable O, class Gen>
 requires (forward_range<R> || random_access_iterator<O>) &&
 indirectly_copyable<iterator_t<R>, O> &&
 uniform_random_bit_generator<remove_reference_t<Gen>>
```

```
0 ranges::sample(R&& r, 0 out, range_difference_t<R> n, Gen&& g);
```

1 **Mandates:** For the overload in namespace `std`, `Distance` is an integer type and `*first` is writable (25.3.1) to `out`.

2 **Preconditions:** `out` is not in the range  $[first, last)$ . For the overload in namespace `std`:

- (2.1) — `PopulationIterator` meets the *Cpp17InputIterator* requirements (25.3.5.3).
- (2.2) — `SampleIterator` meets the *Cpp17OutputIterator* requirements (25.3.5.4).
- (2.3) — `SampleIterator` meets the *Cpp17RandomAccessIterator* requirements (25.3.5.7) unless `PopulationIterator` meets the *Cpp17ForwardIterator* requirements (25.3.5.5).
- (2.4) — `remove_reference_t<UniformRandomBitGenerator>` meets the requirements of a uniform random bit generator type (28.5.3.3).

3 **Effects:** Copies  $\min(last - first, n)$  elements (the *sample*) from  $[first, last)$  (the *population*) to `out` such that each possible sample has equal probability of appearance.

[Note 1: Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*. — end note]

4 **Returns:** The end of the resulting sample range.

5 **Complexity:**  $\mathcal{O}(last - first)$ .

6 **Remarks:**

- (6.1) — For the overload in namespace `std`, stable if and only if `PopulationIterator` meets the *Cpp17ForwardIterator* requirements. For the first overload in namespace `ranges`, stable if and only if `I` models *forward\_iterator*.
- (6.2) — To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation's source of randomness.

### 27.7.13 Shuffle

[alg.random.shuffle]

```
template<class RandomAccessIterator, class UniformRandomBitGenerator>
void shuffle(RandomAccessIterator first,
 RandomAccessIterator last,
 UniformRandomBitGenerator&& g);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Gen>
requires permutable<I> &&
 uniform_random_bit_generator<remove_reference_t<Gen>>
I ranges::shuffle(I first, S last, Gen&& g);
template<random_access_range R, class Gen>
requires permutable<iterator_t<R>> &&
 uniform_random_bit_generator<remove_reference_t<Gen>>
borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

1 **Preconditions:** For the overload in namespace `std`:

- (1.1) — `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).
- (1.2) — The type `remove_reference_t<UniformRandomBitGenerator>` meets the uniform random bit generator (28.5.3.3) requirements.

2 **Effects:** Permutes the elements in the range  $[first, last)$  such that each possible permutation of those elements has equal probability of appearance.

3 **Returns:** `last` for the overloads in namespace `ranges`.

4 **Complexity:** Exactly  $(last - first) - 1$  swaps.

5 **Remarks:** To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation's source of randomness.

### 27.7.14 Shift

[alg.shift]

```
template<class ForwardIterator>
constexpr ForwardIterator
shift_left(ForwardIterator first, ForwardIterator last,
```

```

 typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
 ForwardIterator
 shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
 constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);
template<forward_range R>
 requires permutable<iterator_t<R>>
 constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n)

```

1 *Preconditions:*  $n \geq 0$  is true. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements.

2 *Effects:* If  $n == 0$  or  $n \geq \text{last} - \text{first}$ , does nothing. Otherwise, moves the element from position  $\text{first} + n + i$  into position  $\text{first} + i$  for each non-negative integer  $i < (\text{last} - \text{first}) - n$ . For the overloads without an `ExecutionPolicy` template parameter, does so in order starting from  $i = 0$  and proceeding to  $i = (\text{last} - \text{first}) - n - 1$ .

3 *Returns:* Let *NEW\_LAST* be  $\text{first} + (\text{last} - \text{first} - n)$  if  $n < \text{last} - \text{first}$ , otherwise `first`.

(3.1) — *NEW\_LAST* for the overloads in namespace `std`.

(3.2) —  $\{\text{first}, \text{NEW\_LAST}\}$  for the overloads in namespace `ranges`.

4 *Complexity:* At most  $(\text{last} - \text{first}) - n$  assignments.

```

template<class ForwardIterator>
 constexpr ForwardIterator
 shift_right(ForwardIterator first, ForwardIterator last,
 typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
 ForwardIterator
 shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
 typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
 constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);
template<forward_range R>
 requires permutable<iterator_t<R>>
 constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n);

```

5 *Preconditions:*  $n \geq 0$  is true. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements, and `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements (25.3.5.6) or the *Cpp17ValueSwappable* requirements.

6 *Effects:* If  $n == 0$  or  $n \geq \text{last} - \text{first}$ , does nothing. Otherwise, moves the element from position  $\text{first} + i$  into position  $\text{first} + n + i$  for each non-negative integer  $i < (\text{last} - \text{first}) - n$ . Does so in order starting from  $i = (\text{last} - \text{first}) - n - 1$  and proceeding to  $i = 0$  if:

(6.1) — for the overload in namespace `std` without an `ExecutionPolicy` template parameter, `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements,

(6.2) — for the overloads in namespace `ranges`, `I` models `bidirectional_iterator`.

7 *Returns:* Let *NEW\_FIRST* be  $\text{first} + n$  if  $n < \text{last} - \text{first}$ , otherwise `last`.

(7.1) — *NEW\_FIRST* for the overloads in namespace `std`.

(7.2) —  $\{\text{NEW\_FIRST}, \text{last}\}$  for the overloads in namespace `ranges`.

8 *Complexity:* At most  $(\text{last} - \text{first}) - n$  assignments or swaps.

## 27.8 Sorting and related operations

[alg.sorting]

### 27.8.1 General

[alg.sorting.general]

1 The operations in 27.8 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.

- <sup>2</sup> Compare is a function object type (22.10) that meets the requirements for a template parameter named BinaryPredicate (27.2). The return value of the function call operation applied to an object of type Compare, when contextually converted to bool (7.3), yields true if the first argument of the call is less than the second, and false otherwise. Compare comp is used throughout for algorithms assuming an ordering relation.
- <sup>3</sup> For all algorithms that take Compare, there is a version that uses operator< instead. That is,  $\text{comp}(*i, *j) \neq \text{false}$  defaults to  $*i < *j \neq \text{false}$ . For algorithms other than those described in 27.8.4, comp shall induce a strict weak ordering on the values.
- <sup>4</sup> The term *strict* refers to the requirement of an irreflexive relation ( $!\text{comp}(x, x)$  for all  $x$ ), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define  $\text{equiv}(a, b)$  as  $!\text{comp}(a, b) \ \&\& \ !\text{comp}(b, a)$ , then the requirements are that comp and equiv both be transitive relations:
- (4.1) —  $\text{comp}(a, b) \ \&\& \ \text{comp}(b, c)$  implies  $\text{comp}(a, c)$
- (4.2) —  $\text{equiv}(a, b) \ \&\& \ \text{equiv}(b, c)$  implies  $\text{equiv}(a, c)$
- [Note 1: Under these conditions, it can be shown that
- (4.3) — equiv is an equivalence relation,
- (4.4) — comp induces a well-defined relation on the equivalence classes determined by equiv, and
- (4.5) — the induced relation is a strict total ordering.
- end note]
- <sup>5</sup> A sequence is *sorted with respect to a comp and proj* for a comparator and projection comp and proj if for every iterator i pointing to the sequence and every non-negative integer n such that  $i + n$  is a valid iterator pointing to an element of the sequence,
- ```
bool(invoke(comp, invoke(proj, *(i + n)), invoke(proj, *i)))
```
- is false.
- ⁶ A sequence [start, finish) is *partitioned with respect to an expression f(e)* if there exists an integer n such that for all $0 \leq i < (\text{finish} - \text{start})$, $f(*(start + i))$ is true if and only if $i < n$.
- ⁷ In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an operator==, but an equivalence relation induced by the strict weak ordering. That is, two elements a and b are considered equivalent if and only if $!(a < b) \ \&\& \ !(b < a)$.

27.8.2 Sorting

[alg.sort]

27.8.2.1 sort

[sort]

```
template<class RandomAccessIterator>
    constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
    void sort(ExecutionPolicy&& exec,
              RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
    void sort(ExecutionPolicy&& exec,
              RandomAccessIterator first, RandomAccessIterator last,
              Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
    requires sortable<I, Comp, Proj>
    constexpr I
        ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
    constexpr borrowed_iterator_t<R>
```

```
ranges::sort(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.
- 3 *Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* Let N be `last - first`. $\mathcal{O}(N \log N)$ comparisons and projections.

27.8.2.2 `stable_sort`

[stable.sort]

```
template<class RandomAccessIterator>
    void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
    void stable_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
    void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
    void stable_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
    requires sortable<I, Comp, Proj>
    I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
    borrowed_iterator_t<R>
    ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.
- 3 *Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* Let N be `last - first`. If enough extra memory is available, $N \log(N)$ comparisons. Otherwise, at most $N \log^2(N)$ comparisons. In either case, twice as many projections as the number of comparisons.
- 6 *Remarks:* Stable (16.4.6.8).

27.8.2.3 `partial_sort`

[partial.sort]

```
template<class RandomAccessIterator>
    constexpr void partial_sort(RandomAccessIterator first,
                                RandomAccessIterator middle,
                                RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
    void partial_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last);
```

```

template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
                            RandomAccessIterator middle,
                            RandomAccessIterator last,
                            Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first,
                 RandomAccessIterator middle,
                 RandomAccessIterator last,
                 Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* `[first,middle)` and `[middle,last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.
- 3 *Effects:* Places the first `middle - first` elements from the range `[first,last)` as sorted with respect to `comp` and `proj` into the range `[first,middle)`. The rest of the elements in the range `[middle,last)` are placed in an unspecified order.
- 4 *Returns:* `last` for the overload in namespace `ranges`.
- 5 *Complexity:* Approximately $(last - first) * \log(middle - first)$ comparisons, and twice as many projections.

```

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});

```

- 6 *Effects:* Equivalent to:

```

return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);

```

27.8.2.4 `partial_sort_copy`

[`partial.sort.copy`]

```

template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
                 RandomAccessIterator result_first,
                 RandomAccessIterator result_last);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
                 ForwardIterator first, ForwardIterator last,
                 RandomAccessIterator result_first,
                 RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
        class Compare>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
                 RandomAccessIterator result_first,
                 RandomAccessIterator result_last,
                 Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
        class Compare>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,

```

```

        ForwardIterator first, ForwardIterator last,
        RandomAccessIterator result_first,
        RandomAccessIterator result_last,
        Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
        indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
constexpr ranges::partial_sort_copy_result<I1, I2>
        ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, random_access_range R2, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
        sortable<iterator_t<R2>, Comp, Proj2> &&
        indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
        projected<iterator_t<R2>, Proj2>>
constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
        ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let N be $\min(\text{last} - \text{first}, \text{result_last} - \text{result_first})$. Let comp be $\text{less}\{\}$, and proj1 and proj2 be $\text{identity}\{\}$ for the overloads with no parameters by those names.

2 *Mandates:* For the overloads in namespace `std`, the expression `*first` is writable (25.3.1) to `result_first`.

3 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), the type of `*result_first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17-MoveAssignable* (Table 32) requirements.

4 For iterators $a1$ and $b1$ in $[\text{first}, \text{last})$, and iterators $x2$ and $y2$ in $[\text{result_first}, \text{result_last})$, after evaluating the assignment `*y2 = *b1`, let E be the value of

```
bool(invoke(comp, invoke(proj1, *a1), invoke(proj2, *y2))).
```

Then, after evaluating the assignment `*x2 = *a1`, E is equal to

```
bool(invoke(comp, invoke(proj2, *x2), invoke(proj2, *y2))).
```

[Note 1: Writing a value from the input range into the output range does not affect how it is ordered by comp and proj1 or proj2 . — end note]

5 *Effects:* Places the first N elements as sorted with respect to comp and proj2 into the range $[\text{result_first}, \text{result_first} + N)$.

6 *Returns:*

(6.1) — `result_first + N` for the overloads in namespace `std`.

(6.2) — `{last, result_first + N}` for the overloads in namespace `ranges`.

7 *Complexity:* Approximately $(\text{last} - \text{first}) * \log N$ comparisons, and twice as many projections.

27.8.2.5 `is_sorted`

[is.sorted]

```

template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);

```

1 *Effects:* Equivalent to: `return is_sorted_until(first, last) == last;`

```

template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last);

```

2 *Effects:* Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```
template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                        Compare comp);
```

3 *Effects:* Equivalent to: `return is_sorted_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class ForwardIterator, class Compare>
bool is_sorted(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last,
              Compare comp);
```

4 *Effects:* Equivalent to:
`return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;`

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Effects:* Equivalent to: `return ranges::is_sorted_until(first, last, comp, proj) == last;`

```
template<class ForwardIterator>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class Compare>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last,
               Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

7 *Returns:* The last iterator `i` in `[first, last]` for which the range `[first, i)` is sorted with respect to `comp` and `proj`.

8 *Complexity:* Linear.

27.8.3 Nth element

[alg.nth.element]

```
template<class RandomAccessIterator>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                          RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void nth_element(ExecutionPolicy&& exec,
                RandomAccessIterator first, RandomAccessIterator nth,
                RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
    constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                              RandomAccessIterator last, Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
    void nth_element(ExecutionPolicy&& exec,
                    RandomAccessIterator first, RandomAccessIterator nth,
                    RandomAccessIterator last, Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
    requires sortable<I, Comp, Proj>
    constexpr I
    ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* `[first, nth)` and `[nth, last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.
- 3 *Effects:* After `nth_element` the element in the position pointed to by `nth` is the element that would be in that position if the whole range were sorted with respect to `comp` and `proj`, unless `nth == last`. Also for every iterator `i` in the range `[first, nth)` and every iterator `j` in the range `[nth, last)` it holds that: `bool(involve(comp, involve(proj, *j), involve(proj, *i)))` is false.
- 4 *Returns:* `last` for the overload in namespace `ranges`.
- 5 *Complexity:* For the overloads with no `ExecutionPolicy`, linear on average. For the overloads with an `ExecutionPolicy`, $\mathcal{O}(N)$ applications of the predicate, and $\mathcal{O}(N \log N)$ swaps, where $N = last - first$.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
    constexpr borrowed_iterator_t<R>
    ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
```

- 6 *Effects:* Equivalent to:

```
return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);
```

27.8.4 Binary search

[alg.binary.search]

27.8.4.1 General

[alg.binary.search.general]

- 1 All of the algorithms in 27.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

27.8.4.2 lower_bound

[lower.bound]

```
template<class ForwardIterator, class T>
    constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
               const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
    constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
               const T& value, Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
    constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {},
                                   Proj proj = {});
```

```
template<forward_range R, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
        ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

- 1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
- 2 *Preconditions:* The elements e of [first, last) are partitioned with respect to the expression bool(invoke(comp, invoke(proj, e), value)).
- 3 *Returns:* The furthestmost iterator i in the range [first, last] such that for every iterator j in the range [first, i), bool(invoke(comp, invoke(proj, *j), value)) is true.
- 4 *Complexity:* At most $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$ comparisons and projections.

27.8.4.3 upper_bound

[upper_bound]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
               const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
               const T& value, Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
        ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

- 1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
- 2 *Preconditions:* The elements e of [first, last) are partitioned with respect to the expression !bool(invoke(comp, value, invoke(proj, e))).
- 3 *Returns:* The furthestmost iterator i in the range [first, last] such that for every iterator j in the range [first, i), !bool(invoke(comp, value, invoke(proj, *j))) is true.
- 4 *Complexity:* At most $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$ comparisons and projections.

27.8.4.4 equal_range

[equal_range]

```
template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator>
    equal_range(ForwardIterator first,
               ForwardIterator last, const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
    equal_range(ForwardIterator first,
               ForwardIterator last, const T& value,
               Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr subrange<I>
    ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
```

```
template<forward_range R, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected_iterator_t<R>, Proj>> Comp =
    ranges::less>
constexpr borrowed_subrange_t<R>
    ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions:* The elements `e` of `[first, last)` are partitioned with respect to the expressions `bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 *Returns:*

(3.1) — For the overloads in namespace `std`:

```
{lower_bound(first, last, value, comp),
 upper_bound(first, last, value, comp)}
```

(3.2) — For the overloads in namespace `ranges`:

```
{ranges::lower_bound(first, last, value, comp, proj),
 ranges::upper_bound(first, last, value, comp, proj)}
```

4 *Complexity:* At most $2 * \log_2(\text{last} - \text{first}) + \mathcal{O}(1)$ comparisons and projections.

27.8.4.5 binary_search

[binary.search]

```
template<class ForwardIterator, class T>
constexpr bool
    binary_search(ForwardIterator first, ForwardIterator last,
                 const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
constexpr bool
    binary_search(ForwardIterator first, ForwardIterator last,
                 const T& value, Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
                                     Proj proj = {});
```

```
template<forward_range R, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected_iterator_t<R>, Proj>> Comp =
    ranges::less>
constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},
                                     Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions:* The elements `e` of `[first, last)` are partitioned with respect to the expressions `bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 *Returns:* `true` if and only if for some iterator `i` in the range `[first, last)`, `!bool(invoke(comp, invoke(proj, *i), value)) && !bool(invoke(comp, value, invoke(proj, *i)))` is `true`.

4 *Complexity:* At most $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$ comparisons and projections.

27.8.5 Partitions

[alg.partitions]

```
template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last, Predicate pred);
```

```

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
    constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
    constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});

```

1 Let `proj` be `identity{}` for the overloads with no parameter named `proj`.

2 **Returns:** true if and only if the elements `e` of `[first, last)` are partitioned with respect to the expression `bool(invoke(pred, invoke(proj, e)))`.

3 **Complexity:** Linear. At most `last - first` applications of `pred` and `proj`.

```

template<class ForwardIterator, class Predicate>
    constexpr ForwardIterator
        partition(ForwardIterator first, ForwardIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
    ForwardIterator
        partition(ExecutionPolicy&& exec,
                ForwardIterator first, ForwardIterator last, Predicate pred);

```

```

template<permutable I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
    constexpr subrange<I>
        ranges::partition(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
    requires permutable<iterator_t<R>>
    constexpr borrowed_subrange_t<R>
        ranges::partition(R&& r, Pred pred, Proj proj = {});

```

4 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, x)))`.

5 **Preconditions:** For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

6 **Effects:** Places all the elements `e` in `[first, last)` that satisfy $E(e)$ before all the elements that do not.

7 **Returns:** Let `i` be an iterator such that $E(*j)$ is true for every iterator `j` in `[first, i)` and false for every iterator `j` in `[i, last)`. Returns:

(7.1) — `i` for the overloads in namespace `std`.

(7.2) — `{i, last}` for the overloads in namespace `ranges`.

8 **Complexity:** Let $N = last - first$:

(8.1) — For the overload with no `ExecutionPolicy`, exactly N applications of the predicate and projection. At most $N/2$ swaps if the type of `first` meets the *Cpp17BidirectionalIterator* requirements for the overloads in namespace `std` or models `bidirectional_iterator` for the overloads in namespace `ranges`, and at most N swaps otherwise.

(8.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```

template<class BidirectionalIterator, class Predicate>
    BidirectionalIterator
        stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
    BidirectionalIterator
        stable_partition(ExecutionPolicy&& exec,
                BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

```

```

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
    requires permutable<I>
    subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});

```

```
template<bidirectional_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});
```

9 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, x)))`.

10 *Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.

11 *Effects:* Places all the elements e in $[first, last)$ that satisfy $E(e)$ before all the elements that do not. The relative order of the elements in both groups is preserved.

12 *Returns:* Let i be an iterator such that for every iterator j in $[first, i)$, $E(*j)$ is true, and for every iterator j in the range $[i, last)$, $E(*j)$ is false. Returns:

(12.1) — i for the overloads in namespace `std`.

(12.2) — $\{i, last\}$ for the overloads in namespace `ranges`.

13 *Complexity:* Let $N = last - first$:

(13.1) — For the overloads with no `ExecutionPolicy`, at most $N \log N$ swaps, but only $\mathcal{O}(N)$ swaps if there is enough extra memory. Exactly N applications of the predicate and projection.

(13.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class InputIterator, class OutputIterator1, class OutputIterator2, class Predicate>
constexpr pair<OutputIterator1, OutputIterator2>
partition_copy(InputIterator first, InputIterator last,
              OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1,
        class ForwardIterator2, class Predicate>
pair<ForwardIterator1, ForwardIterator2>
partition_copy(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last,
              ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O1, weakly_incrementable O2,
        class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O1> && indirectly_copyable<I, O2>
constexpr ranges::partition_copy_result<I, O1, O2>
ranges::partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
                      Proj proj = {});
```

```
template<input_range R, weakly_incrementable O1, weakly_incrementable O2,
        class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O1> &&
        indirectly_copyable<iterator_t<R>, O2>
constexpr ranges::partition_copy_result<borrowed_iterator_t<R>, O1, O2>
ranges::partition_copy(R&& r, O1 out_true, O2 out_false, Pred pred, Proj proj = {});
```

14 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, x)))`.

15 *Mandates:* For the overloads in namespace `std`, the expression `*first` is writable (25.3.1) to `out_true` and `out_false`.

16 *Preconditions:* The input range and output ranges do not overlap.

[Note 1: For the overload with an `ExecutionPolicy`, there might be a performance cost if `first`'s value type does not meet the *Cpp17CopyConstructible* requirements. — end note]

17 *Effects:* For each iterator i in $[first, last)$, copies `*i` to the output range beginning with `out_true` if $E(*i)$ is true, or to the output range beginning with `out_false` otherwise.

18 *Returns:* Let `o1` be the end of the output range beginning at `out_true`, and `o2` the end of the output range beginning at `out_false`. Returns

- (18.1) — {o1, o2} for the overloads in namespace std.
- (18.2) — {last, o1, o2} for the overloads in namespace ranges.
- 19 **Complexity:** Exactly last - first applications of pred and proj.

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::partition_point(R&& r, Pred pred, Proj proj = {});
```

- 20 Let proj be identity{} for the overloads with no parameter named proj and let $E(x)$ be `bool(invoke(pred, invoke(proj, x)))`.
- 21 **Preconditions:** The elements e of $[first, last)$ are partitioned with respect to $E(e)$.
- 22 **Returns:** An iterator `mid` such that $E(*i)$ is true for all iterators i in $[first, mid)$, and false for all iterators i in $[mid, last)$.
- 23 **Complexity:** $\mathcal{O}(\log(last - first))$ applications of pred and proj.

27.8.6 Merge

[alg.merge]

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
      InputIterator2 first2, InputIterator2 last2,
      OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result);
```

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
      InputIterator2 first2, InputIterator2 last2,
      OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result, Compare comp);
```

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity,
        class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<I1, I2, O>
ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

```

template<input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::merge(R1&& r1, R2&& r2, O result,
                 Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let N be $(\text{last1} - \text{first1}) + (\text{last2} - \text{first2})$. Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

2 *Preconditions:* The ranges $[\text{first1}, \text{last1})$ and $[\text{first2}, \text{last2})$ are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects:* Copies all the elements of the two ranges $[\text{first1}, \text{last1})$ and $[\text{first2}, \text{last2})$ into the range $[\text{result}, \text{result_last})$, where `result_last` is `result + N`. If an element `a` precedes `b` in an input range, `a` is copied into the output range before `b`. If `e1` is an element of $[\text{first1}, \text{last1})$ and `e2` of $[\text{first2}, \text{last2})$, `e2` is copied into the output range before `e1` if and only if `bool(invoke(comp, invoke(proj2, e2), invoke(proj1, e1)))` is true.

4 *Returns:*

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — $\{\text{last1}, \text{last2}, \text{result_last}\}$ for the overloads in namespace `ranges`.

5 *Complexity:*

(5.1) — For the overloads with no `ExecutionPolicy`, at most $N - 1$ comparisons and applications of each projection.

(5.2) — For the overloads with an `ExecutionPolicy`, $\mathcal{O}(N)$ comparisons.

6 *Remarks:* Stable (16.4.6.8).

```

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec,
                  BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last, Compare comp);
template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec,
                  BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last, Compare comp);

```

```

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});

```

7 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

8 *Preconditions:* $[\text{first}, \text{middle})$ and $[\text{middle}, \text{last})$ are valid ranges sorted with respect to `comp` and `proj`. For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.

9 *Effects:* Merges two sorted consecutive ranges $[\text{first}, \text{middle})$ and $[\text{middle}, \text{last})$, putting the result of the merge into the range $[\text{first}, \text{last})$. The resulting range is sorted with respect to `comp` and `proj`.

10 *Returns:* `last` for the overload in namespace `ranges`.

11 *Complexity:* Let $N = \text{last} - \text{first}$:

- (11.1) — For the overloads with no `ExecutionPolicy`, and if enough additional memory is available, exactly $N - 1$ comparisons.
- (11.2) — Otherwise, $\mathcal{O}(N \log N)$ comparisons.

In either case, twice as many projections as comparisons.

- 12 *Remarks:* Stable (16.4.6.8).

```
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

- 13 *Effects:* Equivalent to:

```
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

27.8.7 Set operations on sorted structures

[alg.set.operations]

27.8.7.1 General

[alg.set.operations.general]

- 1 Subclause 27.8.7 defines all the basic set operations on sorted structures. They also work with multisets (24.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to multisets in a standard way by defining `set_union` to contain the maximum number of occurrences of every element, `set_intersection` to contain the minimum, and so on.

27.8.7.2 includes

[includes]

```
template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2,
                        Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool includes(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        class Proj1 = identity, class Proj2 = identity,
        indirect_strict_weak_order<projected<I1, Proj1>,
                                   projected<I2, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
                                Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
        class Proj2 = identity,
        indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                   projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {},
                                Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

- 2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively.

- 3 *Returns:* true if and only if `[first2, last2)` is a subsequence of `[first1, last1)`.

[Note 1: A sequence *S* is a subsequence of another sequence *T* if *S* can be obtained from *T* by removing some, all, or none of *T*'s elements and keeping the remaining elements in the same order. — end note]

- 4 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.

27.8.7.3 `set_union`

[`set.union`]

```
template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<I1, I2, O>
    ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

- 2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

- 3 *Effects:* Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

- 4 *Returns:* Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

- 5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.

- 6 *Remarks:* Stable (16.4.6.8). If `[first1, last1)` contains m elements that are equivalent to each other and `[first2, last2)` contains n elements that are equivalent to them, then all m elements from the first range are copied to the output range, in order, and then the final $\max(n - m, 0)$ elements from the second range are copied to the output range, in order.

27.8.7.4 set_intersection**[set.intersection]**

```

template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                    InputIterator2 first2, InputIterator2 last2,
                    OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                    ForwardIterator1 first1, ForwardIterator1 last1,
                    ForwardIterator2 first2, ForwardIterator2 last2,
                    ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                    InputIterator2 first2, InputIterator2 last2,
                    OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                    ForwardIterator1 first1, ForwardIterator1 last1,
                    ForwardIterator2 first2, ForwardIterator2 last2,
                    ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incremtable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<I1, I2, O>
    ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                             Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incremtable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_intersection(R1&& r1, R2&& r2, O result,
                             Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects:* Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.

4 *Returns:* Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.

6 *Remarks:* Stable (16.4.6.8). If `[first1, last1)` contains m elements that are equivalent to each other and `[first2, last2)` contains n elements that are equivalent to them, the first $\min(m, n)$ elements are copied from the first range to the output range, in order.

27.8.7.5 set_difference**[set.difference]**

```

template<class InputIterator1, class InputIterator2,

```

```

    class OutputIterator>
constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                  InputIterator2 first2, InputIterator2 last2,
                  OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator>
ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  ForwardIterator result);

template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                  InputIterator2 first2, InputIterator2 last2,
                  OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator, class Compare>
ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incrementable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<I1, O>
    ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                          Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>
    ranges::set_difference(R1&& r1, R2&& r2, O result,
                          Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects:* Copies the elements of the range `[first1, last1)` which are not present in the range `[first2, last2)` to the range beginning at `result`. The elements in the constructed range are sorted.

4 *Returns:* Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, result_last}` for the overloads in namespace `ranges`.

5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.

6 *Remarks:* If `[first1, last1)` contains m elements that are equivalent to each other and `[first2, last2)` contains n elements that are equivalent to them, the last $\max(m - n, 0)$ elements from `[first1, last1)` is copied to the output range, in order.

27.8.7.6 `set_symmetric_difference`

[`set.symmetric.difference`]

```

template<class InputIterator1, class InputIterator2,
        class OutputIterator>
constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,

```

```

        InputIterator2 first2, InputIterator2 last2,
        OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator>
    ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        ForwardIterator result);

template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
    constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
        InputIterator2 first2, InputIterator2 last2,
        OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator, class Compare>
    ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incremtable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
    requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
    constexpr ranges::set_symmetric_difference_result<I1, I2, O>
    ranges::set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
        Comp comp = {}, Proj1 proj1 = {},
        Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incremtable O,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
    requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
    constexpr ranges::set_symmetric_difference_result<borrowed_iterator_t<R1>,
        borrowed_iterator_t<R2>, O>
    ranges::set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects:* Copies the elements of the range `[first1, last1)` that are not present in the range `[first2, last2)`, and the elements of the range `[first2, last2)` that are not present in the range `[first1, last1)` to the range beginning at `result`. The elements in the constructed range are sorted.

4 *Returns:* Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.

6 *Remarks:* Stable (16.4.6.8). If `[first1, last1)` contains m elements that are equivalent to each other and `[first2, last2)` contains n elements that are equivalent to them, then $|m - n|$ of those elements shall be copied to the output range: the last $m - n$ of these elements from `[first1, last1)` if $m > n$, and the last $n - m$ of these elements from `[first2, last2)` if $m < n$. In either case, the elements are copied in order.

27.8.8 Heap operations

[alg.heap.operations]

27.8.8.1 General

[alg.heap.operations.general]

- 1 A random access range $[a, b)$ is a *heap with respect to comp and proj* for a comparator and projection `comp` and `proj` if its elements are organized such that:
 - (1.1) — With $N = b - a$, for all $i, 0 < i < N$, `bool(invoker(comp, invoker(proj, a[$\lfloor \frac{i-1}{2} \rfloor$]), invoker(proj, a[i])))` is false.
 - (1.2) — `*a` may be removed by `pop_heap`, or a new element added by `push_heap`, in $\mathcal{O}(\log N)$ time.
- 2 These properties make heaps useful as priority queues.
- 3 `make_heap` converts a range into a heap and `sort_heap` turns a heap into a sorted sequence.

27.8.8.2 push_heap

[push.heap]

```
template<class RandomAccessIterator>
    constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                             Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
    requires sortable<I, Comp, Proj>
    constexpr I
        ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
    constexpr borrowed_iterator_t<R>
        ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 **Preconditions:** The range $[first, last - 1)$ is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveConstructible* requirements (Table 30) and the *Cpp17MoveAssignable* requirements (Table 32).
- 3 **Effects:** Places the value in the location `last - 1` into the resulting heap $[first, last)$.
- 4 **Returns:** `last` for the overloads in namespace `ranges`.
- 5 **Complexity:** At most $\log(last - first)$ comparisons and twice as many projections.

27.8.8.3 pop_heap

[pop.heap]

```
template<class RandomAccessIterator>
    constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                             Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
    requires sortable<I, Comp, Proj>
    constexpr I
        ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
    constexpr borrowed_iterator_t<R>
        ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 **Preconditions:** The range $[first, last)$ is a valid non-empty heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3)

and the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.

3 *Effects*: Swaps the value in the location `first` with the value in the location `last - 1` and makes `[first, last - 1)` into a heap with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $2 \log(\text{last} - \text{first})$ comparisons and twice as many projections.

27.8.8.4 `make_heap`

[make.heap]

```
template<class RandomAccessIterator>
    constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                             Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
    requires sortable<I, Comp, Proj>
    constexpr I
        ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
    constexpr borrowed_iterator_t<R>
        ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.

3 *Effects*: Constructs a heap with respect to `comp` and `proj` out of the range `[first, last)`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $3(\text{last} - \text{first})$ comparisons and twice as many projections.

27.8.8.5 `sort_heap`

[sort.heap]

```
template<class RandomAccessIterator>
    constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                             Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
    requires sortable<I, Comp, Proj>
    constexpr I
        ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
    constexpr borrowed_iterator_t<R>
        ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range `[first, last)` is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 30) and *Cpp17MoveAssignable* (Table 32) requirements.

3 *Effects*: Sorts elements in the heap `[first, last)` with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $2N \log N$ comparisons, where $N = \text{last} - \text{first}$, and twice as many projections.

27.8.8.6 is_heap**[is.heap]**

```
template<class RandomAccessIterator>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

1 *Effects:* Equivalent to: return `is_heap_until(first, last) == last`;

```
template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);
```

2 *Effects:* Equivalent to:
return `is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last`;

```
template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                       Compare comp);
```

3 *Effects:* Equivalent to: return `is_heap_until(first, last, comp) == last`;

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);
```

4 *Effects:* Equivalent to:
return `is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last`;

```
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Effects:* Equivalent to: return `ranges::is_heap_until(first, last, comp, proj) == last`;

```
template<class RandomAccessIterator>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
RandomAccessIterator
is_heap_until(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);
```

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
is_heap_until(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

7 *Returns:* The last iterator `i` in `[first, last]` for which the range `[first, i)` is a heap with respect to `comp` and `proj`.

8 *Complexity*: Linear.

27.8.9 Minimum and maximum

[alg.min.max]

```
template<class T>
constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

1 *Preconditions*: For the first form, T meets the *Cpp17LessThanComparable* requirements (Table 28).

2 *Returns*: The smaller value. Returns the first argument when the arguments are equivalent.

3 *Complexity*: Exactly one comparison and two applications of the projection, if any.

4 *Remarks*: An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

```
template<class T>
constexpr T min(initializer_list<T> r);
template<class T, class Compare>
constexpr T min(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
constexpr range_value_t<R>
ranges::min(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace std, T meets the *Cpp17CopyConstructible* requirements. For the first form, T meets the *Cpp17LessThanComparable* requirements (Table 28).

6 *Returns*: The smallest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the smallest.

7 *Complexity*: Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

8 *Remarks*: An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

```
template<class T>
constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

9 *Preconditions*: For the first form, T meets the *Cpp17LessThanComparable* requirements (Table 28).

10 *Returns*: The larger value. Returns the first argument when the arguments are equivalent.

11 *Complexity*: Exactly one comparison and two applications of the projection, if any.

12 *Remarks*: An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

```
template<class T>
constexpr T max(initializer_list<T> r);
template<class T, class Compare>
constexpr T max(initializer_list<T> r, Compare comp);
```

```

template<copyable T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
    constexpr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
    requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
    constexpr range_value_t<R>
        ranges::max(R&& r, Comp comp = {}, Proj proj = {});

```

13 *Preconditions:* `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 28).

14 *Returns:* The largest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the largest.

15 *Complexity:* Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

16 *Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```

template<class T>
    constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
    constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

```

```

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
    constexpr ranges::minmax_result<const T&>
        ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});

```

17 *Preconditions:* For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 28).

18 *Returns:* `{b, a}` if `b` is smaller than `a`, and `{a, b}` otherwise.

19 *Complexity:* Exactly one comparison and two applications of the projection, if any.

20 *Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```

template<class T>
    constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
    constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);

```

```

template<copyable T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
    constexpr ranges::minmax_result<T>
        ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
    requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
    constexpr ranges::minmax_result<range_value_t<R>>
        ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});

```

21 *Preconditions:* `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17CopyConstructible* requirements. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 28).

22 *Returns:* Let `X` be the return type. Returns `X{x, y}`, where `x` is a copy of the leftmost element with the smallest value and `y` a copy of the rightmost element with the largest value in the input range.

23 *Complexity:* At most $(3/2)$ `ranges::distance(r)` applications of the corresponding predicate and twice as many applications of the projection, if any.

24 *Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```

template<class ForwardIterator>
    constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
    ForwardIterator min_element(ExecutionPolicy&& exec,
                               ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
    constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                                         Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
    ForwardIterator min_element(ExecutionPolicy&& exec,
                               ForwardIterator first, ForwardIterator last, Compare comp);

```

```

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
    constexpr I ranges::min_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
    constexpr borrowed_iterator_t<R>
        ranges::min_element(R&& r, Comp comp = {}, Proj proj = {});

```

- 25 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 26 *Returns:* The first iterator `i` in the range `[first, last)` such that for every iterator `j` in the range `[first, last)`,
 `bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))`
 is false. Returns `last` if `first == last`.
- 27 *Complexity:* Exactly $\max(\text{last} - \text{first} - 1, 0)$ comparisons and twice as many projections.

```

template<class ForwardIterator>
    constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
    ForwardIterator max_element(ExecutionPolicy&& exec,
                               ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
    constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
                                         Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
    ForwardIterator max_element(ExecutionPolicy&& exec,
                               ForwardIterator first, ForwardIterator last,
                               Compare comp);

```

```

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
    constexpr I ranges::max_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
    constexpr borrowed_iterator_t<R>
        ranges::max_element(R&& r, Comp comp = {}, Proj proj = {});

```

- 28 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 29 *Returns:* The first iterator `i` in the range `[first, last)` such that for every iterator `j` in the range `[first, last)`,
 `bool(invoke(comp, invoke(proj, *i), invoke(proj, *j)))`
 is false. Returns `last` if `first == last`.
- 30 *Complexity:* Exactly $\max(\text{last} - \text{first} - 1, 0)$ comparisons and twice as many projections.

```

template<class ForwardIterator>
    constexpr pair<ForwardIterator, ForwardIterator>
        minmax_element(ForwardIterator first, ForwardIterator last);

```

```

template<class ExecutionPolicy, class ForwardIterator>
pair<ForwardIterator, ForwardIterator>
minmax_element(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
pair<ForwardIterator, ForwardIterator>
minmax_element(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<I>
ranges::minmax_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<borrowed_iterator_t<R>>
ranges::minmax_element(R&& r, Comp comp = {}, Proj proj = {});

```

31 *Returns:* {first, first} if [first, last) is empty, otherwise {m, M}, where m is the first iterator in [first, last) such that no iterator in the range refers to a smaller element, and where M is the last iterator²²⁴ in [first, last) such that no iterator in the range refers to a larger element.

32 *Complexity:* Let N be last - first. At most $\max(\lfloor \frac{3}{2}(N-1) \rfloor, 0)$ comparisons and twice as many applications of the projection, if any.

27.8.10 Bounded value

[alg.clamp]

```

template<class T>
constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);
template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T&
ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});

```

1 Let comp be less{} for the overloads with no parameter comp, and let proj be identity{} for the overloads with no parameter proj.

2 *Preconditions:* bool(involve(comp, involve(proj, hi), involve(proj, lo))) is false. For the first form, type T meets the *Cpp17LessThanComparable* requirements (Table 28).

3 *Returns:* lo if bool(involve(comp, involve(proj, v), involve(proj, lo))) is true, hi if bool(involve(comp, involve(proj, hi), involve(proj, v))) is true, otherwise v.

4 [Note 1: If NaN is avoided, T can be a floating-point type. — end note]

5 *Complexity:* At most two comparisons and three applications of the projection.

27.8.11 Lexicographical comparison

[alg.lex.comparison]

```

template<class InputIterator1, class InputIterator2>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool
lexicographical_compare(ExecutionPolicy&& exec,
                       ForwardIterator1 first1, ForwardIterator1 last1,
                       ForwardIterator2 first2, ForwardIterator2 last2);

```

²²⁴) This behavior intentionally differs from max_element.

```

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, InputIterator2 last2,
                           Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class Compare>
bool
    lexicographical_compare(ExecutionPolicy&& exec,
                           ForwardIterator1 first1, ForwardIterator1 last1,
                           ForwardIterator2 first2, ForwardIterator2 last2,
                           Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        class Proj1 = identity, class Proj2 = identity,
        indirect_strict_weak_order<projected<I1, Proj1>,
        projected<I2, Proj2>> Comp = ranges::less>
constexpr bool
    ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
                                    Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
        class Proj2 = identity,
        indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
        projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool
    ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
                                    Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 *Returns:* true if and only if the sequence of elements defined by the range [first1, last1) is lexicographically less than the sequence of elements defined by the range [first2, last2).

2 *Complexity:* At most $2 \min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the corresponding comparison and each projection, if any.

3 *Remarks:* If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

4 *[Example 1:* ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2) can be implemented as:

```

for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
    if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;

```

— end example]

5 *[Note 1:* An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — end note]

27.8.12 Three-way comparison algorithms

[alg.three.way]

```

template<class InputIterator1, class InputIterator2, class Cmp>
constexpr auto
    lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                      InputIterator2 b2, InputIterator2 e2,
                                      Cmp comp)
    -> decltype(comp(*b1, *b2));

```

1 Let N be $\min(e1 - b1, e2 - b2)$. Let $E(n)$ be $\text{comp}(*(b1 + n), *(b2 + n))$.

2 *Mandates:* $\text{decltype}(\text{comp}(*b1, *b2))$ is a comparison category type.

3 *Returns:* $E(i)$, where i is the smallest integer in $[0, N)$ such that $E(i) \neq \theta$ is true, or $(e1 - b1) <=> (e2 - b2)$ if no such integer exists.

- 4 *Complexity*: At most N applications of `comp`.

```
template<class InputIterator1, class InputIterator2>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                  InputIterator2 b2, InputIterator2 e2);
```

- 5 *Effects*: Equivalent to:

```
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

27.8.13 Permutation generators

[alg.permutation.generators]

```
template<class BidirectionalIterator>
constexpr bool next_permutation(BidirectionalIterator first,
                               BidirectionalIterator last);
```

```
template<class BidirectionalIterator, class Compare>
constexpr bool next_permutation(BidirectionalIterator first,
                               BidirectionalIterator last, Compare comp);
```

```
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::next_permutation_result<I>
ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
        class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

- 2 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

- 3 *Effects*: Takes a sequence defined by the range `[first, last)` and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

- 4 *Returns*: Let `B` be `true` if a next permutation was found and otherwise `false`. Returns:

(4.1) — `B` for the overloads in namespace `std`.

(4.2) — `{ last, B }` for the overloads in namespace `ranges`.

- 5 *Complexity*: At most $(last - first) / 2$ swaps.

```
template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
                               BidirectionalIterator last);
```

```
template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
                               BidirectionalIterator last, Compare comp);
```

```
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::prev_permutation_result<I>
ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
        class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
```

```
ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

7 *Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

8 *Effects:* Takes a sequence defined by the range `[first, last)` and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

9 *Returns:* Let `B` be `true` if a previous permutation was found and otherwise `false`. Returns:

(9.1) — `B` for the overloads in namespace `std`.

(9.2) — `{ last, B }` for the overloads in namespace `ranges`.

10 *Complexity:* At most $(last - first) / 2$ swaps.

27.9 Header `<numeric>` synopsis

[[numeric.ops.overview](#)]

```
namespace std {

```

27.10 Generalized numeric operations

[numeric.ops]

27.10.1 General

[numeric.ops.general]

¹ [Note 1: The use of closed ranges as well as semi-open ranges to specify requirements throughout 27.10 is intentional. — end note]

27.10.2 Definitions

[numeric.defns]

¹ Define *GENERALIZED_NONCOMMUTATIVE_SUM*(op, a₁, ..., a_N) as follows:

- (1.1) — a₁ when N is 1, otherwise
- (1.2) — op(*GENERALIZED_NONCOMMUTATIVE_SUM*(op, a₁, ..., a_K),
GENERALIZED_NONCOMMUTATIVE_SUM(op, a_M, ..., a_N)) for any K where 1 < K + 1 = M ≤ N.

- 2 Define *GENERALIZED_SUM*(op, a1, ..., aN) as *GENERALIZED_NONCOMMUTATIVE_SUM*(op, b1, ..., bN), where b1, ..., bN may be any permutation of a1, ..., aN.

27.10.3 Accumulate

[accumulate]

```
template<class InputIterator, class T>
    constexpr T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
    constexpr T accumulate(InputIterator first, InputIterator last, T init,
        BinaryOperation binary_op);
```

- 1 *Preconditions:* T meets the *Cpp17CopyConstructible* (Table 31) and *Cpp17CopyAssignable* (Table 33) requirements. In the range [first, last], binary_op neither modifies elements nor invalidates iterators or subranges.²²⁵
- 2 *Effects:* Computes its result by initializing the accumulator acc with the initial value init and then modifies it with acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) for every iterator i in the range [first, last) in order.²²⁶

27.10.4 Reduce

[reduce]

```
template<class InputIterator>
    constexpr typename iterator_traits<InputIterator>::value_type
        reduce(InputIterator first, InputIterator last);
```

- 1 *Effects:* Equivalent to:
- ```
return reduce(first, last,
 typename iterator_traits<InputIterator>::value_type{});
```
- ```
template<class ExecutionPolicy, class ForwardIterator>
    typename iterator_traits<ForwardIterator>::value_type
        reduce(ExecutionPolicy&& exec,
            ForwardIterator first, ForwardIterator last);
```
- 2 *Effects:* Equivalent to:
- ```
return reduce(std::forward<ExecutionPolicy>(exec), first, last,
 typename iterator_traits<ForwardIterator>::value_type{});
```

```
template<class InputIterator, class T>
 constexpr T reduce(InputIterator first, InputIterator last, T init);
```

- 3 *Effects:* Equivalent to:
- ```
return reduce(first, last, init, plus<>());
```
- ```
template<class ExecutionPolicy, class ForwardIterator, class T>
 T reduce(ExecutionPolicy&& exec,
 ForwardIterator first, ForwardIterator last, T init);
```
- 4 *Effects:* Equivalent to:
- ```
return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());
```

```
template<class InputIterator, class T, class BinaryOperation>
    constexpr T reduce(InputIterator first, InputIterator last, T init,
        BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
    T reduce(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last, T init,
        BinaryOperation binary_op);
```

- 5 *Mandates:* All of
- (5.1) — binary_op(init, *first),
- (5.2) — binary_op(*first, init),

²²⁵) The use of fully closed ranges is intentional.

²²⁶) accumulate is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

(5.3) — `binary_op(init, init)`, and

(5.4) — `binary_op(*first, *first)`

are convertible to `T`.

6 **Preconditions:**

(6.1) — `T` meets the *Cpp17MoveConstructible* (Table 30) requirements.

(6.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the range `[first, last]`.

7 **Returns:** *GENERALIZED_SUM*(`binary_op`, `init`, `*i`, ...) for every `i` in `[first, last]`.

8 **Complexity:** $\mathcal{O}(\text{last} - \text{first})$ applications of `binary_op`.

9 [Note 1: The difference between `reduce` and `accumulate` is that `reduce` applies `binary_op` in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative `binary_op` such as floating-point addition. — end note]

27.10.5 Inner product

[inner.product]

```
template<class InputIterator1, class InputIterator2, class T>
    constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                             InputIterator2 first2, T init);
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
    constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                             InputIterator2 first2, T init,
                             BinaryOperation1 binary_op1,
                             BinaryOperation2 binary_op2);
```

1 **Preconditions:** `T` meets the *Cpp17CopyConstructible* (Table 31) and *Cpp17CopyAssignable* (Table 33) requirements. In the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]` `binary_op1` and `binary_op2` neither modifies elements nor invalidates iterators or subranges.²²⁷

2 **Effects:** Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifying it with `acc = std::move(acc) + (*i1) * (*i2)` or `acc = binary_op1(std::move(acc), binary_op2(*i1, *i2))` for every iterator `i1` in the range `[first1, last1)` and iterator `i2` in the range `[first2, first2 + (last1 - first1))` in order.

27.10.6 Transform reduce

[transform.reduce]

```
template<class InputIterator1, class InputIterator2, class T>
    constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                                 InputIterator2 first2,
                                 T init);
```

1 **Effects:** Equivalent to:

```
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T>
    T transform_reduce(ExecutionPolicy&& exec,
                      ForwardIterator1 first1, ForwardIterator1 last1,
                      ForwardIterator2 first2,
                      T init);
```

2 **Effects:** Equivalent to:

```
return transform_reduce(std::forward<ExecutionPolicy>(exec),
                      first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
    constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                                 InputIterator2 first2,
                                 T init,
                                 BinaryOperation1 binary_op1,
```

²²⁷) The use of fully closed ranges is intentional.

```

        BinaryOperation2 binary_op2);
template<class ExecutionPolicy,
        class ForwardIterator1, class ForwardIterator2, class T,
        class BinaryOperation1, class BinaryOperation2>
T transform_reduce(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2,
        T init,
        BinaryOperation1 binary_op1,
        BinaryOperation2 binary_op2);

```

3 **Mandates:** All of

- (3.1) — `binary_op1(init, init)`,
- (3.2) — `binary_op1(init, binary_op2(*first1, *first2))`,
- (3.3) — `binary_op1(binary_op2(*first1, *first2), init)`, and
- (3.4) — `binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))`

are convertible to `T`.

4 **Preconditions:**

- (4.1) — `T` meets the *Cpp17MoveConstructible* (Table 30) requirements.
- (4.2) — Neither `binary_op1` nor `binary_op2` invalidates subranges, nor modifies elements in the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]`.

5 **Returns:**

`GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)`

for every iterator `i` in `[first1, last1]`.

6 **Complexity:** $\mathcal{O}(\text{last1} - \text{first1})$ applications each of `binary_op1` and `binary_op2`.

```

template<class InputIterator, class T,
        class BinaryOperation, class UnaryOperation>
constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
        BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
        class ForwardIterator, class T,
        class BinaryOperation, class UnaryOperation>
T transform_reduce(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last,
        T init, BinaryOperation binary_op, UnaryOperation unary_op);

```

7 **Mandates:** All of

- (7.1) — `binary_op(init, init)`,
- (7.2) — `binary_op(init, unary_op(*first))`,
- (7.3) — `binary_op(unary_op(*first), init)`, and
- (7.4) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

8 **Preconditions:**

- (8.1) — `T` meets the *Cpp17MoveConstructible* (Table 30) requirements.
- (8.2) — Neither `unary_op` nor `binary_op` invalidates subranges, nor modifies elements in the range `[first, last]`.

9 **Returns:**

`GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)`

for every iterator `i` in `[first, last]`.

10 **Complexity:** $\mathcal{O}(\text{last} - \text{first})$ applications each of `unary_op` and `binary_op`.

11 [Note 1: `transform_reduce` does not apply `unary_op` to `init`. —end note]

27.10.7 Partial sum**[partial.sum]**

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator
    partial_sum(InputIterator first, InputIterator last,
                OutputIterator result);
template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
    partial_sum(InputIterator first, InputIterator last,
                OutputIterator result, BinaryOperation binary_op);

```

- 1 *Mandates:* InputIterator's value type is constructible from *first. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` is implicitly convertible to InputIterator's value type. `acc` is writable (25.3.1) to result.
- 2 *Preconditions:* In the ranges `[first, last]` and `[result, result + (last - first)]` `binary_op` neither modifies elements nor invalidates iterators or subranges.²²⁸
- 3 *Effects:* For a non-empty range, the function creates an accumulator `acc` whose type is InputIterator's value type, initializes it with *first, and assigns the result to *result. For every iterator `i` in `[first + 1, last)` in order, `acc` is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.
- 4 *Returns:* `result + (last - first)`.
- 5 *Complexity:* Exactly `(last - first) - 1` applications of the binary operation.
- 6 *Remarks:* `result` may be equal to `first`.

27.10.8 Exclusive scan**[exclusive.scan]**

```

template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
    exclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result, T init);

```

1 *Effects:* Equivalent to:

```

return exclusive_scan(first, last, result, init, plus<>());

```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
    exclusive_scan(ExecutionPolicy&& exec,
                  ForwardIterator1 first, ForwardIterator1 last,
                  ForwardIterator2 result, T init);

```

2 *Effects:* Equivalent to:

```

return exclusive_scan(std::forward<ExecutionPolicy>(exec),
                    first, last, result, init, plus<>());

```

```

template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
constexpr OutputIterator
    exclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result, T init, BinaryOperation binary_op);
template<class ExecutionPolicy,
          class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
ForwardIterator2
    exclusive_scan(ExecutionPolicy&& exec,
                  ForwardIterator1 first, ForwardIterator1 last,
                  ForwardIterator2 result, T init, BinaryOperation binary_op);

```

- 3 *Mandates:* All of
- (3.1) — `binary_op(init, init)`,
- (3.2) — `binary_op(init, *first)`, and
- (3.3) — `binary_op(*first, *first)`

²²⁸) The use of fully closed ranges is intentional.

are convertible to T .

4 **Preconditions:**

- (4.1) — T meets the *Cpp17MoveConstructible* (Table 30) requirements.
 (4.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

5 **Effects:** For each integer K in $[0, last - first)$ assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))
```

6 **Returns:** The end of the resulting range beginning at `result`.

7 **Complexity:** $\mathcal{O}(last - first)$ applications of `binary_op`.

8 **Remarks:** `result` may be equal to `first`.

9 [Note 1: The difference between `exclusive_scan` and `inclusive_scan` is that `exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `exclusive_scan` can be nondeterministic. — end note]

27.10.9 Inclusive scan

[inclusive.scan]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result);
```

1 **Effects:** Equivalent to:

```
return inclusive_scan(first, last, result, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                  ForwardIterator1 first, ForwardIterator1 last,
                  ForwardIterator2 result);
```

2 **Effects:** Equivalent to:

```
return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());
```

```
template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result, BinaryOperation binary_op);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class BinaryOperation>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                  ForwardIterator1 first, ForwardIterator1 last,
                  ForwardIterator2 result, BinaryOperation binary_op);
```

```
template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result, BinaryOperation binary_op, T init);
```

```
template<class ExecutionPolicy,
        class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                  ForwardIterator1 first, ForwardIterator1 last,
                  ForwardIterator2 result, BinaryOperation binary_op, T init);
```

3 Let U be the value type of `decltype(first)`.

4 **Mandates:** If `init` is provided, all of

- (4.1) — `binary_op(init, init)`,

(4.2) — `binary_op(init, *first)`, and

(4.3) — `binary_op(*first, *first)`

are convertible to `T`; otherwise, `binary_op(*first, *first)` is convertible to `U`.

5 **Preconditions:**

(5.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* (Table 30) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.

(5.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

6 **Effects:** For each integer `K` in `[0, last - first)` assigns through `result + K` the value of

(6.1) — `GENERALIZED_NONCOMMUTATIVE_SUM(`
`binary_op, init, *(first + 0), *(first + 1), ..., *(first + K)`
`if init is provided, or`

(6.2) — `GENERALIZED_NONCOMMUTATIVE_SUM(`
`binary_op, *(first + 0), *(first + 1), ..., *(first + K)`
`otherwise.`

7 **Returns:** The end of the resulting range beginning at `result`.

8 **Complexity:** $\mathcal{O}(\text{last} - \text{first})$ applications of `binary_op`.

9 **Remarks:** `result` may be equal to `first`.

10 [Note 1: The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` can be nondeterministic. — end note]

27.10.10 Transform exclusive scan

[transform.exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T,
        class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
transform_exclusive_scan(InputIterator first, InputIterator last,
                        OutputIterator result, T init,
                        BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
        class ForwardIterator1, class ForwardIterator2, class T,
        class BinaryOperation, class UnaryOperation>
ForwardIterator2
transform_exclusive_scan(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result, T init,
                        BinaryOperation binary_op, UnaryOperation unary_op);
```

1 **Mandates:** All of

(1.1) — `binary_op(init, init)`,

(1.2) — `binary_op(init, unary_op(*first))`, and

(1.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

2 **Preconditions:**

(2.1) — `T` meets the *Cpp17MoveConstructible* (Table 30) requirements.

(2.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

3 **Effects:** For each integer `K` in `[0, last - first)` assigns through `result + K` the value of:

`GENERALIZED_NONCOMMUTATIVE_SUM(`
`binary_op, init,`
`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K - 1))`
`)`

4 **Returns:** The end of the resulting range beginning at `result`.

5 *Complexity:* $\mathcal{O}(\text{last} - \text{first})$ applications each of `unary_op` and `binary_op`.

6 *Remarks:* result may be equal to `first`.

7 [Note 1: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` can be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`. — end note]

27.10.11 Transform inclusive scan

[transform.inclusive.scan]

```
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                            OutputIterator result,
                            BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation>
ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                            ForwardIterator1 first, ForwardIterator1 last,
                            ForwardIterator2 result,
                            BinaryOperation binary_op, UnaryOperation unary_op);

template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation, class T>
constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                            OutputIterator result,
                            BinaryOperation binary_op, UnaryOperation unary_op,
                            T init);

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation, class T>
ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                            ForwardIterator1 first, ForwardIterator1 last,
                            ForwardIterator2 result,
                            BinaryOperation binary_op, UnaryOperation unary_op,
                            T init);
```

1 Let `U` be the value type of `decltype(first)`.

2 *Mandates:* If `init` is provided, all of

- (2.1) — `binary_op(init, init)`,
- (2.2) — `binary_op(init, unary_op(*first))`, and
- (2.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`; otherwise, `binary_op(unary_op(*first), unary_op(*first))` is convertible to `U`.

3 *Preconditions:*

- (3.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* (Table 30) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.
- (3.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

4 *Effects:* For each integer `K` in $[0, \text{last} - \text{first})$ assigns through `result + K` the value of

- (4.1) — `GENERALIZED_NONCOMMUTATIVE_SUM(`
`binary_op, init,`
`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))`
`if init is provided, or`
- (4.2) — `GENERALIZED_NONCOMMUTATIVE_SUM(`
`binary_op,`

unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))
otherwise.

5 *Returns:* The end of the resulting range beginning at result.

6 *Complexity:* $\mathcal{O}(\text{last} - \text{first})$ applications each of unary_op and binary_op.

7 *Remarks:* result may be equal to first.

8 [Note 1: The difference between transform_exclusive_scan and transform_inclusive_scan is that transform_inclusive_scan includes the i^{th} input element in the i^{th} sum. If binary_op is not mathematically associative, the behavior of transform_inclusive_scan can be nondeterministic. transform_inclusive_scan does not apply unary_op to init. — end note]

27.10.12 Adjacent difference

[adjacent.difference]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                       OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                       ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                       OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class BinaryOperation>
ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                       ForwardIterator1 first, ForwardIterator1 last,
                       ForwardIterator2 result, BinaryOperation binary_op);
```

1 Let T be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`, let `binary_op` be an lvalue that denotes an object of type `minus<>`.

2 *Mandates:*

- (2.1) — For the overloads with no `ExecutionPolicy`, T is constructible from `*first`. `acc` (defined below) is writable (25.3.1) to the result output iterator. The result of the expression `binary_op(val, std::move(acc))` is writable to result.
- (2.2) — For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first, *first)` and `*first` are writable to result.

3 *Preconditions:*

- (3.1) — For the overloads with no `ExecutionPolicy`, T meets the *Cpp17MoveAssignable* (Table 32) requirements.
- (3.2) — For all overloads, in the ranges `[first, last]` and `[result, result + (last - first)]`, `binary_op` neither modifies elements nor invalidate iterators or subranges.²²⁹

4 *Effects:* For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type T , initializes it with `*first`, and assigns the result to `*result`. For every iterator i in `[first + 1, last)` in order, creates an object `val` whose type is T , initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.

5 For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every d in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

6 *Returns:* `result + (last - first)`.

7 *Complexity:* Exactly `(last - first) - 1` applications of the binary operation.

8 *Remarks:* For the overloads with no `ExecutionPolicy`, result may be equal to first. For the overloads with an `ExecutionPolicy`, the ranges `[first, last]` and `[result, result + (last - first)]` shall not overlap.

²²⁹) The use of fully closed ranges is intentional.

27.10.13 Iota**[numeric.iota]**

```
template<class ForwardIterator, class T>
constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

- 1 *Mandates:* T is convertible to ForwardIterator's value type. The expression ++val, where val has type T, is well-formed.
- 2 *Effects:* For each element referred to by the iterator i in the range [first, last), assigns *i = value and increments value as if by ++value.
- 3 *Complexity:* Exactly last - first increments and assignments.

```
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
requires indirectly_writable<O, const T&>
constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);
template<weakly_incrementable T, output_range<const T&> R>
constexpr ranges::iota_result<borrowed_iterator_t<R>, T> ranges::iota(R&& r, T value);
```

- 4 *Effects:* Equivalent to:

```
while (first != last) {
    *first = as_const(value);
    ++first;
    ++value;
}
return {std::move(first), std::move(value)};
```

27.10.14 Greatest common divisor**[numeric.ops.gcd]**

```
template<class M, class N>
constexpr common_type_t<M, N> gcd(M m, N n);
```

- 1 *Mandates:* M and N both are integer types other than cv bool.
- 2 *Preconditions:* |m| and |n| are representable as a value of common_type_t<M, N>.

[Note 1: These requirements ensure, for example, that gcd(m, m) = |m| is representable as a value of type M. — end note]
- 3 *Returns:* Zero when m and n are both zero. Otherwise, returns the greatest common divisor of |m| and |n|.
- 4 *Throws:* Nothing.

27.10.15 Least common multiple**[numeric.ops.lcm]**

```
template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);
```

- 1 *Mandates:* M and N both are integer types other than cv bool.
- 2 *Preconditions:* |m| and |n| are representable as a value of common_type_t<M, N>. The least common multiple of |m| and |n| is representable as a value of type common_type_t<M, N>.
- 3 *Returns:* Zero when either m or n is zero. Otherwise, returns the least common multiple of |m| and |n|.
- 4 *Throws:* Nothing.

27.10.16 Midpoint**[numeric.ops.midpoint]**

```
template<class T>
constexpr T midpoint(T a, T b) noexcept;
```

- 1 *Constraints:* T is an arithmetic type other than bool.
- 2 *Returns:* Half the sum of a and b. If T is an integer type and the sum is odd, the result is rounded towards a.
- 3 *Remarks:* No overflow occurs. If T is a floating-point type, at most one inexact operation occurs.

```
template<class T>
constexpr T* midpoint(T* a, T* b);
```

- 4 *Constraints:* T is an object type.
- 5 *Mandates:* T is a complete type.

- 6 *Preconditions:* *a* and *b* point to, respectively, elements *i* and *j* of the same array object *x*.
 [Note 1: As specified in 6.8.3, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of *n* elements is considered to be equivalent to a pointer to a hypothetical array element *n* for this purpose. — end note]
- 7 *Returns:* A pointer to array element $i + \frac{j-i}{2}$ of *x*, where the result of the division is truncated towards zero.

27.11 Specialized <memory> algorithms

[specialized.algorithms]

27.11.1 General

[specialized.algorithms.general]

- 1 The contents specified in 27.11 are declared in the header <memory> (20.2.2).
- 2 Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement *new-expression* (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.
- 3 [Note 1: When invoked on ranges of potentially-overlapping subobjects (6.7.2), the algorithms specified in 27.11 result in undefined behavior. — end note]
- 4 Some algorithms specified in 27.11 make use of the exposition-only function *voidify*:

```
template<class T>
constexpr void* voidify(T& obj) noexcept {
    return const_cast<void*>(static_cast<const volatile void*>(addressof(obj)));
}
```

27.11.2 Special memory concepts

[special.mem.concepts]

- 1 Some algorithms in this subclause are constrained with the following exposition-only concepts:

```
template<class I>
concept nothrow-input-iterator = // exposition only
    input_iterator<I> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

- 2 A type *I* models *nothrow-input-iterator* only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.
- 3 [Note 1: This concept allows some *input_iterator* (25.3.4.9) operations to throw exceptions. — end note]

```
template<class S, class I>
concept nothrow-sentinel-for = sentinel_for<S, I>; // exposition only
```

- 4 Types *S* and *I* model *nothrow-sentinel-for* only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type *I* and *S*.
- 5 [Note 2: This concept allows some *sentinel_for* (25.3.4.7) operations to throw exceptions. — end note]

```
template<class R>
concept nothrow-input-range = // exposition only
    range<R> &&
    nothrow-input-iterator<iterator_t<R>> &&
    nothrow-sentinel-for<sentinel_t<R>, iterator_t<R>>;
```

- 6 A type *R* models *nothrow-input-range* only if no exceptions are thrown from calls to *ranges::begin* and *ranges::end* on an object of type *R*.

```
template<class I>
concept nothrow-forward-iterator = // exposition only
    nothrow-input-iterator<I> &&
    forward_iterator<I> &&
    nothrow-sentinel-for<I, I>;
```

- 7 [Note 3: This concept allows some *forward_iterator* (25.3.4.11) operations to throw exceptions. — end note]

```
template<class R>
concept nothrow-forward-range = // exposition only
    nothrow-input-range<R> &&
    nothrow-forward-iterator<iterator_t<R>>;
```

27.11.3 uninitialized_default_construct**[uninitialized.construct.default]**

```
template<class NoThrowForwardIterator>
void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

1 *Effects:* Equivalent to:

```
    for (; first != last; ++first)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type;
```

```
namespace ranges {
template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
requires default_initializable<iter_value_t<I>>
I uninitialized_default_construct(I first, S last);
template<nothrow-forward-range R>
requires default_initializable<range_value_t<R>>
borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}
```

2 *Effects:* Equivalent to:

```
    for (; first != last; ++first)
        ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
    return first;
```

```
template<class NoThrowForwardIterator, class Size>
NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects:* Equivalent to:

```
    for (; n > 0; (void)++first, --n)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type;
    return first;
```

```
namespace ranges {
template<nothrow-forward-iterator I>
requires default_initializable<iter_value_t<I>>
I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}
```

4 *Effects:* Equivalent to:

```
    return uninitialized_default_construct(counted_iterator(first, n),
        default_sentinel).base();
```

27.11.4 uninitialized_value_construct**[uninitialized.construct.value]**

```
template<class NoThrowForwardIterator>
void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

1 *Effects:* Equivalent to:

```
    for (; first != last; ++first)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type();
```

```
namespace ranges {
template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
requires default_initializable<iter_value_t<I>>
I uninitialized_value_construct(I first, S last);
template<nothrow-forward-range R>
requires default_initializable<range_value_t<R>>
borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}
```

2 *Effects:* Equivalent to:

```
    for (; first != last; ++first)
        ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
    return first;
```

```
template<class NoThrowForwardIterator, class Size>
    NoThrowForwardIterator uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects:* Equivalent to:

```
for (; n > 0; (void)++first, --n)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type();
return first;
```

```
namespace ranges {
    template<nothrow-forward-iterator I>
        requires default_initializable<iter_value_t<I>>
        I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}
```

4 *Effects:* Equivalent to:

```
return uninitialized_value_construct(counted_iterator(first, n),
    default_sentinel).base();
```

27.11.5 uninitialized_copy

[uninitialized.copy]

```
template<class InputIterator, class NoThrowForwardIterator>
    NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
        NoThrowForwardIterator result);
```

1 *Preconditions:* result + [0, (last - first)) does not overlap with [first, last).

2 *Effects:* Equivalent to:

```
for (; first != last; ++result, (void) ++first)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

3 *Returns:* result.

```
namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
        nothrow-forward-iterator O, nothrow-sentinel-for<O> S2>
        requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
        uninitialized_copy_result<I, O>
            uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
    template<input_range IR, nothrow-forward-range OR>
        requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
        uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
            uninitialized_copy(IR&& in_range, OR&& out_range);
}
```

4 *Preconditions:* [ofirst, olast) does not overlap with [ifirst, ilast).

5 *Effects:* Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
    ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
return {std::move(ifirst), ofirst};
```

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
    NoThrowForwardIterator uninitialized_copy_n(InputIterator first, Size n,
        NoThrowForwardIterator result);
```

6 *Preconditions:* result + [0, n) does not overlap with first + [0, n).

7 *Effects:* Equivalent to:

```
for (; n > 0; ++result, (void) ++first, --n)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

8 *Returns:* result.

```

namespace ranges {
  template<input_iterator I, nothrow-forward-iterator O, nothrow-sentinel-for<O> S>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_n_result<I, O>
    uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}

```

9 *Preconditions:* [ofirst, olast) does not overlap with ifirst + [0, n).

10 *Effects:* Equivalent to:

```

    auto t = uninitialized_copy(counted_iterator(ifirst, n),
                               default_sentinel, ofirst, olast);
    return {std::move(t.in).base(), t.out};

```

27.11.6 uninitialized_move

[uninitialized.move]

```

template<class InputIterator, class NoThrowForwardIterator>
  NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
                                           NoThrowForwardIterator result);

```

1 *Preconditions:* result + [0, (last - first)) does not overlap with [first, last).

2 *Effects:* Equivalent to:

```

    for (; first != last; (void)++result, ++first)
      ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
    return result;

```

```

namespace ranges {
  template<input_iterator I, sentinel_for<I> S1,
           nothrow-forward-iterator O, nothrow-sentinel-for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    uninitialized_move_result<I, O>
    uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
  template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
    uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
    uninitialized_move(IR&& in_range, OR&& out_range);
}

```

3 *Preconditions:* [ofirst, olast) does not overlap with [ifirst, ilast).

4 *Effects:* Equivalent to:

```

    for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
      ::new (voidify(*ofirst))
        remove_reference_t<iter_reference_t<O>>(ranges::iter_move(ifirst));
    return {std::move(ifirst), ofirst};

```

5 [Note 1: If an exception is thrown, some objects in the range [first, last) are left in a valid, but unspecified state. — end note]

```

template<class InputIterator, class Size, class NoThrowForwardIterator>
  pair<InputIterator, NoThrowForwardIterator>
  uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);

```

6 *Preconditions:* result + [0, n) does not overlap with first + [0, n).

7 *Effects:* Equivalent to:

```

    for (; n > 0; ++result, (void) ++first, --n)
      ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
    return {first, result};

```

```

namespace ranges {
  template<input_iterator I, nothrow-forward-iterator O, nothrow-sentinel-for<O> S>
    requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    uninitialized_move_n_result<I, O>

```

```

    uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}

```

8 *Preconditions:* [ofirst,olast) does not overlap with ifirst + [0, n).

9 *Effects:* Equivalent to:

```

    auto t = uninitialized_move(counted_iterator(ifirst, n),
                               default_sentinel, ofirst, olast);
    return {std::move(t.in).base(), t.out};

```

10 [Note 2: If an exception is thrown, some objects in the range first + [0, n) are left in a valid but unspecified state. —end note]

27.11.7 uninitialized_fill

[uninitialized.fill]

```

template<class NoThrowForwardIterator, class T>
void uninitialized_fill(NoThrowForwardIterator first, NoThrowForwardIterator last, const T& x);

```

1 *Effects:* Equivalent to:

```

    for (; first != last; ++first)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type(x);

```

```

namespace ranges {
    template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S, class T>
        requires constructible_from<iter_value_t<I>, const T&>
        I uninitialized_fill(I first, S last, const T& x);
    template<nothrow-forward-range R, class T>
        requires constructible_from<range_value_t<R>, const T&>
        borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);
}

```

2 *Effects:* Equivalent to:

```

    for (; first != last; ++first)
        ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);
    return first;

```

```

template<class NoThrowForwardIterator, class Size, class T>
NoThrowForwardIterator uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);

```

3 *Effects:* Equivalent to:

```

    for (; n--; ++first)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type(x);
    return first;

```

```

namespace ranges {
    template<nothrow-forward-iterator I, class T>
        requires constructible_from<iter_value_t<I>, const T&>
        I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}

```

4 *Effects:* Equivalent to:

```

    return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();

```

27.11.8 construct_at

[specialized.construct]

```

template<class T, class... Args>
constexpr T* construct_at(T* location, Args&&... args);

```

```

namespace ranges {
    template<class T, class... Args>
        constexpr T* construct_at(T* location, Args&&... args);
}

```

1 *Constraints:* The expression `::new (declval<void*>()) T(declval<Args>()...)` is well-formed when treated as an unevaluated operand (7.2.3).

2 *Effects:* Equivalent to:
 return ::new (voidify(*location)) T(std::forward<Args>(args)...);

27.11.9 destroy

[specialized.destroy]

```
template<class T>
constexpr void destroy_at(T* location);
namespace ranges {
template<destructible T>
constexpr void destroy_at(T* location) noexcept;
}
```

1 *Effects:*

- (1.1) — If T is an array type, equivalent to destroy(begin(*location), end(*location)).
- (1.2) — Otherwise, equivalent to location->~T().

```
template<class NoThrowForwardIterator>
constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

2 *Effects:* Equivalent to:

```
for (; first != last; ++first)
  destroy_at(addressof(*first));
```

```
namespace ranges {
template<nothrow-input-iterator I, nothrow-sentinel-for<I> S>
requires destructible<iter_value_t<I>>
constexpr I destroy(I first, S last) noexcept;
template<nothrow-input-range R>
requires destructible<range_value_t<R>>
constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}
```

3 *Effects:* Equivalent to:

```
for (; first != last; ++first)
  destroy_at(addressof(*first));
return first;
```

```
template<class NoThrowForwardIterator, class Size>
constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);
```

4 *Effects:* Equivalent to:

```
for (; n > 0; (void)++first, --n)
  destroy_at(addressof(*first));
return first;
```

```
namespace ranges {
template<nothrow-input-iterator I>
requires destructible<iter_value_t<I>>
constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}
```

5 *Effects:* Equivalent to:

```
return destroy(counted_iterator(first, n), default_sentinel).base();
```

27.12 C library algorithms

[alg.c.library]

1 [Note 1: The header <cstdlib> (17.2.2) declares the functions described in this subclause. — end note]

```
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
```

```
void qsort(void* base, size_t nmem, size_t size, compare-pred* compar);
```

2 *Preconditions:* For `qsort`, the objects in the array pointed to by `base` are of trivially copyable type.

3 *Effects:* These functions have the semantics specified in the C standard library.

4 *Throws:* Any exception thrown by `compar` ([16.4.6.13](#)).

See also: ISO C 7.22.5

28 Numerics library

[numerics]

28.1 General

[numerics.general]

- ¹ This Clause describes components that C++ programs may use to perform seminumerical operations.
- ² The following subclauses describe components for complex number types, random number generation, numeric (*n*-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in [Table 90](#).

Table 90: Numerics library summary [tab:numerics.summary]

Subclause	Header
28.2 Requirements	
28.3 Floating-point environment	<cfenv>
28.4 Complex numbers	<complex>
28.5 Random number generation	<random>
28.6 Numeric arrays	<valarray>
28.7 Mathematical functions for floating-point types	<cmath>, <cstdlib>
28.8 Numbers	<numbers>

28.2 Numeric type requirements

[numeric.requirements]

- ¹ The `complex` and `valarray` components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A *numeric type* is a cv-unqualified object type `T` that meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements ([16.4.4.2](#)).²³⁰
- ² If any operation on `T` throws an exception the effects are undefined.
- ³ In addition, many member and related functions of `valarray<T>` can be successfully instantiated and will exhibit well-defined behavior if and only if `T` meets additional requirements specified for each such member or related function.
- ⁴ [Example 1: It is valid to instantiate `valarray<complex>`, but `operator>()` will not be successfully instantiated for `valarray<complex>` operands, since `complex` does not have any ordering operators. — end example]

28.3 The floating-point environment

[cfenv]

28.3.1 Header <cfenv> synopsis

[cfenv.syn]

```
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below // optional
#define FE_INEXACT see below // optional
#define FE_INVALID see below // optional
#define FE_OVERFLOW see below // optional
#define FE_UNDERFLOW see below // optional

#define FE_DOWNWARD see below // optional
#define FE_TONEAREST see below // optional
#define FE_TOWARDZERO see below // optional
#define FE_UPWARD see below // optional

#define FE_DFL_ENV see below

namespace std {
    // types
    using fenv_t = object type;
    using fexcept_t = integer type;
```

²³⁰) In other words, value types. These include arithmetic types, pointers, the library class `complex`, and instantiations of `valarray` for value types.

```

// functions
int feclearexcept(int except);
int fegetexceptflag(fexcept_t* pflag, int except);
int feraiseexcept(int except);
int fesetexceptflag(const fexcept_t* pflag, int except);
int fetestexcept(int except);

int fegetround();
int fesetround(int mode);

int fegetenv(fenv_t* penv);
int feholdexcept(fenv_t* penv);
int fesetenv(const fenv_t* penv);
int feupdateenv(const fenv_t* penv);
}

```

- ¹ The contents and meaning of the header `<cfenv>` are the same as the C standard library header `<fenv.h>`.

[*Note 1:* This document does not require an implementation to support the `FENV_ACCESS` pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — *end note*]

See also: ISO C 7.6

28.3.2 Threads

[**cfenv.thread**]

- ¹ The floating-point environment has thread storage duration (6.7.5.3). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding thread object (33.4.3) or `jthread` object (33.4.4) at the time it constructed the object.

[*Note 1:* That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation. — *end note*]

- ² A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

28.4 Complex numbers

[**complex.numbers**]

28.4.1 General

[**complex.numbers.general**]

- ¹ The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.
- ² The effect of instantiating the template `complex` for any type other than `float`, `double`, or `long double` is unspecified. The specializations `complex<float>`, `complex<double>`, and `complex<long double>` are literal types (6.8.1).
- ³ If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.
- ⁴ If `z` is an lvalue of type `cv complex<T>` then:
- (4.1) — the expression `reinterpret_cast<cv T(&)[2]>(z)` is well-formed,
- (4.2) — `reinterpret_cast<cv T(&)[2]>(z)[0]` designates the real part of `z`, and
- (4.3) — `reinterpret_cast<cv T(&)[2]>(z)[1]` designates the imaginary part of `z`.

Moreover, if `a` is an expression of type `cv complex<T>*` and the expression `a[i]` is well-defined for an integer expression `i`, then:

- (4.4) — `reinterpret_cast<cv T*>(a)[2*i]` designates the real part of `a[i]`, and
- (4.5) — `reinterpret_cast<cv T*>(a)[2*i + 1]` designates the imaginary part of `a[i]`.

28.4.2 Header `<complex>` synopsis

[**complex.syn**]

```

namespace std {
    // 28.4.3, class template complex
    template<class T> class complex;
}

```

```

// 28.4.4, specializations
template<> class complex<float>;
template<> class complex<double>;
template<> class complex<long double>;

// 28.4.7, operators
template<class T> constexpr complex<T> operator+(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator+(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator+(const T&, const complex<T>&);

template<class T> constexpr complex<T> operator-(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator-(const complex<T>&, const T&);

// 28.4.8, values
template<class T> constexpr T real(const complex<T>&);
template<class T> constexpr T imag(const complex<T>&);

template<class T> T abs(const complex<T>&);
template<class T> T arg(const complex<T>&);
template<class T> constexpr T norm(const complex<T>&);

template<class T> constexpr complex<T> conj(const complex<T>&);
template<class T> complex<T> proj(const complex<T>&);
template<class T> complex<T> polar(const T&, const T& = T());

// 28.4.9, transcendentals
template<class T> complex<T> acos(const complex<T>&);
template<class T> complex<T> asin(const complex<T>&);
template<class T> complex<T> atan(const complex<T>&);

template<class T> complex<T> acosh(const complex<T>&);
template<class T> complex<T> asinh(const complex<T>&);
template<class T> complex<T> atanh(const complex<T>&);

template<class T> complex<T> cos (const complex<T>&);
template<class T> complex<T> cosh (const complex<T>&);
template<class T> complex<T> exp (const complex<T>&);
template<class T> complex<T> log (const complex<T>&);
template<class T> complex<T> log10(const complex<T>&);

template<class T> complex<T> pow (const complex<T>&, const T&);
template<class T> complex<T> pow (const complex<T>&, const complex<T>&);
template<class T> complex<T> pow (const T&, const complex<T>&);

```

```

template<class T> complex<T> sin (const complex<T>&);
template<class T> complex<T> sinh (const complex<T>&);
template<class T> complex<T> sqrt (const complex<T>&);
template<class T> complex<T> tan (const complex<T>&);
template<class T> complex<T> tanh (const complex<T>&);

```

// 28.4.11, complex literals

```

inline namespace literals {
inline namespace complex_literals {
    constexpr complex<long double> operator""il(long double);
    constexpr complex<long double> operator""il(unsigned long long);
    constexpr complex<double> operator""i(long double);
    constexpr complex<double> operator""i(unsigned long long);
    constexpr complex<float> operator""if(long double);
    constexpr complex<float> operator""if(unsigned long long);
}
}
}

```

28.4.3 Class template `complex`

[`complex`]

```

namespace std {
    template<class T> class complex {
    public:
        using value_type = T;

        constexpr complex(const T& re = T(), const T& im = T());
        constexpr complex(const complex&);
        template<class X> constexpr complex(const complex<X>&);

        constexpr T real() const;
        constexpr void real(T);
        constexpr T imag() const;
        constexpr void imag(T);

        constexpr complex& operator= (const T&);
        constexpr complex& operator+=(const T&);
        constexpr complex& operator-=(const T&);
        constexpr complex& operator*=(const T&);
        constexpr complex& operator/=(const T&);

        constexpr complex& operator=(const complex&);
        template<class X> constexpr complex& operator= (const complex<X>&);
        template<class X> constexpr complex& operator+=(const complex<X>&);
        template<class X> constexpr complex& operator-=(const complex<X>&);
        template<class X> constexpr complex& operator*=(const complex<X>&);
        template<class X> constexpr complex& operator/=(const complex<X>&);
    };
}

```

- ¹ The class `complex` describes an object that can store the Cartesian components, `real()` and `imag()`, of a complex number.

28.4.4 Specializations

[`complex.special`]

```

namespace std {
    template<> class complex<float> {
    public:
        using value_type = float;

        constexpr complex(float re = 0.0f, float im = 0.0f);
        constexpr complex(const complex<float>&) = default;
        constexpr explicit complex(const complex<double>&);
        constexpr explicit complex(const complex<long double>&);
    };
}

```

```

constexpr float real() const;
constexpr void real(float);
constexpr float imag() const;
constexpr void imag(float);

constexpr complex& operator= (float);
constexpr complex& operator+=(float);
constexpr complex& operator-=(float);
constexpr complex& operator*=(float);
constexpr complex& operator/=(float);

constexpr complex& operator=(const complex&);
template<class X> constexpr complex& operator= (const complex<X>&);
template<class X> constexpr complex& operator+=(const complex<X>&);
template<class X> constexpr complex& operator-=(const complex<X>&);
template<class X> constexpr complex& operator*=(const complex<X>&);
template<class X> constexpr complex& operator/=(const complex<X>&);
};

template<> class complex<double> {
public:
    using value_type = double;

    constexpr complex(double re = 0.0, double im = 0.0);
    constexpr complex(const complex<float>&);
    constexpr complex(const complex<double>&) = default;
    constexpr explicit complex(const complex<long double>&);

    constexpr double real() const;
    constexpr void real(double);
    constexpr double imag() const;
    constexpr void imag(double);

    constexpr complex& operator= (double);
    constexpr complex& operator+=(double);
    constexpr complex& operator-=(double);
    constexpr complex& operator*=(double);
    constexpr complex& operator/=(double);

    constexpr complex& operator=(const complex&);
    template<class X> constexpr complex& operator= (const complex<X>&);
    template<class X> constexpr complex& operator+=(const complex<X>&);
    template<class X> constexpr complex& operator-=(const complex<X>&);
    template<class X> constexpr complex& operator*=(const complex<X>&);
    template<class X> constexpr complex& operator/=(const complex<X>&);
};

template<> class complex<long double> {
public:
    using value_type = long double;

    constexpr complex(long double re = 0.0L, long double im = 0.0L);
    constexpr complex(const complex<float>&);
    constexpr complex(const complex<double>&);
    constexpr complex(const complex<long double>&) = default;

    constexpr long double real() const;
    constexpr void real(long double);
    constexpr long double imag() const;
    constexpr void imag(long double);

    constexpr complex& operator= (long double);
    constexpr complex& operator+=(long double);
    constexpr complex& operator-=(long double);

```

```

constexpr complex& operator*=(long double);
constexpr complex& operator/=(long double);

constexpr complex& operator=(const complex&);
template<class X> constexpr complex& operator= (const complex<X>&);
template<class X> constexpr complex& operator+=(const complex<X>&);
template<class X> constexpr complex& operator-=(const complex<X>&);
template<class X> constexpr complex& operator*=(const complex<X>&);
template<class X> constexpr complex& operator/=(const complex<X>&);
};
}

```

28.4.5 Member functions

[complex.members]

```
template<class T> constexpr complex(const T& re = T(), const T& im = T());
```

1 *Postconditions:* `real() == re && imag() == im` is true.

```
constexpr T real() const;
```

2 *Returns:* The value of the real component.

```
constexpr void real(T val);
```

3 *Effects:* Assigns `val` to the real component.

```
constexpr T imag() const;
```

4 *Returns:* The value of the imaginary component.

```
constexpr void imag(T val);
```

5 *Effects:* Assigns `val` to the imaginary component.

28.4.6 Member operators

[complex.member.ops]

```
constexpr complex& operator+=(const T& rhs);
```

1 *Effects:* Adds the scalar value `rhs` to the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

2 *Returns:* `*this`.

```
constexpr complex& operator-=(const T& rhs);
```

3 *Effects:* Subtracts the scalar value `rhs` from the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

4 *Returns:* `*this`.

```
constexpr complex& operator*=(const T& rhs);
```

5 *Effects:* Multiplies the scalar value `rhs` by the complex value `*this` and stores the result in `*this`.

6 *Returns:* `*this`.

```
constexpr complex& operator/=(const T& rhs);
```

7 *Effects:* Divides the scalar value `rhs` into the complex value `*this` and stores the result in `*this`.

8 *Returns:* `*this`.

```
template<class X> constexpr complex& operator+=(const complex<X>& rhs);
```

9 *Effects:* Adds the complex value `rhs` to the complex value `*this` and stores the sum in `*this`.

10 *Returns:* `*this`.

```
template<class X> constexpr complex& operator-=(const complex<X>& rhs);
```

11 *Effects:* Subtracts the complex value `rhs` from the complex value `*this` and stores the difference in `*this`.

12 *Returns:* `*this`.

```
template<class X> constexpr complex& operator*=(const complex<X>& rhs);
```

13 *Effects:* Multiplies the complex value rhs by the complex value *this and stores the product in *this.

14 *Returns:* *this.

```
template<class X> constexpr complex& operator/=(const complex<X>& rhs);
```

15 *Effects:* Divides the complex value rhs into the complex value *this and stores the quotient in *this.

16 *Returns:* *this.

28.4.7 Non-member operations

[complex.ops]

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
```

1 *Returns:* complex<T>(lhs).

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
```

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
```

```
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);
```

2 *Returns:* complex<T>(lhs) += rhs.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
```

3 *Returns:* complex<T>(-lhs.real(), -lhs.imag()).

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
```

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
```

```
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);
```

4 *Returns:* complex<T>(lhs) -= rhs.

```
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
```

```
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
```

```
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);
```

5 *Returns:* complex<T>(lhs) *= rhs.

```
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
```

```
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
```

```
template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);
```

6 *Returns:* complex<T>(lhs) /= rhs.

```
template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
```

```
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
```

7 *Returns:* lhs.real() == rhs.real() && lhs.imag() == rhs.imag().

8 *Remarks:* The imaginary part is assumed to be T(), or 0.0, for the T arguments.

```
template<class T, class charT, class traits>
```

```
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);
```

9 *Preconditions:* The input values are convertible to T.

10 *Effects:* Extracts a complex number x of the form: u, (u), or (u,v), where u is the real part and v is the imaginary part (31.7.4.3).

11 If bad input is encountered, calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)).

12 *Returns:* is.

13 *Remarks:* This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

```
template<class T, class charT, class traits>
```

```
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);
```

14 *Effects:* Inserts the complex number x onto the stream o as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
```

```

s.flags(o.flags());
s.imbue(o.getloc());
s.precision(o.precision());
s << '(' << x.real() << ", " << x.imag() << ')';
return o << s.str();

```

- 15 [Note 1: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting showpoint into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. — end note]

28.4.8 Value operations

[complex.value.ops]

```
template<class T> constexpr T real(const complex<T>& x);
```

- 1 *Returns:* `x.real()`.

```
template<class T> constexpr T imag(const complex<T>& x);
```

- 2 *Returns:* `x.imag()`.

```
template<class T> T abs(const complex<T>& x);
```

- 3 *Returns:* The magnitude of `x`.

```
template<class T> T arg(const complex<T>& x);
```

- 4 *Returns:* The phase angle of `x`, or `atan2(imag(x), real(x))`.

```
template<class T> constexpr T norm(const complex<T>& x);
```

- 5 *Returns:* The squared magnitude of `x`.

```
template<class T> constexpr complex<T> conj(const complex<T>& x);
```

- 6 *Returns:* The complex conjugate of `x`.

```
template<class T> complex<T> proj(const complex<T>& x);
```

- 7 *Returns:* The projection of `x` onto the Riemann sphere.

- 8 *Remarks:* Behaves the same as the C function `cproj`. See also: ISO C 7.3.9.5

```
template<class T> complex<T> polar(const T& rho, const T& theta = T());
```

- 9 *Preconditions:* `rho` is non-negative and non-NaN. `theta` is finite.

- 10 *Returns:* The complex value corresponding to a complex number whose magnitude is `rho` and whose phase angle is `theta`.

28.4.9 Transcendentals

[complex.transcendentals]

```
template<class T> complex<T> acos(const complex<T>& x);
```

- 1 *Returns:* The complex arc cosine of `x`.

- 2 *Remarks:* Behaves the same as the C function `cacos`. See also: ISO C 7.3.5.1

```
template<class T> complex<T> asin(const complex<T>& x);
```

- 3 *Returns:* The complex arc sine of `x`.

- 4 *Remarks:* Behaves the same as the C function `casin`. See also: ISO C 7.3.5.2

```
template<class T> complex<T> atan(const complex<T>& x);
```

- 5 *Returns:* The complex arc tangent of `x`.

- 6 *Remarks:* Behaves the same as the C function `catan`. See also: ISO C 7.3.5.3

```
template<class T> complex<T> acosh(const complex<T>& x);
```

- 7 *Returns:* The complex arc hyperbolic cosine of `x`.

- 8 *Remarks:* Behaves the same as the C function `cacosh`. See also: ISO C 7.3.6.1

```
template<class T> complex<T> asinh(const complex<T>& x);
```

9 *Returns:* The complex arc hyperbolic sine of x .

10 *Remarks:* Behaves the same as the C function `casinh`. See also: ISO C 7.3.6.2

```
template<class T> complex<T> atanh(const complex<T>& x);
```

11 *Returns:* The complex arc hyperbolic tangent of x .

12 *Remarks:* Behaves the same as the C function `catanh`. See also: ISO C 7.3.6.3

```
template<class T> complex<T> cos(const complex<T>& x);
```

13 *Returns:* The complex cosine of x .

```
template<class T> complex<T> cosh(const complex<T>& x);
```

14 *Returns:* The complex hyperbolic cosine of x .

```
template<class T> complex<T> exp(const complex<T>& x);
```

15 *Returns:* The complex base- e exponential of x .

```
template<class T> complex<T> log(const complex<T>& x);
```

16 *Returns:* The complex natural (base- e) logarithm of x . For all x , $\text{imag}(\log(x))$ lies in the interval $[-\pi, \pi]$.

[*Note 1:* The semantics of this function are intended to be the same in C++ as they are for `clog` in C. — *end note*]

17 *Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> log10(const complex<T>& x);
```

18 *Returns:* The complex common (base-10) logarithm of x , defined as $\log(x) / \log(10)$.

19 *Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
```

```
template<class T> complex<T> pow(const complex<T>& x, const T& y);
```

```
template<class T> complex<T> pow(const T& x, const complex<T>& y);
```

20 *Returns:* The complex power of base x raised to the y^{th} power, defined as $\exp(y * \log(x))$. The value returned for `pow(0, 0)` is implementation-defined.

21 *Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> sin(const complex<T>& x);
```

22 *Returns:* The complex sine of x .

```
template<class T> complex<T> sinh(const complex<T>& x);
```

23 *Returns:* The complex hyperbolic sine of x .

```
template<class T> complex<T> sqrt(const complex<T>& x);
```

24 *Returns:* The complex square root of x , in the range of the right half-plane.

[*Note 2:* The semantics of this function are intended to be the same in C++ as they are for `csqrt` in C. — *end note*]

25 *Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> tan(const complex<T>& x);
```

26 *Returns:* The complex tangent of x .

```
template<class T> complex<T> tanh(const complex<T>& x);
```

27 *Returns:* The complex hyperbolic tangent of x .

28.4.10 Additional overloads

[**cmplx.over**]

1 The following function templates shall have additional overloads:

arg	norm
conj	proj
imag	real

where `norm`, `conj`, `imag`, and `real` are `constexpr` overloads.

2 The additional overloads shall be sufficient to ensure:

- (2.1) — If the argument has type `long double`, then it is effectively cast to `complex<long double>`.
- (2.2) — Otherwise, if the argument has type `double` or an integer type, then it is effectively cast to `complex<double>`.
- (2.3) — Otherwise, if the argument has type `float`, then it is effectively cast to `complex<float>`.

3 Function template `pow` shall have additional overloads sufficient to ensure, for a call with at least one argument of type `complex<T>`:

- (3.1) — If either argument has type `complex<long double>` or type `long double`, then both arguments are effectively cast to `complex<long double>`.
- (3.2) — Otherwise, if either argument has type `complex<double>`, `double`, or an integer type, then both arguments are effectively cast to `complex<double>`.
- (3.3) — Otherwise, if either argument has type `complex<float>` or `float`, then both arguments are effectively cast to `complex<float>`.

28.4.11 Suffixes for complex number literals

[**complex.literals**]

1 This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);
```

2 *Returns:* `complex<long double>{0.0L, static_cast<long double>(d)}`.

```
constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);
```

3 *Returns:* `complex<double>{0.0, static_cast<double>(d)}`.

```
constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);
```

4 *Returns:* `complex<float>{0.0f, static_cast<float>(d)}`.

28.5 Random number generation

[**rand**]

28.5.1 General

[**rand.general**]

1 Subclause 28.5 defines a facility for generating (pseudo-)random numbers.

2 In addition to a few utilities, four categories of entities are described: *uniform random bit generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

[*Note 1:* These entities are specified in such a way as to permit the binding of any uniform random bit generator object `e` as the argument to any random number distribution object `d`, thus producing a zero-argument function object such as given by `bind(d,e)`. — *end note*]

3 Each of the entities specified in 28.5 has an associated arithmetic type (6.8.2) identified as `result_type`. With `T` as the `result_type` thus associated with such an entity, that entity is characterized:

- (3.1) — as *boolean* or equivalently as *boolean-valued*, if `T` is `bool`;
- (3.2) — otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is true;
- (3.3) — otherwise as *floating-point* or equivalently as *real-valued*.

If integer-valued, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

4 Unless otherwise specified, all descriptions of calculations in 28.5 use mathematical real numbers.

- ⁵ Throughout 28.5, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:
- (5.1) — the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and
 - (5.2) — the operator `lshiftw` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo 2^w .

28.5.2 Header `<random>` synopsis

[rand.synopsis]

```
#include <initializer_list>

28.5.3 Requirements

[rand.req]

28.5.3.1 General requirements

[rand.req.genl]

- 1 Throughout this subclause 28.5, the effect of instantiating a template:
 - (1.1) — that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (28.5.3.2).
 - (1.2) — that has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (28.5.3.3).
 - (1.3) — that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (28.5.3.4).
 - (1.4) — that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.
 - (1.5) — that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
 - (1.6) — that has a template type parameter named `UIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
- 2 Throughout this subclause 28.5, phrases of the form “x is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “x is a value of a type meeting the requirements of the specified iterator type”.
- 3 Throughout this subclause 28.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared `explicit`.

28.5.3.2 Seed sequence requirements

[rand.req.seedseq]

- 1 A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values i , $0 \leq i < 2^{32}$, based on the consumed data.

[Note 1: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — end note]
- 2 A class `S` meets the requirements of a seed sequence if the expressions shown in Table 91 are valid and have the indicated semantics, and if `S` also meets all other requirements of this subclause 28.5.3.2. In that Table and throughout this subclause:
 - (2.1) — `T` is the type named by `S`'s associated `result_type`;
 - (2.2) — `q` is a value of `S` and `r` is a possibly `const` value of `S`;
 - (2.3) — `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;
 - (2.4) — `rb` and `re` are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;
 - (2.5) — `ob` is an output iterator; and
 - (2.6) — `il` is a value of `initializer_list<T>`.

Table 91: Seed sequence requirements [tab:rand.req.seedseq]

Expression	Return type	Pre/post-condition	Complexity
<code>S::result_type</code>	<code>T</code>	<code>T</code> is an unsigned integer type (6.8.2) of at least 32 bits.	compile-time
<code>S()</code>		Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type <code>S</code> .	constant
<code>S(ib,ie)</code>		Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence <code>[ib, ie)</code> .	$\mathcal{O}(ie - ib)$
<code>S(il)</code>		Same as <code>S(il.begin(), il.end())</code> .	same as <code>S(il.begin(), il.end())</code>
<code>q.generate(rb,re)</code>	<code>void</code>	Does nothing if <code>rb == re</code> . Otherwise, fills the supplied sequence <code>[rb, re)</code> with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of <code>generate</code> 's previous invocations.	$\mathcal{O}(re - rb)$
<code>r.size()</code>	<code>size_t</code>	The number of 32-bit units that would be copied by a call to <code>r.param</code> .	constant
<code>r.param(ob)</code>	<code>void</code>	Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type <code>S</code> , and that would reproduce in that second object a state indistinguishable from the state of the first object.	$\mathcal{O}(r.size())$

28.5.3.3 Uniform random bit generator requirements

[rand.req.urng]

- ¹ A *uniform random bit generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

[Note 1: The degree to which `g`'s results approximate the ideal is often determined statistically. — end note]

```
template<class G>
concept uniform_random_bit_generator =
    invocable<G&&> && unsigned_integral<invoke_result_t<G&&>> &&
    requires {
        { G::min() } -> same_as<invoke_result_t<G&&>>;
        { G::max() } -> same_as<invoke_result_t<G&&>>;
        requires bool_constant<(G::min() < G::max())::value;
    };
```

- ² Let `g` be an object of type `G`. `G` models `uniform_random_bit_generator` only if

(2.1) — `G::min() <= g()`,

(2.2) — `g() <= G::max()`, and

(2.3) — `g()` has amortized constant complexity.

- ³ A class `G` meets the *uniform random bit generator* requirements if `G` models `uniform_random_bit_generator`, `invoke_result_t<G&&>` is an unsigned integer type (6.8.2), and `G` provides a nested *typedef-name* `result_type` that denotes the same type as `invoke_result_t<G&&>`.

28.5.3.4 Random number engine requirements**[rand.req.eng]**

- 1 A *random number engine* (commonly shortened to *engine*) e of type E is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.
- 2 At any given time, e has a state e_i for some integer $i \geq 0$. Upon construction, e has an initial state e_0 . An engine's state may be established via a constructor, a seed function, assignment, or a suitable operator $>>$.
- 3 E 's specification shall define:
 - (3.1) — the size of E 's state in multiples of the size of `result_type`, given as an integral constant expression;
 - (3.2) — the *transition algorithm* TA by which e 's state e_i is advanced to its *successor state* e_{i+1} ; and
 - (3.3) — the *generation algorithm* GA by which an engine's state is mapped to a value of type `result_type`.
- 4 A class E that meets the requirements of a uniform random bit generator (28.5.3.3) also meets the requirements of a *random number engine* if the expressions shown in Table 92 are valid and have the indicated semantics, and if E also meets all other requirements of this subclause 28.5.3.4. In that Table and throughout this subclause:
 - (4.1) — T is the type named by E 's associated `result_type`;
 - (4.2) — e is a value of E , v is an lvalue of E , x and y are (possibly `const`) values of E ;
 - (4.3) — s is a value of T ;
 - (4.4) — q is an lvalue meeting the requirements of a seed sequence (28.5.3.2);
 - (4.5) — z is a value of type `unsigned long long`;
 - (4.6) — os is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
 - (4.7) — is is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 23 and Clause 31.

Table 92: Random number engine requirements [tab:rand.req.eng]

Expression	Return type	Pre/post-condition	Complexity
$E()$		Creates an engine with the same initial state as all other default-constructed engines of type E .	\mathcal{O} (size of state)
$E(x)$		Creates an engine that compares equal to x .	\mathcal{O} (size of state)
$E(s)$		Creates an engine with initial state determined by s .	\mathcal{O} (size of state)
$E(q)$ ²³¹		Creates an engine with an initial state that depends on a sequence produced by one call to <code>q.generate</code> .	same as complexity of <code>q.generate</code> called on a sequence whose length is size of state
<code>e.seed()</code>	<code>void</code>	<i>Postconditions</i> : $e == E()$.	same as $E()$
<code>e.seed(s)</code>	<code>void</code>	<i>Postconditions</i> : $e == E(s)$.	same as $E(s)$
<code>e.seed(q)</code>	<code>void</code>	<i>Postconditions</i> : $e == E(q)$.	same as $E(q)$
$e()$	T	Advances e 's state e_i to $e_{i+1} = TA(e_i)$ and returns $GA(e_i)$.	per 28.5.3.3
<code>e.discard(z)</code> ²³²	<code>void</code>	Advances e 's state e_i to e_{i+z} by any means equivalent to z consecutive calls $e()$.	no worse than the complexity of z consecutive calls $e()$

²³¹ This constructor (as well as the subsequent corresponding `seed()` function) can be particularly useful to applications requiring a large number of independent random sequences.

²³² This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes z consecutive calls $e()$.

Expression	Return type	Pre/post-condition	Complexity
<code>x == y</code>	bool	This operator is an equivalence relation. With S_x and S_y as the infinite sequences of values that would be generated by repeated future calls to <code>x()</code> and <code>y()</code> , respectively, returns true if $S_x = S_y$; else returns false.	$\mathcal{O}(\text{size of state})$
<code>x != y</code>	bool	$!(x == y)$.	$\mathcal{O}(\text{size of state})$
<code>os << x</code>	reference to the type of <code>os</code>	With <code>os.fmtflags</code> set to <code>ios_base::dec ios_base::left</code> and the fill character set to the space character, writes to <code>os</code> the textual representation of <code>x</code> 's current state. In the output, adjacent numbers are separated by one or more space characters. <i>Postconditions:</i> The <code>os.fmtflags</code> and fill character are unchanged.	$\mathcal{O}(\text{size of state})$
<code>is >> v</code>	reference to the type of <code>is</code>	With <code>is.fmtflags</code> set to <code>ios_base::dec</code> , sets <code>v</code> 's state as determined by reading its textual representation from <code>is</code> . If bad input is encountered, ensures that <code>v</code> 's state is unchanged by the operation and calls <code>is.setstate(ios_base::failbit)</code> (which may throw <code>ios_base::failure</code> (31.5.4.4)). If a textual representation written via <code>os << x</code> was subsequently read via <code>is >> v</code> , then <code>x == v</code> provided that there have been no intervening invocations of <code>x</code> or of <code>v</code> . <i>Preconditions:</i> <code>is</code> provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of <code>is</code> , and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were respectively the same as those of <code>is</code> . <i>Postconditions:</i> The <code>is.fmtflags</code> are unchanged.	$\mathcal{O}(\text{size of state})$

- ⁵ E shall meet the *Cpp17CopyConstructible* (Table 31) and *Cpp17CopyAssignable* (Table 33) requirements. These operations shall each be of complexity no worse than $\mathcal{O}(\text{size of state})$.

28.5.3.5 Random number engine adaptor requirements

[rand.req.adapt]

- 1 A *random number engine adaptor* (commonly shortened to *adaptor*) `a` of type `A` is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine `b` of type `B` adapted in this way is termed a *base engine* in this context. The expression `a.base()` shall be valid and shall return a const reference to `a`'s base engine.
- 2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

`A::A();`

- 3 *Effects:* The base engine is initialized as if by its default constructor.

```
bool operator==(const A& a1, const A& a2);
```

4 *Returns:* true if a1's base engine is equal to a2's base engine. Otherwise returns false.

```
A::A(result_type s);
```

5 *Effects:* The base engine is initialized with s.

```
template<class Sseq> A::A(Sseq& q);
```

6 *Effects:* The base engine is initialized with q.

```
void seed();
```

7 *Effects:* With b as the base engine, invokes b.seed().

```
void seed(result_type s);
```

8 *Effects:* With b as the base engine, invokes b.seed(s).

```
template<class Sseq> void seed(Sseq& q);
```

9 *Effects:* With b as the base engine, invokes b.seed(q).

10 A shall also meet the following additional requirements:

- (10.1) — The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.
- (10.2) — The state of A shall include the state of its base engine. The size of A's state shall be no less than the size of the base engine.
- (10.3) — Copying A's state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of A.
- (10.4) — The textual representation of A shall include the textual representation of its base engine.

28.5.3.6 Random number distribution requirements

[rand.req.dist]

- 1 A *random number distribution* (commonly shortened to *distribution*) d of type D is a function object returning values that are distributed according to an associated mathematical *probability density function* $p(z)$ or according to an associated *discrete probability function* $P(z_i)$. A distribution's specification identifies its associated probability function $p(z)$ or $P(z_i)$.
- 2 An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example, $p(z | a, b)$ or $P(z_i | a, b)$, to name specific parameters, or by writing, for example, $p(z | \{p\})$ or $P(z_i | \{p\})$, to denote a distribution's parameters p taken as a whole.
- 3 A class D meets the requirements of a *random number distribution* if the expressions shown in Table 93 are valid and have the indicated semantics, and if D and its associated types also meet all other requirements of this subclause 28.5.3.6. In that Table and throughout this subclause,
 - (3.1) — T is the type named by D 's associated `result_type`;
 - (3.2) — P is the type named by D 's associated `param_type`;
 - (3.3) — d is a value of D , and x and y are (possibly `const`) values of D ;
 - (3.4) — `glb` and `lub` are values of T respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by d 's `operator()`, as determined by the current values of d 's parameters;
 - (3.5) — p is a (possibly `const`) value of P ;
 - (3.6) — g , $g1$, and $g2$ are lvalues of a type meeting the requirements of a uniform random bit generator (28.5.3.3);
 - (3.7) — os is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
 - (3.8) — is is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 23 and Clause 31.

Table 93: Random number distribution requirements [tab:rand.req.dist]

Expression	Return type	Pre/post-condition	Complexity
<code>D::result_type</code>	T	T is an arithmetic type (6.8.2).	compile-time
<code>D::param_type</code>	P		compile-time
<code>D()</code>		Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type D.	constant
<code>D(p)</code>		Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct p.	same as p's construction
<code>d.reset()</code>	void	Subsequent uses of d do not depend on values produced by any engine prior to invoking reset.	constant
<code>x.param()</code>	P	Returns a value p such that $D(p).param() == p$.	no worse than the complexity of D(p)
<code>d.param(p)</code>	void	<i>Postconditions:</i> $d.param() == p$.	no worse than the complexity of D(p)
<code>d(g)</code>	T	With $p = d.param()$, the sequence of numbers returned by successive invocations with the same object g is randomly distributed according to the associated $p(z \{p\})$ or $P(z_i \{p\})$ function.	amortized constant number of invocations of g
<code>d(g,p)</code>	T	The sequence of numbers returned by successive invocations with the same objects g and p is randomly distributed according to the associated $p(z \{p\})$ or $P(z_i \{p\})$ function.	amortized constant number of invocations of g
<code>x.min()</code>	T	Returns glb.	constant
<code>x.max()</code>	T	Returns lub.	constant
<code>x == y</code>	bool	This operator is an equivalence relation. Returns true if $x.param() == y.param()$ and $S_1 = S_2$, where S_1 and S_2 are the infinite sequences of values that would be generated, respectively, by repeated future calls to $x(g_1)$ and $y(g_2)$ whenever $g_1 == g_2$. Otherwise returns false.	constant
<code>x != y</code>	bool	$!(x == y)$.	same as $x == y$.
<code>os << x</code>	reference to the type of os	Writes to os a textual representation for the parameters and the additional internal data of x. <i>Postconditions:</i> The <code>os.flags</code> and fill character are unchanged.	

Expression	Return type	Pre/post-condition	Complexity
<code>is >> d</code>	reference to the type of <code>is</code>	Restores from <code>is</code> the parameters and additional internal data of the lvalue <code>d</code> . If bad input is encountered, ensures that <code>d</code> is unchanged by the operation and calls <code>is.setstate(ios_base::failbit)</code> (which may throw <code>ios_base::failure</code> (31.5.4.4)). <i>Preconditions:</i> <code>is</code> provides a textual representation that was previously written using an <code>os</code> whose imbued locale and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were the same as those of <code>is</code> . <i>Postconditions:</i> The <code>is.fmtflags</code> are unchanged.	

- ⁴ `D` shall meet the *Cpp17CopyConstructible* (Table 31) and *Cpp17CopyAssignable* (Table 33) requirements.
- ⁵ The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of `D` between any of the invocations `d(g)`.
- ⁶ If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.
- ⁷ It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 28.5, declarations of `D::param_type` are in the form of `typedefs` for convenience of exposition only.
- ⁸ `P` shall meet the *Cpp17CopyConstructible* (Table 31), *Cpp17CopyAssignable* (Table 33), and *Cpp17EqualityComparable* (Table 27) requirements.
- ⁹ For each of the constructors of `D` taking arguments corresponding to parameters of the distribution, `P` shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of `D` that return values corresponding to parameters of the distribution, `P` shall have a corresponding member function with the identical name, type, and semantics.
- ¹⁰ `P` shall have a declaration of the form
- ```
using distribution_type = D;
```

## 28.5.4 Random number engine class templates

[rand.eng]

### 28.5.4.1 General

[rand.eng.general]

- <sup>1</sup> Each type instantiated from a class template specified in 28.5.4 meets the requirements of a random number engine (28.5.3.4) type.
- <sup>2</sup> Except where specified otherwise, the complexity of each function specified in 28.5.4 is constant.
- <sup>3</sup> Except where specified otherwise, no function described in 28.5.4 throws an exception.
- <sup>4</sup> Every function described in 28.5.4 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.
- <sup>5</sup> Descriptions are provided in 28.5.4 only for engine operations that are not described in 28.5.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- <sup>6</sup> Each template specified in 28.5.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.
- <sup>7</sup> For every random number engine and for every random number engine adaptor `x` defined in 28.5.4 and in 28.5.5:
- (7.1) — if the constructor

```
template<class Sseq> explicit X(Sseq& q);
```

is called with a type `Sseq` that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

- (7.2) — if the member function

```
template<class Sseq> void seed(Sseq& q);
```

is called with a type `Sseq` that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to `X::result_type`.

#### 28.5.4.2 Class template `linear_congruential_engine` [rand.eng.lcong]

- <sup>1</sup> A `linear_congruential_engine` random number engine produces unsigned integer random numbers. The state  $x_i$  of a `linear_congruential_engine` object `x` is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form  $TA(x_i) = (a \cdot x_i + c) \bmod m$ ; the generation algorithm is  $GA(x_i) = x_{i+1}$ .

```
namespace std {
 template<class UIntType, UIntType a, UIntType c, UIntType m>
 class linear_congruential_engine {
 public:
 // types
 using result_type = UIntType;

 // engine characteristics
 static constexpr result_type multiplier = a;
 static constexpr result_type increment = c;
 static constexpr result_type modulus = m;
 static constexpr result_type min() { return c == 0u ? 1u : 0u; }
 static constexpr result_type max() { return m - 1u; }
 static constexpr result_type default_seed = 1u;

 // constructors and seeding functions
 linear_congruential_engine() : linear_congruential_engine(default_seed) {}
 explicit linear_congruential_engine(result_type s);
 template<class Sseq> explicit linear_congruential_engine(Sseq& q);
 void seed(result_type s = default_seed);
 template<class Sseq> void seed(Sseq& q);

 // equality operators
 friend bool operator==(const linear_congruential_engine& x,
 const linear_congruential_engine& y);

 // generating functions
 result_type operator()();
 void discard(unsigned long long z);

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const linear_congruential_engine& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, linear_congruential_engine& x);
 };
}
```

- <sup>2</sup> If the template parameter `m` is 0, the modulus  $m$  used throughout this subclause 28.5.4.2 is `numeric_limits<result_type>::max()` plus 1.

[Note 1:  $m$  need not be representable as a value of type `result_type`. — end note]

- <sup>3</sup> If the template parameter `m` is not 0, the following relations shall hold:  $a < m$  and  $c < m$ .
- <sup>4</sup> The textual representation consists of the value of  $x_i$ .

```
explicit linear_congruential_engine(result_type s);
```

- 5 *Effects:* If  $c \bmod m$  is 0 and  $s \bmod m$  is 0, sets the engine's state to 1, otherwise sets the engine's state to  $s \bmod m$ .

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

- 6 *Effects:* With  $k = \left\lceil \frac{\log_2 m}{32} \right\rceil$  and  $a$  an array (or equivalent) of length  $k + 3$ , invokes  $q.generate(a + 0, a + k + 3)$  and then computes  $S = \left( \sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j} \right) \bmod m$ . If  $c \bmod m$  is 0 and  $S$  is 0, sets the engine's state to 1, else sets the engine's state to  $S$ .

### 28.5.4.3 Class template mersenne\_twister\_engine

[rand.eng.mers]

- 1 A `mersenne_twister_engine` random number engine<sup>233</sup> produces unsigned integer random numbers in the closed interval  $[0, 2^w - 1]$ . The state  $x_i$  of a `mersenne_twister_engine` object  $x$  is of size  $n$  and consists of a sequence  $X$  of  $n$  values of the type delivered by  $x$ ; all subscripts applied to  $X$  are to be taken modulo  $n$ .
- 2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values  $n$  and  $m$ , a twist value  $r$ , and a conditional xor-mask  $a$ . To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values  $u, d, s, b, t, c$ , and  $\ell$ .

The state transition is performed as follows:

- (2.1) — Concatenate the upper  $w - r$  bits of  $X_{i-n}$  with the lower  $r$  bits of  $X_{i+1-n}$  to obtain an unsigned integer value  $Y$ .
- (2.2) — With  $\alpha = a \cdot (Y \text{ bitand } 1)$ , set  $X_i$  to  $X_{i+m-n}$  xor  $(Y \text{ rshift } 1)$  xor  $\alpha$ .

The sequence  $X$  is initialized with the help of an initialization multiplier  $f$ .

- 3 The generation algorithm determines the unsigned integer values  $z_1, z_2, z_3, z_4$  as follows, then delivers  $z_4$  as its result:

- (3.1) — Let  $z_1 = X_i$  xor  $((X_i \text{ rshift } u) \text{ bitand } d)$ .
- (3.2) — Let  $z_2 = z_1$  xor  $((z_1 \text{ lshift}_w s) \text{ bitand } b)$ .
- (3.3) — Let  $z_3 = z_2$  xor  $((z_2 \text{ lshift}_w t) \text{ bitand } c)$ .
- (3.4) — Let  $z_4 = z_3$  xor  $(z_3 \text{ rshift } \ell)$ .

```
namespace std {
 template<class UIntType, size_t w, size_t n, size_t m, size_t r,
 UIntType a, size_t u, UIntType d, size_t s,
 UIntType b, size_t t,
 UIntType c, size_t l, UIntType f>
 class mersenne_twister_engine {
 public:
 // types
 using result_type = UIntType;

 // engine characteristics
 static constexpr size_t word_size = w;
 static constexpr size_t state_size = n;
 static constexpr size_t shift_size = m;
 static constexpr size_t mask_bits = r;
 static constexpr UIntType xor_mask = a;
 static constexpr size_t tempering_u = u;
 static constexpr UIntType tempering_d = d;
 static constexpr size_t tempering_s = s;
 static constexpr UIntType tempering_b = b;
 static constexpr size_t tempering_t = t;
 static constexpr UIntType tempering_c = c;
 static constexpr size_t tempering_l = l;
 static constexpr UIntType initialization_multiplier = f;
 static constexpr result_type min() { return 0; }
 static constexpr result_type max() { return 2w - 1; }
 static constexpr result_type default_seed = 5489u;
 };
};
```

<sup>233</sup> The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```

// constructors and seeding functions
mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
explicit mersenne_twister_engine(result_type value);
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const mersenne_twister_engine& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, mersenne_twister_engine& x);
};
}

```

4 The following relations shall hold:  $0 < m, m \leq n, 2u < w, r \leq w, u \leq w, s \leq w, t \leq w, l \leq w, w \leq \text{numeric\_limits}<\text{UIntType}>::\text{digits}$ ,  $a \leq (1u << w) - 1u$ ,  $b \leq (1u << w) - 1u$ ,  $c \leq (1u << w) - 1u$ ,  $d \leq (1u << w) - 1u$ , and  $f \leq (1u << w) - 1u$ .

5 The textual representation of  $x_i$  consists of the values of  $X_{i-n}, \dots, X_{i-1}$ , in that order.

```
explicit mersenne_twister_engine(result_type value);
```

6 *Effects:* Sets  $X_{-n}$  to value mod  $2^w$ . Then, iteratively for  $i = 1 - n, \dots, -1$ , sets  $X_i$  to

$$[f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w - 2))) + i \bmod n] \bmod 2^w.$$

7 *Complexity:*  $\mathcal{O}(n)$ .

```
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
```

8 *Effects:* With  $k = \lceil w/32 \rceil$  and  $a$  an array (or equivalent) of length  $n \cdot k$ , invokes  $q.\text{generate}(a + 0, a + n \cdot k)$  and then, iteratively for  $i = -n, \dots, -1$ , sets  $X_i$  to  $(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j}) \bmod 2^w$ . Finally, if the most significant  $w - r$  bits of  $X_{-n}$  are zero, and if each of the other resulting  $X_i$  is 0, changes  $X_{-n}$  to  $2^{w-1}$ .

#### 28.5.4.4 Class template `subtract_with_carry_engine`

[rand.eng.sub]

1 A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.

2 The state  $x_i$  of a `subtract_with_carry_engine` object  $x$  is of size  $\mathcal{O}(r)$ , and consists of a sequence  $X$  of  $r$  integer values  $0 \leq X_i < m = 2^w$ ; all subscripts applied to  $X$  are to be taken modulo  $r$ . The state  $x_i$  additionally consists of an integer  $c$  (known as the *carry*) whose value is either 0 or 1.

3 The state transition is performed as follows:

(3.1) — Let  $Y = X_{i-s} - X_{i-r} - c$ .

(3.2) — Set  $X_i$  to  $y = Y \bmod m$ . Set  $c$  to 1 if  $Y < 0$ , otherwise set  $c$  to 0.

[Note 1: This algorithm corresponds to a modular linear function of the form  $\text{TA}(x_i) = (a \cdot x_i) \bmod b$ , where  $b$  is of the form  $m^r - m^s + 1$  and  $a = b - (b - 1)/m$ . — end note]

4 The generation algorithm is given by  $\text{GA}(x_i) = y$ , where  $y$  is the value produced as a result of advancing the engine's state as described above.

```

namespace std {
 template<class UIntType, size_t w, size_t s, size_t r>
 class subtract_with_carry_engine {
 public:
 // types
 using result_type = UIntType;

```

```

// engine characteristics
static constexpr size_t word_size = w;
static constexpr size_t short_lag = s;
static constexpr size_t long_lag = r;
static constexpr result_type min() { return 0; }
static constexpr result_type max() { return m - 1; }
static constexpr result_type default_seed = 19780503u;

// constructors and seeding functions
subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
explicit subtract_with_carry_engine(result_type value);
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const subtract_with_carry_engine& x,
 const subtract_with_carry_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const subtract_with_carry_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, subtract_with_carry_engine& x);
};
}

```

5 The following relations shall hold:  $0u < s$ ,  $s < r$ ,  $0 < w$ , and  $w \leq \text{numeric\_limits}<U\text{IntType}>::\text{digits}$ .

6 The textual representation consists of the values of  $X_{i-r}, \dots, X_{i-1}$ , in that order, followed by  $c$ .

```
explicit subtract_with_carry_engine(result_type value);
```

7 *Effects:* Sets the values of  $X_{-r}, \dots, X_{-1}$ , in that order, as specified below. If  $X_{-1}$  is then 0, sets  $c$  to 1; otherwise sets  $c$  to 0.

To set the values  $X_k$ , first construct  $e$ , a `linear_congruential_engine` object, as if by the following definition:

```
linear_congruential_engine<result_type,
 40014u, 0u, 2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each  $X_k$ , obtain new values  $z_0, \dots, z_{n-1}$  from  $n = \lceil w/32 \rceil$  successive invocations of  $e$ . Set  $X_k$  to  $\left(\sum_{j=0}^{n-1} z_j \cdot 2^{32j}\right) \bmod m$ .

8 *Complexity:* Exactly  $n \cdot r$  invocations of  $e$ .

```
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

9 *Effects:* With  $k = \lceil w/32 \rceil$  and  $a$  an array (or equivalent) of length  $r \cdot k$ , invokes  $q.\text{generate}(a + 0, a + r \cdot k)$  and then, iteratively for  $i = -r, \dots, -1$ , sets  $X_i$  to  $\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j}\right) \bmod m$ . If  $X_{-1}$  is then 0, sets  $c$  to 1; otherwise sets  $c$  to 0.

## 28.5.5 Random number engine adaptor class templates

[rand.adapt]

### 28.5.5.1 In general

[rand.adapt.general]

- Each type instantiated from a class template specified in this subclause 28.5.5 meets the requirements of a random number engine adaptor (28.5.3.5) type.
- Except where specified otherwise, the complexity of each function specified in this subclause 28.5.5 is constant.
- Except where specified otherwise, no function described in this subclause 28.5.5 throws an exception.

- 4 Every function described in this subclause 28.5.5 that has a function parameter  $q$  of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of  $q$ .`generate` throws.
- 5 Descriptions are provided in this subclause 28.5.5 only for adaptor operations that are not described in subclause 28.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- 6 Each template specified in this subclause 28.5.5 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

### 28.5.5.2 Class template `discard_block_engine`

[rand.adapt.disc]

- 1 A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine  $e$ . The state  $x_i$  of a `discard_block_engine` engine adaptor object  $x$  consists of the state  $e_i$  of its base engine  $e$  and an additional integer  $n$ . The size of the state is the size of  $e$ 's state plus 1.
- 2 The transition algorithm discards all but  $r > 0$  values from each block of  $p \geq r$  values delivered by  $e$ . The state transition is performed as follows: If  $n \geq r$ , advance the state of  $e$  from  $e_i$  to  $e_{i+p-r}$  and set  $n$  to 0. In any case, then increment  $n$  and advance  $e$ 's then-current state  $e_j$  to  $e_{j+1}$ .
- 3 The generation algorithm yields the value returned by the last invocation of  $e()$  while advancing  $e$ 's state as described above.

```
namespace std {
 template<class Engine, size_t p, size_t r>
 class discard_block_engine {
 public:
 // types
 using result_type = typename Engine::result_type;

 // engine characteristics
 static constexpr size_t block_size = p;
 static constexpr size_t used_block = r;
 static constexpr result_type min() { return Engine::min(); }
 static constexpr result_type max() { return Engine::max(); }

 // constructors and seeding functions
 discard_block_engine();
 explicit discard_block_engine(const Engine& e);
 explicit discard_block_engine(Engine&& e);
 explicit discard_block_engine(result_type s);
 template<class Sseq> explicit discard_block_engine(Sseq& q);
 void seed();
 void seed(result_type s);
 template<class Sseq> void seed(Sseq& q);

 // equality operators
 friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);

 // generating functions
 result_type operator()();
 void discard(unsigned long long z);

 // property functions
 const Engine& base() const noexcept { return e; };

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const discard_block_engine& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, discard_block_engine& x);
 };
};
```

```

private:
 Engine e; // exposition only
 size_t n; // exposition only
};
}

```

- 4 The following relations shall hold:  $\theta < r$  and  $r \leq p$ .
- 5 The textual representation consists of the textual representation of  $e$  followed by the value of  $n$ .
- 6 In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor sets  $n$  to 0.

### 28.5.5.3 Class template `independent_bits_engine`

[rand.adapt.ibits]

- 1 An `independent_bits_engine` random number engine adaptor combines random numbers that are produced by some base engine  $e$ , so as to produce random numbers with a specified number of bits  $w$ . The state  $x_i$  of an `independent_bits_engine` engine adaptor object  $x$  consists of the state  $e_i$  of its base engine  $e$ ; the size of the state is the size of  $e$ 's state.
- 2 The transition and generation algorithms are described in terms of the following integral constants:
  - (2.1) — Let  $R = e.\text{max}() - e.\text{min}() + 1$  and  $m = \lfloor \log_2 R \rfloor$ .
  - (2.2) — With  $n$  as determined below, let  $w_0 = \lfloor w/n \rfloor$ ,  $n_0 = n - w \bmod n$ ,  $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$ , and  $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$ .
  - (2.3) — Let  $n = \lceil w/m \rceil$  if and only if the relation  $R - y_0 \leq \lfloor y_0/n \rfloor$  holds as a result. Otherwise let  $n = 1 + \lceil w/m \rceil$ .

[Note 1: The relation  $w = n_0 w_0 + (n - n_0)(w_0 + 1)$  always holds. — end note]
- 3 The transition algorithm is carried out by invoking  $e()$  as often as needed to obtain  $n_0$  values less than  $y_0 + e.\text{min}()$  and  $n - n_0$  values less than  $y_1 + e.\text{min}()$ .
- 4 The generation algorithm uses the values produced while advancing the state as described above to yield a quantity  $S$  obtained as if by the following algorithm:

```

S = 0;
for (k = 0; k ≠ n0; k += 1) {
 do u = e() - e.min(); while (u ≥ y0);
 S = 2w0 · S + u mod 2w0;
}
for (k = n0; k ≠ n; k += 1) {
 do u = e() - e.min(); while (u ≥ y1);
 S = 2w0+1 · S + u mod 2w0+1;
}

```

```

template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
 // types
 using result_type = UIntType;

 // engine characteristics
 static constexpr result_type min() { return 0; }
 static constexpr result_type max() { return 2w - 1; }

 // constructors and seeding functions
 independent_bits_engine();
 explicit independent_bits_engine(const Engine& e);
 explicit independent_bits_engine(Engine&& e);
 explicit independent_bits_engine(result_type s);
 template<class Sseq> explicit independent_bits_engine(Sseq& q);
 void seed();
 void seed(result_type s);
 template<class Sseq> void seed(Sseq& q);

 // equality operators
 friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

 // generating functions
 result_type operator()();
}

```

```

void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; };

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);

private:
 Engine e; // exposition only
};

```

5 The following relations shall hold:  $0 < w$  and  $w \leq \text{numeric\_limits}<\text{result\_type}>::\text{digits}$ .

6 The textual representation consists of the textual representation of  $e$ .

#### 28.5.5.4 Class template `shuffle_order_engine`

[rand.adapt.shuf]

1 A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine  $e$ , but delivers them in a different sequence. The state  $x_i$  of a `shuffle_order_engine` engine adaptor object  $x$  consists of the state  $e_i$  of its base engine  $e$ , an additional value  $Y$  of the type delivered by  $e$ , and an additional sequence  $V$  of  $k$  values also of the type delivered by  $e$ . The size of the state is the size of  $e$ 's state plus  $k + 1$ .

2 The transition algorithm permutes the values produced by  $e$ . The state transition is performed as follows:

(2.1) — Calculate an integer  $j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor$ .

(2.2) — Set  $Y$  to  $V_j$  and then set  $V_j$  to  $e()$ .

3 The generation algorithm yields the last value of  $Y$  produced while advancing  $e$ 's state as described above.

```

namespace std {
 template<class Engine, size_t k>
 class shuffle_order_engine {
 public:
 // types
 using result_type = typename Engine::result_type;

 // engine characteristics
 static constexpr size_t table_size = k;
 static constexpr result_type min() { return Engine::min(); }
 static constexpr result_type max() { return Engine::max(); }

 // constructors and seeding functions
 shuffle_order_engine();
 explicit shuffle_order_engine(const Engine& e);
 explicit shuffle_order_engine(Engine&& e);
 explicit shuffle_order_engine(result_type s);
 template<class Sseq> explicit shuffle_order_engine(Sseq& q);
 void seed();
 void seed(result_type s);
 template<class Sseq> void seed(Sseq& q);

 // equality operators
 friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

 // generating functions
 result_type operator()();
 void discard(unsigned long long z);

 // property functions
 const Engine& base() const noexcept { return e; };

```

```

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, shuffle_order_engine& x);

private:
 Engine e; // exposition only
 result_type V[k]; // exposition only
 result_type Y; // exposition only
};
}

```

- 4 The following relation shall hold:  $0 < k$ .
- 5 The textual representation consists of the textual representation of  $e$ , followed by the  $k$  values of  $V$ , followed by the value of  $Y$ .
- 6 In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor initializes  $V[0], \dots, V[k-1]$  and  $Y$ , in that order, with values returned by successive invocations of  $e()$ .

### 28.5.6 Engines and engine adaptors with predefined parameters

[rand.predef]

```

using minstd_rand0 =
 linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;

```

- 1 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `minstd_rand0` produces the value 1043618065.

```

using minstd_rand =
 linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;

```

- 2 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `minstd_rand` produces the value 399268537.

```

using mt19937 =
 mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
 0x9908'b0df, 11, 0xffff'ffff, 7, 0x9d2c'5680, 15, 0xefc6'0000, 18, 1'812'433'253>;

```

- 3 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `mt19937` produces the value 4123659995.

```

using mt19937_64 =
 mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
 0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,
 0x71d6'7fff'eda6'0000, 37, 0xffff'eee0'0000'0000, 43, 6'364'136'223'846'793'005>;

```

- 4 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `mt19937_64` produces the value 9981545732273789042.

```

using ranlux24_base =
 subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;

```

- 5 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux24_base` produces the value 7937952.

```

using ranlux48_base =
 subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;

```

- 6 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux48_base` produces the value 61839128582725.

```

using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;

```

- 7 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux24` produces the value 9901578.

```
using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
```

- 8 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux48` produces the value 249142670248501.

```
using knuth_b = shuffle_order_engine<minstd_rand0,256>;
```

- 9 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `knuth_b` produces the value 1112339016.

```
using default_random_engine = implementation-defined;
```

- 10 *Remarks:* The choice of engine type named by this typedef is implementation-defined.

[*Note 1:* The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexperienced, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this typedef need not generate identical sequences across implementations. — *end note*]

### 28.5.7 Class `random_device`

[**rand.device**]

- 1 A `random_device` uniform random bit generator produces nondeterministic random numbers.
- 2 If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```
namespace std {
 class random_device {
 public:
 // types
 using result_type = unsigned int;

 // generator characteristics
 static constexpr result_type min() { return numeric_limits<result_type>::min(); }
 static constexpr result_type max() { return numeric_limits<result_type>::max(); }

 // constructors
 random_device() : random_device(implementation-defined) {}
 explicit random_device(const string& token);

 // generating functions
 result_type operator()();

 // property functions
 double entropy() const noexcept;

 // no copy functions
 random_device(const random_device&) = delete;
 void operator=(const random_device&) = delete;
 };
}
```

```
explicit random_device(const string& token);
```

- 3 *Throws:* A value of an implementation-defined type derived from exception if the `random_device` cannot be initialized.

- 4 *Remarks:* The semantics of the `token` parameter and the `token` value used by the default constructor are implementation-defined.<sup>234</sup>

```
double entropy() const noexcept;
```

- 5 *Returns:* If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate<sup>235</sup> for the random numbers returned by `operator()`, in the range `min()` to `log2(max() + 1)`.

<sup>234</sup> The parameter is intended to allow an implementation to differentiate between different sources of randomness.

<sup>235</sup> If a device has  $n$  states whose respective probabilities are  $P_0, \dots, P_{n-1}$ , the device entropy  $S$  is defined as  $S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i$ .

```
result_type operator()();
```

6 *Returns:* A nondeterministic random value, uniformly distributed between `min()` and `max()` (inclusive). It is implementation-defined how these values are generated.

7 *Throws:* A value of an implementation-defined type derived from `exception` if a random number cannot be obtained.

## 28.5.8 Utilities

[rand.util]

### 28.5.8.1 Class `seed_seq`

[rand.util.seedseq]

```
namespace std {
 class seed_seq {
 public:
 // types
 using result_type = uint_least32_t;

 // constructors
 seed_seq() noexcept;
 template<class T>
 seed_seq(initializer_list<T> il);
 template<class InputIterator>
 seed_seq(InputIterator begin, InputIterator end);

 // generating functions
 template<class RandomAccessIterator>
 void generate(RandomAccessIterator begin, RandomAccessIterator end);

 // property functions
 size_t size() const noexcept;
 template<class OutputIterator>
 void param(OutputIterator dest) const;

 // no copy functions
 seed_seq(const seed_seq&) = delete;
 void operator=(const seed_seq&) = delete;

 private:
 vector<result_type> v; // exposition only
 };
}
```

```
seed_seq() noexcept;
```

1 *Postconditions:* `v.empty()` is true.

```
template<class T>
 seed_seq(initializer_list<T> il);
```

2 *Constraints:* `T` is an integer type.

3 *Effects:* Same as `seed_seq(il.begin(), il.end())`.

```
template<class InputIterator>
 seed_seq(InputIterator begin, InputIterator end);
```

4 *Mandates:* `iterator_traits<InputIterator>::value_type` is an integer type.

5 *Preconditions:* `InputIterator` meets the *Cpp17InputIterator* requirements (25.3.5.3).

6 *Effects:* Initializes `v` by the following algorithm:

```
for (InputIterator s = begin; s != end; ++s)
 v.push_back((*s) mod 232);
```

```
template<class RandomAccessIterator>
 void generate(RandomAccessIterator begin, RandomAccessIterator end);
```

7 *Mandates:* `iterator_traits<RandomAccessIterator>::value_type` is an unsigned integer type capable of accommodating 32-bit quantities.

8 *Preconditions:* `RandomAccessIterator` meets the *Cpp17RandomAccessIterator* requirements (25.3.5.7) and the requirements of a mutable iterator.

9 *Effects:* Does nothing if `begin == end`. Otherwise, with  $s = v.size()$  and  $n = end - begin$ , fills the supplied range `[begin, end)` according to the following algorithm in which each operation is to be carried out modulo  $2^{32}$ , each indexing operator applied to `begin` is to be taken modulo  $n$ , and  $T(x)$  is defined as  $x \text{ xor } (x \text{ rshift } 27)$ :

(9.1) — By way of initialization, set each element of the range to the value `0x8b8b8b8b`. Additionally, for use in subsequent steps, let  $p = (n - t)/2$  and let  $q = p + t$ , where

$$t = (n \geq 623) ? 11 : (n \geq 68) ? 7 : (n \geq 39) ? 5 : (n \geq 7) ? 3 : (n - 1)/2;$$

(9.2) — With  $m$  as the larger of  $s + 1$  and  $n$ , transform the elements of the range: iteratively for  $k = 0, \dots, m - 1$ , calculate values

$$\begin{aligned} r_1 &= 1664525 \cdot T(\text{begin}[k] \text{ xor } \text{begin}[k + p] \text{ xor } \text{begin}[k - 1]) \\ r_2 &= r_1 + \begin{cases} s & , k = 0 \\ k \bmod n + v[k - 1] & , 0 < k \leq s \\ k \bmod n & , s < k \end{cases} \end{aligned}$$

and, in order, increment `begin[k + p]` by  $r_1$ , increment `begin[k + q]` by  $r_2$ , and set `begin[k]` to  $r_2$ .

(9.3) — Transform the elements of the range again, beginning where the previous step ended: iteratively for  $k = m, \dots, m + n - 1$ , calculate values

$$\begin{aligned} r_3 &= 1566083941 \cdot T(\text{begin}[k] + \text{begin}[k + p] + \text{begin}[k - 1]) \\ r_4 &= r_3 - (k \bmod n) \end{aligned}$$

and, in order, update `begin[k + p]` by xoring it with  $r_3$ , update `begin[k + q]` by xoring it with  $r_4$ , and set `begin[k]` to  $r_4$ .

10 *Throws:* What and when `RandomAccessIterator` operations of `begin` and `end` throw.

```
size_t size() const noexcept;
```

11 *Returns:* The number of 32-bit units that would be returned by a call to `param()`.

12 *Complexity:* Constant time.

```
template<class OutputIterator>
void param(OutputIterator dest) const;
```

13 *Mandates:* Values of type `result_type` are writable (25.3.1) to `dest`.

14 *Preconditions:* `OutputIterator` meets the *Cpp17OutputIterator* requirements (25.3.5.4).

15 *Effects:* Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```
copy(v.begin(), v.end(), dest);
```

16 *Throws:* What and when `OutputIterator` operations of `dest` throw.

### 28.5.8.2 Function template `generate_canonical`

[rand.util.canonical]

```
template<class RealType, size_t bits, class URBG>
RealType generate_canonical(URBG& g);
```

1 *Effects:* Invokes `g()`  $k$  times to obtain values  $g_0, \dots, g_{k-1}$ , respectively. Calculates a quantity

$$S = \sum_{i=0}^{k-1} (g_i - g.min()) \cdot R^i$$

using arithmetic of type `RealType`.

2 *Returns:*  $S/R^k$ .

[Note 1:  $0 \leq S/R^k < 1$ . — end note]

3 *Throws:* What and when `g` throws.

- 4 *Complexity*: Exactly  $k = \max(1, \lceil b / \log_2 R \rceil)$  invocations of  $g$ , where  $b^{236}$  is the lesser of `numeric_limits<RealType>::digits` and `bits`, and  $R$  is the value of `g.max() - g.min() + 1`.
- 5 [Note 2: If the values  $g_i$  produced by  $g$  are uniformly distributed, the instantiation's results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — end note]

## 28.5.9 Random number distribution class templates [rand.dist]

### 28.5.9.1 In general [rand.dist.general]

- 1 Each type instantiated from a class template specified in this subclause 28.5.9 meets the requirements of a random number distribution (28.5.3.6) type.
- 2 Descriptions are provided in this subclause 28.5.9 only for distribution operations that are not described in 28.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- 3 The algorithms for producing each of the specified distributions are implementation-defined.
- 4 The value of each probability density function  $p(z)$  and of each discrete probability function  $P(z_i)$  specified in this subclause is 0 everywhere outside its stated domain.

### 28.5.9.2 Uniform distributions [rand.dist.uni]

#### 28.5.9.2.1 Class template `uniform_int_distribution` [rand.dist.uni.int]

- 1 A `uniform_int_distribution` random number distribution produces random integers  $i$ ,  $a \leq i \leq b$ , distributed according to the constant discrete probability function

$$P(i | a, b) = 1 / (b - a + 1).$$

```
namespace std {
 template<class IntType = int>
 class uniform_int_distribution {
 public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 uniform_int_distribution() : uniform_int_distribution(0) {}
 explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
 explicit uniform_int_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 result_type a() const;
 result_type b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
 };
};
```

<sup>236</sup>)  $b$  is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`.

```

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const uniform_int_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, uniform_int_distribution& x);
};
}

```

```
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
```

2     *Preconditions:*  $a \leq b$ .

3     *Remarks:* a and b correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4     *Returns:* The value of the a parameter with which the object was constructed.

```
result_type b() const;
```

5     *Returns:* The value of the b parameter with which the object was constructed.

### 28.5.9.2.2 Class template uniform\_real\_distribution

[rand.dist.uni.real]

1 A uniform\_real\_distribution random number distribution produces random numbers  $x$ ,  $a \leq x < b$ , distributed according to the constant probability density function

$$p(x | a, b) = 1/(b - a).$$

[Note 1: This implies that  $p(x | a, b)$  is undefined when  $a == b$ . — end note]

```

namespace std {
 template<class RealType = double>
 class uniform_real_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 uniform_real_distribution() : uniform_real_distribution(0.0) {}
 explicit uniform_real_distribution(RealType a, RealType b = 1.0);
 explicit uniform_real_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const uniform_real_distribution& x,
 const uniform_real_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 result_type a() const;
 result_type b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
 };
}

```

```

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, uniform_real_distribution& x);
};
}

```

```
explicit uniform_real_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions:*  $a \leq b$  and  $b - a \leq \text{numeric\_limits}<\text{RealType}>::\text{max}()$ .

3 *Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4 *Returns:* The value of the  $a$  parameter with which the object was constructed.

```
result_type b() const;
```

5 *Returns:* The value of the  $b$  parameter with which the object was constructed.

### 28.5.9.3 Bernoulli distributions

[rand.dist.bern]

#### 28.5.9.3.1 Class `bernoulli_distribution`

[rand.dist.bern.bernoulli]

1 A `bernoulli_distribution` random number distribution produces `bool` values  $b$  distributed according to the discrete probability function

$$P(b|p) = \begin{cases} p & \text{if } b = \text{true, or} \\ 1 - p & \text{if } b = \text{false.} \end{cases}$$

```

namespace std {
 class bernoulli_distribution {
 public:
 // types
 using result_type = bool;
 using param_type = unspecified;

 // constructors and reset functions
 bernoulli_distribution() : bernoulli_distribution(0.5) {}
 explicit bernoulli_distribution(double p);
 explicit bernoulli_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
 };
}

```

```

 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);
};
}

```

```
explicit bernoulli_distribution(double p);
```

2 *Preconditions:*  $0 \leq p \leq 1$ .

3 *Remarks:*  $p$  corresponds to the parameter of the distribution.

```
double p() const;
```

4 *Returns:* The value of the  $p$  parameter with which the object was constructed.

### 28.5.9.3.2 Class template `binomial_distribution`

[rand.dist.bern.bin]

1 A `binomial_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i|t,p) = \binom{t}{i} \cdot p^i \cdot (1-p)^{t-i}.$$

```

namespace std {
 template<class IntType = int>
 class binomial_distribution {
 public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 binomial_distribution() : binomial_distribution(1) {}
 explicit binomial_distribution(IntType t, double p = 0.5);
 explicit binomial_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const binomial_distribution& x, const binomial_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 IntType t() const;
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);
};
}

```

```
explicit binomial_distribution(IntType t, double p = 0.5);
```

2 *Preconditions:*  $0 \leq p \leq 1$  and  $0 \leq t$ .

3 *Remarks:*  $t$  and  $p$  correspond to the respective parameters of the distribution.

```
IntType t() const;
```

4 *Returns:* The value of the  $t$  parameter with which the object was constructed.

```
double p() const;
```

5 *Returns:* The value of the  $p$  parameter with which the object was constructed.

### 28.5.9.3.3 Class template `geometric_distribution`

[rand.dist.bern.geo]

1 A `geometric_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i|p) = p \cdot (1 - p)^i.$$

```
namespace std {
 template<class IntType = int>
 class geometric_distribution {
 public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 geometric_distribution() : geometric_distribution(0.5) {}
 explicit geometric_distribution(double p);
 explicit geometric_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const geometric_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, geometric_distribution& x);
 };
}
```

```
explicit geometric_distribution(double p);
```

2 *Preconditions:*  $0 < p < 1$ .

3 *Remarks:*  $p$  corresponds to the parameter of the distribution.

```
double p() const;
```

4 *Returns:* The value of the  $p$  parameter with which the object was constructed.

**28.5.9.3.4 Class template negative\_binomial\_distribution****[rand.dist.bern.negbin]**

- <sup>1</sup> A negative\_binomial\_distribution random number distribution produces random integers  $i \geq 0$  distributed according to the discrete probability function

$$P(i | k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i.$$

[Note 1: This implies that  $P(i | k, p)$  is undefined when  $p == 1$ . — end note]

```

namespace std {
 template<class IntType = int>
 class negative_binomial_distribution {
 public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructor and reset functions
 negative_binomial_distribution() : negative_binomial_distribution(1) {}
 explicit negative_binomial_distribution(IntType k, double p = 0.5);
 explicit negative_binomial_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const negative_binomial_distribution& x,
 const negative_binomial_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 IntType k() const;
 double p() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const negative_binomial_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, negative_binomial_distribution& x);
 };
}

```

```
explicit negative_binomial_distribution(IntType k, double p = 0.5);
```

- <sup>2</sup> *Preconditions:*  $0 < p \leq 1$  and  $0 < k$ .
- <sup>3</sup> *Remarks:*  $k$  and  $p$  correspond to the respective parameters of the distribution.

```
IntType k() const;
```

- <sup>4</sup> *Returns:* The value of the  $k$  parameter with which the object was constructed.

```
double p() const;
```

- <sup>5</sup> *Returns:* The value of the  $p$  parameter with which the object was constructed.

**28.5.9.4 Poisson distributions****[rand.dist.pois]****28.5.9.4.1 Class template poisson\_distribution****[rand.dist.pois.poisson]**

- <sup>1</sup> A `poisson_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i | \mu) = \frac{e^{-\mu} \mu^i}{i!}.$$

The distribution parameter  $\mu$  is also known as this distribution's *mean*.

```
template<class IntType = int>
class poisson_distribution
{
public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructors and reset functions
 poisson_distribution() : poisson_distribution(1.0) {}
 explicit poisson_distribution(double mean);
 explicit poisson_distribution(const param_type& parm);
 void reset();

 };
}

```

```
explicit exponential_distribution(RealType lambda);
```

2     *Preconditions:*  $0 < \text{lambda}$ .

3     *Remarks:* lambda corresponds to the parameter of the distribution.

```
RealType lambda() const;
```

4     *Returns:* The value of the lambda parameter with which the object was constructed.

#### 28.5.9.4.3 Class template gamma\_distribution

[rand.dist.pois.gamma]

1 A gamma\_distribution random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.$$

```

namespace std {
 template<class RealType = double>
 class gamma_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

```

```

// constructors and reset functions
gamma_distribution() : gamma_distribution(1.0) {}
explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
explicit gamma_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const gamma_distribution& x, const gamma_distribution& y);

// generating functions
template<class URBG>
 result_type operator()(URBG& g);
template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType alpha() const;
RealType beta() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&

template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, gamma_distribution& x);
};
}

explicit gamma_distribution(RealType alpha, RealType beta = 1.0);

```

2     *Preconditions:*  $0 < \alpha$  and  $0 < \beta$ .

3     *Remarks:*  $\alpha$  and  $\beta$  correspond to the parameters of the distribution.

RealType alpha() const;

4     *Returns:* The value of the  $\alpha$  parameter with which the object was constructed.

RealType beta() const;

5     *Returns:* The value of the  $\beta$  parameter with which the object was constructed.

#### 28.5.9.4.4 Class template `weibull_distribution`

[rand.dist.pois.weibull]

1 A `weibull_distribution` random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function

$$p(x | a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right).$$

```

namespace std {
 template<class RealType = double>
 class weibull_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 weibull_distribution() : weibull_distribution(1.0) {}
 explicit weibull_distribution(RealType a, RealType b = 1.0);
 explicit weibull_distribution(const param_type& parm);
 void reset();
 };
}

```

```

// equality operators
friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

// generating functions
template<class URBG>
 result_type operator()(URBG& g);
template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType a() const;
RealType b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const weibull_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
};
}

```

```
explicit weibull_distribution(RealType a, RealType b = 1.0);
```

2     *Preconditions:*  $0 < a$  and  $0 < b$ .

3     *Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4     *Returns:* The value of the  $a$  parameter with which the object was constructed.

```
RealType b() const;
```

5     *Returns:* The value of the  $b$  parameter with which the object was constructed.

#### 28.5.9.4.5 Class template `extreme_value_distribution`

[rand.dist.pois.extreme]

1 An `extreme_value_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function<sup>237</sup>

$$p(x | a, b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right).$$

```

namespace std {
 template<class RealType = double>
 class extreme_value_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 extreme_value_distribution() : extreme_value_distribution(0.0) {}
 explicit extreme_value_distribution(RealType a, RealType b = 1.0);
 explicit extreme_value_distribution(const param_type& parm);
 void reset();
 };
}

```

<sup>237</sup> The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

```

// equality operators
friend bool operator==(const extreme_value_distribution& x,
 const extreme_value_distribution& y);

// generating functions
template<class URBG>
 result_type operator()(URBG& g);
template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType a() const;
RealType b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
};
}

```

```
explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

2     *Preconditions:*  $0 < b$ .

3     *Remarks:* a and b correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4     *Returns:* The value of the a parameter with which the object was constructed.

```
RealType b() const;
```

5     *Returns:* The value of the b parameter with which the object was constructed.

### 28.5.9.5 Normal distributions

[rand.dist.norm]

#### 28.5.9.5.1 Class template normal\_distribution

[rand.dist.norm.normal]

1 A normal\_distribution random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right).$$

The distribution parameters  $\mu$  and  $\sigma$  are also known as this distribution's *mean* and *standard deviation*.

```

namespace std {
 template<class RealType = double>
 class normal_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructors and reset functions
 normal_distribution() : normal_distribution(0.0) {}
 explicit normal_distribution(RealType mean, RealType stddev = 1.0);
 explicit normal_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const normal_distribution& x, const normal_distribution& y);
 };
}

```

```

// generating functions
template<class URBG>
 result_type operator()(URBG& g);
template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType mean() const;
RealType stddev() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const normal_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
};
}

```

explicit normal\_distribution(RealType mean, RealType stddev = 1.0);

2     *Preconditions:*  $0 < \text{stddev}$ .

3     *Remarks:* mean and stddev correspond to the respective parameters of the distribution.

RealType mean() const;

4     *Returns:* The value of the mean parameter with which the object was constructed.

RealType stddev() const;

5     *Returns:* The value of the stddev parameter with which the object was constructed.

### 28.5.9.5.2 Class template `lognormal_distribution`

[rand.dist.norm.lognormal]

1 A `lognormal_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right).$$

```

namespace std {
 template<class RealType = double>
 class lognormal_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 lognormal_distribution() : lognormal_distribution(0.0) {}
 explicit lognormal_distribution(RealType m, RealType s = 1.0);
 explicit lognormal_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);

```

```

template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType m() const;
RealType s() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
};
}

```

```
explicit lognormal_distribution(RealType m, RealType s = 1.0);
```

2     *Preconditions:*  $0 < s$ .

3     *Remarks:*  $m$  and  $s$  correspond to the respective parameters of the distribution.

```
RealType m() const;
```

4     *Returns:* The value of the  $m$  parameter with which the object was constructed.

```
RealType s() const;
```

5     *Returns:* The value of the  $s$  parameter with which the object was constructed.

### 28.5.9.5.3 Class template `chi_squared_distribution`

[rand.dist.norm.chisq]

1 A `chi_squared_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.$$

```

namespace std {
 template<class RealType = double>
 class chi_squared_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 chi_squared_distribution() : chi_squared_distribution(1.0) {}
 explicit chi_squared_distribution(RealType n);
 explicit chi_squared_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const chi_squared_distribution& x, const chi_squared_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);
 };
}

```

```

// property functions
RealType n() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const chi_squared_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, chi_squared_distribution& x);
};
}

```

```
explicit chi_squared_distribution(RealType n);
```

2     *Preconditions:*  $0 < n$ .

3     *Remarks:*  $n$  corresponds to the parameter of the distribution.

```
RealType n() const;
```

4     *Returns:* The value of the  $n$  parameter with which the object was constructed.

#### 28.5.9.5.4 Class template `cauchy_distribution`

[rand.dist.norm.cauchy]

1 A `cauchy_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | a, b) = \left( \pi b \left( 1 + \left( \frac{x - a}{b} \right)^2 \right) \right)^{-1}.$$

```

namespace std {
 template<class RealType = double>
 class cauchy_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 cauchy_distribution() : cauchy_distribution(0.0) {}
 explicit cauchy_distribution(RealType a, RealType b = 1.0);
 explicit cauchy_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 RealType a() const;
 RealType b() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;
 };
}

```

```

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const cauchy_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
};
}

```

```
explicit cauchy_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions:*  $0 < b$ .

3 *Remarks:* a and b correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns:* The value of the a parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns:* The value of the b parameter with which the object was constructed.

#### 28.5.9.5.5 Class template `fisher_f_distribution`

[rand.dist.norm.f]

1 A `fisher_f_distribution` random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function

$$p(x | m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}.$$

```

namespace std {
 template<class RealType = double>
 class fisher_f_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 fisher_f_distribution() : fisher_f_distribution(1.0) {}
 explicit fisher_f_distribution(RealType m, RealType n = 1.0);
 explicit fisher_f_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const fisher_f_distribution& x, const fisher_f_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 RealType m() const;
 RealType n() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>

 operator<<(basic_ostream<charT, traits>& os, const fisher_f_distribution& x);
 };
}

```

```

 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
};
}

```

explicit fisher\_f\_distribution(RealType m, RealType n = 1);

2 *Preconditions:*  $0 < m$  and  $0 < n$ .

3 *Remarks:*  $m$  and  $n$  correspond to the respective parameters of the distribution.

RealType m() const;

4 *Returns:* The value of the  $m$  parameter with which the object was constructed.

RealType n() const;

5 *Returns:* The value of the  $n$  parameter with which the object was constructed.

### 28.5.9.5.6 Class template student\_t\_distribution

[rand.dist.norm.t]

1 A student\_t\_distribution random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}.$$

```

namespace std {
 template<class RealType = double>
 class student_t_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 student_t_distribution() : student_t_distribution(1.0) {}
 explicit student_t_distribution(RealType n);
 explicit student_t_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 RealType n() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
};
}

```

```
explicit student_t_distribution(RealType n);
```

2     *Preconditions:*  $0 < n$ .

3     *Remarks:*  $n$  corresponds to the parameter of the distribution.

```
RealType n() const;
```

4     *Returns:* The value of the  $n$  parameter with which the object was constructed.

### 28.5.9.6 Sampling distributions

[rand.dist.samp]

#### 28.5.9.6.1 Class template `discrete_distribution`

[rand.dist.samp.discrete]

1 A `discrete_distribution` random number distribution produces random integers  $i$ ,  $0 \leq i < n$ , distributed according to the discrete probability function

$$P(i | p_0, \dots, p_{n-1}) = p_i.$$

2 Unless specified otherwise, the distribution parameters are calculated as:  $p_k = w_k/S$  for  $k = 0, \dots, n-1$ , in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```
namespace std {
 template<class IntType = int>
 class discrete_distribution {
 public:
 // types
 using result_type = IntType;
 using param_type = unspecified;

 // constructor and reset functions
 discrete_distribution();
 template<class InputIterator>
 discrete_distribution(InputIterator firstW, InputIterator lastW);
 discrete_distribution(initializer_list<double> wl);
 template<class UnaryOperation>
 discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
 explicit discrete_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

 // property functions
 vector<double> probabilities() const;
 param_type param() const;
 void param(const param_type& parm);
 result_type min() const;
 result_type max() const;

 // inserters and extractors
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
 template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);
 };
}
```

```
discrete_distribution();
```

- 3 *Effects:* Constructs a `discrete_distribution` object with  $n = 1$  and  $p_0 = 1$ .

[*Note 1:* Such an object will always deliver the value 0. — *end note*]

```
template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);
```

- 4 *Mandates:* `is_convertible_v<iterator_traits<InputIterator>::value_type, double>` is true.

- 5 *Preconditions:* `InputIterator` meets the *Cpp17InputIterator* requirements (25.3.5.3). If `firstW == lastW`, let  $n = 1$  and  $w_0 = 1$ . Otherwise,  $[firstW, lastW)$  forms a sequence  $w$  of length  $n > 0$ .

- 6 *Effects:* Constructs a `discrete_distribution` object with probabilities given by the formula above.

```
discrete_distribution(initializer_list<double> wl);
```

- 7 *Effects:* Same as `discrete_distribution(wl.begin(), wl.end())`.

```
template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
```

- 8 *Mandates:* `is_invocable_r_v<double, UnaryOperation&, double>` is true.

- 9 *Preconditions:* If  $nw = 0$ , let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  holds.

- 10 *Effects:* Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If  $nw = 0$ , let  $w_0 = 1$ . Otherwise, let  $w_k = fw(xmin + k \cdot \delta + \delta/2)$  for  $k = 0, \dots, n - 1$ .

- 11 *Complexity:* The number of invocations of `fw` does not exceed  $n$ .

```
vector<double> probabilities() const;
```

- 12 *Returns:* A `vector<double>` whose `size` member returns  $n$  and whose `operator[]` member returns  $p_k$  when invoked with argument  $k$  for  $k = 0, \dots, n - 1$ .

### 28.5.9.6.2 Class template `piecewise_constant_distribution`

[**rand.dist.samp.pconst**]

- 1 A `piecewise_constant_distribution` random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , uniformly distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1}.$$

- 2 The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n - 1$ . Unless specified otherwise, the remaining  $n$  distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \dots, n - 1,$$

in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```
namespace std {
template<class RealType = double>
class piecewise_constant_distribution {
public:
// types
using result_type = RealType;
using param_type = unspecified;

// constructor and reset functions
piecewise_constant_distribution();
template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
InputIteratorW firstW);
template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
UnaryOperation fw);
```

```

explicit piecewise_constant_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const piecewise_constant_distribution& x,
 const piecewise_constant_distribution& y);

// generating functions
template<class URBG>
 result_type operator()(URBG& g);
template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);

// property functions
vector<result_type> intervals() const;
vector<result_type> densities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const piecewise_constant_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, piecewise_constant_distribution& x);
};
}

```

```
piecewise_constant_distribution();
```

- 3 **Effects:** Constructs a `piecewise_constant_distribution` object with  $n = 1$ ,  $\rho_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```

template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);

```

- 4 **Mandates:** Both of

(4.1) — `is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>`

(4.2) — `is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>`

are true.

- 5 **Preconditions:** `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (25.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let  $n = 1$ ,  $w_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise,  $[firstB, lastB)$  forms a sequence  $b$  of length  $n + 1$ , the length of the sequence  $w$  starting from `firstW` is at least  $n$ , and any  $w_k$  for  $k \geq n$  are ignored by the distribution.

- 6 **Effects:** Constructs a `piecewise_constant_distribution` object with parameters as specified above.

```

template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);

```

- 7 **Mandates:** `is_invocable_r_v<double, UnaryOperation&, double>` is true.

- 8 **Effects:** Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let  $n = 1$ ,  $w_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let  $[bl.begin(), bl.end())$  form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw((b_{k+1} + b_k)/2)$  for  $k = 0, \dots, n - 1$ .

- 9 **Complexity:** The number of invocations of `fw` does not exceed  $n$ .

```

template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

```

- 10 **Mandates:** `is_invocable_r_v<double, UnaryOperation&, double>` is true.

- 11 *Preconditions:* If  $n_w = 0$ , let  $n = 1$ , otherwise let  $n = n_w$ . The relation  $0 < \delta = (x_{\max} - x_{\min})/n$  holds.
- 12 *Effects:* Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: Let  $b_k = x_{\min} + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = f_w(b_k + \delta/2)$  for  $k = 0, \dots, n - 1$ .
- 13 *Complexity:* The number of invocations of `fw` does not exceed  $n$ .

```
vector<result_type> intervals() const;
```

- 14 *Returns:* A `vector<result_type>` whose `size` member returns  $n + 1$  and whose `operator[]` member returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

```
vector<result_type> densities() const;
```

- 15 *Returns:* A `vector<result_type>` whose `size` member returns  $n$  and whose `operator[]` member returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n - 1$ .

### 28.5.9.6.3 Class template `piecewise_linear_distribution`

[`rand.dist.samp.plinear`]

- <sup>1</sup> A `piecewise_linear_distribution` random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.$$

- <sup>2</sup> The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n - 1$ . Unless specified otherwise, the remaining  $n + 1$  distribution parameters are calculated as  $\rho_k = w_k/S$  for  $k = 0, \dots, n$ , in which the values  $w_k$ , commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k).$$

```
namespace std {
 template<class RealType = double>
 class piecewise_linear_distribution {
 public:
 // types
 using result_type = RealType;
 using param_type = unspecified;

 // constructor and reset functions
 piecewise_linear_distribution();
 template<class InputIteratorB, class InputIteratorW>
 piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);
 template<class UnaryOperation>
 piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
 template<class UnaryOperation>
 piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
 explicit piecewise_linear_distribution(const param_type& parm);
 void reset();

 // equality operators
 friend bool operator==(const piecewise_linear_distribution& x,
 const piecewise_linear_distribution& y);

 // generating functions
 template<class URBG>
 result_type operator()(URBG& g);
 template<class URBG>
 result_type operator()(URBG& g, const param_type& parm);
 };
}
```

```

// property functions
vector<result_type> intervals() const;
vector<result_type> densities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const piecewise_linear_distribution& x);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
};
}

```

```
piecewise_linear_distribution();
```

3 **Effects:** Constructs a `piecewise_linear_distribution` object with  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```

template<class InputIteratorB, class InputIteratorW>
piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
 InputIteratorW firstW);

```

4 **Mandates:** `is_invocable_r_v<double, UnaryOperation&, double>` is true.

5 **Preconditions:** `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (25.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise,  $[firstB, lastB)$  forms a sequence  $b$  of length  $n + 1$ , the length of the sequence  $w$  starting from `firstW` is at least  $n + 1$ , and any  $w_k$  for  $k \geq n + 1$  are ignored by the distribution.

6 **Effects:** Constructs a `piecewise_linear_distribution` object with parameters as specified above.

```

template<class UnaryOperation>
piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);

```

7 **Mandates:** `is_invocable_r_v<double, UnaryOperation&, double>` is true.

8 **Effects:** Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let  $[bl.begin(), bl.end())$  form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .

9 **Complexity:** The number of invocations of `fw` does not exceed  $n + 1$ .

```

template<class UnaryOperation>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

```

10 **Mandates:** `is_invocable_r_v<double, UnaryOperation&, double>` is true.

11 **Preconditions:** If `nw = 0`, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  holds.

12 **Effects:** Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: Let  $b_k = xmin + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .

13 **Complexity:** The number of invocations of `fw` does not exceed  $n + 1$ .

```
vector<result_type> intervals() const;
```

14 **Returns:** A `vector<result_type>` whose `size` member returns  $n + 1$  and whose `operator[]` member returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

```
vector<result_type> densities() const;
```

15 **Returns:** A `vector<result_type>` whose `size` member returns  $n$  and whose `operator[]` member returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

## 28.5.10 Low-quality random number generation

[c.math.rand]

1 [Note 1: The header `<cstdliblib>` (17.2.2) declares the functions described in this subclause. — end note]

```
int rand();
void srand(unsigned int seed);
```

2 *Effects:* The `rand` and `srand` functions have the semantics specified in the C standard library.

3 *Remarks:* The implementation may specify that particular library functions may call `rand`. It is implementation-defined whether the `rand` function may introduce data races (16.4.6.10).

[*Note 2:* The other random number generation facilities in this document (28.5) are often preferable to `rand`, because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance. — *end note*]

See also: ISO C 7.22.2

## 28.6 Numeric arrays

[**numarray**]

### 28.6.1 Header `<valarray>` synopsis

[**valarray.syn**]

```
#include <initializer_list>

template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
}

```

- 1 The header <valarray> defines five class templates (valarray, slice\_array, gslice\_array, mask\_array, and indirect\_array), two classes (slice and gslice), and a series of related function templates for representing and manipulating arrays of values.
- 2 The valarray array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.
- 3 Any function returning a valarray<T> is permitted to return an object of another type, provided all the const member functions of valarray<T> are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.<sup>238</sup>
- 4 Implementations introducing such replacement types shall provide additional functions and operators as follows:
  - (4.1) — for every function taking a const valarray<T>& other than begin and end (28.6.10), identical functions taking the replacement types shall be added;
  - (4.2) — for every function taking two const valarray<T>& arguments, identical functions taking every combination of const valarray<T>& and replacement types shall be added.
- 5 In particular, an implementation shall allow a valarray<T> to be constructed from such replacement types and shall allow assignments and compound assignments of such types to valarray<T>, slice\_array<T>, gslice\_array<T>, mask\_array<T> and indirect\_array<T> objects.
- 6 These library functions are permitted to throw a bad\_alloc (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

<sup>238</sup> Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.

**28.6.2 Class template `valarray`****[`template.valarray`]****28.6.2.1 Overview****[`template.valarray.overview`]**

```

namespace std {
 template<class T> class valarray {
 public:
 using value_type = T;

 // 28.6.2.2, construct/destroy
 valarray();

 valarray& operator^=(const T&);
 valarray& operator&=(const T&);
 valarray& operator|=(const T&);
 valarray& operator<<=(const T&);
 valarray& operator>>=(const T&);

```

```

 valarray& operator*= (const valarray&);
 valarray& operator/= (const valarray&);
 valarray& operator%= (const valarray&);
 valarray& operator+= (const valarray&);
 valarray& operator-= (const valarray&);
 valarray& operator^= (const valarray&);
 valarray& operator|= (const valarray&);
 valarray& operator&= (const valarray&);
 valarray& operator<<=(const valarray&);
 valarray& operator>>=(const valarray&);

 // 28.6.2.8, member functions
 void swap(valarray&) noexcept;

 size_t size() const;

 T sum() const;
 T min() const;
 T max() const;

 valarray shift (int) const;
 valarray cshift(int) const;
 valarray apply(T func(T)) const;
 valarray apply(T func(const T&)) const;
 void resize(size_t sz, T c = T());
};

template<class T, size_t cnt> valarray(const T&[cnt], size_t) -> valarray<T>;
}

```

- <sup>1</sup> The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 28.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.<sup>239</sup>

### 28.6.2.2 Constructors

[`valarray.cons`]

```
valarray();
```

- <sup>1</sup> *Effects:* Constructs a `valarray` that has zero length.<sup>240</sup>

```
explicit valarray(size_t n);
```

- <sup>2</sup> *Effects:* Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.4).

```
valarray(const T& v, size_t n);
```

- <sup>3</sup> *Effects:* Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

```
valarray(const T* p, size_t n);
```

- <sup>4</sup> *Preconditions:* `[p, p + n)` is a valid range.

- <sup>5</sup> *Effects:* Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.<sup>241</sup>

<sup>239</sup>) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

<sup>240</sup>) This default constructor is essential, since arrays of `valarray` can be useful. After initialization, the length of an empty array can be increased with the `resize` member function.

<sup>241</sup>) This constructor is the preferred method for converting a C array to a `valarray` object.

```
valarray(const valarray& v);
```

- 6 *Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.<sup>242</sup>

```
valarray(valarray&& v) noexcept;
```

- 7 *Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

- 8 *Complexity:* Constant.

```
valarray(initializer_list<T> il);
```

- 9 *Effects:* Equivalent to `valarray(il.begin(), il.size())`.

```
valarray(const slice_array<T>&);
valarray(const gsllice_array<T>&);
valarray(const mask_array<T>&);
valarray(const indirect_array<T>&);
```

- 10 These conversion constructors convert one of the four reference templates to a `valarray`.

```
~valarray();
```

- 11 *Effects:* The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

### 28.6.2.3 Assignment

[`valarray.assign`]

```
valarray& operator=(const valarray& v);
```

- 1 *Effects:* Each element of the `*this` array is assigned the value of the corresponding element of `v`. If the length of `v` is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

- 2 *Postconditions:* `size() == v.size()`.

- 3 *Returns:* `*this`.

```
valarray& operator=(valarray&& v) noexcept;
```

- 4 *Effects:* `*this` obtains the value of `v`. The value of `v` after the assignment is not specified.

- 5 *Returns:* `*this`.

- 6 *Complexity:* Linear.

```
valarray& operator=(initializer_list<T> il);
```

- 7 *Effects:* Equivalent to: `return *this = valarray(il);`

```
valarray& operator=(const T& v);
```

- 8 *Effects:* Assigns `v` to each element of `*this`.

- 9 *Returns:* `*this`.

```
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gsllice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);
```

- 10 *Preconditions:* The length of the array to which the argument refers equals `size()`. The value of an element in the left-hand side of a `valarray` assignment operator does not depend on the value of another element in that left-hand side.

- 11 These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

### 28.6.2.4 Element access

[`valarray.access`]

```
const T& operator[](size_t n) const;
```

<sup>242</sup>) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

```
T& operator[](size_t n);
```

1 *Preconditions:* `n < size()` is true.

2 *Returns:* A reference to the corresponding element of the array.

[*Note 1:* The expression `(a[i] = q, a[i]) == q` evaluates to true for any non-constant `valarray<T>` `a`, any `T` `q`, and for any `size_t` `i` such that the value of `i` is less than the length of `a`. — *end note*]

3 *Remarks:* The expression `addressof(a[i+j]) == addressof(a[i]) + j` evaluates to true for all `size_t` `i` and `size_t` `j` such that `i+j < a.size()`.

4 The expression `addressof(a[i]) != addressof(b[j])` evaluates to true for any two arrays `a` and `b` and for any `size_t` `i` and `size_t` `j` such that `i < a.size()` and `j < b.size()`.

[*Note 2:* This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarrays`. — *end note*]

5 The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

### 28.6.2.5 Subset operations

[**valarray.sub**]

1 The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new `valarray` object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=` and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

```
valarray operator[](slice slicearr) const;
```

2 *Returns:* A `valarray` containing those elements of the controlled sequence designated by `slicearr`.

[*Example 1:*

```
const valarray<char> v0("abcdefghijklmnop", 16);
//v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
```

— *end example*]

```
slice_array<T> operator[](slice slicearr);
```

3 *Returns:* An object that holds references to elements of the controlled sequence selected by `slicearr`.

[*Example 2:*

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
//v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
```

— *end example*]

```
valarray operator[](const gslice& gslicearr) const;
```

4 *Returns:* A `valarray` containing those elements of the controlled sequence designated by `gslicearr`.

[*Example 3:*

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
//v0[gslice(3, len, str)] returns
//valarray<char>("dfhkmo", 6)
```

— *end example*]

```
gslice_array<T> operator[](const gslice& gslicearr);
```

5 *Returns:* An object that holds references to elements of the controlled sequence selected by `gslicearr`.

[*Example 4:*

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDEF", 6);
```

```

const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
//v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
—end example]

```

```
valarray operator[](const valarray<bool>& boolarr) const;
```

6 **Returns:** A `valarray` containing those elements of the controlled sequence designated by `boolarr`.

[Example 5:

```

const valarray<char> v0("abcdefghijklmnop", 16);
const bool vb[] = { false, false, true, true, false, true };
//v0[valarray<bool>(vb, 6)] returns
//valarray<char>("cdf", 3)
—end example]

```

```
mask_array<T> operator[](const valarray<bool>& boolarr);
```

7 **Returns:** An object that holds references to elements of the controlled sequence selected by `boolarr`.

[Example 6:

```

valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
//v0 == valarray<char>("abABeCghijklmnop", 16)
—end example]

```

```
valarray operator[](const valarray<size_t>& indarr) const;
```

8 **Returns:** A `valarray` containing those elements of the controlled sequence designated by `indarr`.

[Example 7:

```

const valarray<char> v0("abcdefghijklmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
//v0[valarray<size_t>(vi, 5)] returns
//valarray<char>("hfcdi", 5)
—end example]

```

```
indirect_array<T> operator[](const valarray<size_t>& indarr);
```

9 **Returns:** An object that holds references to elements of the controlled sequence selected by `indarr`.

[Example 8:

```

valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
//v0 == valarray<char>("abCDeBgAEijklmnop", 16)
—end example]

```

### 28.6.2.6 Unary operators

[`valarray.unary`]

```

valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

```

1 **Mandates:** The indicated operator can be applied to operands of type `T` and returns a value of type `T` (`bool` for `operator!`) or which may be unambiguously implicitly converted to type `T` (`bool` for `operator!`).

2 **Returns:** A `valarray` whose length is `size()`. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

**28.6.2.7 Compound assignment****[valarray.cassign]**

```

valarray& operator*= (const valarray& v);
valarray& operator/= (const valarray& v);
valarray& operator%= (const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-= (const valarray& v);
valarray& operator^= (const valarray& v);
valarray& operator&= (const valarray& v);
valarray& operator|= (const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);

```

1 *Mandates:* The indicated operator can be applied to two operands of type  $\tau$ .

2 *Preconditions:* `size() == v.size()` is true.

The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.

3 *Effects:* Each of these operators performs the indicated operation on each of the elements of `*this` and the corresponding element of `v`.

4 *Returns:* `*this`.

5 *Remarks:* The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```

valarray& operator*= (const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator^= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|= (const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);

```

6 *Mandates:* The indicated operator can be applied to two operands of type  $\tau$ .

7 *Effects:* Each of these operators applies the indicated operation to each element of `*this` and `v`.

8 *Returns:* `*this`

9 *Remarks:* The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

**28.6.2.8 Member functions****[valarray.members]**

```
void swap(valarray& v) noexcept;
```

1 *Effects:* `*this` obtains the value of `v`. `v` obtains the value of `*this`.

2 *Complexity:* Constant.

```
size_t size() const;
```

3 *Returns:* The number of elements in the array.

4 *Complexity:* Constant time.

```
T sum() const;
```

5 *Mandates:* `operator+=` can be applied to operands of type  $\tau$ .

6 *Preconditions:* `size() > 0` is true.

7 *Returns:* The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying `operator+=` to a copy of an element of the array and all other elements of the array in an unspecified order.

T min() const;

8 *Preconditions:* size() > 0 is true.

9 *Returns:* The minimum value contained in \*this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

T max() const;

10 *Preconditions:* size() > 0 is true.

11 *Returns:* The maximum value contained in \*this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

valarray shift(int n) const;

12 *Returns:* A valarray of length size(), each of whose elements *I* is (\*this)[*I* + *n*] if *I* + *n* is non-negative and less than size(), otherwise T().

[*Note 1:* If element zero is taken as the leftmost element, a positive value of *n* shifts the elements left *n* places, with zero fill. —end note]

13 [*Example 1:* If the argument has the value −2, the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of the argument; etc. —end example]

valarray cshift(int n) const;

14 *Returns:* A valarray of length size() that is a circular shift of \*this. If element zero is taken as the leftmost element, a non-negative value of *n* shifts the elements circularly left *n* places and a negative value of *n* shifts the elements circularly right −*n* places.

valarray apply(T func(T)) const;

valarray apply(T func(const T&)) const;

15 *Returns:* A valarray whose length is size(). Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of \*this.

void resize(size\_t sz, T c = T());

16 *Effects:* Changes the length of the \*this array to sz and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

### 28.6.3 valarray non-member operations

[valarray.nonmembers]

#### 28.6.3.1 Binary operators

[valarray.binary]

template<class T> valarray<T> operator\* (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);

1 *Mandates:* The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

2 *Preconditions:* The argument arrays have the same length.

3 *Returns:* A valarray whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

template<class T> valarray<T> operator\* (const valarray<T>&,  
const typename valarray<T>::value\_type&);

template<class T> valarray<T> operator\* (const typename valarray<T>::value\_type&,  
const valarray<T>&);

```

template<class T> valarray<T> operator/ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&,
 const valarray<T>&);

```

- 4 *Mandates:* The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.
- 5 *Returns:* A valarray whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

### 28.6.3.2 Logical operators

[valarray.comparison]

```

template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator|| (const valarray<T>&, const valarray<T>&);

```

- 1 *Mandates:* The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.
- 2 *Preconditions:* The two array arguments have the same length.
- 3 *Returns:* A valarray<bool> whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```

template<class T> valarray<bool> operator==(const valarray<T>&,
 const typename valarray<T>::value_type&);

```

```

template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator<(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator>(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>=(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&,
 const valarray<T>&);
template<class T> valarray<bool> operator|| (const valarray<T>&,
 const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator|| (const typename valarray<T>::value_type&,
 const valarray<T>&);

```

- 4 *Mandates:* The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.
- 5 *Returns:* A `valarray<bool>` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

### 28.6.3.3 Transcendentals

[`valarray.transcend`]

```

template<class T> valarray<T> abs (const valarray<T>&);
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp (const valarray<T>&);
template<class T> valarray<T> log (const valarray<T>&);
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);

```

- 1 *Mandates:* A unique function with the indicated name can be applied (unqualified) to an operand of type `T`. This function returns a value of type `T` or which can be unambiguously implicitly converted to type `T`.

**28.6.3.4 Specialized algorithms****[valarray.special]**

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

- 1 *Effects:* Equivalent to `x.swap(y)`.

**28.6.4 Class slice****[class.slice]****28.6.4.1 Overview****[class.slice.overview]**

```
namespace std {
 class slice {
 public:
 slice();
 slice(size_t, size_t, size_t);

 size_t start() const;
 size_t size() const;
 size_t stride() const;

 friend bool operator==(const slice& x, const slice& y);
 };
}
```

- 1 The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.<sup>243</sup>

**28.6.4.2 Constructors****[cons.slice]**

```
slice();
slice(size_t start, size_t length, size_t stride);
slice(const slice&);
```

- 1 The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.
- 2 *[Example 1:* `slice(3, 8, 2)` constructs a slice which selects elements 3, 5, 7, ..., 17 from an array. *— end example]*

**28.6.4.3 Access functions****[slice.access]**

```
size_t start() const;
size_t size() const;
size_t stride() const;
```

- 1 *Returns:* The start, length, or stride specified by a `slice` object.
- 2 *Complexity:* Constant time.

**28.6.4.4 Operators****[slice.ops]**

```
friend bool operator==(const slice& x, const slice& y);
```

- 1 *Effects:* Equivalent to:
- ```
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

28.6.5 Class template slice_array**[template.slice.array]****28.6.5.1 Overview****[template.slice.array.overview]**

```
namespace std {
    template<class T> class slice_array {
    public:
        using value_type = T;
```

²⁴³BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

```

void operator= (const valarray<T>&) const;
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;

slice_array(const slice_array&);
~slice_array();
const slice_array& operator=(const slice_array&) const;
void operator=(const T&) const;

slice_array() = delete;    // as implied by declaring copy constructor above
};
}

```

- ¹ This template is a helper template used by the `slice` subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```

- ² It has reference semantics to a subset of an array specified by a `slice` object.

[*Example 1:* The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are 1, 4, ..., 13. — *end example*]

28.6.5.2 Assignment

[**slice.arr.assign**]

```

void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;

```

- ¹ These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

28.6.5.3 Compound assignment

[**slice.arr.comp.assign**]

```

void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;

```

- ¹ These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

28.6.5.4 Fill function

[**slice.arr.fill**]

```
void operator=(const T&) const;
```

- ¹ This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

28.6.6 The `gslice` class

[**class.gslice**]

28.6.6.1 Overview

[**class.gslice.overview**]

```

namespace std {
class gslice {
public:
gslice();
gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

```

```

    size_t      start() const;
    valarray<size_t> size() const;
    valarray<size_t> stride() const;
};
}

```

- ¹ This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset (s), a set of lengths (l_j), and a set of strides (d_j). The number of lengths shall equal the number of strides.
- ² A `gslice` represents a mapping from a set of indices (i_j), equal in number to the number of strides, to a single index k . It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices i_j range in value from 0 to $l_{ij} - 1$.

- ³ [Example 1: The `gslice` specification

```

start = 3
length = {2, 4, 3}
stride = {19, 4, 1}

```

yields the sequence of one-dimensional indices

$$k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1$$

which are ordered as shown in the following table:

```

(i0, i1, i2, k) =
(0, 0, 0, 3),
(0, 0, 1, 4),
(0, 0, 2, 5),
(0, 1, 0, 7),
(0, 1, 1, 8),
(0, 1, 2, 9),
(0, 2, 0, 11),
(0, 2, 1, 12),
(0, 2, 2, 13),
(0, 3, 0, 15),
(0, 3, 1, 16),
(0, 3, 2, 17),
(1, 0, 0, 22),
(1, 0, 1, 23),
...
(1, 3, 2, 36)

```

That is, the highest-ordered index turns fastest. — *end example*]

- ⁴ It is possible to have degenerate generalized slices in which an address is repeated.
- ⁵ [Example 2: If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

```

(0, 0, 0, 3),
(0, 0, 1, 4),
(0, 0, 2, 5),
(0, 1, 0, 4),
(0, 1, 1, 5),
(0, 1, 2, 6),
...

```

— *end example*]

- ⁶ If a degenerate slice is used as the argument to the non-const version of `operator[]`(`const gslice&`), the behavior is undefined.

28.6.6.2 Constructors**[gslice.cons]**

```
gslice();
gslice(size_t start, const valarray<size_t>& lengths,
       const valarray<size_t>& strides);
gslice(const gslice&);
```

- ¹ The default constructor is equivalent to `gslice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gslice` based on a specification of start, lengths, and strides, as explained in the previous subclause.

28.6.6.3 Access functions**[gslice.access]**

```
size_t      start() const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
```

- ¹ *Returns:* The representation of the start, lengths, or strides specified for the `gslice`.
- ² *Complexity:* `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

28.6.7 Class template `gslice_array`**[template.gslice.array]****28.6.7.1 Overview****[template.gslice.array.overview]**

```
namespace std {
    template<class T> class gslice_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;

        gslice_array(const gslice_array&);
        ~gslice_array();
        const gslice_array& operator=(const gslice_array&) const;
        void operator=(const T&) const;

        gslice_array() = delete; // as implied by declaring copy constructor above
    };
}
```

- ¹ This template is a helper template used by the `gslice` subscript operator

```
gslice_array<T> valarray<T>::operator[](const gslice&);
```

- ² It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

28.6.7.2 Assignment**[gslice.array.assign]**

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

- ¹ These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

28.6.7.3 Compound assignment**[gslice.array.comp.assign]**

```

void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

```

- ¹ These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

28.6.7.4 Fill function**[gslice.array.fill]**

```
void operator=(const T&) const;
```

- ¹ This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

28.6.8 Class template `mask_array`**[template.mask.array]****28.6.8.1 Overview****[template.mask.array.overview]**

```

namespace std {
    template<class T> class mask_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;

        mask_array(const mask_array&);
        ~mask_array();
        const mask_array& operator=(const mask_array&) const;
        void operator=(const T&) const;

        mask_array() = delete;    // as implied by declaring copy constructor above
    };
}

```

- ¹ This template is a helper template used by the `mask` subscript operator:

```
mask_array<T> valarray<T>::operator[](const valarray<bool>&).
```

- ² It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is true).

28.6.8.2 Assignment**[mask.array.assign]**

```

void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;

```

- ¹ These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `mask_array` object refers.

28.6.8.3 Compound assignment**[mask.array.comp.assign]**

```

void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

```

- ¹ These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `mask_array` object refers.

28.6.8.4 Fill function**[mask.array.fill]**

```
void operator=(const T&) const;
```

- ¹ This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

28.6.9 Class template indirect_array**[template.indirect.array]****28.6.9.1 Overview****[template.indirect.array.overview]**

```

namespace std {
    template<class T> class indirect_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;

        indirect_array(const indirect_array&);
        ~indirect_array();
        const indirect_array& operator=(const indirect_array&) const;
        void operator=(const T&) const;

        indirect_array() = delete; // as implied by declaring copy constructor above
    };
}

```

- ¹ This template is a helper template used by the indirect subscript operator

```
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&).
```

- ² It has reference semantics to a subset of an array specified by an `indirect_array`. Thus, the expression `a[indirect] = b`; has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

28.6.9.2 Assignment**[indirect.array.assign]**

```

void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;

```

- ¹ These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

- 2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

3 [Example 1:

```
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
```

results in undefined behavior since element 4 is specified twice in the indirection. — *end example*]

28.6.9.3 Compound assignment

[`indirect.array.comp.assign`]

```
void operator*= (const valarray<T>& const);
void operator/= (const valarray<T>& const);
void operator%= (const valarray<T>& const);
void operator+= (const valarray<T>& const);
void operator-= (const valarray<T>& const);
void operator^= (const valarray<T>& const);
void operator&= (const valarray<T>& const);
void operator|= (const valarray<T>& const);
void operator<<= (const valarray<T>& const);
void operator>>= (const valarray<T>& const);
```

- 1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.
- 2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

28.6.9.4 Fill function

[`indirect.array.fill`]

```
void operator=(const T& const);
```

- 1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

28.6.10 `valarray` range access

[`valarray.range`]

- 1 In the `begin` and `end` function templates that follow, *unspecified1* is a type that meets the requirements of a mutable *Cpp17RandomAccessIterator* (25.3.5.7) and models *contiguous_iterator* (25.3.4.14), whose `value_type` is the template parameter `T` and whose `reference_type` is `T&`. *unspecified2* is a type that meets the requirements of a constant *Cpp17RandomAccessIterator* and models *contiguous_iterator*, whose `value_type` is the template parameter `T` and whose `reference_type` is `const T&`.
- 2 The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
```

- 3 *Returns:* An iterator referencing the first value in the array.

```
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
```

- 4 *Returns:* An iterator referencing one past the last value in the array.

long double sph_neumannl(unsigned n, long double x);
}

```

- ¹ The contents and meaning of the header `<cmath>` are the same as the C standard library header `<math.h>`, with the addition of a three-dimensional hypotenuse function (28.7.3), a linear interpolation function (28.7.4), and the mathematical special functions described in 28.7.6.

[Note 1: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — end note]

- ² For each set of overloaded functions within `<cmath>`, with the exception of `abs`, there shall be additional overloads sufficient to ensure:
- (2.1) — If any argument of arithmetic type corresponding to a `double` parameter has type `long double`, then all arguments of arithmetic type (6.8.2) corresponding to `double` parameters are effectively cast to `long double`.
 - (2.2) — Otherwise, if any argument of arithmetic type corresponding to a `double` parameter has type `double` or an integer type, then all arguments of arithmetic type corresponding to `double` parameters are effectively cast to `double`.
 - (2.3) — [Note 2: Otherwise, all arguments of arithmetic type corresponding to `double` parameters have type `float`. — end note]

[Note 3: `abs` is exempted from these rules in order to stay compatible with C. — end note]

See also: ISO C 7.12

28.7.2 Absolute values

[c.math.abs]

- ¹ [Note 1: The headers `<stdlib.h>` (17.2.2) and `<cmath>` (28.7.1) declare the functions described in this subclause. — end note]

```

constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);
constexpr float abs(float j);
constexpr double abs(double j);
constexpr long double abs(long double j);

```

- ² **Effects:** The `abs` functions have the semantics specified in the C standard library for the functions `abs`, `labs`, `llabs`, `fabsf`, `fabs`, and `fabsl`.
- ³ **Remarks:** If `abs()` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X` cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

[Note 2: Arguments that can be promoted to `int` are permitted for compatibility with C. — end note]

See also: ISO C 7.12.7.2, 7.22.6.1

28.7.3 Three-dimensional hypotenuse**[c.math.hypot3]**

```
float hypot(float x, float y, float z);
double hypot(double x, double y, double z);
long double hypot(long double x, long double y, long double z);
```

1 *Returns:* $\sqrt{x^2 + y^2 + z^2}$.

28.7.4 Linear interpolation**[c.math.lerp]**

```
constexpr float lerp(float a, float b, float t) noexcept;
constexpr double lerp(double a, double b, double t) noexcept;
constexpr long double lerp(long double a, long double b, long double t) noexcept;
```

1 *Returns:* $a + t(b - a)$.

2 *Remarks:* Let r be the value returned. If $\text{isfinite}(a) \ \&\& \ \text{isfinite}(b)$, then:

(2.1) — If $t == 0$, then $r == a$.

(2.2) — If $t == 1$, then $r == b$.

(2.3) — If $t >= 0 \ \&\& \ t <= 1$, then $\text{isfinite}(r)$.

(2.4) — If $\text{isfinite}(t) \ \&\& \ a == b$, then $r == a$.

(2.5) — If $\text{isfinite}(t) \ || \ !\text{isnan}(t) \ \&\& \ b - a != 0$, then $!\text{isnan}(r)$.

Let $\text{CMP}(x, y)$ be 1 if $x > y$, -1 if $x < y$, and 0 otherwise. For any t_1 and t_2 , the product of $\text{CMP}(\text{lerp}(a, b, t_2), \text{lerp}(a, b, t_1))$, $\text{CMP}(t_2, t_1)$, and $\text{CMP}(b, a)$ is non-negative.

28.7.5 Classification / comparison functions**[c.math.fpclass]**

1 The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library. Each function is overloaded for the three floating-point types.

See also: ISO C 7.12.3, 7.12.4

28.7.6 Mathematical special functions**[sf.cmath]****28.7.6.1 General****[sf.cmath.general]**

1 If any argument value to any of the functions specified in 28.7.6 is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

(1.1) — the function description's *Returns*: element explicitly specifies a domain and those argument values fall outside the specified domain, or

(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or

(1.3) — the corresponding mathematical function is not mathematically defined.²⁴⁴

2 Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

28.7.6.2 Associated Laguerre polynomials**[sf.cmath.assoc.laguerre]**

```
double      assoc_laguerre(unsigned n, unsigned m, double x);
float       assoc_laguerref(unsigned n, unsigned m, float x);
long double assoc_laguerrel(unsigned n, unsigned m, long double x);
```

1 *Effects:* These functions compute the associated Laguerre polynomials of their respective arguments n , m , and x .

2 *Returns:*

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0,$$

where n is n , m is m , and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $n >= 128$ or if $m >= 128$.

²⁴⁴ A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.

28.7.6.3 Associated Legendre functions**[sf.cmath.assoc.legendre]**

```
double    assoc_legendre(unsigned l, unsigned m, double x);
float     assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
```

1 *Effects:* These functions compute the associated Legendre functions of their respective arguments l , m , and x .

2 *Returns:*

$$P_{\ell}^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_{\ell}(x), \quad \text{for } |x| \leq 1,$$

where l is l , m is m , and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $l \geq 128$.

28.7.6.4 Beta function**[sf.cmath.beta]**

```
double    beta(double x, double y);
float     betaf(float x, float y);
long double betal(long double x, long double y);
```

1 *Effects:* These functions compute the beta function of their respective arguments x and y .

2 *Returns:*

$$B(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)}, \quad \text{for } x > 0, y > 0,$$

where x is x and y is y .

28.7.6.5 Complete elliptic integral of the first kind**[sf.cmath.comp.ellint.1]**

```
double    comp_ellint_1(double k);
float     comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
```

1 *Effects:* These functions compute the complete elliptic integral of the first kind of their respective arguments k .

2 *Returns:*

$$K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1,$$

where k is k .

3 See also [28.7.6.12](#).

28.7.6.6 Complete elliptic integral of the second kind**[sf.cmath.comp.ellint.2]**

```
double    comp_ellint_2(double k);
float     comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

1 *Effects:* These functions compute the complete elliptic integral of the second kind of their respective arguments k .

2 *Returns:*

$$E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1,$$

where k is k .

3 See also [28.7.6.13](#).

28.7.6.7 Complete elliptic integral of the third kind**[sf.cmath.comp.ellint.3]**

```
double    comp_ellint_3(double k, double nu);
float     comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);
```

1 *Effects:* These functions compute the complete elliptic integral of the third kind of their respective arguments k and ν .

2 *Returns:*

$$\Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for } |k| \leq 1,$$

where k is k and ν is ν .

3 See also [28.7.6.14](#).

28.7.6.8 Regular modified cylindrical Bessel functions**[sf.cmath.cyl.bessel.i]**

```
double    cyl_bessel_i(double nu, double x);
float     cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

1 *Effects:* These functions compute the regular modified cylindrical Bessel functions of their respective arguments ν and x .

2 *Returns:*

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where ν is nu and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $\text{nu} \geq 128$.

4 See also [28.7.6.9](#).

28.7.6.9 Cylindrical Bessel functions of the first kind**[sf.cmath.cyl.bessel.j]**

```
double    cyl_bessel_j(double nu, double x);
float     cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Bessel functions of the first kind of their respective arguments ν and x .

2 *Returns:*

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where ν is nu and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $\text{nu} \geq 128$.

28.7.6.10 Irregular modified cylindrical Bessel functions**[sf.cmath.cyl.bessel.k]**

```
double    cyl_bessel_k(double nu, double x);
float     cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

1 *Effects:* These functions compute the irregular modified cylindrical Bessel functions of their respective arguments ν and x .

2 *Returns:*

$$K_\nu(x) = (\pi/2)i^{\nu+1}(J_\nu(ix) + iN_\nu(ix)) = \begin{cases} \frac{\pi}{2} \frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \frac{\pi}{2} \lim_{\mu \rightarrow \nu} \frac{I_{-\mu}(x) - I_\mu(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where ν is nu and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $\text{nu} \geq 128$.

4 See also [28.7.6.8](#), [28.7.6.9](#), [28.7.6.11](#).

28.7.6.11 Cylindrical Neumann functions**[sf.cmath.cyl.neumann]**

```
double    cyl_neumann(double nu, double x);
float     cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments ν and x .

2 *Returns:*

$$N_\nu(x) = \begin{cases} \frac{J_\nu(x) \cos \nu\pi - J_{-\nu}(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim_{\mu \rightarrow \nu} \frac{J_\mu(x) \cos \mu\pi - J_{-\mu}(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where ν is nu and x is x.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if nu \geq 128.

4 See also 28.7.6.9.

28.7.6.12 Incomplete elliptic integral of the first kind

[sf.cmath.ellint.1]

```
double    ellint_1(double k, double phi);
float     ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

1 *Effects:* These functions compute the incomplete elliptic integral of the first kind of their respective arguments k and ϕ (ϕ measured in radians).

2 *Returns:*

$$F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1,$$

where k is k and ϕ is phi.

28.7.6.13 Incomplete elliptic integral of the second kind

[sf.cmath.ellint.2]

```
double    ellint_2(double k, double phi);
float     ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

1 *Effects:* These functions compute the incomplete elliptic integral of the second kind of their respective arguments k and ϕ (ϕ measured in radians).

2 *Returns:*

$$E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta} d\theta, \quad \text{for } |k| \leq 1,$$

where k is k and ϕ is phi.

28.7.6.14 Incomplete elliptic integral of the third kind

[sf.cmath.ellint.3]

```
double    ellint_3(double k, double nu, double phi);
float     ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

1 *Effects:* These functions compute the incomplete elliptic integral of the third kind of their respective arguments k , ν , and ϕ (ϕ measured in radians).

2 *Returns:*

$$\Pi(\nu, k, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1,$$

where ν is nu, k is k, and ϕ is phi.

28.7.6.15 Exponential integral

[sf.cmath.expint]

```
double    expint(double x);
float     expintf(float x);
long double expintl(long double x);
```

1 *Effects:* These functions compute the exponential integral of their respective arguments x .

2 *Returns:*

$$Ei(x) = - \int_{-x}^{\infty} \frac{e^{-t}}{t} dt$$

where x is x.

28.7.6.16 Hermite polynomials**[sf.cmath.hermite]**

```
double    hermite(unsigned n, double x);
float     hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

1 *Effects:* These functions compute the Hermite polynomials of their respective arguments n and x .

2 *Returns:*

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

where n is n and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $n \geq 128$.

28.7.6.17 Laguerre polynomials**[sf.cmath.laguerre]**

```
double    laguerre(unsigned n, double x);
float     laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1 *Effects:* These functions compute the Laguerre polynomials of their respective arguments n and x .

2 *Returns:*

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}), \quad \text{for } x \geq 0,$$

where n is n and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $n \geq 128$.

28.7.6.18 Legendre polynomials**[sf.cmath.legendre]**

```
double    legendre(unsigned l, double x);
float     legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1 *Effects:* These functions compute the Legendre polynomials of their respective arguments l and x .

2 *Returns:*

$$P_\ell(x) = \frac{1}{2^\ell \ell!} \frac{d^\ell}{dx^\ell} (x^2 - 1)^\ell, \quad \text{for } |x| \leq 1,$$

where l is l and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $l \geq 128$.

28.7.6.19 Riemann zeta function**[sf.cmath.riemann.zeta]**

```
double    riemann_zeta(double x);
float     riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

1 *Effects:* These functions compute the Riemann zeta function of their respective arguments x .

2 *Returns:*

$$\zeta(x) = \begin{cases} \sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \frac{1}{1 - 2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\ 2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0 \end{cases}$$

where x is x .

28.7.6.20 Spherical Bessel functions of the first kind**[sf.cmath.sph.bessel]**

```
double    sph_bessel(unsigned n, double x);
float     sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

1 *Effects:* These functions compute the spherical Bessel functions of the first kind of their respective arguments n and x .

2 *Returns:*

$$j_n(x) = (\pi/2x)^{1/2} J_{n+1/2}(x), \quad \text{for } x \geq 0,$$

where n is n and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $n >= 128$.

4 See also [28.7.6.9](#).

28.7.6.21 Spherical associated Legendre functions**[sf.cmath.sph.legendre]**

```
double    sph_legendre(unsigned l, unsigned m, double theta);
float     sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

1 *Effects:* These functions compute the spherical associated Legendre functions of their respective arguments l , m , and θ (θ measured in radians).

2 *Returns:*

$$Y_\ell^m(\theta, 0)$$

where

$$Y_\ell^m(\theta, \phi) = (-1)^m \left[\frac{(2\ell + 1)(\ell - m)!}{4\pi(\ell + m)!} \right]^{1/2} P_\ell^m(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq \ell,$$

and l is l , m is m , and θ is θ .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $l >= 128$.

4 See also [28.7.6.3](#).

28.7.6.22 Spherical Neumann functions**[sf.cmath.sph.neumann]**

```
double    sph_neumann(unsigned n, double x);
float     sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

1 *Effects:* These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments n and x .

2 *Returns:*

$$n_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x), \quad \text{for } x \geq 0,$$

where n is n and x is x .

3 *Remarks:* The effect of calling each of these functions is implementation-defined if $n >= 128$.

4 See also [28.7.6.11](#).

28.8.2 Mathematical constants

[math.constants]

- ¹ The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of e , $\log_2 e$, $\log_{10} e$, π , $\frac{1}{\pi}$, $\frac{1}{\sqrt{\pi}}$, $\ln 2$, $\ln 10$, $\sqrt{2}$, $\sqrt{3}$, $\frac{1}{\sqrt{3}}$, the Euler-Mascheroni γ constant, and the golden ratio ϕ constant $\frac{1+\sqrt{5}}{2}$, respectively.
- ² Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.
- ³ A program that instantiates a primary template of a mathematical constant variable template is ill-formed.

29 Time library

[time]

29.1 General

[time.general]

- ¹ This Clause describes the chrono library (29.2) and various C functions (29.14) that provide generally useful time utilities, as summarized in Table 94.

Table 94: Time library summary [tab:time.summary]

Subclause	Header
29.3	<i>Cpp17Clock</i> requirements
29.4	Time-related traits <chrono>
29.5	Class template duration
29.6	Class template time_point
29.7	Clocks
29.8	Civil calendar
29.9	Class template hh_mm_ss
29.10	12/24 hour functions
29.11	Time zones
29.12	Formatting
29.13	Parsing
29.14	C library time utilities <ctime>

- ² Let *STATICALLY-WIDEN*<charT>("...") be "..." if charT is char and L"..." if charT is wchar_t.

29.2 Header <chrono> synopsis

[time.syn]

```
#include <compare>           // see 17.11.1

```

29.3 Cpp17Clock requirements

[time.clock.req]

- 1 A clock is a bundle consisting of a duration, a time_point, and a function now() to get the current time_point. The origin of the clock's time_point is referred to as the clock's epoch. A clock shall meet the requirements in Table 95.
- 2 In Table 95 C1 and C2 denote clock types. t1 and t2 are values returned by C1::now() where the call returning t1 happens before (6.9.2) the call returning t2 and both of these calls occur before C1::time_point::max().

[Note 1: This means C1 did not wrap around between t1 and t2. —end note]

Table 95: Cpp17Clock requirements [tab:time.clock]

Expression	Return type	Operational semantics
C1::rep	An arithmetic type or a class emulating an arithmetic type	The representation type of C1::duration.
C1::period	a specialization of ratio	The tick period of the clock in seconds.
C1::duration	chrono::duration<C1::rep, C1::period>	The duration type of the clock.
C1::time_point	chrono::time_point<C1> or chrono::time_point<C2, C1::duration>	The time_point type of the clock. C1 and C2 shall refer to the same epoch.
C1::is_steady	const bool	true if t1 <= t2 is always true and the time between clock ticks is constant, otherwise false.
C1::now()	C1::time_point	Returns a time_point object representing the current point in time.

- 3 [Note 2: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. —end note]

- 4 A type TC meets the Cpp17TrivialClock requirements if:

- (4.1) — TC meets the Cpp17Clock requirements,
- (4.2) — the types TC::rep, TC::duration, and TC::time_point meet the Cpp17EqualityComparable (Table 27) and Cpp17LessThanComparable (Table 28) requirements and the requirements of numeric types (28.2).

[Note 3: This means, in particular, that operations on these types will not throw exceptions. —end note]

- (4.3) — lvalues of the types TC::rep, TC::duration, and TC::time_point are swappable (16.4.4.3),
- (4.4) — the function TC::now() does not throw exceptions, and
- (4.5) — the type TC::time_point::clock meets the Cpp17TrivialClock requirements, recursively.

29.4 Time-related traits

[time.traits]

29.4.1 `treat_as_floating_point`

[time.traits.is.fp]

```
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

- ¹ The duration template uses the `treat_as_floating_point` trait to help determine if a duration object can be converted to another duration with a different tick period. If `treat_as_floating_point_v<Rep>` is true, then implicit conversions are allowed among durations. Otherwise, the implicit convertibility depends on the tick periods of the durations.

[*Note 1*: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is false, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions. — *end note*]

29.4.2 `duration_values`

[time.traits.duration.values]

```
template<class Rep>
struct duration_values {
public:
    static constexpr Rep zero() noexcept;
    static constexpr Rep min() noexcept;
    static constexpr Rep max() noexcept;
};
```

- ¹ The duration template uses the `duration_values` trait to construct special values of the duration's representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```
static constexpr Rep zero() noexcept;
```

- ² *Returns*: `Rep(0)`.

[*Note 1*: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value. — *end note*]

- ³ *Remarks*: The value returned shall be the additive identity.

```
static constexpr Rep min() noexcept;
```

- ⁴ *Returns*: `numeric_limits<Rep>::lowest()`.

- ⁵ *Remarks*: The value returned shall compare less than or equal to `zero()`.

```
static constexpr Rep max() noexcept;
```

- ⁶ *Returns*: `numeric_limits<Rep>::max()`.

- ⁷ *Remarks*: The value returned shall compare greater than `zero()`.

29.4.3 Specializations of `common_type`

[time.traits.specializations]

```
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
    using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

- ¹ The period of the duration indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

[*Note 1*: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`. — *end note*]

- ² [*Note 2*: The typedef name `type` is a synonym for the duration with the largest tick period possible where both duration arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors. — *end note*]

```
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```

};

- ³ The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two durations.

29.4.4 Class template `is_clock`

[time.traits.is.clock]

```
template<class T> struct is_clock;
```

- ¹ `is_clock` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` meets the *Cpp17Clock* requirements (29.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the *Cpp17Clock* requirements is unspecified, except that as a minimum a type `T` shall not qualify as a *Cpp17Clock* unless it meets all of the following conditions:

- (1.1) — the *qualified-ids* `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.3),
- (1.2) — the expression `T::is_steady` is well-formed when treated as an unevaluated operand (7.2.3),
- (1.3) — the expression `T::now()` is well-formed when treated as an unevaluated operand.

- ² The behavior of a program that adds specializations for `is_clock` is undefined.

29.5 Class template `duration`

[time.duration]

29.5.1 General

[time.duration.general]

- ¹ A duration type measures time between two points in time (`time_points`). A duration has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```
namespace std::chrono {
    template<class Rep, class Period = ratio<1>>
    class duration {
    public:
        using rep      = Rep;
        using period   = typename Period::type;

    private:
        rep rep_;      // exposition only

    public:
        // 29.5.2, construct/copy/destroy
        constexpr duration() = default;
        template<class Rep2>
            constexpr explicit duration(const Rep2& r);
        template<class Rep2, class Period2>
            constexpr duration(const duration<Rep2, Period2>& d);
        ~duration() = default;
        duration(const duration&) = default;
        duration& operator=(const duration&) = default;

        // 29.5.3, observer
        constexpr rep count() const;

        // 29.5.4, arithmetic
        constexpr common_type_t<duration> operator+() const;
        constexpr common_type_t<duration> operator-() const;
        constexpr duration& operator++();
        constexpr duration operator++(int);
        constexpr duration& operator--();
        constexpr duration operator--(int);

        constexpr duration& operator+=(const duration& d);
        constexpr duration& operator-=(const duration& d);
    };
};
```

```
constexpr duration& operator*=(const rep& rhs);
constexpr duration& operator/=(const rep& rhs);
constexpr duration& operator%=(const rep& rhs);
constexpr duration& operator%=(const duration& rhs);
```

// 29.5.5, special values

```
static constexpr duration zero() noexcept;
static constexpr duration min() noexcept;
static constexpr duration max() noexcept;
```

```
};
}
```

- 2 Rep shall be an arithmetic type or a class emulating an arithmetic type. If duration is instantiated with a duration type as the argument for the template parameter Rep, the program is ill-formed.
- 3 If Period is not a specialization of ratio, the program is ill-formed. If Period::num is not positive, the program is ill-formed.
- 4 Members of duration do not throw exceptions other than those thrown by the indicated operations on their representations.
- 5 The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization of the member rep_ for copy and move, respectively, would satisfy the requirements for a constexpr function.
- 6 [Example 1:

```
duration<long, ratio<60>> d0;           // holds a count of minutes using a long
duration<long long, milli> d1;        // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2;    // holds a count with a tick period of  $\frac{1}{30}$  of a second
                                       // (30 Hz) using a double
```

— end example]

29.5.2 Constructors

[time.duration.cons]

```
template<class Rep2>
constexpr explicit duration(const Rep2& r);
```

- 1 **Constraints:** is_convertible_v<const Rep2&, rep> is true and
 - (1.1) — treat_as_floating_point_v<rep> is true or
 - (1.2) — treat_as_floating_point_v<Rep2> is false.

[Example 1:

```
duration<int, milli> d(3);           // OK
duration<int, milli> d(3.5);        // error
```

— end example]

- 2 **Effects:** Initializes rep_ with r.

```
template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);
```

- 3 **Constraints:** No overflow is induced in the conversion and treat_as_floating_point_v<rep> is true or both ratio_divide<Period2, period>::den is 1 and treat_as_floating_point_v<Rep2> is false.

[Note 1: This requirement prevents implicit truncation error when converting between integral-based duration types. Such a construction could easily lead to confusion about the value of the duration. — end note]

[Example 2:

```
duration<int, milli> ms(3);
duration<int, micro> us = ms;       // OK
duration<int, milli> ms2 = us;      // error
```

— end example]

- 4 **Effects:** Initializes rep_ with duration_cast<duration>(d).count().

29.5.3 Observer**[time.duration.observer]**

```
constexpr rep count() const;
```

1 *Returns:* rep_.

29.5.4 Arithmetic**[time.duration.arithmetic]**

```
constexpr common_type_t<duration> operator+() const;
```

1 *Returns:* common_type_t<duration>(*this).

```
constexpr common_type_t<duration> operator-() const;
```

2 *Returns:* common_type_t<duration>(-rep_).

```
constexpr duration& operator++();
```

3 *Effects:* Equivalent to: ++rep_.

4 *Returns:* *this.

```
constexpr duration operator++(int);
```

5 *Effects:* Equivalent to: return duration(rep_++);

```
constexpr duration& operator--();
```

6 *Effects:* Equivalent to: --rep_.

7 *Returns:* *this.

```
constexpr duration operator--(int);
```

8 *Effects:* Equivalent to: return duration(rep_--);

```
constexpr duration& operator+=(const duration& d);
```

9 *Effects:* Equivalent to: rep_ += d.count().

10 *Returns:* *this.

```
constexpr duration& operator-=(const duration& d);
```

11 *Effects:* Equivalent to: rep_ -= d.count().

12 *Returns:* *this.

```
constexpr duration& operator*=(const rep& rhs);
```

13 *Effects:* Equivalent to: rep_ *= rhs.

14 *Returns:* *this.

```
constexpr duration& operator/=(const rep& rhs);
```

15 *Effects:* Equivalent to: rep_ /= rhs.

16 *Returns:* *this.

```
constexpr duration& operator%=(const rep& rhs);
```

17 *Effects:* Equivalent to: rep_ %= rhs.

18 *Returns:* *this.

```
constexpr duration& operator%=(const duration& rhs);
```

19 *Effects:* Equivalent to: rep_ %= rhs.count().

20 *Returns:* *this.

29.5.5 Special values**[time.duration.special]**

```
static constexpr duration zero() noexcept;
```

1 *Returns:* duration(duration_values<rep>::zero()).

```
static constexpr duration min() noexcept;
```

2 *Returns:* duration(duration_values<rep>::min()).

```
static constexpr duration max() noexcept;
```

3 *Returns:* duration(duration_values<rep>::max()).

29.5.6 Non-member arithmetic

[time.duration.nonmember]

1 In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

2 *Returns:* CD(CD(lhs).count() + CD(rhs).count()).

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

3 *Returns:* CD(CD(lhs).count() - CD(rhs).count()).

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& d, const Rep2& s);
```

4 *Constraints:* is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true.

5 *Returns:* CD(CD(d).count() * s).

```
template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const Rep1& s, const duration<Rep2, Period>& d);
```

6 *Constraints:* is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>> is true.

7 *Returns:* d * s.

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator/(const duration<Rep1, Period>& d, const Rep2& s);
```

8 *Constraints:* is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is not a specialization of duration.

9 *Returns:* CD(CD(d).count() / s).

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<Rep1, Rep2>
operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

10 Let CD be common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.

11 *Returns:* CD(lhs).count() / CD(rhs).count().

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator%(const duration<Rep1, Period>& d, const Rep2& s);
```

12 *Constraints:* is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is not a specialization of duration.

13 *Returns:* CD(CD(d).count() % s).

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

14 *Returns:* CD(CD(lhs).count() % CD(rhs).count()).

29.5.7 Comparisons

[time.duration.comparisons]

- 1 In the function descriptions that follow, CT represents `common_type_t<A, B>`, where A and B are the types of the two arguments to the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs,
                          const duration<Rep2, Period2>& rhs);
```

- 2 *Returns:* `CT(lhs).count() == CT(rhs).count()`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs,
                        const duration<Rep2, Period2>& rhs);
```

- 3 *Returns:* `CT(lhs).count() < CT(rhs).count()`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs,
                        const duration<Rep2, Period2>& rhs);
```

- 4 *Returns:* `rhs < lhs`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
                          const duration<Rep2, Period2>& rhs);
```

- 5 *Returns:* `!(rhs < lhs)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
                          const duration<Rep2, Period2>& rhs);
```

- 6 *Returns:* `!(lhs < rhs)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
requires three_way_comparable<typename CT::rep>
constexpr auto operator<=>(const duration<Rep1, Period1>& lhs,
                          const duration<Rep2, Period2>& rhs);
```

- 7 *Returns:* `CT(lhs).count() <=> CT(rhs).count()`.

29.5.8 Conversions

[time.duration.cast]

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
```

- 1 *Constraints:* ToDuration is a specialization of duration.

- 2 *Returns:* Let CF be `ratio_divide<Period, typename ToDuration::period>`, and CR be `common_type<typename ToDuration::rep, Rep, intmax_t>::type`.

- (2.1) — If `CF::num == 1` and `CF::den == 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(d.count()))
```

- (2.2) — otherwise, if `CF::num != 1` and `CF::den == 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))
```

- (2.3) — otherwise, if `CF::num == 1` and `CF::den != 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))
```

- (2.4) — otherwise, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))
```

- 3 [Note 1: This function does not use any implicit conversions; all conversions are done with `static_cast`. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — end note]

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);
```

4 *Constraints:* ToDuration is a specialization of duration.

5 *Returns:* The greatest result t representable in ToDuration for which t <= d.

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);
```

6 *Constraints:* ToDuration is a specialization of duration.

7 *Returns:* The least result t representable in ToDuration for which t >= d.

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);
```

8 *Constraints:* ToDuration is a specialization of duration and `treat_as_floating_point_v<typename ToDuration::rep>` is false.

9 *Returns:* The value of ToDuration that is closest to d. If there are two closest values, then return the value t for which `t % 2 == 0`.

29.5.9 Suffixes for duration literals

[time.duration.literals]

1 This subclause describes literal suffixes for constructing duration literals. The suffixes h, min, s, ms, us, ns denote duration values of the corresponding types hours, minutes, seconds, milliseconds, microseconds, and nanoseconds respectively if they are applied to *integer-literals*.

2 If any of these suffixes are applied to a *floating-point-literal* the result is a `chrono::duration` literal with an unspecified floating-point representation.

3 If any of these suffixes are applied to an *integer-literal* and the resulting `chrono::duration` value cannot be represented in the result type because of overflow, the program is ill-formed.

4 [Example 1: The following code shows some duration literals.

```
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
```

— end example]

```
constexpr chrono::hours operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);
```

5 *Returns:* A duration literal representing hours hours.

```
constexpr chrono::minutes operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator""min(long double minutes);
```

6 *Returns:* A duration literal representing minutes minutes.

```
constexpr chrono::seconds operator""s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator""s(long double sec);
```

7 *Returns:* A duration literal representing sec seconds.

8 [Note 1: The same suffix s is used for `basic_string` but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

```
constexpr chrono::milliseconds operator""ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);
```

9 *Returns:* A duration literal representing msec milliseconds.

```
constexpr chrono::microseconds operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);
```

10 *Returns:* A duration literal representing usec microseconds.

```
constexpr chrono::nanoseconds operator""ns(unsigned long long nsec);
```

```
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);
```

11 *Returns:* A duration literal representing nsec nanoseconds.

29.5.10 Algorithms

[time.duration.alg]

```
template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);
```

1 *Constraints:* numeric_limits<Rep>::is_signed is true.

2 *Returns:* If d >= d.zero(), return d, otherwise return -d.

29.5.11 I/O

[time.duration.io]

```
template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);
```

1 *Effects:* Inserts the duration d onto the stream os as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();
```

where *units-suffix* depends on the type `Period::type` as follows:

- (1.1) — If `Period::type` is `atto`, *units-suffix* is "as".
- (1.2) — Otherwise, if `Period::type` is `femto`, *units-suffix* is "fs".
- (1.3) — Otherwise, if `Period::type` is `pico`, *units-suffix* is "ps".
- (1.4) — Otherwise, if `Period::type` is `nano`, *units-suffix* is "ns".
- (1.5) — Otherwise, if `Period::type` is `micro`, it is implementation-defined whether *units-suffix* is "µs" ("`\u00b5`" "`\u0073`") or "us".
- (1.6) — Otherwise, if `Period::type` is `milli`, *units-suffix* is "ms".
- (1.7) — Otherwise, if `Period::type` is `centi`, *units-suffix* is "cs".
- (1.8) — Otherwise, if `Period::type` is `deci`, *units-suffix* is "ds".
- (1.9) — Otherwise, if `Period::type` is `ratio<1>`, *units-suffix* is "s".
- (1.10) — Otherwise, if `Period::type` is `deca`, *units-suffix* is "das".
- (1.11) — Otherwise, if `Period::type` is `hecto`, *units-suffix* is "hs".
- (1.12) — Otherwise, if `Period::type` is `kilo`, *units-suffix* is "ks".
- (1.13) — Otherwise, if `Period::type` is `mega`, *units-suffix* is "Ms".
- (1.14) — Otherwise, if `Period::type` is `giga`, *units-suffix* is "Gs".
- (1.15) — Otherwise, if `Period::type` is `tera`, *units-suffix* is "Ts".
- (1.16) — Otherwise, if `Period::type` is `peta`, *units-suffix* is "Ps".
- (1.17) — Otherwise, if `Period::type` is `exa`, *units-suffix* is "Es".
- (1.18) — Otherwise, if `Period::type` is `ratio<60>`, *units-suffix* is "min".
- (1.19) — Otherwise, if `Period::type` is `ratio<3600>`, *units-suffix* is "h".
- (1.20) — Otherwise, if `Period::type` is `ratio<86400>`, *units-suffix* is "d".
- (1.21) — Otherwise, if `Period::type::den == 1`, *units-suffix* is "[num]s".
- (1.22) — Otherwise, *units-suffix* is "[num/den]s".

In the list above, the use of *num* and *den* refer to the static data members of `Period::type`, which are converted to arrays of `charT` using a decimal conversion with no leading zeroes.

2 *Returns:* os.

```
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
           duration<Rep, Period>& d,
           basic_string<charT, traits, Alloc>* abbrev = nullptr,
           minutes* offset = nullptr);
```

- 3 *Effects:* Attempts to parse the input stream *is* into the duration *d* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid duration, *is.setstate(ios_base::failbit)* is called and *d* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null.

- 4 *Returns:* *is*.

29.6 Class template `time_point`

[time.point]

29.6.1 General

[time.point.general]

```
namespace std::chrono {
template<class Clock, class Duration = typename Clock::duration>
class time_point {
public:
    using clock      = Clock;
    using duration   = Duration;
    using rep        = typename duration::rep;
    using period     = typename duration::period;

private:
    duration d_; // exposition only

public:
    // 29.6.2, construct
    constexpr time_point(); // has value epoch
    constexpr explicit time_point(const duration& d); // same as time_point() + d
    template<class Duration2>
        constexpr time_point(const time_point<clock, Duration2>& t);

    // 29.6.3, observer
    constexpr duration time_since_epoch() const;

    // 29.6.4, arithmetic
    constexpr time_point& operator++();
    constexpr time_point operator++(int);
    constexpr time_point& operator--();
    constexpr time_point operator--(int);
    constexpr time_point& operator+=(const duration& d);
    constexpr time_point& operator-=(const duration& d);

    // 29.6.5, special values
    static constexpr time_point min() noexcept;
    static constexpr time_point max() noexcept;
};
}
```

- 1 If *Duration* is not a specialization of *duration*, the program is ill-formed.

29.6.2 Constructors

[time.point.cons]

```
constexpr time_point();
```

- 1 *Effects:* Initializes *d_* with *duration::zero()*. Such a *time_point* object represents the epoch.

```
constexpr explicit time_point(const duration& d);
```

- 2 *Effects:* Initializes *d_* with *d*. Such a *time_point* object represents the epoch + *d*.

```
template<class Duration2>
  constexpr time_point(const time_point<clock, Duration2>& t);
3   Constraints: is_convertible_v<Duration2, duration> is true.
4   Effects: Initializes d_ with t.time_since_epoch().
```

29.6.3 Observer**[time.point.observer]**

```
constexpr duration time_since_epoch() const;
1   Returns: d_.
```

29.6.4 Arithmetic**[time.point.arithmetic]**

```
constexpr time_point& operator++();
1   Effects: Equivalent to: ++d_.
2   Returns: *this.

constexpr time_point operator++(int);
3   Effects: Equivalent to: return time_point{d_++};

constexpr time_point& operator--();
4   Effects: Equivalent to: --d_.
5   Returns: *this.

constexpr time_point operator--(int);
6   Effects: Equivalent to: return time_point{d_--};

constexpr time_point& operator+=(const duration& d);
7   Effects: Equivalent to: d_ += d.
8   Returns: *this.

constexpr time_point& operator-=(const duration& d);
9   Effects: Equivalent to: d_ -= d.
10  Returns: *this.
```

29.6.5 Special values**[time.point.special]**

```
static constexpr time_point min() noexcept;
1   Returns: time_point(duration::min()).

static constexpr time_point max() noexcept;
2   Returns: time_point(duration::max()).
```

29.6.6 Non-member arithmetic**[time.point.nonmember]**

```
template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
  operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
1   Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
  constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>
  operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);
2   Returns: rhs + lhs.
```

```
template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

3 *Returns:* CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.

```
template<class Clock, class Duration1, class Duration2>
constexpr common_type_t<Duration1, Duration2>
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
```

4 *Returns:* lhs.time_since_epoch() - rhs.time_since_epoch().

29.6.7 Comparisons

[time.point.comparisons]

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs,
                          const time_point<Clock, Duration2>& rhs);
```

1 *Returns:* lhs.time_since_epoch() == rhs.time_since_epoch().

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
                        const time_point<Clock, Duration2>& rhs);
```

2 *Returns:* lhs.time_since_epoch() < rhs.time_since_epoch().

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
                        const time_point<Clock, Duration2>& rhs);
```

3 *Returns:* rhs < lhs.

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
                          const time_point<Clock, Duration2>& rhs);
```

4 *Returns:* !(rhs < lhs).

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
                          const time_point<Clock, Duration2>& rhs);
```

5 *Returns:* !(lhs < rhs).

```
template<class Clock, class Duration1,
        three_way_comparable_with<Duration1> Duration2>
constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,
                          const time_point<Clock, Duration2>& rhs);
```

6 *Returns:* lhs.time_since_epoch() <=> rhs.time_since_epoch().

29.6.8 Conversions

[time.point.cast]

```
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);
```

1 *Constraints:* ToDuration is a specialization of duration.

2 *Returns:*

```
time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))
```

```
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);
```

3 *Constraints:* ToDuration is a specialization of duration.

4 *Returns:* time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch())).

```
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);
```

5 *Constraints:* ToDuration is a specialization of duration.

6 *Returns:* `time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))`.

```
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);
```

7 *Constraints:* `ToDuration` is a specialization of `duration`, and `treat_as_floating_point_v<typename ToDuration::rep>` is false.

8 *Returns:* `time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch()))`.

29.7 Clocks

[time.clock]

29.7.1 General

[time.clock.general]

1 The types defined in 29.7 meet the *Cpp17TrivialClock* requirements (29.3) unless otherwise specified.

29.7.2 Class `system_clock`

[time.clock.system]

29.7.2.1 Overview

[time.clock.system.overview]

```
namespace std::chrono {
    class system_clock {
    public:
        using rep          = see below;
        using period       = ratio<unspecified, unspecified>;
        using duration     = chrono::duration<rep, period>;
        using time_point   = chrono::time_point<system_clock>;
        static constexpr bool is_steady = unspecified;

        static time_point now() noexcept;

        // mapping to/from C type time_t
        static time_t      to_time_t (const time_point& t) noexcept;
        static time_point  from_time_t(time_t t) noexcept;
    };
}
```

1 Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as *Unix time*. This measure facilitates an efficient mapping between `sys_time` and calendar types (29.8).

[Example 1:

`sys_seconds{sys_days{1970y/January/1}}.time_since_epoch()` is 0s.

`sys_seconds{sys_days{2000y/January/1}}.time_since_epoch()` is 946'684'800s, which is $10'957 * 86'400$ s.

— end example]

29.7.2.2 Members

[time.clock.system.members]

```
using system_clock::rep = unspecified;
```

1 *Constraints:* `system_clock::duration::min() < system_clock::duration::zero()` is true.

[Note 1: This implies that `rep` is a signed type. — end note]

```
static time_t to_time_t(const time_point& t) noexcept;
```

2 *Returns:* A `time_t` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

```
static time_point from_time_t(time_t t) noexcept;
```

3 *Returns:* A `time_point` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

29.7.2.3 Non-member functions

[time.clock.system.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);
```

1 *Constraints:* `treat_as_floating_point_v<typename Duration::rep>` is false, and `Duration{1} < days{1}` is true.

2 *Effects:* Equivalent to:

```
return os << format(os.getloc(), STatically-WIDEN("{:L%F %T}"), tp);
```

3 [Example 1:

```
cout << sys_seconds{0s} << '\n';           // 1970-01-01 00:00:00
cout << sys_seconds{946'684'800s} << '\n';   // 2000-01-01 00:00:00
cout << sys_seconds{946'688'523s} << '\n';   // 2000-01-01 01:02:03
```

—end example]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);
```

4 *Effects:* `os << year_month_day{dp}`.

5 *Returns:* `os`.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

6 *Effects:* Attempts to parse the input stream `is` into the `sys_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

7 *Returns:* `is`.

29.7.3 Class `utc_clock`

[time.clock.utc]

29.7.3.1 Overview

[time.clock.utc.overview]

```
namespace std::chrono {
class utc_clock {
public:
using rep = a signed arithmetic type;
using period = ratio<unspecified, unspecified>;
using duration = chrono::duration<rep, period>;
using time_point = chrono::time_point<utc_clock>;
static constexpr bool is_steady = unspecified;

static time_point now();

template<class Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& t);
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);
};
}
```

1 In contrast to `sys_time`, which does not take leap seconds into account, `utc_clock` and its associated `time_point`, `utc_time`, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

[*Note 1:* The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant `sys_days{1972y/1/1} - sys_days{1970y/1/1}` (63'072'000s) from the `utc_time`. — *end note*]

[*Example 1:*

```
clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch() is 946'684'822s,
which is 10'957 * 86'400s + 22s.
```

— *end example*]

- 2 `utc_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `utc_clock::now()` does not propagate an exception.

[*Note 2:* `noexcept(from_sys(system_clock::now()))` is false. — *end note*]

29.7.3.2 Member functions

[**time.clock.utc.members**]

```
static time_point now();
```

- 1 *Returns:* `from_sys(system_clock::now())`, or a more accurate value of `utc_time`.

```
template<class Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& u);
```

- 2 *Returns:* A `sys_time` `t`, such that `from_sys(t) == u` if such a mapping exists. Otherwise `u` represents a `time_point` during a positive leap second insertion, the conversion counts that leap second as not inserted, and the last representable value of `sys_time` prior to the insertion of the leap second is returned.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);
```

- 3 *Returns:* A `utc_time` `u`, such that `u.time_since_epoch() - t.time_since_epoch()` is equal to the sum of leap seconds that were inserted between `t` and 1970-01-01. If `t` is exactly the date of leap second insertion, then the conversion counts that leap second as inserted.

[*Example 1:*

```
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
```

— *end example*]

29.7.3.3 Non-member functions

[**time.clock.utc.nonmembers**]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);
```

- 1 *Effects:* Equivalent to:

```
return os << format(os.getloc(), STatically-WIDEN<charT>("{:L%F %T}"), t);
```

2 [*Example 1:*

```
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
    cout << u << " UTC\n";
```

Produces this output:

```
2015-06-30 23:59:59.500 UTC
```

```

2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC

```

— end example]

```

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);

```

- 3 *Effects:* Attempts to parse the input stream *is* into the *utc_time* *tp* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid date, *is.setstate(ios_base::failbit)* is called and *tp* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to *tp*.

- 4 *Returns:* *is*.

```

struct leap_second_info {
    bool    is_leap_second;
    seconds elapsed;
};

```

- 5 The type *leap_second_info* has data members and special members specified above. It has no base classes or members other than those specified.

```

template<class Duration>
leap_second_info get_leap_second_info(const utc_time<Duration>& ut);

```

- 6 *Returns:* A *leap_second_info* *lsi*, where *lsi.is_leap_second* is true if *ut* is during a positive leap second insertion, and otherwise false. *lsi.elapsed* is the sum of leap seconds between 1970-01-01 and *ut*. If *lsi.is_leap_second* is true, the leap second referred to by *ut* is included in the sum.

29.7.4 Class *tai_clock*

[time.clock.tai]

29.7.4.1 Overview

[time.clock.tai.overview]

```

namespace std::chrono {
    class tai_clock {
    public:
        using rep                = a signed arithmetic type;
        using period              = ratio<unspecified, unspecified>;
        using duration            = chrono::duration<rep, period>;
        using time_point         = chrono::time_point<tai_clock>;
        static constexpr bool is_steady = unspecified;

        static time_point now();

        template<class Duration>
        static utc_time<common_type_t<Duration, seconds>>
            to_utc(const tai_time<Duration>&) noexcept;
        template<class Duration>
        static tai_time<common_type_t<Duration, seconds>>
            from_utc(const utc_time<Duration>&) noexcept;
    };
}

```

- 1 The clock *tai_clock* measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to TAI. For example by

2000-01-01 there had been 22 positive and 0 negative leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

- ² `tai_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `tai_clock::now()` does not propagate an exception.

[*Note 1*: `noexcept(from_utc(utc_clock::now()))` is false. — *end note*]

29.7.4.2 Member functions

[**time.clock.tai.members**]

```
static time_point now();
```

- ¹ *Returns*: `from_utc(utc_clock::now())`, or a more accurate value of `tai_time`.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const tai_time<Duration>& t) noexcept;
```

- ² *Returns*:

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s
```

[*Note 1*:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— *end note*]

```
template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;
```

- ³ *Returns*:

```
tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s
```

[*Note 2*:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— *end note*]

29.7.4.3 Non-member functions

[**time.clock.tai.nonmembers**]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);
```

- ¹ *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

- ² [*Example 1*:

```
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

- ³ *Effects*: Attempts to parse the input stream `is` into the `tai_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns:* is.

29.7.5 Class `gps_clock`

[[time.clock.gps](#)]

29.7.5.1 Overview

[[time.clock.gps.overview](#)]

```
namespace std::chrono {
    class gps_clock {
    public:
        using rep                = a signed arithmetic type;
        using period              = ratio<unspecified, unspecified>;
        using duration            = chrono::duration<rep, period>;
        using time_point          = chrono::time_point<gps_clock>;
        static constexpr bool is_steady = unspecified;

        static time_point now();

        template<class Duration>
            static utc_time<common_type_t<Duration, seconds>>
                to_utc(const gps_time<Duration>&) noexcept;
        template<class Duration>
            static gps_time<common_type_t<Duration, seconds>>
                from_utc(const utc_time<Duration>&) noexcept;
    };
}
```

1 The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

2 `gps_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception.

[*Note 1:* `noexcept(from_utc(utc_clock::now()))` is false. — *end note*]

29.7.5.2 Member functions

[[time.clock.gps.members](#)]

```
static time_point now();
```

1 *Returns:* `from_utc(utc_clock::now())`, or a more accurate value of `gps_time`.

```
template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>& t) noexcept;
```

2 *Returns:*

```
    utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
```

[*Note 1:*

```
    315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

— *end note*]

```
template<class Duration>
    static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>& t) noexcept;
```

3 *Returns:*

```
    gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
```

[*Note 2:*

```
    315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

— *end note*]

29.7.5.3 Non-member functions**[time.clock.gps.nonmembers]**

```
template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);
```

1 *Effects:* Equivalent to:

```
return os << format(os.getloc(), STatically-WIDEN<charT>("{:L%F %T}"), t);
```

2 *[Example 1:*

```
auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

— *end example]*

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
        from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                    gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                    minutes* offset = nullptr);
```

3 *Effects:* Attempts to parse the input stream *is* into the *gps_time* *tp* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid date, *is.setstate(ios_base::failbit)* is called and *tp* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to *tp*.

4 *Returns:* *is*.

29.7.6 Type file_clock**[time.clock.file]****29.7.6.1 Overview****[time.clock.file.overview]**

```
namespace std::chrono {
    using file_clock = see below;
}
```

1 *file_clock* is an alias for a type meeting the *Cpp17TrivialClock* requirements (29.3), and using a signed arithmetic type for *file_clock::rep*. *file_clock* is used to create the *time_point* system used for *file_time_type* (31.12). Its epoch is unspecified, and *noexcept(file_clock::now())* is true.

[*Note 1:* The type that *file_clock* denotes can be in a different namespace than *std::chrono*, such as *std::filesystem*. — *end note]*

29.7.6.2 Member functions**[time.clock.file.members]**

1 The type denoted by *file_clock* provides precisely one of the following two sets of static member functions:

```
template<class Duration>
    static sys_time<see below>
        to_sys(const file_time<Duration>&);
template<class Duration>
    static file_time<see below>
        from_sys(const sys_time<Duration>&);
```

OR:

```
template<class Duration>
    static utc_time<see below>
        to_utc(const file_time<Duration>&);
template<class Duration>
    static file_time<see below>
        from_utc(const utc_time<Duration>&);
```

These member functions shall provide *time_point* conversions consistent with those specified by *utc_clock*, *tai_clock*, and *gps_clock*. The Duration of the resultant *time_point* is computed from the Duration of the input *time_point*.

29.7.6.3 Non-member functions**[time.clock.file.nonmembers]**

```
template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
```

1 *Effects:* Equivalent to:

```
return os << format(os.getloc(), STatically-WIDEN<charT>("{:L%F %T}"), t);
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
        from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                    file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                    minutes* offset = nullptr);
```

2 *Effects:* Attempts to parse the input stream *is* into the *file_time* *tp* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid date, *is.setstate(ios_base::failbit)* is called and *tp* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to *tp*.

3 *Returns:* *is*.

29.7.7 Class steady_clock**[time.clock.steady]**

```
namespace std::chrono {
    class steady_clock {
    public:
        using rep          = unspecified;
        using period       = ratio<unspecified, unspecified>;
        using duration     = chrono::duration<rep, period>;
        using time_point   = chrono::time_point<unspecified, duration>;
        static constexpr bool is_steady = true;

        static time_point now() noexcept;
    };
}
```

1 Objects of class *steady_clock* represent clocks for which values of *time_point* never decrease as physical time advances and for which values of *time_point* advance at a steady rate relative to real time. That is, the clock may not be adjusted.

29.7.8 Class high_resolution_clock**[time.clock.hires]**

```
namespace std::chrono {
    class high_resolution_clock {
    public:
        using rep          = unspecified;
        using period       = ratio<unspecified, unspecified>;
        using duration     = chrono::duration<rep, period>;
        using time_point   = chrono::time_point<unspecified, duration>;
        static constexpr bool is_steady = unspecified;

        static time_point now() noexcept;
    };
}
```

1 Objects of class *high_resolution_clock* represent clocks with the shortest tick period. *high_resolution_clock* may be a synonym for *system_clock* or *steady_clock*.

29.7.9 Local time**[time.clock.local]**

1 The family of time points denoted by *local_time<Duration>* are based on the pseudo clock *local_t*. *local_t* has no member *now()* and thus does not meet the clock requirements. Nevertheless *local_time<Duration>* serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete *time_point* algebra is available for *local_time<Duration>* (just as for *sys_time<Duration>*).

```
template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);
```

2 *Effects:*

```
os << sys_time<Duration>{lt.time_since_epoch()};
```

3 *Returns:* os.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
        from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                    local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                    minutes* offset = nullptr);
```

4 *Effects:* Attempts to parse the input stream *is* into the *local_time* *tp* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid date, *is.setstate(ios_base::failbit)* is called and *tp* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null.

5 *Returns:* *is*.

29.7.10 time_point conversions

[time.clock.cast]

29.7.10.1 Class template clock_time_conversion

[time.clock.conv]

```
namespace std::chrono {
    template<class DestClock, class SourceClock>
        struct clock_time_conversion {};
}
```

1 *clock_time_conversion* serves as a trait which can be used to specify how to convert a source *time_point* of type *time_point<SourceClock, Duration>* to a destination *time_point* of type *time_point<DestClock, Duration>* via a specialization: *clock_time_conversion<DestClock, SourceClock>*. A specialization of *clock_time_conversion<DestClock, SourceClock>* shall provide a const-qualified operator() that takes a parameter of type *time_point<SourceClock, Duration>* and returns a *time_point<DestClock, OtherDuration>* representing an equivalent point in time. *OtherDuration* is a *chrono::duration* whose specialization is computed from the input *Duration* in a manner which can vary for each *clock_time_conversion* specialization. A program may specialize *clock_time_conversion* if at least one of the template parameters is a user-defined clock type.

2 Several specializations are provided by the implementation, as described in 29.7.10.2, 29.7.10.3, 29.7.10.4, and 29.7.10.5.

29.7.10.2 Identity conversions

[time.clock.cast.id]

```
template<class Clock>
    struct clock_time_conversion<Clock, Clock> {
        template<class Duration>
            time_point<Clock, Duration>
                operator()(const time_point<Clock, Duration>& t) const;
    };
```

```
template<class Duration>
    time_point<Clock, Duration>
        operator()(const time_point<Clock, Duration>& t) const;
```

1 *Returns:* *t*.

```
template<>
    struct clock_time_conversion<system_clock, system_clock> {
        template<class Duration>
            sys_time<Duration>
                operator()(const sys_time<Duration>& t) const;
    };
```

```
template<class Duration>
  sys_time<Duration>
    operator()(const sys_time<Duration>& t) const;
```

2 *Returns:* t.

```
template<>
  struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
      utc_time<Duration>
        operator()(const utc_time<Duration>& t) const;
  };
```

```
template<class Duration>
  utc_time<Duration>
    operator()(const utc_time<Duration>& t) const;
```

3 *Returns:* t.

29.7.10.3 Conversions between system_clock and utc_clock

[time.clock.cast.sys.utc]

```
template<>
  struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
      utc_time<common_type_t<Duration, seconds>>
        operator()(const sys_time<Duration>& t) const;
  };
```

```
template<class Duration>
  utc_time<common_type_t<Duration, seconds>>
    operator()(const sys_time<Duration>& t) const;
```

1 *Returns:* utc_clock::from_sys(t).

```
template<>
  struct clock_time_conversion<system_clock, utc_clock> {
    template<class Duration>
      sys_time<common_type_t<Duration, seconds>>
        operator()(const utc_time<Duration>& t) const;
  };
```

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    operator()(const utc_time<Duration>& t) const;
```

2 *Returns:* utc_clock::to_sys(t).

29.7.10.4 Conversions between system_clock and other clocks

[time.clock.cast.sys]

```
template<class SourceClock>
  struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
      auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_sys(t));
  };
```

```
template<class Duration>
  auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));
```

1 *Constraints:* SourceClock::to_sys(t) is well-formed.

2 *Mandates:* SourceClock::to_sys(t) returns a sys_time<Duration2> for some type Duration2 (29.6.1).

3 *Returns:* SourceClock::to_sys(t).

```
template<class DestClock>
  struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
      auto operator()(const sys_time<Duration>& t) const
        -> decltype(DestClock::from_sys(t));
```

};

```
template<class Duration>
auto operator()(const sys_time<Duration>& t) const
-> decltype(DestClock::from_sys(t));
```

4 *Constraints:* DestClock::from_sys(t) is well-formed.

5 *Mandates:* DestClock::from_sys(t) returns a time_point<DestClock, Duration2> for some type Duration2 (29.6.1).

6 *Returns:* DestClock::from_sys(t).

29.7.10.5 Conversions between utc_clock and other clocks

[time.clock.cast.utc]

```
template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_utc(t));
};
```

```
template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
-> decltype(SourceClock::to_utc(t));
```

1 *Constraints:* SourceClock::to_utc(t) is well-formed.

2 *Mandates:* SourceClock::to_utc(t) returns a utc_time<Duration2> for some type Duration2 (29.6.1).

3 *Returns:* SourceClock::to_utc(t).

```
template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
        -> decltype(DestClock::from_utc(t));
};
```

```
template<class Duration>
auto operator()(const utc_time<Duration>& t) const
-> decltype(DestClock::from_utc(t));
```

4 *Constraints:* DestClock::from_utc(t) is well-formed.

5 *Mandates:* DestClock::from_utc(t) returns a time_point<DestClock, Duration2> for some type Duration2 (29.6.1).

6 *Returns:* DestClock::from_utc(t).

29.7.10.6 Function template clock_cast

[time.clock.cast.fn]

```
template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);
```

1 *Constraints:* At least one of the following clock time conversion expressions is well-formed:

- (1.1) — clock_time_conversion<DestClock, SourceClock>{}(t)
- (1.2) — clock_time_conversion<DestClock, system_clock>{}(
 clock_time_conversion<system_clock, SourceClock>{}(t))
- (1.3) — clock_time_conversion<DestClock, utc_clock>{}(
 clock_time_conversion<utc_clock, SourceClock>{}(t))
- (1.4) — clock_time_conversion<DestClock, utc_clock>{}(
 clock_time_conversion<utc_clock, system_clock>{}(
 clock_time_conversion<system_clock, SourceClock>{}(t)))
- (1.5) — clock_time_conversion<DestClock, system_clock>{}(
 clock_time_conversion<system_clock, utc_clock>{}(
 clock_time_conversion<utc_clock, SourceClock>{}(t)))

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations.

- 2 *Mandates:* Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.
- 3 *Returns:* The best well-formed clock time conversion expression in the above list.

29.8 The civil calendar [time.cal]

29.8.1 In general [time.cal.general]

- 1 The types in 29.8 describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.

29.8.2 Class `last_spec` [time.cal.last]

```
namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}
```

- 1 The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

29.8.3 Class `day` [time.cal.day]

29.8.3.1 Overview [time.cal.day.overview]

```
namespace std::chrono {
    class day {
        unsigned char d_;           // exposition only
    public:
        day() = default;
        constexpr explicit day(unsigned d) noexcept;

        constexpr day& operator++() noexcept;
        constexpr day operator++(int) noexcept;
        constexpr day& operator--() noexcept;
        constexpr day operator--(int) noexcept;

        constexpr day& operator+=(const days& d) noexcept;
        constexpr day& operator-=(const days& d) noexcept;

        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;
